THEATRUM BOTANICVM:

THE

THEATER OF PLANTS.

OR,

AN HERBALL OF A LARGE EXTENT:

Containing therein a more ample and exact Hiſtory and declaration of the Phyſicall Herbs and Plants that are in other Authours, encreaſed by the acceſſe of many hundreds of new, rare, and ſtrange Plants from all the parts of the world, with ſundry Gummes, and other Phyſicall materials, than hath beene hitherto publiſhed by any before; And a moſt large demonſtration of their Natures and Vertues.

Shewing vvithall the many errors, differences, and overſights of ſundry Authors that have formerly written of them; and a certaine confidence, or moſt probable conjecture of the true and genuine Herbes and Plants.

Diſtributed into ſundry Claſſes or Tribes, for the more eaſie knowledge of the many Herbes of one nature and property, with the chiefe notes of Dr. *Lobel*, Dr. *Bonham*, and others inſerted therein.

Collected by the many yeares travaile, induſtry, and experience in this ſubject, by *John Parkinſon* Apothecary of *London*, and the Kings Herbariſt.

And Publiſhed by the Kings Majeſtyes eſpeciall priviledge.

LONDON,
Printed by *Tho. Cotes*. 1640.

TO THE KINGS MOST EXCELLENT MAIESTIE.

HAving by long paines and endeavours, composed this Manlike Worke of Herbes and Plants, Most gracious Soveraigne (as I formerly did a Feminine of Flowers, and presented it to the Queenes most excellent Majesty) I could doe no lesse then submissively lay it at your Majesties feet, to be approved or condemned, and if thought fit and worthy a publique passage, to offer it on the Altar of your Majestyes many favours to me, to be commanded as well as commended unto all for their owne good. For as your Majesty is *Summus Pater patriæ*, the chiefe of your people under God, that not onely provideth for their soules health, that they may have the pure Word of God, whereby to live ever, wherein we justly claime the prerogative above any Nation under Heaven, and most devoutly praise God for the same, and desire religiously to live thereunder: but many wayes also for their bodily estates, by good and wholesome Lawes, that every one may live obediently and peaceably under their owne Vine and Figtree, and by protection, &c. And I doubt not of your Majesties further care of their bodies health, that such Workes as deliver approved remedyes may be divulged, whereby they may both cure and prevent their diseases. Most properly therefore doth this Worke belong to your Majesties Patronage both to further and defend, that malevolent spirits should not dare to cast forth their venome or aspertions, to the prejudice of any well deserving, but that therby under God and good direction, all may live in health, as well as wealth, peace, and godlines, which God grant, and that this boldnesse may be pardoned to

Your Majestyes
Loyall Subject,
Servant, and Herbarist,

John Parkinson.

To the Reader.

THe disastrous times, but much more wretched and perverse men have so farre prevailed against my intended purpose, and promise, in exhibiting this Worke to the publicke view of all; that their extreame covetousnesse had well nigh deprived my Country of the fruition: But having at last, though long and with much adoe, broken through all obstacles opposing tandem prodiit in lucem. And although by the revolution of time it hath changed the note (that is from a Physicall Garden of Simples, to a Theater of Plants) yet not the nature, yea rather it hath gained the more matter by the overture, that intending to exclude many of those things that were not proper for it, this including a tot quot dici poterint. For finding in my Profession many slips and errors crept therein and incident thereto, it stirred up a desire in me, having rightly weighed them, seriously to consider how such a customary custome evill be left off and amended; yet not doubting of the effect, by the religious inclination of my Country when just reasons shall be shewed therefore, (although some delight to be obstinate, and because they were bred up in errors, they will not be wiser then their Fathers, but together live and dye in them, yea and condemne that light that others have, because they thinke their darkenesse better) both to avoyd and amend them: but to accomplish this, hic labor hoc opus erat, this was a taske lay somewhat heavy on me to undergoe, and tooke up no small time to finish, howsoever Master Iohnsons agility could easily wade through with it, and his younger yeares carry away greater burdens, for saith he, heavy taskes are worst borne by them that are least able, but his quicke speed may conclude with this adage Canis festinans cœcos parit catullos: but how and in what sort it is done I leave to judicious censure, not to sharpe toothed and tongued selfe-gnawing envy, that will traduce all others workes to magnifie their owne; for mine owne part, although I boast not of great learning, such as might better have illustrated this worke, yet seeing my genius hath ever driven me to these studies, and my many yeares I thinke hath given me a little more experience, being so long verst thereabout, I hope my time hath not beene ill spent if well taken both in the detection and direction, as also that it will prove more usefull and certaine in rem publicam Botanicam, then some others have gone before me, yet if any after me can without envy, having younger and clearer eyes and more setled judgement withall, amend ought that I have set amisse, or not fully declared, per me licet. I know that whosoever shall runne through so many Fields, Woods, Hils, &c. as this worke includeth, and shall trip at no time, hic erit mihi magnus Apollo, I will crowne him with such a Garland as neither his antecessors or successours ever did or shall weare; yet let not anyes presumptuous spirit malice or menace the Authour, if he have laid open some of their errors, as if they onely were free, or thinke themselves better then Theophrastus, Dioscorides, Galen, Pliny, &c. of the Ancients; or, Tragus, Matthiolus, Clusius, Lobel, Bauhinus, of the Modernes, whose slips and errors I unfold likewise, who no doubt if now alive, being rightly informed, would rather embrace then spurne the stone that stroke them. One bout more with Momus in a Bookesellers shop, for more roome I must not overslip, that would teare this Worke in peeces because I have not followed Gerards method, in setting Letters to the severall vertues of the Plants, and must therefore be villifyed as if no other method were comparable thereto. I verily

say

say unto you that by the alteration you enjoy a double benefit, first in the bulke of the Booke which if that course had beene followed, would have enlarged it well neere halfe as much more; and made it the more unwelldy, and likewise the dearer and never a whit the better: Secondly, in recompense of the time spent in looking for what you seek, you may read that which may be more helpefull and beneficiall to you: let Momus *chaps therefore be sowed up to barke no more. Among other the good uses this worke affordeth, this may be one, that it will helpe to correct the* English *names in all the Dictionaries to bee hereafter set forth, which have them in many ignorantly, in some contrary, in most devious, in very few true, whereby many hoping for helpe in their Dictionaries when an Herball was not at hand have beene frustrated, the blind leading the blind, which how profitable, I leave to every intelligent to consider. And lastly, although I goe not about to teach Doctors (who but little intended this practise, having enough to doe otherwayes, and yet it is as I may so say, the fundamentall part thereof, and approved by* Galen *in his censure of Simples, and* Dioscorides *Text) but to helpe their memories, and withall to shew them my judgement, that they mistake not one thing for another, or one mans plant for another, which I hope will well deserve their good liking: for the various conceites of men about Plants, is for the most part according to their knowledge in them, and hath caused such mistakings and controversie, as are to be seene in their writings Goe forth now therefore thou issue artificiall of mine, and supply the defect of a Naturall, to beare up thy Fathers name and memory to succeeding ages, and what in thee lyeth effect more good to thy Prince and Country then numerous of others, which often prove rather plagues then profits thereto, and feare not the face of thy fiercest foe: but say that while we live (although the course of the World is* Orientem semper adorare Solem non occidentem) *and* per multa discrimina rerum tendimus in Patriam supercœlestem, *if any oppose thee, or professe himselfe a Proctor for* Bauhinus *or any others slips, the lists shall be ready, and the controversie* ex ore *decided: if extinct let the judicious determine the matter. And because some may object I am somewhat too tart and quicke, my Apology to all is* Amicus mihi Plato, Amicus Seneca sed magis Amica mihi veritas: *Accept therefore in courtesie of his paines that hath onely intended it for your good, and if I have eyther slipped or overslipped, with a gentle hand amend it; so shall he still be*

Thine in what he may,

IOHN PARKINSON,

Botanicus Regius.

Iohanni Parkinſon Pharmacopœo Londinenſi, Regis Botanico primario. S. P.

PRodeat tandem & propitiâ Lucinâ vitali fruatur aurâ decennis illa fœtura ingenii tui perſpicacis, & laboris indefeſſi, in rimandis & aperiendis fœcundæ Veſtæ penetralibus, ejuſque perluſtranda ſuperficie, ad Vegetabilis Regni firmamentum, cui partui neque ipſum *Dioſcoridem* Anazarbæum pudeat obſtetricari. Tam ſcité, tam eleganter, tam enucleaté abs te deſcripta depictaque omnia, quæ in hunc uſque diem, Rei herbariæ ſtudioſis innotuerunt, ut habeat abundé tua *Britannia* unde de te poſſit jure gloriari: In cujus opulentiſſimi, amœniſſimi, fertiliſſimi regni grande decus, Mithridatis (maximi ſua ætate Regúm) curioſam circa materiam medicam ſedulitatem, Evacis Regis Arabùm, Cratevæ, Dyonyſii, Metrodori, Macri & cæterorum qui ſimpliciúm notitiâ cluerunt olim dotes eximias, cum neotericorum artificioſâ Indagine, in unum coegiſti faſciculum, datis quidem immenſo diſquiſitionis & obſervationùm Oceano limitibus, tam laxis tamen & ſequacibus, ut ad inſtructiſſimi hujus gazophylacii ſupplementum, nova congeries granatim poſſit indies magna cum facilitate accreſcere. *Botanici* ut plurimùm meri ſunt nomen clatores, qui præclaré ſe rem geſſiſſe arbitrantur, ſi perluſtratis variis plagis, nomina repertorum ſimplicium, & forſan eorum Icones redigant in volumen, quo operæ pretio arti ſatis cautum exiſtimant. Tu verò non prætermiſſâ externâ plantarum ſpecie, earum corpora penetras medullitús, & ſingularùm virtutes in publicam ſalutem, & mortalium ſolatium tam graphicé pandis, ut deinceps populares tui *Angli* (gens ad pacem, bellum, ſcientias, artes, ad omnia apta, nata) Theſauri naturæ ditiſſimam, morbiſque tutó debellandis utiliſſimam partem, cultu donatam vernaculo, (hiſtoriam nempe Vegetabilium, virtutum aſſignatione nobilitatam) penitiſſimè noſſe, atque haſce γυμνὰς χείρας nudas exoſculari, & ſibi ipſis applicare valeant. Circa operis tui laudes volubili vel bullatâ oratione expatiari injurioſum duco: quippe Vino vendibili non eſt opus ſuſpenſâ hederâ. Suum ſibi pariat Liber tuus encomium, quem nemo ſanæ mentis, operùm naturæ peritus, ſine Authoris ſingulari commendatione unquam perlecturus eſt. Siquis exoriatur vel Momus vel Zoilus, qui Maledicendi prurigine, aut inſanabili cacoethe laborans, tua carpere audeat, ille malis avibus aggreſſus dormientem Herculem, cum Achemone & Paſſalo victus vinctuſque, ex victoris clavâ æternum pendeat. Imbellium catellorum inanes latratus ſpernunt generoſi moloſſi; Non ſi ſe ruperit ille Par erit. Interim tu calumniarum ſecurus æque & contemptor, In amplificando tuo Theatro pergito quamdiu vixeris. Hanc imponit tibi provinciam, ejuſque poſcit foenus REX CAROLVS Dominus noſter Magnæ *Britaniæ* Monarcha, cui placuit nuperrime honorificum tibi dare

dare titulum Botanici Regii Primarii, virtuti tuæ sanè non indebitum, quo fit ut in Medicam Aulæ familiam accitus, tenearis opus tuum Sereniſſimo Principi dedicare, cum præfatione religioſa Caii Valgii ad Diuum Auguſtum (cui etiam lucubrationes ſuas botanicas offerebat illuſtris & eruditione ſpectatus vir) Vt omnibus malis humanis (præſertim fortunatarum Inſularum quibus fœliciter imperat:) ſemper medicetur ejus Majeſtas: Deſcende audacter in arenam, in qua ut diutiſſime bono publico exercearis, & longiſſima precum vota pro Rege, Patria, probis omnibus nuncupes & fundas, atque alacriter & ſtrenue in *Botanica* deſudes palæſtrâ, opto tibi ſi non Artephii Philoſophi, millenarii dicti, ſaltem nobilis Rizotomi antiqui, *Antonii Caſtoris* (*Plinio* noti) ſæculum, qui centeſimum annum exceſſit, nullum corporis malum expertus, ac ne ætate quidem memoria aut vigore concuſſis. *Vale ex meo Muſæo Londini Idibus Aprilis Anno ſalutis*, 1640.

THEODORVS *de* MAYERNE,
Eques auratus, Baro Albonæ, in Aula Regum Magnæ Britanniæ Iacobi & Caroli, P. & F. *Archiatrorum Comes.*

In

In Laudem Operis, & Authoris Domini Iohannis Parkinſoni Archi Botanici Regii Digniſſ: & Pharmocopolæ Peritiſsimi.

TEla quod invidiæ, dentes quod deſpuit ævi,
Hic *Parkinſoni* Nobile cernis opus.
Hic ſimul Alcinoi ſpectas & Adonidis hortos,
Quicquid & Herbarum barbara Colchis habet.
Aſpicis hic quicquid Boreæ conterminа Thule,
Quicquid & *Æthiopum* torrida fundit humus.
Nobilis hic Tameſis meſſes miratur Eoas,
Quotquot & occiduo gramina ſole tepent.
Qui dedit has Patriæ gazas, me Iudice, vincit
Acta Cleonei Pharmacopola ducis.
Claruit Heſperidum ſpoliis Tyrinthius: hortos
Hic expilavit quotquot in Orbe vides.

Regiarum Majeſtatum
Medicus Cubicularius.

Digniſſimo

Dignissimo viro Io. Parkinsono Pharnacopæo expertissimo, & Botanico Regio solertissimo.

AVdio & gaudeo (Charissime Parkinsone) lucubrationes tuas Botanicas nunc tandem prodire in lucem, seu verius in Theatrū: sertus quidē ab incude tua quam optabas, prodeunt tamen hac verna tempestate opportunè, cum Plantæ ipsæ hybernis compedibus expeditæ emergunt e terra, & novis vestibus amictæ quasi summo congratulandi desiderio obviam libro tuo veniunt; fallor si quid in hoc genere viderim plenius aut limatius: nam quicquid puriores succi habent in suis latifundiis veteres & novi, nostrates & transmarini Scriptores Herbarii, totum ad hoc opus mellutissimum videris exuxisse. Qui jampridem in lucem prodiit Paradisus tuus aut Florilegium, totus erat conflatus ex Veneribus et Gratiis, effigies quædam erat ridentis, ludentis, lasciuientis naturæ, sertū quasi aut corolla ex omni florū genere contexta, uno verbulo vera erat Polyanthæa, Deabus medicinæ Hygiæ & Panaceæ dedicata: Sed istud tuum Theatrum tanquam fœcunda seges, magis frugibus quam floribus luxuriat, ipsius Æsculapii patrocinio dignius, & ad usus medicos accomodatius: hic enim medicam oeconomiam instruis omnisario simplicium apparatu, tanquam fidelissimus medicinæ minister totam terræ opulentiam congeris in ærarium pharmaceuticum. Hic non speciosos terræ tapetes & aulæa explicas ad ornatum & Majestatem universi, sed commodiora ejus utensilia ad solatium & subsidium generis humani, pro famelicis alimenta, pro ægrotis pharmaca, pro languentibus cardiaca, pro singulis morbis singula remedia ex fœcundo terræ sinu & gremio depromis: Ex sinu inquam terræ & gremio, non ex intimis terræ visceribus & meditullio, Mineralia siquidem in profundis terræ recessibus recondit, & procul a liberorum conspectu abscondit sagacissima natura parens, tanquā cultellos aut gladios tenellis illorū corporibus nocituros: Vegetabilia vero tanquam terræ mammas & ubera in summa ejus cute & extima superficie nuda propalavit: nos enim non modo dum sumus embryones, sed viri & senes adhuc vivimus vitam plantæ, & indies nutrimur a terræ umbilico. Quæ vitam habent cedunt viventibus fœlicius in medecinam, sola in alimentum, quia blanda quadam naturæ familiaritate sensim dilabuntur in eorum viscera, & insinuant se in eorum sanguinem, illis quasi cognata sanguine: mineralia vero ipsa cum sint vitæ expertia, vitam invident, mortem inferunt viventibus, nisi innata illorum malitia in fornacibus Vulcani novis Spagyricorum artibus edometur: Plantarum cum hominibus tanta est similitudo, ut hominem plantam inversam Divinus Plato nuncupaverit, mineralium quia prorsus nulla est cum humano corpore similitudo, nulla erit (ut loquuntur Scholæ) assimilatio. Fuit aliquando Midæ in aurum fabulosa metamorphosis, at auri in Midam ne puctarum aliquis somniavit. Neque vero solam genericam societatem ineunt Plantæ cum hominibus, quia ambo in una viventium familia, sed illarum plurimæ arctiorem vendicant cum hnmanis partibus sympathiam & analogiam, unde aliæ capiti, aliæ oculis, aliæ pulmonibus, aliæ jecori, aliæ lieni specificam dicarunt operam, & ab illis quibus famulantur partibus nomenclaturas suas derivarunt, neque nuda tantum nomina earum ferunt, sed insignia, quibus ut magnatum famuli discriminantur: nam (si Hermeticis credimus) signaturas physiognomonicas plantis inussit summus naturæ parens, & ipsis quasi tot emblemata & characteres insculpsit, non modo occultarum suarum virium indices & notas, sed partium quibus inserviunt figuras & expressas imagines, incundissima similitudine referentes quas Quercetanus & Crollius curiosius delinearunt: gessit calamus in hoc campo liberius spatiari, sed ne cancellos suos mea transiliat Epistola, revoco me ad Theatrum tuum, in quo apparet mira genii ingeniique tui in re Botanica fœlicitas, labor indefessus, nec horarum modo sed (quod pudet dicere) mmmorum tuorum sumptus non mediocris: Vereor mi Parkinsone, te non posse cum Matthiolo gloriari, te Mœcenates habuisse Imperatores, Reges, Archiduces, Cardinales, Episcopos, (ipsius utor verbis) qui auro argentoque hos conatos tuos juverint cumulatius; Credo nullos imbres aureos hortum tuum irrigasse, ut potius ut bono publico inservires private defuisti, ut liberius vacares studio, Pharmacopolium deseruisti, spretoque vilioris lucelli aucupio totus in hortulo tuo consenescis: quid dixi, te senescere? nullane in Paradiso tuo arbor vitæ, quæ senectutem tuam retardet? nullæne in Theatro tuo herbæ Balsamicæ, nectaris nativi restauratrices, ex quibus Medeæ suum antidotum composuit, magnum illud secretum, quo Æsonem ultimo confectum senio restituit juventuti? si illarum notitia infælicius perierit, at nostrates Herbæ quæ quotannis repullulant, revirescunt, reflorescunt, parem si non ætati tuæ, famæ quidem tuæ gratiam indulgebunt, & perenni gratitudine semper spirabunt suavem nominis tui auram: mihi cum talia desunt Pharmaca, non deerunt vota, ut diu vivas & valeas.

Tuus

Datum Calend
Aprilis. 1640.

Simon Baskervill
Eques Auratus. D. M.

To

To Englands chiefeſt Herbariſt, Maſter *John Parkinſon.*

Worthy Sir,

I Have given (as was due) many thankes to my learned good friend Dr. *Bainbridge*, for communicating to me the ſight and peruſall of your chargeable, induſtrious, judicious, uſefull, *Herculean Botanicall* labours. The Commonwealth of learning, particularly the Tribe of Phyſitians, Apothecaries, Chirurgians, the Court of Nobles, and Gentles, of all who love knowledge, delight, and the honour and good of their Country, owe thankes to you, a Benefactour to the publique, to your Nation, to many millions of particular perſons, to the preſent and ſucceeding ages. A Triumphall evergreene Lawrell crowne is due to you, for maſtering ſuch difficulties, for conquering the great enemyes of a civill World, Ignorance and Barbariſme, for ſaving ſo many Citizens of your owne Country, from danger, diſeaſes, deſtruction, by your carefull underſtanding directions, for proper fit remedies, in ſuch a rationall pleaſing way. *Oxford* and *England* are happy in the foundation of a ſpecious illuſtrious phyſicke Garden, compleately beautifully walled, and gated, now in levelling, and planting, with the charges and expences of thouſands by the many wayes Honourable Earle of *Danby*, the furniſhing and enriching whereof, and of many a glorious *Tempe*, withall uſefull delightfull plants, will be the better expedited by your painefull happy ſatisfying Worke.

THO. CLAYTON, *His Majeſties profeſſor of Phyſicke*, Oxon.

To the excellent Herbariſt Mr. *John Parkinſon.*

Sir,

I Am a ſtranger to your ſelfe, but not to your learned, and elaborate volumnes. I have with delight, and admiration ſurveyed your *Theatrum Botanicum*, a ſpecious, and ſtately Fabrique, collected and compoſed with exceſſive paines, and charges, exquiſite Art, and Iudgement: wherein, may at once be ſeene, whatſoever (worth th' obſerving) lyeth diſperſed in the ſeverall Botanique monuments of former Ages, and the preſent: It being indeed, a ſelect Deflo ration of them all: enriched, and beautifyed with new diſcoveries (at home, and abroad, ſo far as both th' Indies) of many rare Plants, Herbes, and Flowers. It is a curious pourtait, and deſcription of th' Earths flowred mantle, the Botanique Pandects, and the Herbariſts Oracle, a rich Magazin of ſoveraigne Medicines, phyſicall experiments, and other rarities. And which I may not omit. It is (not without th' influence of ſome benigne Conſtellation) an Auſpicious deſigne of our *Oxford* Garden, which being (by the Munificence of the Honorable Founder) once finiſhed, will be * ὀφθαλμῶν πανήγυεις, th' eyes *Rendez-vous*, of moſt delightfull, and raviſhing objects; another Paradiſe. In a word, this Theater, is without Parallell, the moſt compleate, and abſolute Worke (in this kinde) yet knowne unto the world: and will be a perpetuall Monument of your Name, Art, and Induſtry. Such (Sir) is your merit, and the vote of one, that is ſincerely,

* Ælian in the deſcription of *Tempe*.

Your affectionate friend,
IOHN BAINBRIDGE,
Doctor of Phyſique, and
Profeſſor of Aſtronomy, *Oxon.*

To the VVorthy Apothecary and Herbariſt
Maſter IOHN PARKINSON.

Worthy Sir,

YOu have built us a Botanicke Theater; with ſuch excellent skill and advantage to the Spectator; that at one view he commands the proſpect of both Hemiſphers; and all their vegetables in the pride of beauty: ranged in their proper orders, decking the Hils, Plaines, Valleyes, Medowes, Woods, and Barkes, with ſuch a world of ſhapes and colours, ſo delightfull to the eye, ſo winning upon the rationall Soule which feeds on rarities! that we cannot hope for a more compleate Paradiſe upon earth, till Nature have found out a new ſtocke for more variety; what can be added to this I ſee not; nor is it (I beleeve) yet knowne to the beſt of Artiſts that have made ſearch. *Ita Cenſuit.*

Io. Speed. Med. D. Oxon.

Elogium in Theatrum Botanicum
Iohannis Parkinſoni

NE amplius nobis indet Cratevam, Andream, Dioſcoridem
Græcia, ſua, ſuoſque tantum mirari ſolita;
Ecce, ex ultimo Occidente,
Et penitus toto diviſis orbe Britannis,
Exoritur nobis jam diu ex optatus
Sol alter Botanicorum,
Qui alios omnes luce ſua præſtrinxit,
Et, tanquam nanus humeris giganteis ſublatus,
Plus aliis vidit:
Nec id orbi literato invidet,
Meliore omnia ordine, methodoque accuratiore digeſſit,
Quæque alii ſtrictim, ſparſimque, in unum congeſſit,
Tibique, Lector, uno intuitu
Spectanda propoſuit,
Itaque diſpoſuit,
Ut, quæ mole uſuque maxima ſint,
Ordine & methodo quaſi modica allubeſcant.
Sileat ætas avorum, noſtraque,
Tragum, Matthiolum, Fuchſium, Geſnerum, Dodonæum, Lobelium,
Alios item quotcumque, qualeſcunque;
Vnus inſtar omnium Parkinſonus,
Columna Britannicus, *cui vere inſcribas licet*
Nil ultra.
In quem felice & perquam rara συμφυΐα
Tam veterum, quam recentium omnium Botanicorum animum in unum commigraſſe jures.
Hoc operi laudis vectigal,
Autori amicitiæ teſſeram,
Et cultus teſtimonium,
Non tam amori, quam veritati obſequens
Perſolvit. L.M. Iohannes Mauritius.

Aliud.

SAlve, Salve, venerande Senex,
Qui genius, corculum, medulla, coryphæus Botanicorum cluis,
Quem natura, tuusque genius
In hæc studia impulit,
Imo vi traxit,
Industria, laborque indefessus perfectum dedit.
Ne vero tibi, musisque solis caneres,
Sed nostræ simul, posteræque ætati pie prospiceres,
Opus hoc doctum, Jupiter & laboriosum
Summo studio laboreque improbo dedolasti;
Spretis interim & insuper habitis vitæ omnibus fere delinimentis,
Tanquam Vlysses alter;
Obstructis auribus ad Syrenum cantum,
Scyllam Charybdimque voluptatis lucrique preternavigasti,
Quæ vere sunt mortalium, in hoc vitæ solo,
Scopuli, Syrtes, Symplegades;
Vt totum te hisce studiis immergeres.
Tanquam Alexander alter,
Controversiarum Botanicarum nodos plusquam Gordios
Aut fœliciter enodasti,
Aut fortiter saltem dissecuisti.
Hinc merito vivus volitas per ora virum.
I, perge, perge Floræ supreme mysta
De re literaria bene porro mereri,
Studia hæc ad metam evehere,
Perenne nomen, decusque tuum ultra supraque invidiam provehere,
Qui priscis palmam eripuisti
Invidiam æqualium & posterorum haut facile vitabis
Deopere, ut de Demosthene olim antiquitas,
Quo longius eo melius jure dixerim:
Cujus unica laus admiratio,
Idque tui maximum Elogium.
Amico de his studijs, de Patria, de se B M.
D. D. C. L M.

Iohannes Mauritius.

To my good Friend Mr. Iohn Parkinſon.

MY Age of Verſe is out, what then? ſhall I
Be ſilent, and not open in this cry
And generall applauſe? that have more cauſe
Then ſome that crowded in; nor ſhall the lawes
Of friendſhip draw me from the rigide way
Of bare and naked truth, and force me ſay,
In Court civility, more then what I thinke.
Such compliment is on the very brinke
Of flattery, and deſtroyes the very ſoule
And eſſence of true friendſhip, makes't a foule
Commerce of mutuall ſordid ends, which is
The *Panacea* of humane miſeries.
But whether now, my Muſe? 'twas not my end
To treate of friendſhip, but to praiſe a friend.
This weary worke of thy unwearyed braine
Shall doe't for me, and ſave my further paine.
But ſoft, that's onely for the Authour, ſhall
I give nought to the Worke, which gives thee all
Whatſoere th'haſt here from us, becauſe 'tis ſuch;
As like good wine, it doth require no buſh?
It were indeed not needfull, if that all
Would enter in and taſte, without a call,
And gentle invitation; as in trade
Chapmen paſſe by, nor enter, if not made
And ply'd, yea rudely, with a violent hand.
To ſuch thy Cuſtomers, which come and ſtand,
As 'twere at gaze; I promiſe here good ware,
And cheape: all trees, all ſhrubs, all herbes, that are
In the voluminous *Dioſcorides*,
Theophraſtus, *Galen*, or *Hipocrates*;
Crateevas or th'acute *Arabians*, who
Retriv'd this Art firſt, and all th'other too,
After the generall Deluge of the *Goths*,
And ſwarme of other barbarous Nations, moths,
And cankers of good Letters: nor here wants
Whatſoere the diligent Modernes have of Plants,
Omitted by the ancients, out of which
Gleanings thou here haſt made a pretty, rich,
And fruitfull harveſt; neither doſt thou ſpare
T'inſert whatſoere the other world doth beare.
Nor temperaments, or vertues doſt thou miſſe,
Names, faculties, or properties; and this

With

With ſuch a perſpecuity the while,
Order, and method, that it does beguile
The readers paines ſo charmingly, that he
Thinkes it compendious, though ſo vaſt it be;
And calls for *London* meaſure, and he has't,
And I my purpoſe too, ſaying this at laſt:
If any in this ſubject, ſeeke more now,
Nature muſt adde to what th'haſt done; not thou.

John Morris.

Ad Ampliſsimum doctiſsimum virum D. *Parkinſonium*, S.R. Magnæ Britanniæ Botanographum, quum abſolutiſſimum Herbarium ſuum ederet.

Lugduni Batavorum.

To my old Friend and the Kings Herbariſt Mr. Iohn Parkinſon, in praiſe of his *Theatrum Botanicum*

PHœbus *hath fifty times laſh't through the* ſignes,
Since thou intend'ſt this Iubile *of lines.*
And now *'tis extant; and ſhall ſwiftly ſcou'r*
Through darke oblivion to the worlds laſt houre.
From fragrant aſhes of Antiquitie
Phœnix-like *ſprung, this is the laſt ſhall dye.*
And if old Dodon *were alive againe,*
Heere *would be wonder,* hence *more knowledge gaine.*
Caſpar *th'* Helvetian, *and* Mathiolus
The Tuſcan, *by* thy Booke *ſhall vaile to us.*
Heere's more then growes in the Botavian *ground;*
And more then's in Patavian *Garden found:*
Or vernant Oxfords Plat *neere Rivers ſide;*
By which brave Maudlens Charwell *ſtill ſhall glide.*
Montpeliers *flow'ry meadowes yeeld to thee;*
More in thy leaves, *then on their* beds *we ſee.*
Yet thy rich Worke *which we peruſe, and uſe,*
Th' unwary vulgar raſhly may abuſe.
This was not thy intent: yet thy good paines
Proſtitutes noble Phyſique *unto Swaines.*
Yet ſtill enjoy thy Ground, *and we thy* Booke,
On which Poſterity *ſhall ever looke;*
Lodge in the high-bed; and at thy beds feete
Thy Plants *in their moiſt pallets all ſhall meete.*
From them *to* Thee, *I will* tranſplant *that name,*
Semper virum. Ἀείζωον *for ſuch muſt bee thy fame.*
Keepe thy Heſperides; *may thy herbes with thee*
Still bloome; by Preſter *never blaſted bee.*
And ſeeing by thy hands the day *is wonne,*
No night *of Age ſhall cloude bright* Parke-in-ſunne.

IOANNES HARMARVS
Oxonienſis, φιλέλλην.

The Classes or Tribes contained in this Worke, are these:

1 PLantæ Odoratæ. *Sweete smelling Plants.*

2 Cathartícæ sive Purgantes. *Purging Plants.*

3 Venenosæ, Narcoticæ, Nocivæ & Alexipharmacæ. *Venemous, Sleepy, and Hurtfull Plants, and their Counterpoysons.*

4 Saxifragæ Plantæ, Nephriticæ sive Calculum frangentes. *Saxifrages, or Breakestone Plants.*

5 Plantæ Vulnerariæ & Ferruminantes, id est, Consolidantes. *Vulnerary or Wound Herbes.*

6 Plantæ Refrigerantes & Intubaceæ. *Cooling and Succory-like Herbes.*

7 Plantæ Calidæ & Acres. *Hot and sharpe biting Plants.*

8 Vmbelliferæ. *Vmbelliferous Plants.*

9 Cardui & Spinosæ Plantæ. *Thistles and Thorny Plants.*

10 Filices & Herbæ Capillares. *Fearnes and Capillary Herbes.*

11 Legumina. *Pulses.*

12 Cerealia. *Cornes.*

13 Gramina, Iunci & Arundines. *Grasses, Rushes and Reedes.*

14. Plantæ Paludosæ Aquaticæ & Marinæ, Musci & Fungi. *Marsh, Water and Sea Plants, and Mosses, and Mushromes.*

15 Miscelanea. *The Vnordered Tribe.*

16 Arbores & Frutices. *Trees and Shrubbes.*

17 Exoticæ & Peregrinæ Plantæ. *Strange and Outlandish Plants.*

Theatro Botanico Appendix. *An Appendix to the Theater of Plants.*

PLAN-

PLANS.

THEATRUM BOTANICVM: PLANTÆ ODORATÆ.

CLASSIS PRIMA.

Sweete smelling Herbes. The first Tribe.

FROM a Paradise of pleasant Flowers, I am fallen (*Adam* like) to a world of profitable Herbes and Plants, (*Vt Omne tulit punctum qui miscuit utile dulci*) namely those Plants that are frequently used to helpe the diseases of our bodies: In which world or sea of Simples, I have propounded to my selfe this methode; to distribute them into sundry *Classes* or *Tribes*, that so as neere as may be, and is most convenient, shall be sorted out those severall Herbes and Plants that are fit for each *Tribe*, that so they may be found in one place together: and first of the *Hisopes*.

Hyssopus. Hysope. CHAP. I.

THere are sundry sorts of Hysops, whereof the most are unknowne to many: whose descriptions, names, and properties shall follow.

1. *Hyssopus Vulgaris*, Common garden Hysope

The common garden Hysope is so well knowne to all that have a garden, or that have beene in a garden, that I shall but seeme *actum agere*, to bestow my time in describing it to be a smal busny plant, that riseth up more than a foot high; with many wooddy branches, but tender; at the tops whereof are set at certaine distances, sundry small long and narrow greene leaves: at the tops of the stalkes stand blewish purple gaping flowers, in spiked heads one rowe above another: after which follow the seed, which is small and blackish: the roote is somewhat wooddy with many threddy strings: the whole plant is of a strong sweete sent.

2. 3. *Hyssopus foliis niveis: & foliis aureis.* White Hysope, and golden or yellow Hysope.

These two sorts of Hysope are both of the same kinde with the common Hysope, but differre onely in the party colouring of the leaves; the white having diverse leaves parted white and greene in the midst, and some all or most part white, and some wholy greene, or with some stripes in the greene: for all these sorts are seene together upon one Plant. The golden or yellow sort, hath the uppermost leaves usually wholly yellow in the summer time, parted with greene; the lower leaves often abiding without discolouring.

1 *Hyssopus vulgaris.* Common garden Hysope.

2.3. *Hyssopus versicolor.* Party coloured Hysope.

4. *Hyssopus fol. cinereis.* Russet Hysope.

This Russet Hysope also differeth from the former in no other chiefe matter, than in the colour of the leaves, which are of a grayish or ash colour, which some call Russet; this is likely to be that sort that *Bauhinus* saith was sent him from *England*.

5. *Hyssopus furculis densis* Double Hysope.

This Hysope groweth lower, and thicker set with slender and not so wooddy branches, bending somewhat downewards, and

much

much more thicke set with leaves of a darke greene colour: in the flower and other things it differeth not from the first.

6. *Hyssopus latifolia,* Broade-leafed Hysope.

This also differeth not from the first here specified, but in having larger and broader greene leaves, upon more woody stalkes, keeping forme and substance.

7. *Hyssopus foliis crenatis.* Iagged or dented Hysope.

This difference of the dented leaves, maketh me to set it downe as another species hereof, as others have done.

8. *Hyssopus moschata vel de Cilissa.* Musked Hysope.

Gesner in *Hortis Germaniæ* remembreth this Hysope to differre nothing from the ordinary Hysope, but in the sent, which is so gratious and pleasant, that it commeth neerest to the sent of Muske.

9. *Hyssopus Arabum floribus rubris vel albis.* White or red flowred Hysope.

The red or white flowred Hysope differ but a little from the garden sort, yet are distinguished from it, in that they both doe usually beare red or white flowers, all on one side of the spike, yet continue not constant in that forme, but change into the forme of the ordinary kinde.

10. *Hyssopus minor sive Hyspanica.* Dwarfe Spanish Hysop.

This Spanish kinde is a smaller and lower sort, whose branches rise not so high as the garden Hisope, but bend a little downewards, the leaves also being smaller and thicker, and of a sadder greene colour, and the heads or spikes are also shorter, but the flowers are purple like the garden sort. *Lobel* calleth this, *Hyssopus parva angustis foliis.*

11. *Hyssopus Coronata sive Comosa Clusij.* Tufted Hysope.

Tufted Hysope is in leaves, flowers, and manner of growing somewhat like the common garden kinde, but a little smaller and lower, the leaves being of a paler greene colour, and the top branches spreading a little broader, have shorter spikes of leaves and flowers growing as it were in tuftes, which hath caused the name, and noted it for a difference.

12. *Hyssopus foliis crispis.* Curld Hysope.

Curld Hysope hath the leaves curled or crampled at the edges, that each leafe seemeth to be composed of many: and herein consisteth the chiefest difference.

6. *Hyssopus latifolia.* Broad leafed Hysope.

7. *Hyssopus foliis crenatis.* Iagged or dented Hysop.

11. *Hyssopus Coronata sive Comosa Clusii.* Tufted Hysope.

9. *Hissopus Arabum.* White or red flowred Hys.

10 *Hyssopus minor sive Hispanica.* Dwarfe Spanish Hysope.

13. *Hyſſopus montana.* Mountaine wilde Hyſope.

Mountaine or wilde Hyſope is very like unto the garden kinde, for the manner of growing: but that the leaves which are not ſo many at a joynt, are ſomwhat harder and rougher, and a little hairie, and ſomwhat narrower alſo, which (as *Matthiolus* ſaith) being brought into gardens, and there cheriſhed; will by time put off that roughneſſe; and become more milde and gentle, the taſte whereof is much more bitter, and nothing ſo hot or ſweete as the common kinde: the flowers and ſeedes are like the garden ſort, both for forme and colour.

14. *Hyſſopus anguſti folia ſpicata.* Narrow leafed Hyſope.

Narrow leafed Hyſope is a fine kinde, and hath many ſlender hard ſtalkes, whereon are ſet at diſtances, as in the common Hyſope, many ſmall greene leaves, but longer and narrower than they, and ending in a longer point: the flowers likewiſe grow at ſeveral diſtances, as it were in roundles, almoſt from the middle of the ſtalke up to the topes, of a blewiſh purple colour like the ordinary kinde, but much ſmaller and ſo is the ſeede alſo: the branches hereof will take roote and grow being laid into the ground, the roote ſpreading much in the earth.

15. *Hyſſopus folijs origani.* Round leafed Hyſope.

This Hyſope hath divers hard woody ſtalkes, whereon grow ſundry ſmall and almoſt round leaves, one againſt another, but pointed at the endes, the heads or ſpikes of flowers are like unto the common ſort, of a blewiſh purple colour; the ſent alſo differeth little from it.

15. *Hyſſopus folijs Origani.* Round leafed Hyſope. 14 *Hyſſopus anguſtifolia ſpicata* Narrow leafed Hyſope.

Hyſſopus folijs Nummularie.

Gerard hath ſet forth an Hyſope with the leaves of *Nummularie*, *Monymorte*, which peradventure might bee this kinde, yet I never ſaw ſuch an one with him.

The Place.

Pena ſaith that our common Hyſope, groweth on the hills of *Romania* about *Verona*, and neere unto Mount *Raldus*: the dwarfe kinde in *Spaine*, and the mountaine wilde kind, on the hils in many places of *Germany*, and as *Matthiolus* ſaith, on the hill *Salvatin* in the Country of *Goritia*: the reſt, with theſe alſo when they may be gotten, are nourſed up in the gardens of the curious.

The Time.

They doe all flower in the ſummer moneths of *Iune* and *Iuly*, and their ſeede is ripe in the beginning or middle of *Auguſt*.

The Names.

It is called in *Greeke* ὕσσωπος, *ſic dici putant quaſi* ὄσμασιν (προ χεύο-μενον) ἐπὶ τοῖς σώμασι, *quia ſuper vultus affunditur, in Latine Hyſſopus & Hyſſopum*, of the *Arabians Cyſe*, *Iuſa* and *Iaves*, of the *Italians* and *Spaniards Hiſſopo*, of the *French Hiſſope*, of the *Germanes Iſop*, of the *Dutch Yſpen*, and of us *Hyſope*. The names of every one of them, are ſufficiently expreſſed in the titles and deſcriptions of them. But there is a great controverſie among our later writers, what hearbe ſhould be the true Hyſope of *Dioſcorides*, and other the Greeke authours; for that our common Hyſope is not it, but is the true Hyſope of the *Arabians*, as all doe acknowledge except *Matthiolus*, who doth earneſtly contend, that our garden Hyſope is the ſame of *Dioſcorides*, whoſe arguments are too weake, to perſwade any to be of his opinion, for the deſcription of *Dioſcorides* his Hyſope hath no face or true reſemblance with ours, his bearing tufted heads like Chryſocome or Goldilockes, as he compareth it, and ours in ſpikes: the leaves alſo of his are like unto the *Origanum Onitis*, which are ſomewhat round like *Marjerome*, as you may ſee heere ſhortly after, and are not narrow and long, as thoſe of our Hyſope are: therefore *Lugdunenſis* ſetteth forth a round leafed Hyſope, which he taketh to be the true Hyſope of *Dioſcorides*, but neither are the leaves thereof whitiſh, as thoſe of *Onitis*, nor doe the heads much differ from the common Hyſope: *Lobel* alſo propoundeth another, that is our pot Marjerome to be the right, in that it hath roundiſh leaves like *Organum*, and tufted heads of flowers that are ſpread abroad like it alſo, this he ſaith, is the likelieſt hearbe, comming neereſt unto the true kinde, unleſſe as he ſaith, it may be referred unto an *Origanum*: but *Fabius Columna* confuteth that of *Lobel* and *Pena*, as well for that the tufted heads, are more like unto wilde Marjerome, then unto Chryſocome, or garden Marjerome, as *Cratevas*, *Serapio*, *Iſaack*, *Meſues* and others doe compare them, as alſo that the leaves of *Dioſcorides* his Hyſope, are whitiſh like unto *Origanum Onitis* which thoſe of *Lobels* Marjerome is not: beſides this, that it is a kitchen hearbe, fit for meate and ſawce, and ſo is our ordinary Hyſope alſo, and not a Phyſicke hearbe as *Dioſcorides* maketh his to be: and laſtly, that neither *Lobel* his Marjerome, nor yet our Hyſope, are equall in the properties unto that of *Dioſcorides* and others, howſoever it is uſually received in the ſteede thereof: thus ſaith *Fabius Columna*, and therefore by many reaſons would perſwade us to beleeve, that our ordinary *Polium montanum* is the true Hyſope, as well for that the leaves are white, and the heades of flowers like unto *Origanum* and *Chryſocome*, as he ſaith, as alſo for that his vertues and properties by the bitterneſſe thereof, are more effectuall in all the diſeaſes, whereunto *Plinye* applies his Hyſope, which are not remembred of *Dioſcorides*; and that although *Dioſcorides* maketh no bitterneſſe in his Hyſope, yet *Serapio* doth as he ſaith: thus much *Columna*. But let me ſay, ſeeing he himſelf ſaith, that our *Polium* is anſwerable in all the parts thereof, unto the *Polium* of the auncients, I ſee no good reaſon, why it ſhould be their Hyſope alſo, and therefore I think, we may as well refuſe his *Polium*, as he doth *Lobels* Marjerome. Others alſo would make *Gratiola* to be the true Hyſope, which hath leſſe likelihood than any of the former. *Bauhinus* in his *Pinax* would make our ordinary Roſemary, to be the Hyſope of the *Hebrewes*; taking peradventure his ground from the Scripture, in Saint *Johns* Goſpell, the 19. *chap.* and 29. *verſe*, where the Souldiers bound a ſponge wet in vinegar, to the end of an Hyſope ſtalke, to put it

to our Saviours mouth when he was on the Croſſe, in that our ordinary Hyſope hath not ſo long a ſtalke, as might reach up ſo high: but both the Evangeliſts, *Matthew* and *Marke* ſay it was a reede, and it may bee that the Hyſope ſtalke was bound therevnto, for Saint *John* as an eye witneſſe of what was done, calleth it as before: Now it is not likely that the Iewes had an other Hyſope, divers both from the Greekes & Arabians; but rather that their Hyſope was the ſame of the *Arabians*, being their neere neighbours, and as it ſhould ſeeme, was ſo familiar to their Countrey, that it grew on mudde-walles, as the Scripture ſaith that *Salomon* ſpake of it; which I verily thinke Roſemary doth not. But Hyſope is often mentioned in the Scripture, to bee uſed in the Iewes ceremonies, which was not without materiall ſignification; for as Saint *Paul* ſaith, all was done among them in types and figures, and to bee rightly underſtood and well applied, were worthie of much obſervation and good uſe. Now although the true Hyſope of *Dioſcorides*, and the other Greekes, is not yet certainely knowne, yet aſſuredly this which is knowne, and generally receaved, may ſafely be uſed in the ſtead thereof, untill the true Hyſope may be knowne.

The Vertues.

Dioſcorides ſaith, that Hyſope boyled with Rue and Hony, and drunke doth helpe thoſe that are troubled with Coughes, ſhortneſſe of breath, wheeſing, and rheumaticke diſtillations upon the lungs; taken alſo with Oxymel, it purgeth groſſe humours by the ſtoole, and with hony killeth the wormes in the belly, and taken alſo with freſh or new figges bruiſed, helpeth to looſen the belly, but more forcibly, if the roote of the Flouerdeluce and Creſſes (yet ſome copies in ſtead of *Cardamon* have *Cardamomum*, which I never knew put into any purging medicine in our times, and *Macer* his verſe doth intimate Creſſes thus; *Cardama ſi jungas his ſolves fortius alvum*) be added thereunto: it amendeth and cheriſheth the native colour of the body, ſpoyled by the yellow-jaundiſe, helpeth the dropſie and the ſplene, if it be taken with figges and nitar: being boiled with wine, it is good to waſh inflamations, it taketh away the blew and blacke ſpottes, and markes that come by ſtrokes, bruiſes, or falles; being applied with warme water; it is alſo an excellent medicine for thoſe, that are troubled with the Quinſie, or ſwelling in the throate, to waſh and gargle it, being boyled with Figges; it helpeth the tooth-ach, being boyled in vinegar and gargled therewith; the hot vapours of the decoction, taken by a funnell in at the eares, eaſeth the inflamations of them, *Meſues* ſaith the ſinging noyſe of them; *Pliny* addeth, that it is an enemy to the ſtomacke, and provoketh caſting being taken with figges: being bruiſed, and ſalt, hony, and cumminſeede put to it, it helpeth thoſe that are ſtung by ſerpents. *Galen* is very briefe herein and onely ſaith, it is hot and dry in the third degree, and of thin parts. *Matthiolus* ſaith, that our Hyſope is of thinne parts, and that it cutteth & breaketh tough flegme, it rarifieth or maketh thinne that which is thicke or groſſe, it openeth that which is ſtopped, and clenſeth that which is corrupt, the oyle thereof being annoynted killeth lice, and taketh away the itching of the head, it helpeth thoſe that have the falling ſickneſſe, which way ſoever it be applyed, but more eſpecially being made into pilles in this manner. Take of Hyſope, Horehound and Caſtoreum, of each halfe a dragme, of the roote of Peonye (the male kinde is moſt proper in this diſeaſe) two drammes, of Aſſafœtida one ſcruple, let them all bee beaten as they ſhould be, & made into ſeven pilles (or more if they be too great) with the juyce of Hyſope, and one of the greater, or two ſmall ones, taken every night going to bed is appointed; the beſt Phyſitians of our tymes, aſſuredly doe account it, to be hot and dry in the third degree, and of thinne parts; for being ſharpe and a little bitter withall, they apply it effectually, for all cold griefes or diſeaſes of the cheſt and lungs, helping to expectorate tough flegme, that ſtuffeth or oppreſſeth them, being taken either in a *loboc* or licking medicine, or in a Syrupe, or any other way, and in a decoction thus; Take an handfull of Hyſope, two ounces of figges, and one ounce of Sugarcandy, boyle them in a quart of Muſcadine, untill halfe a pint be conſumed, which being ſtrained, & taken morning and evening, availeth much for thoſe that are troubled with an old cough, by cauſing the tough flegme the more eaſily to be avoided: it helpeth alſo to provoke vrine being ſtopped, or that is made by droppes: it helpeth to breake winde, and to cauſe womens monethly courſes, and eaſeth the ſharpe fits of agues; the greene hearbe being bruiſed and a little ſugar put thereto, doth quickly heale any greene wound or cut in the hand, or elſe where being applied thereto.

CHAP. II.

Thymbra ſive Satureia. Savorie.

THere are Foure or five ſorts of Savorye, two moſt uſually to be ſeene in many gardens, but there are three others that are more rare.

1. *Satureia vulgaris*, Winter Savorie.

The common Winter Savory, is a ſmal & low buſhie herbe, very like unto Hyſope, but not much above a foote high, with diverſe ſmall hard branches, & hard darke greene leaves theron, as thicke ſet as Hyſope, & ſometimes but with foure leaves ſet at a joynt, of a reaſonable ſtrong ſent, yet not ſo much as the Sommer kinde: the flowers are of a pale purpliſh colour, ſet at ſeverall diſtances at the toppes of the ſtalkes, and leaves alſo under them: the roote hath divers ſmall ſtrings thereat, and abideth with greene leaves all the winter, and is more uſually encreaſed by ſlipping then ſowing.

2. *Satureia Hortenſis.* Sommer Savorie.

This alſo is a ſmall tender herbe growing up with divers brittle branches, ſlenderly or ſparſedly ſet with two long narrow leaves at each joynt, ſoft in handling, and of a ſtronger and quicker ſent and taſte: the flowres are ſmall and purpliſh, ſet at the joynts with two leaves under them up to the toppes of the ſtalkes: the ſeede is of a darke colour, bigger then Tyme ſeede by the halfe: the rootes have fewer ſtrings and periſh every yeare, and muſt be new ſowne every yeare.

3. *Satureia Spicata* S. *Iuliani.* Rocke Savorie.

Rocke Savorie hath many ſlender, hard, and woody browniſh ſtalkes about a foot long, whereon doe grow at ſeverall ſpaces, many very ſmall and narrow leaves, very like to the leaves of the true Tyme, but ſomewhat longer, of a ſharpe quicke taſte, and of a ſtrong ſweete ſent: at the toppes of the branches, come forth many ſpiked heads of ſmall leaves, & out of them thruſt forth purpliſh flowers, which afterwards give a ſmall, browniſh ſeede, more like Tyme then Savory, the whole plant will be ſometimes of a ſad purpliſh colour, daſht over with a white mealines, as for the moſt part all Sea plants are: this doth ſeldome endure a winter with us.

4. *Thymbra ſive Satureia Cretica legitima.* The true Savorie of Candie.

The true Savory of Candie brancheth forth from the ground like Tyme, with many purpliſh ſquare branches, covered

2. *Satureia hortensis.* Somer Savory.

3. *Satureia spicata* Rocke Savory.
S. *Italiana.*

4. *Thymbra sive Satureia* The true Savory
Creuana legitima. of Candy.

coverd over with a rough or hayrie downe: from the lower joynts of the ſtalkes come alwaies two branches, and two leaves ſet at them and ſo in like manner all along the branches two at every joynt, one againſt another on the contrarie ſide, and are very like unto the leaves of the true Tyme, but ſomewhat hairye, of a ſweete ſent and ſharpe taſte betweene Tyme and Savory; on the toppes of the branches at certaine diſtances one above another, grow forth heads or tufts of greene leaves, from among which ſtart forth many purpliſh flowers like unto Tyme, ſtanding in browniſh huskes: the ſeede is of a blackiſh browne colour, very like unto Tyme; the roote is ſomewhat long, hard and woody, with ſome ſmall blackiſh fibers growing from it, and will as hardly winter with us as the laſt, although the lower branches that lie on the ground are apt to take roote, which ſheweth, that in the naturall place where it feeleth no cold winter, it ſpeadeth and increaſeth.

5. *Satureia Cretica ſpinoſa.* Prickly Savory of Candy.

Pona, in his Italian deſcription of *Mount Baldus* maketh mention of this Savory, but without any deſcription or further relation; whereby I gather that there is ſmall difference betweene it and the laſt, ſaving that as in the *Chamædrys ſpinoſa*, the branches have ſmall prickes on them at the ends, and therefore I cannot yet give you any further knowledge of it, having not ſeene it. *Bauhinus* alſo hath made mention of another, received from *Contarenus* for *Thymbra*, and as he ſaith is the *Satureia Dioſcoridis* by *Matthiolus*; but becauſe I doe not thinke it to be a Savory, I forbeare it here.

The Place and Tyme.

All theſe Savories are with us onely nourſed in gardens, but they are as wilde hearbes in divers parts of *Europe*, eſpecially in Groves very plentifully, and are intituled to their places; flouriſhing in the end of ſummer, ſome not abiding the winter.

The Names.

It is called in Greeke, θύμβρον & θύμβρα *forte* ἀπὸ τῆ θύειν *ob fragrantiam*, in Latine *Satureia*, *aljis a ſaturando dicta*, *aljis*, *a Satyris nomen traxiſſe putant*, *eo quod*, *coitus marceſſentes ſtimulat*: ſome alſo call it *Thymbra* in Latine, and ſome take *Satureia & Thymbra* to bee differing plantes. The *Arabians* call it *Sahater* or *Sabutar*, the *Italians Savoreggia Coniella & Peverella*, the *Spanyardes*, *Axadrea & Segurella*, the *French*, *Savoreè*, *Sauriette & Sadreè*, the *Germanes*, *Kunel*, *Zwibe Hyſope*, *& Sature*, the *Dutch*, *Kenle*, and winter *Kenle*, and we in *Engliſh*, *Savorye*. There is much controverſie among our moderne writers, what hearbe ſhould certainely be the *Thymbra* of *Dioſcorides*, which in his time as it ſhould ſeeme was moſt familiarly known, & therfore giveth no further deſcription thereof, then that it was like unto Tyme, but leſſe and more tender, having heads of greene flowers, and that it grew in rough and ſtony places. *Matthiolus* giveth us one, *Lobel* another, *Cluſius* a third, and each entitle theirs

to be *Vera & legitima*: *Matthiolus*, becauſe it was ſent for it, *Pena* becauſe he founde it growing on Saint *Iulians Rocke* in the *Florentine* dominion, and *Cluſius*, becauſe *Honorius Bellus* ſent him the ſeede from *Candye*, who ſaith, that the *Candit Greekes* call it to this day uſually *Thrubi & Thrumbi*: but it is certaine, that neither our winter or ſummer Savory doe anſwere unto the *Thymbra* of *Dioſcorides*, for that neither of them is like, or leſſe then Tyme, although they are familiarly eaten by divers nations being put into brothes, meates, &c. as *Dioſcorides* ſaith of his garden *Thymbra*, which as he ſaith is much leſſe then the wilde ſort of *Thymbra*. The firſt is generally called with us *Satureia hyberna*, Winter Savorye and by *Camerarius*, *perennis*; by *Lobel Satureia ſive Thymbra altera*; by *Cæſalpinus*, *Satureia Hortenſis*. By *Brunfelſius*, *Hyſſopus Agreſtis*; but *Thymbra ſyl.* by *Anguilara*, by *Geſner in hortis*, *Thymbra agreſtis*, *& Satureia montana*, by *Bauhinus*: The ſecond is generally called *Satureia ſativa & hortenſis*, or *Thymbra ſativa*, by moſt writers, but *Tabermontanus* & *Cæſalpinus* only call it *Cunila*, and *Thymbra agreſtis*; *Geſner in hortis*, *Thymbra vera*, and *Bauhinus*, *Satureia hortenſis ſive cunila Plinij*: but I ſomewhat doubt whether *Pliny* meant this *Satureia* to be *Cunila* in his 19. booke and 8. chap. or ſome of the other ſorts. And for the name *Cunila*, it is by him referred to divers other plants; for *Origanum Heracleoticum* is called by him *Cunila gallinacea*, *Lib.* 20. *c.* 16. and *Origanum ſylveſtre Cunila bubula* (as *Dioſcorides* hath it alſo, as ſhall bee ſhewed hereafter) *Leviſticum*. alſo otherwiſe called *Panaces*, is falſely called *Cunila bubula* by *Cratevas*, as *Pliny* ſheweth both in the 8. chapter of his 19. booke, and in the 15. chap. of his 20. Againe, in the 10. chap. of his 32. booke, he nameth an other herbe *Cunila capitata*, which in the fourth chap. of his 24. booke hee ſeemeth to name *Policnemum*, whereof alſo *Dioſcorides* maketh mention; in an other place he ſaith, that *Cunila* is called *Cunilago*: *Columella* alſo calleth *Satureia*, *Cunila*, but he maketh *Thymbra* and *Satureia* to be two ſundry herbes, *lib.* 9. chap. 4. *de re ruſtica*; as alſo in this verſe, *Et Satureia Thymi referens Thymbraq́, ſaporem*: but *Pliny* in his 19. booke and 8. chap. maketh them to bee both one. The third ſort is called by *Lobel* and *Pena*, *Thymbra vera* S. *Iuliani*, *Lugdunenſis* and *Tabermontanus*, *Thymbra vera Penæ*; *Bauhinus* in his notes upon *Lugdunenſis* ſaith, that the *Saxifraga vera Dioſcoridis* of *Matthiolus*; is this *Thymbra vera* of *Lobel* and *Pena*; which it is very probable to be, both figure and deſcription anſwering well thereunto, as any that will compare them may ſee. The fourth is called by *Cluſius*, *Thymbra legitima*, *Proſper Alpinus*, *Thymbra Cretenſis*, and *Pona*, *Thymbra Legitima Dioſcoridis*, and ſo doe I thinke alſo, no other that wee know comming neerer thereunto.

The Vertues.

Our Savory of both ſorts is hot and dry in the third degree, eſpecially thē ſummēr kindē, which is both ſharpe and quicke in taſte, expelling winde in the ſtomacke and bowels, and is a preſent helpe for the riſing of the mother procured by winde, provoketh Vrine and womens courſes, and is much commended for women with child to take inwardly, and to ſmell often thereunto: Some that from *Satyris* thinke *Satureia* to be derived, ſay it helpeth the diſeaſe called *Satyriaſis* or *Pryapiſmus*, and to helpe dull or decayed coiture: others taking it to bee derived *a ſaturando*, ſay it is in familiar uſe with many to procure a good appetite unto meate, and to take away all manner of loathing to the ſame: it cutteth tough flegme in the cheſt and lunges, and helpeth to expectorate it the more eaſily: it helpeth to quicken the dull ſpirites of the Lethargye, the juice being ſnuffed or caſt up into the noſtrills: the juice alſo is of good uſe to be dropped into the eyes to cleare the dull ſight, if it proceede of raw thinne colde humours diſtilling from the braine: the juice alſo heated with a little oyle of Roſes, and dropped into the eares, eaſeth them of the noyſe and ſinging in them, and deafenes alſo: outwardly applyed with white flower in manner of a poultis, giveth eaſe to the Sciatica or hippe gowte, or paralyticall members, by heating and warming them, and taking away the paine: it taketh away alſo the ſtinging of bees, waſpes, &c.

CHAP. III.

Thymum & Serpillum. Tyme, and Mother of Tymē.

I Have joyned both theſe ſorts of Tyme in one Chapter, for the neere vicinity they have togēther, both in name and nature, yet eache by themſelves they having many ſorts apart.

1. *Thymum legitimum capitatum.* The true Tyme of the ancients.

The true Tyme is a very tender plant, having hard and hoarye brittle branches, ſpreading from a ſmall woody ſtemme about a foote and a halfe high, whereon are ſet at ſeverall joynts, and by ſpaces many ſmall whitiſh or hoary greene leaves, of a quicke ſent and taſte: at the toppes of the branches ſtand ſmall whitiſh greene heads, ſomewat like unto the heads of *Stœchas*, made as it were of many leaves or ſcales; out of which ſtart forth ſmall purpliſh flowers, not having any other ſeede (as *Theophraſtus* and ſome other of the old authors have ſet it downe,) and therefore appoint the flowers only, to be ſowne as if there were no ſeede in the heads, thinking it to ſpring of the flowers alone, which was an errour in them by tradition not experience, for we have found it otherwiſe.

2. *Thymum durius vulgare.* Our common garden Tyme.

Our ordinary garden Tyme, is alſo a ſmall low woody plant, with brittle branches, and ſmall hard greene leaves on them, well knowne to moſt, having ſmall white purpliſh flowers, ſtanding with ſome leaves in roundles round about the toppes of the ſtalkes; the ſeede is ſmall and browner then Marjerome ſeede; the roote is woody and abideth well divers winters, if they be not too violent, and the plants not growne too great or woody, which then will periſh therein.

3. *Thymum durius Candidius.* Hoarye Tymē.

Among the ſeedes of the laſt recited Tyme, which I ſowed in my garden, came up this hoaryē Tyme, which is in forme like it, but that the branches are ſmaller, and the leaves whiter or more hoary, a little alſo more thinly or ſparſedly ſet on the branches; the flowers, ſeedes, and rootes are like the former, and ſo are both ſent and taſte, but rather more quicke.

4. *Thymum latifolium.* Maſticke Tyme.

This Tymē groweth not ſo upright as the former, but rather lyeth and ſpreadeth upon thē ground, ſmall but many more branches, nothing ſo woody; the leaves alſo are not ſo hard but broader; the flowers are of a purpliſh white colour, ſtanding in roundles as the two firſt ſorts: this better endureth the winters, and longer, yet giveth no ſeede, but is propagated by ſlipping: the taſte and ſent is not altogether ſo quicke as the ordinary garden kinde.

5. *Thymum inodorum.* Vnſavory Tyme.

This is a lowe ſmall ſhrubby plant, very like unto the firſt kinde, with hard branches and hairy more then it: the leaves

1. *Thymus legitimum capitatum.* The true Tyme of the ancients.

2. *Thymus hortensis* Common garden Tyme.

leaves are set at distances, many growing together, but without either smell or taste utterly: The flowers are of a pale purplish colour, and grow like the common sorts, at the toppes round about the branches.

6. *Serpillum Narbonense.* French wilde Tyme.

6. *Serpillum Narbonense.* French wilde Tyme.

This wilde Tyme groweth with many hard or woody branches, somewhat upright, leaning a little downewards, somewhat like unto our garden Tyme, set with many leaves together at spaces, which are somewhat longer then the rest, lesse sweet, & more strong and heady in sent, somwhat like unto Southernwood, & lesse hot or sharpe also in taste: the flowers grow in wharles or roundles, by spaces towards the tops of the stalkes, with some leaves at them being of a purplish colour, very like unto garden Tyme: both stalkes and leaves are of a whitish hoarines, and abide all the winter.

7. *Serpillum majus.* The greater mother of Tyme.

7. *Serpillum majus.* The greater Mother of Tyme.

This greater Mother of Tyme groweth more upright then the common wild kinde doth, with two leaves for the

most part at a joynt like the other, but greater and not of so darke a greene colour. but rather resembling Marjerom leaves; the flowres grow at the toppes of the stalkes, of a redish purple colour like unto garden Tyme, but somwhat larger as the whole plant is, and of a small, but somewhat hot sent and taste.

Flore albo There is another of this kinde, that beareth white flowers and fresher greene leaves, else in other things like the former.

8. *Serpillum latifolium hirsutum.* Rough Mother of Tyme.

This Mother of Tyme groweth in most things like the ordinary sort, speading on the ground in the same manner, but that the branches are more hoary or white, and the leaves somewhat rounder and rougher, or as it were hairie, smelling like unto Bitumen or hard pitch, which hath no good savour pleasing to any: the flowers and other parts thereof are like the common Mother of Tyme.

9. *Serpillum Pannonicum Clusij.* Hungarian Mother of Tyme.

This small Mother of Tyme creepeth upon the ground, taking roote as it spreadeth, with many square stalkes set with leaves, two alwaies at a joynt, but more thinly or sparsedly growing on them, then the ordinary wild kinde, and are narrower and longer than they, and very smooth withall: the flowers growe at the toppes of the branches not unlike the common kinde, and hath little or no sent at all.

There is an other of this kinde little differing but in the hoarines of the leaves from the other.

9. *Serpillum Pannonicum Clusij.* Hungarian Mother of Tyme

10. *Serpillum Vulgare minus.* The ordinary small wilde, or Mother of Tyme.

10 *Serpillum vulgare minus.* Ordinary Mother of Tyme

This lesser wilde Tyme spreadeth sundry hard browish long branches rounde about the roote upon the ground, which take roote againe as they lye and spread; the leaves are small, and of a sad green colour, smelling like unto Tyme almost, but nothing so quicke either in smell or taste: the flowres grow at the toppes of the branches of a purplish or white colour, for of both sorts some are so found.

11. *Serpillum Citratum.* Lemmon Tyme.

The Lemmon Tyme is somewhat like the common wild kinde in the manner of growing, but standeth more upright, bushing thicke with branches, the leaves are small and of a darke greene colour like them; but have the sent of a Pomecitron or Lemmon: the flowers are more white then in the common sorts.

12. *Serpillum Moschatum.* Muske Tyme.

The Muske Tyme also groweth somewhat upright, but with fewer stalkes and thinner set with somewhat longer leaves, which are not of so sad a greene colour, whose sent is much neere unto the sent of Muske, and therupon tooke the name.

13. *Serpillum aureum sive versicolor.* Guilded or embrodered Tyme.

In the variable mixture of greene and yellow in the leaves of this Tyme, consisteth the chiefest difference of this sorte, from the common wilde kinde, for the greene leaves thereof are in some striped, in others edged with a gold yellow colour, which hath caused the guilded or embroidered name.

The Place.

The first or true Tyme groweth plentifully about *Sevill* in *Spaine*, where they use and know no other Tyme, as also in *Syria*, &c. and yet as *Clusius* saith all the rest of *Spaine*, neither use it nor know it, but use our common garden kinde, which groweth in old *Castile* verie plentifully & in divers other places in Spaine; the fourth we plant in our gardens ordinarily by slipping, not sowing: the fift in the Kingdome of *Valentia* in Spaine neere the seaside at *Alikanta*: the sixt *Clusius* saith, hee found in old *Castile*, growing promiscuously with our common garden Tyme; and *Lobell* and *Pena* say it was found in *Narbone* in *France*: the seventh is planted in the gardens of the curi-

ous and

ous, and the naturall place not well knowne to us: the eight *Banhimus* saith, groweth in many of the dry grounds about *Bassill*: the ninth, *Clusius* saith he found in *Hungary*: the tenth is common with us generally in most countries, and that with white flowers on Bushie heathe, in Digswell pastures by Hatfield; and the eleaventh in many places in Kent, betweene Southfleet and Longfield downes, and betweene Rochester and Sittingborne, even in the high way, where by the sent chiefly it is to bee knowne from the common: the two last are noursed up in gardens onely.

The Tyme.

The first true kinde flowreth late with us, as not vntill August with the soonest: the rest for the most part in July or thereabouts.

The Names

Tyme is called in Greeke, θύμος ἀπὸτῦ θυμᾶ, *quod ijs qui animi deliquium patiuntur adhibeatur, alij,* ἀπὸ τῆς θυμέδεος ἢ τῆς θύης *deducunt, quod hoc veteres in sacris, quæ igne accenso fiebant primum usi sunt; in Latine, Thymus & Thymum:* the Arabians *Hasce*, the Italians *Thymo*, the Spaniards *Tomilho*, the French *Thym & Marjolaine d'Angleterre*, the Germanes *Quendel*, & the true kind *Romscher Quendel & welscher Quendel*, the Dutch *Thymus*, & we in English Tyme, or garden Tyme, or as they are in their titles. *Serpillum* or *Serpyllum* is called in Greeke ἕρπυλλος ἀπὸ τῦ ἕρπειν *a serpendo dictum*, of the Arabians *Hemen*, of the Italians *Serpillo*, of the Spaniards *Serpilio*, of the French *Serpoller*, of the Germanes *Huner Kol*, of the Dutch *Quendel*, or wilde *Thymus*, & we in English *wild Tyme*, or *Mother of Tyme*. The first true Tyme is usually called by all that have written of it, *Thymum legitimum*, or *Capitatum*, or *Creticum* as *Cordus* & *Camerarius* do, but it is not that which the old *Gerard* setteth downe for it: the second is called *Thymus vulgaris & nostras* by many authors, and *Thymum durius & nigrum* by others, & by *Cæsalpinus Pepolina*: the fourth is called by *Lobel*, *Thymum latifolium*, and *Serpyllum hortense* by others: but *Banhinus* doth not number it among his Tymes, but calles it *Serpillum, jus latifolium*, and is the same with *Matthiolus* his *Serpillum*, although *Banhinus* doth distinguish them: the fift is from *Banhinus*; the sixt is called by *Lobel Serpyllum Narbonense*, and by *Clusius Serpyllum sylvestre Zygis Dioscorides*: the seventh *Camerarius* calleth *Serpyllum majus flore purpureo*, and that with the white flower *flore candido*, but both the old and new *Gerard*, have erred in the figure and discription therof: for this *majus* and the *folijs Amaraci* are both one; the eighth is of *Banhinus* his relation and denomination: the ninth of both sorts, *Clusius* calleth *Serpyllum Pannonicum*, and *Banhinus*, *angustifolium glabrum & hirsutum*: the tenth is called by most authors *Serpyllum*, or *Serpyllum vulgare minus* by others: the rest have their names in their titles, as whereby they may fitliest be called.

The Vertues.

The true Tyme, or in the want thereof our garden Tyme, (as neerest thereunto, although not altogether so effectuall) doth helpe somewhat to purge flegme, if as *Dioscorides* saith, it be taken with hony salt and vinegar: the decoction thereof is good for those, that are troubled with shortnes or straightnesse of breath: it killeth the wormes in the belly, procureth the monethly courses of women, expelleth the secondine or afterbirth, after it hath holpen the delivery of the child, & causeth easie expectorations of tough flegme, being taken with hony in an Electuary; it dissolveth tumours or swellings when they are fresh; the juyce thereof being annoynted or bathed on the place with some vinegar, taketh away loose or hanging warts: it helpeth those that have the Sciatica, applyed with wine and meale: it helpeth those that are dull sighted, and is of good vse in meates and brothes, to warme and comfort the stomacke, and to helpe to breake winde as well for the licke as the sound. *Galen* saith the same things almost. It is found by experience saith *Ætius*, that if 4. dragmes of dried Tyme in powther, be given in Oxymel fasting, to them that have the gowte it helpeth them, for it purgeth choller and other sharpe humours, and that if one dragme thereof bee given fasting with meade, it dissolveth the hard swellings of the belly: It is profitable for those that have swellings in their sides, and paines in their loynes and hippes: it is likewise given fasting to those that have greate paines in their eyes, and are bleare-eyed: it is with wine applyed to the cods that are swollen. Wild Tyme, or Mother of Tyme if it be boyled and drunke, moveth vrine, and the monethly courses, helpeth such as have griping paines in the belly, or that have cramps, or are bursten bellied, or are troubled with inflamation of the liver: being taken inwardly, or applyed outwardly with Rosemary and vinegar to the head, it ceaseth the paines thereof, and is very helpefull to those, that are troubled with either Frensye or Lethargy: foure dragmes of the juyce drunke with a little vinegar, is very availeable to those that spitt or vomit blood: taken with hony, licoris and aniseede in wine, it helpeth a dry cough, and is comfortable both to the head, stomacke and reines, and helpeth to expell winde: the distilled water therof applyed with vinegar of Roses to the forehead, easeth the rage of Frensye, & expelleth Vertigo that is the swimming or turning of the braine, & helpeth to breake the stone in the bladder.

CHAP. IIII.

Cuscuta. Dodder.

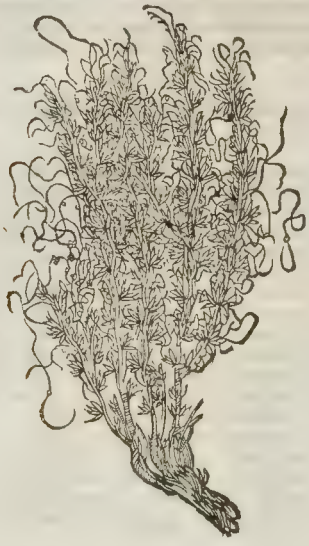
VNder this title of Dodder, I comprehend not onely Epithymum as the chiefest kinde thereof: but all the other sorts of laces or threads, that grow either upon hearbes and shrubbes, &c. or upon the ground: and because I would not speake of them in many places, (as I shall doe of the plants whereon they grow, in severall places of this worke) I though it more fitt to include them in one Chapter, and give you knowledge both of their formes and vertues, in one place rather then in many: I acknowledge I might more fitly have placed this plant among the purgers, but that for the names sake I would set it next unto the Tymes.

Epithymum. The Dodder of Tyme.

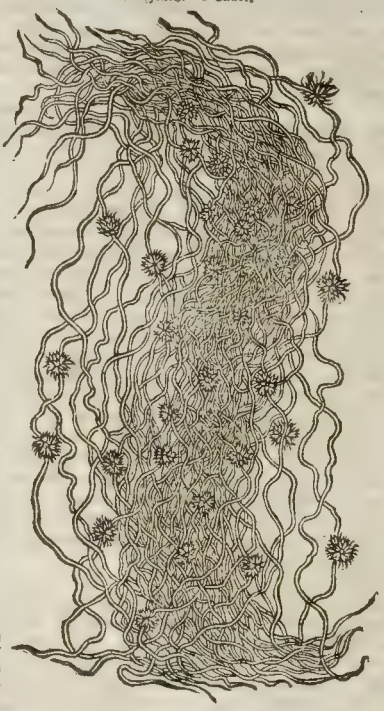
Pliny setteth downe in the eigth Chapter of his 26. booke, two sorts of Epithymum, (which *Matthiolus* seemeth to confute) the one to be the flowers of Tyme as *Dioscorides* before him did, both greene and white, the other to be red haires growing without roote: now most of our moderne writers doe acknowledge but one kinde, & *Tragus* as I thinke, first mentioned both white & red strings, growing on severall hearbs, even as I have done also, which yet are but one and the same thing in it selfe, growing in the same manner upon Tyme or Savory, as it doth upon any other plant, being red on some hearbes, and white on others, as may bee observed on sundry plants on Hampstead heath. It first from seedes giveth rootes in the ground, which shoote forth threads or strings, grosser or

finer

1. *Epithymum.* The Dodder of Tyme.



2. *Cuscuta.* Dodder.



finer, as the property of the plants whereon it groweth, and the climate doth suffer, (although *Matthiolus* and others, have thought it to grow without roote) creeping and spreading on that plant whereon it fasteneth, bee it high or low, clasping the very grasse if it meete with none else. (although *Ruellius* saith it groweth not on the ground, but on hearbes) as upon some vines also in *Narbone*, as *Pena* saith he observed: these strings have no leaves at all upon them, but winde and enterlace themselves so thicke oftentimes upon a small plant, that it taketh away all comfort (as one would thinke) of the Sun from it, and ready to choake or strangle it; after these strings are risen up to that height, that they may draw nourishment from the plant, you shall scarse see any appearance of strings from the ground, they being broken off, either by the strength of their rising, or withered by the heate of the Sunne, (and if they meete with no herbe or plant whereon to spreade, they will soone perish of themselves, as I have tryed my selfe, by sowing the seedes in a pot by themselves, & so observed their springing) from whence divers have imagined, that it might grow as Mosse upon trees, or like Mistelto; but I think rather as Ivie, by drawing nourishment insensibly from the plants whereon it groweth, & thereby partaketh of the nature of the same plants: upon these strings of both sorts & upon what plants or herbe soever they grow, are found clusters of small heads or huskes, out of which start forth whitish flowers, which afterwards give small pale coloured seede, somewhat flat and twice as bigge as Poppye seede: thus much I thought good to let all others understand, by that experience and observation I have had thereof: yet after this mine owne observation, I reade much to this purpose in *Tragus*, in his chapter of *Androsace* or *Cuscuta*: by this which I have truely related, it may appeare plainely to any, that neither Tyme, Savory, or any other herbe, doe naturally of their owne seede bring these stringes or laces, but that they spring from their owne seede, either shed or scattered of themselves upon the ground, or comming among the seedes of other hearbs that are sowne. The plantes whereon these laces doe grow, are observed by divers, to be Vines, as *Pena* and others that have observed them in *France*, and in some places of *Turkey*, upon trees and thornes, and some other things: *Theophrastus* in the 23. chap. of his second booke of the causes of plants, doth set downe, that *Cadmia* groweth on trees and bushes in *Syria*, which *Plinie* altereth to *Cassita*, in the last chap. of his 16. booke, by which word no doubt they meant this plant, for it differeth not much from *Cassita*, as many others have it, or *Cuscuta* as it is generally called, the Arabian name being *Chassith* and *Cuscuth*: the hearbs are *Polium*, *Dictamus*, *Coleymander*, *Hyssope*, *Mother of Tyme*, *Marjerome*, *Stebe*, *Wallwort*, *Rosemary*, and others as *Bauhinus* hath recorded, and also very plentifully in many places of our owne land upon Nettles, and upon Line or Flaxe, and called *Polygonum lini*, and *Anginalini*, upon Tares also more aboundantly in some places, where it destroyeth the pulse, or at the least maketh it much worse, and is called of the Country people *Hell-weede*, because they know not how to destroy it; upon Fearne also and other hearbes upon Hampstead heath, as I lately found my selfe, the strings & flowers being white, and upon the grasse likewise on Black-heath in Kent, on the very ground, not rising an inch or two high, being red.

The place, Tyme, and Names are sufficiently as I thinke expressed before, yet in particular, *Tragus* and *Anguillara* thinke it to be the *Androsace* of *Dioscorides*, but erroniously: for *Epithymum* as *Matthiolus* sheweth out of *Ætius*, *Actuarius* and others, is the threads or laces growing upon Tyme, although *Dioscorides* calleth it the flower thereof: we doe generally call that *Epithymum* that groweth on Tyme, in English, laced Tyme, as the *Epithymbra*, laced Savory, and so of *Epistœbe*, *Epimayorana*, *Epinasca*, *Epimibu* and so the rest, laced Stebe, laced Ma-

jorane,

rome, laced Nettles, laced Brambles: but wee call those strings generally by the name of *Dodder*, especially that which groweth on Flaxe and Tares, which are red and most frequent with us.

The Vertues.

Epithymum by *Dioscorides*, *Paulus*, *Ætius*, *Actuarius*, *Mesues*, and all others, is accounted the most principall and powerfull Dodder growing upon any herbe, (and that upon Savory or Stœbe not to bee so effectuall) for all melancholicke diseases, and to purge blacke or burnt choller, which is the cause of many diseases of the head and braines, as also for the trembling of the heart, faintings and swounings: it is helpefull in all the diseases or griefes of the spleene, and of that melancholy that riseth from the windines of the Hypochondria, which is that part of the belly under the short ribbes where the spleene lyeth, & by flying up to the braine causeth a kinde of frenzy or madnes: it purgeth also the reines and kidneys by Vrine; it profiteth them that have the Iaundise in opening the obstructions of the gall: *Galen* saith, it hath the properties of Tyme being hot and dry in the third degree, & as *Ruellius* boserveth from the Arabian authors, that it hath by the astriction or drying quality, a strengthning property besids the purging, as it is also found in *Rubarbe*, and that it is a safe medicine for the obstructions as well of the liver as spleene, purging the veines of flegmaticke & cholericke humours, & likewise as (*Mesues* saith, it helpeth childrens agues if a little wormeseed be put to it. The Dodder of all other plants & herbes in like maner pertaketh of the nature of them whereon they grow, be they hot or cold, and is thought to worke more effectually for those diseases, wherunto the herbe it selfe is applyed: *Lobel* saith, that in the west parts of this kingdom where he found these laces upon Nettles, the people had good experience, that it was a soveraigne remedy to procure plenty of Vrine, where it was stopped or hindred, & my selfe also have understood it from those parts: But that Dodder which groweth upon Tares, being the most frequent about London, and wherewith our markets are onely in a manner furnished, and our Apothecaries shoppes stored from thence, taketh his propertie from the Tares whereon it groweth, and can have no effectuall quality comparable to *Epithymum*: for as *Galen* saith, Tares are hard of digestion and binde the bellye, and that the nourishment of them engendereth thicke blood, apt to turne into melancholie, which qualities are cleane contrary to those of *Epithymum*, *Epithymbra*, or of other good herbes.

CHAP. V

Majorana vulgares exotica. Common, and Strange Marjeroms.

THere are divers sorts of sweete garden Marjeroms, some growing onely in the summer; others abiding the winter, and one that groweth wilde: there are some other sorts called Marum, that I have intituled strange Marjerom, all which shall be comprehended in this chapter.

1. *Majorana vulgaris æstiva.* The ordinary garden sweete Marjerome.

Our common sweete Marjerome, that is commonly sowen in our countrey, is a small low herbe, little above a foote high, full of branches, and small whitish and soft roundish leaves on them, smelling very sweete: at the toppes of the branches, stand divers smal long and round scaly heads or knots (and therefore of some called Knotted Marjerom) of a whitish greene colour, out of which come here and there small white flowers, and after them small reddish seede: the roote is composed of divers small threads or strings which perisheth with the whole plant every yeere.

1. *Majorana vulgaris.* Sweete Marjerome.

Majorana tenuifolia. Marjerome gentle.

This Marjerome likewise hath divers small branches growing low, and not higher then the former, but having finer and smaller leaves, hoary and soft, but much sweeter; the heads are like unto the former, and so are the flowers and seede, the whole plant being more tender then the former, abiding but a Summer in like manner.

3. *Majorana odorata perennis.* Winter sweete Marjerom.

Wee have also another sweete Marjerom that abideth greene all the winter, if it bee not two violent, growing in the same manner that the first doth, whose leaves are a little smaller and greener then it, but with the like heads and knots: yet some take this to be but the ordinary Summer Marjerom, which by transplanting is made the more strong, and able to abide the winter.

4. *Majorana latifolia sive major Anglica.* Winter or pot Marjerom.

The Winter or pot Marjerom, is a small low bushing herbe growing not much higher, but spreading the branches wider, whereon doe grow broader and greener leaves, set by couples with some smaller leaves likewise at the severall joynts all along the branches; at the toppes whereof growe a number of small purplish white flowers, set together in a tuft, which turne into small & round seede bigger then sweet Marjerome seede: the whole plant is of a small and fine sent, but much inferiour to the other, being also nothing so bitter

ſo bitter as the ſweete Marjerome, and therby the fitter and the more willingly uſed for meates, the roote is white and threddye periſhing not in the winter, but abideth many yeares, and is to be encreaſed by ſlipping rather then ſowing the ſeede.

5. *Majorana latifola aurea.* Yellow Marjerom.

This Marjerome is of the ſame ſort with the laſt deſcribed, differing onely in the colour of the leaves, which are in Summer wholy yellow in ſome, or but a little greene, or parted with yellow and greene, more or leſſe as nature liſteth to play, the ſent being ſmall like the other. We have alſo an other ſort parted with white and greene.

6. *Majorana ſylveſtris.* Wilde or fielde Marjerome.

7. *Marum vulgare.* Hearbe Maſticke.

The neerer reſemblance that this hearbe hath with Marjerome, then with Tyme, (as ſome have taken it) doth make mee joyne it in the ſame chapter. It riſeth up with greater & more wooddy ſtalkes then any of the former Marjeroms, being two foote high or better in ſome places, where it liketh the ground and ayre branching it ſelfe on all ſides towards the upper parts, leaving the ſtemme bare below if it be old, otherwiſe being yong, thinly furniſhing the branches from the bottome, with ſmall greene leaves bigger then the leaves of any Tyme, and neere the bignes of the leaves of the Marjerome gentle: at the toppes of the branches, ſtand ſmall flowers on a head, which afterwards turne into a looſe tuft, of along white hoarie matter like unto ſoft down, with ſome leaves under and about them, which abide not long on the ſtalkes, but are blowne away with the winde: the ſeede is ſo ſmall if it have any, that I have not obſerved it; the roote is threaddy, the whole plant is of a ſweet reſinous ſent, ſtronger then Marjerome, and abideth our winters, if it bee carefully planted and regarded afterwardes.

8. *Marum ſupinum.* Creeping ſtrang Marjerome.

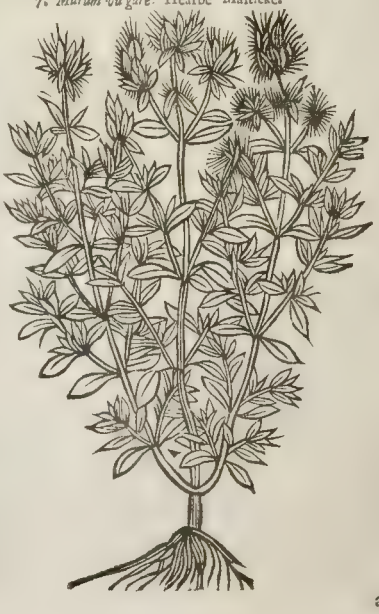
This ſtrange Marjerome hath divers ſlender weake ſtalkes, lying upon the ground, and not ſtanding upright as all the ſweete Marjeroms & hearbe Maſticke do, therin reſembling the wild Tyme rather then Marjerome: the leaves are many

4 *Majorana latifolia ſive major Anglica.* Winter or pot Marjerome.

6. *Majorana ſylveſtris.* Wilde or field Marjerome.

The wild or fielde Marjerome ſendeth forth ſundry brownish hard ſquare ſtalks, with ſmall darke greene leaves ſet by couples on them, very like thoſe of the ſweete Marjerome, but harder and ſomewhat broader: at the toppes of the ſtalkes ſtand tufts of darke or deepe purpliſh red flowers, which turne into a ſmall ſeede as the garden Marjerom ſeede, but blacker; the roote creepeth under ground, and encreaſeth much, abiding from yeere to yeere: the whole plant ſmelleth ſtrong.

7. *Marum vulgare.* Hearbe Maſticke.



and

8. *Marum Supinum.* Creeping strange Marjerome.

and; smaller than those of *Mother* of *Time*, growing at several distances upon the branches, the flowers are small and purplish, growing at the tops, with leaves among them, the smell whereof is very sweet, and neerest unto *Marjerome*.

9. *Marum Syriacum vel Creticum.*
Syrian or Candye Mastick.

9. *Marum Syriacum vel Creticum.*
The Syrian or Candye Mastick.

This Candye or Syrian Marjerome, hath sundry upright stalkes, not so wooddy as the hearb Mastick, but more tender and slender also, about a foot and a halfe high, whereon are set divers small whitish greene leaves, very like unto the small fine sweet Marjerome, but somewhat rougher up to the very tops, which beare smaller heads or knots then the sweet Marjerome, & white flowers out of them, all the hearbe is of a most fragrant sweet smel, enduring a long time after it hath beene dryed: it is very tender to keepe, and will not endure any of our cold nights that come in August or September, but will quickly perish by them.

The Place and Time.

The sweet Marjeromes grow wild on the mountaines in *Spaine*, and in other places, and the wild Marjerome, in the borders of corne fields and pastures in sundry places of this Land: the rest are all nursed up in Gardens, their naturall places being not well knowne to us, saving that the last, *Lobel* saith he had out of *Syria*, and *Prosper Alpinus* saith he saw it in *Candye*. The former seven sorts doe flower in the end of Summer at the furthest, but the two last much later if they come any yeere to flower with us.

The Names.

Marjerome is called in Greek Σαμψυχον & Αμαρακον, in Latine *Majorana a majori cura*, *Sampsuchum* also, and *Amaracus* after the Greeke, of the *Arabians Mersenius*, or *Morsangus*, of the Italians *Maiorana & Persa*, of the Spaniards *Moiorana*, of the French *Mariolaine*, of the Germanes *Maioron & Mijoran*, of the Dutch *Mariolaine*, and of us *Marjerome*, and sweet *Marjerome*. *Marum* is called in Greeke μαρον, and so in Latine: *Sunt inquit Pœna, qui regi Thraciæ cui nomen Maroni esset, Mari herbæ appellationem acceptum ferunt: veruntamen potuit etiã ab Amaraco per apocopen dici, utpote cũ Amaraci species videatur Marum.* The French call it *Marone* and *Mastic*, and wee in English *Mastick* or *hearbe Mastick*, to make a distinction betweene it and the Mastick Time. There is much controversie among the moderne Writers about these two hearbes. First whether *Sampsuchum* and *Amaracum* should be but one or differing hearbes, and whether our Marjerome should be either: for *Galen* and *Paulus Ægineta* in their records and censures of simples, mention them both in severall chapters as differing hearbs, and the suspition hereof is encreased the more, in that *Dioscorides* himselfe in the composition of his oyntments, maketh *Oleum Sampsuchinum* and *Amaracinum* to beare two names, as of two severall simples, although he had said in the chapter of *Sampsuchum* that the Sicilians and those of *Cyzicena* call that *Amaracus*, which those of *Cyprus* and *Egypt* call *Sampsuchum*: but *Dioscorides* thereby rather sheweth the diversitie of the compositions, and the more excellency of the one from the other, which hee could not doe without diversitie of names, but especially because those of *Cyzicen* being the chiefest compositors of such oyles, according to their Country name gave it that title: Some have thought that the *Amaracus* of *Galen* is not the same of *Dioscorides* or *Theophrastus*, but *Parthenium*, because *Dioscorides* saith that by some in his time it was called *Amaracus*, and the rather because he maketh no mention of *Parthenium* in the censure of his simples: which how erronious it is, appeareth by *Galens* owne words of the *Oleum Amaracinum*, which he calleth a sweet oyle, although not so sweet as *Marum*; and *Dioscorides* termeth the smell of *Parthenium*, *subviросus*, having leaves like *Coriander*: then whether the *Sampsuchum* of *Dioscorides* be our Marjerome, for I finde that *Lobel in Adversaria*

faria termeth his *Marum ſupinum Sampſuchus forte Dioſcorides*, and *Bauhinus* in his *Pinax* entituleth our ordinary *Marum* or *hearbe Maſtick Sampſuchus, ſive Marum Maſtichen redolens*, which two authors thought *Marum* better to argue with his *Sampſuchum* then Marjerome, becauſe *Dioſcorides* ſaith that his *Sampſuchum* is an hearbe full of branches creeping on the ground with hairy round leaves, like the ſmaller or finer leafed *Calamint*, ſmelling very ſweet, and in the compoſition of the *Oleum Sampſuchinum* hee adviſeth to chuſe that *Sampſuchum* that hath darke greene leaves, neither of which properties are in our Marjerome, nor yet in either of *Lobels* or *Bauhinus* their *Marum*, for although *Lobel* his *Marum ſupinum* creepe on the ground, yet it hath not hairy round leaves but ſmall and long, and *Bauhinus* his and our *Marum* creepeth not upon the ground, but ſtandeth upright as Marjerome doth. The next controverſie is, whether the *Marum* of *Dioſcorides* be anſwerable to any of thoſe hearbes, are called *Marum* by any of our moderne Writers: that none of them can be his *Marum*, this ſheweth plainely, that he ſaith his *Marum* hath whiter leaves by much then *Origanum*, and a ſweeter flower, and neither the *Marum ſupinum* of *Lobel*, no nor our ordinary *Marum* hath whitiſh leaves, or is ſweeter then Marjerome. *Cluſius* therefore thought good to call our ordinary *Marum*, *Tragoriganum* rather then *Marum*, and ſaith that the ſeed thereof was ſent him by the name of *Ambraduleis*, and *Bauhinus* calleth the *Marum Syriacum* of *Lobel Majorana Syriaca*, and yet by *Bauhinus* leave, his *Syriacum* or *Alpinus Creticum* commeth neerer to *Dioſcorides* his *Marum*, then to his *Sampſuchum*: moſt Writers call the ſweet Marjerome *Amaracus* and *Sampſuchus*, and ſome *Majorana vulgatior*, and the ſmaller or finer ſort *tenuior*: but I doe not finde that any of them hath made mention of my living ſweet ſort, although both *Camerarius* and *Bauhinus* doe entitle the fourth *Majorana perennis*, as I doe the next before it, but they adde *Sylveſtris* as *Tragus* and *Geſner* doe, and *Maiorana major*, or *latifolia* as others doe, and *Anglica*, and *Camerarius* ſaith he found a ſort thereof about *Bononia*, going a ſimpling with *Vliſſes Aldroandus* that had larger and ſofter leaves: the ſixt is called by many Authors *Origanum vulgare*, and by others *Origanum ſylveſtre*; *Lobel*, *Origanum Onitis majus*, and *Agrioriganum*, *Cæſalpinus Origanum Italicum*; and *Gerarde Anglicum*: but I as you ſee number it rather among the Marjeromes, as a wilde kind thereof, as we uſually call it in Engliſh, and as we doe the fourth and fift, this having leaves like Marjerome, but greener. *Pliny* as I ſaid before calleth it *Cunila bubula*, and ſo doth *Dioſcorides* his alſo. But take them here as wee uſually call them, the ſeventh is commonly called *Marum* by moſt Authors, yet *Dodonæus*, *Geſner in hortis*, and *Camerarius* take it to be *Clinopodium*, *Anguilara* and *Lobel* to be *Helenium odorum* of *Theophraſtus*, *Cluſius* to be *Tragoriganum*, and *Bauhinus* to be *Sampſuchus Dioſcoridis*, it is called *Maſtic* both by the French and us. The eight is called by *Lobel*, *Marum ſupinum*, by *Cæſalpinus*, *Marum ex Sicilia allatum*, *Sampſuchum Dioſcoridis*, *Lobel in Adverſarijs* calleth it *Sampſuchus Dioſcorid. Amaracus ſerpens*, and *Bauhinus*, *Marum repens verticillatum* The laſt is called by *Lobel*, *Marum Syriacum*, and ſo doe after him *Dodonæus* and *Taber montanus*, but *Alpinus* calleth it *Cretenſe* finding it in *Candye*, and *Bauhinus* as I ſaid before, *Majorana Syriaca vel Cretica*.

The Vertues.

Our common ſweet Marjerome is hot and dry in the ſecond degree, and is warming and comfortable in cold diſeaſes of the head, ſtomack, ſinewes, and other parts, taken inwardly, or applyed outwardly: it digeſteth ſaith *Matthiolus*, attenuateth, openeth, and ſtrengthneth: the decoction thereof, being drunke helpeth all the diſeaſes of the cheſt, which hinder the freeneſſe of breathing: it is likewiſe profitable for the obſtructions of the liver and ſpleene, for it not onely cleareth them of thoſe humours did ſtuffe them, but ſtrengthneth alſo and confirmeth the inward parts: it helpeth the cold griefes of the wombe, and the windines thereof, or in any other inward part: it helpeth the loſſe of ſpeech by the reſolution of the tongue: the decoction thereof made with ſome *Pelletory* of *Spaine*, and long pepper, or with a little *Acorus* or *Origanum*: *Dioſcorides* and *Galens Sampſuchum* is hot and dry in the third degree of thin parts, and of a digeſting quality: the decoction thereof drunke is good for thoſe that are beginning to fall into a dropſie; for thoſe that cannot make their water, and againſt paines and torments in the belly, it provoketh alſo womens courſes, if it be put up, being made into a peſſary, and applyed with ſalt and vinegar, it taketh away the venome of the Scorpions ſting: being made into powder and mixed with hony, it taketh away the black markes of blowes or bruiſes applied thereto: it is good for the inflammations and watering of the eyes, being mixed with fine flower, and laid unto them: the juyce thereof dropped into the eares eaſeth the paines in them, and helpeth the ſinging noyſe of them: it is profitably put into thoſe oyntments and ſalves, that are made to warme and comfort the outward parts or members, the joynts alſo and ſinewes, for ſwellings alſo and places out of joynt: the powder thereof ſnuffed up into the noſe, provoketh neeſing, and thereby purgeth the braine, and chewed in the mouth draweth forth much flegme. The oyle made thereof is very warming and comfortable to the joynts that are ſtiffe, and the ſinewes that are hard, to molifie, ſupple, and ſtretch them forth. Our Marjerome is much uſed in all odoriferous waters, powders, &c. that are for ornament and delight. The great or pot Marjerome becauſe it is more mild and leſſe bitter than the former, is leſſe uſed in Phyſicke, but more in meates and brothes to give a relliſh unto them, and to helpe to warme a cold ſtomack, and to expell winde: the wilde Marjerome is more hot than it, and therefore more effectuall to heat, warme, comfort, and ſtrengthen both inwardly and outwardly in all things whereunto it is applyed: Hearb Maſtick is more temperate in heat than Marjerome, and is uſed by our Apothecaries, in ſtead of the true *Marum* (which may well bee admitted untill a truer may be knowne in the compoſition of the *Trochiſci Hedychroi* which *Andromachus* thought fit to make a principal part of his Treacle, accounting it effectuall againſt all poiſons, eſpecially of vipers, and other Serpents. Our daintieſt women doe put it to ſtill among their other ſweet hearbs, to make ſweet waſhing water.

CHAP. VI.

Origanum. Organy, or baſtard Marjerome.

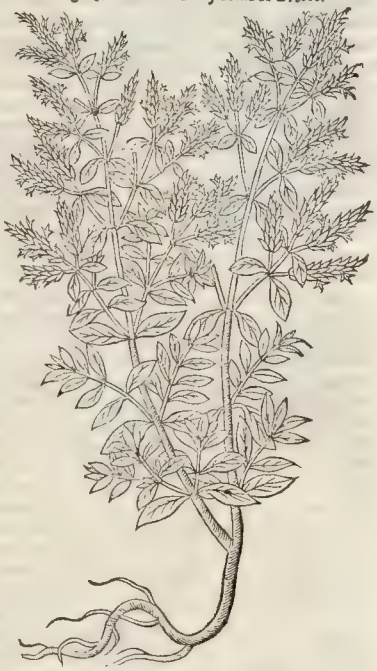
THeophraſtus, *Dioſcorides* and *Pliny* do much vary one from the other, in ſetting down the ſorts of *Origanum* that were knowne to them in their times, for *Theophraſtus* maketh but two ſorts, a black that is barren, and a white that beareth ſeed. *Dioſcorides* maketh 5. ſorts, three of *Origanum*, and two of *Tragoriganum*. *Origanum Heracleoticum*, *Onitis*, and *Sylveſtre*, (which yet is not that which ſome with us call *Sylveſtre*, and is ſet forth in the foregoing Chapter, for his beareth a white flower, and ſo doth not that) *Pliny* is more confuſed, therefore thought not to be without error, for in divers places of his 20. and 21. bookes, he mentioneth

severall sorts of *Origanum*, and in one place maketh three sorts of *Heracleoticum*: but leaving these, I will shew you those sorts are knowne to us in these dayes.

1. *Origanum Heracleoticum verius.* Organie, or bastard Marjerome of *Greece*.

This bastard Marjerome riseth up with divers hard, round, reddish greene stalkes, spreading forth into other smaller branches, whereon are set sundry leaves by couples at the joynts, being somewhat round, and of a whitish greene colour, very like unto Marjerome, but larger, whiter, and harder, or rougher in handling: at the toppes of the branches stand such like scaly heads or knots, as Marjerome hath, but longer, from whence come small whitish purple flowers, and afterwards small browniish seed. The whole plant riseth with us not much higher than Marjerome, but of a hotter and sharper scent and taste, yet somewhat pleasant withall.

1. *Origanum Heracleoticum Verius.*
Organy, or bastard Marjerome of *Greece*.



2. *Origanum Onitis Matthioli.* White Organie of *Greece*.

This Organy differeth somewhat from the former, for it hath whiter and narrower leaves: the flowers also are white, and the heads more divided or separated into smaller tuftes: this is rather more tender to keepe than the former, hardly abiding the sharpnesse of our winter, although it be as well defended.

3. *Origanum Onitis alind majus.* The greater White Organy.

This hath larger and whiter leaves than the former, the umbels or tufts of heads are larger also, and more spread abroad than they, which beare white flowers in the like manner. This kind is somewhat more hardy, and will better abide a Winter, if there be any care used to preserve it. There is also another with somewhat longer leaves than this.

4. *Origanum Sylvestre sive vulgare.* Wilde Organy.

This kind of wilde Organy (which is the ordinary kinde brought from *Candy*, and other places, and usually kept in our Apothecaries shops) riseth up with divers round hard stalkes, whereon are set somewhat broader, lesser, and rougher leaves than the former; the flowers stand at the toppes of the branches in manner of an umbell, that is in smaller heads, and more dispersed than the former, of a reddish purple colour, after which come small browniish seed: the root perisheth when it hath given seed, most especially with us.

4. *Origanum Sylvestre sive vulgare.* Wilde Organy.

The Place.

All these kindes of Bastard Marjeromes have come to us from divers places, but which of them is more proper to this or that place, hath not beene truely signified vnto us; for some have named that *Creticum* which others have *Hispanicum*, so that it is likely to be naturall in both those places.

The Time.

They flower or at least beare their toppes or heads about the end of August, or middle of September with us, so that their seed scarcely commeth to maturity in our Country.

The Names.

It is called in Greeke ὀίγανος *vel* ἀπὸ τοῦ ὄρεος *montem &* γάνος *gaudium, quod clivosos montososque locos amat, vel* παρὰ τὸ ὀξὺν & γανὺν *id est* τὸ λαμπρυντὴν *quod visum illustret & acuat vel a* ῥιγῶσι ῥίγανον & *redundante o,* ὀίγανον *per antiphrasim, natura enim calidum est, in Latine Origanum.* The first is called *Origanum Heracleoticum*, by *Matthiolus*, *Gesner*, *Castor Durantes*, *Lobel*, *Lugdunensis*, *Camerarius*, *Tabermontanus*, and *Dodonæus*, & hath been sent me by the name of *Creticum*, and also *Hispanicum*. *Bauhinus* saith it is the *Cunila Gallinacea* of *Pliny*, and *Dioscorides* calleth it *Cunila*. The second *Matthiolus* calleth *Onitis*, and so doe *Gesner*, *Castor Durantes*, *Bauhinus*, and *Lugdunensis*, who saith also that some called it *Marum*, and came to me by the name *Italicum*. The third *Camerarius* calleth *Onites*, whom *Bauhinus* followeth. The fourth is the common *Origanum* as I said we have in shops, and is thought by *Ruellius* to be the *Cunila Bubula* of *Pliny*, whom *Bauhinus* followeth. *Dioscorides* saith that this (if it be his wild kinde) was called also in his time *Cunila*. But to discusse how fitly each of these sorts answere unto those of *Dioscorides*, I think it fittest to prefixe the text of *Dioscorides*, by which they may be compared. *Origanum Heracleoticum*, (saith *Dioscorides*) which is also called *Cu-*

nita, hath leaves like unto *Hyssope*, the toppes or umbels are not fashioned round, but as it were divided into many parts: the seed in the toppe branches is not great. That *Origanum* that is called *Onitis*, hath whiter leaves, and doth more resemble Hissope: it beareth seed in tufts, as it were joyned together, the force or vertue although it be like, yet is lesse effectuall by much. Wilde *Origanum*, which some call *Panax Heracleum*, and others *Cunila*, (as *Nicander Colephonius*) hath leaves like *Origanum*, and small branches not a foot high, bearing white flowers at the toppes in umbels, like unto Dill: the root is small, and of no use. These bee the words of *Dioscorides*, whereby comparing his first two sorts, we verily thinke, that howsoever some Authors doe vary in their judgements concerning them, the first of them here set downe is the true (at least the truest hath beene knowne to be) *Origanum Heracleoticum* of *Dioscorides*. The two next that follow, the one of *Matthiolus*, the other of *Camerarius*, are both in resemblance so neere his *Onitis*, that we may truely say, that either of them are the same, and that both of them differing but in largnesse of leaves, (which the fertility of the soyle wherein it grew might bee the cause) are but one *Onitis*. But that wild *Origanum* of *Dioscorides*, that hath an umbell like unto Dill is not to be found, unlesse the wilde *Origanum*, that is to be had at the Druggists and Apothecaries be his, for it is the neerest thereunto, being the strangest and quickest in taste, which by *Galens* judgement is the best. The Arabians call it *Faudenigi*, or *Faudenegi*: the Italians *Origano*; the Spaniards, *Oreganos*: the French *Origan*, and *Marjolaine*, bastarde: the Germanes *Volgemuth, quasi dicas animi bonitatem vel letitiam & Rott Doſten*, or *Coſtent*: the Dutch *Orega*: and we in English, Organy, or bastard Marjerome.

The Vertues.

The decoction of Organy or bastard Marjerome with wine, is good for those that are bitten with Serpents, or venemous beasts, and to be taken with sodden wine, for such as have taken *Hemlocke*, or *Opium*: with *Oxymel* it is good for those that have taken poison, or the root of *Colchicum Ephemerum*. It is given with Figges to those that are burſten, or have a rupture, convulsions, or cramps, or have the Dropsie. The dryed hearbe taken in honyed water, purgeth downwards, blacke or melancholick humors. It helpeth to procure womens courses, and taken with Honey is helpfull to those that have a cough. It profiteth those that have an itch, or are scabbed and mangy, and those that have the Iaundise, are much holpen by a decoction thereof taken when they are in a bath. The juyce of the greene hearbe healeth the swellings of the almonds of the throat, and the ulcers of the mouth; it draweth forth fleagme by the nostrils, if it be infused in the oyle of Flower-de-luces. It easeth the paines of the eares, being used with milke. A medicine purging by vomit is made with it, Onions, and Sumach, (such as is used to be eaten) being set in the Sunne for 40. dayes, in a copper vessell, whilst the Dogge-starre lasteth. All Serpents will avoide the place where the hearbe is strowed. The wild kinde especially, healeth all bytings of venemous beasts, if the heads and flowers be taken in wine. And to this purpose *Antigonus* an ancient Greeke Author, in his Rhapsody or huddle of memorable reports, relateth a pretty fable of a Tortois eating *Origanum*, when hee goes to fight with the Serpent, which when one had heedfully observed, he cut up the *Origanum* where it grew, and took it away; whereof when the Tortoise was deprived, he perished by the venemous force of the Serpent; which fable *Plutarch* in his naturall questions, relateth somewhat otherwise: that is, that the Tortoise having eaten of the flesh of a Viper, by eating the hearbe *Origanum*, was free from the danger. The same *Antigonus* setteth downe there also another fable of Ring-doves, who by putting *Origanum* into their wounds, were thereby cured. As also that if the hills of Ants were stopped up with *Origanum* and Brimstone, they would quickly flie away: which thing also *Palladius* reporteth. *Galen* saith all the sorts are of a cutting, rarefying, or thinning faculty, and that in the third degree, and that the *Heracleoticum* is of more efficacy than *Onitis*, and the wild stronger than either. The decoction of *Origanum* with a few Cloves and Sugar, helpeth those that have the Hickock exceedingly. The powder thereof mixed with a little Salt-peter and honey, made into the manner of a thin Electuary, and therewith the teeth being rubbed for sundry times, will make them whiter and firmer.

CHAP. VII.

Tragoriganum. Goates Marjerome.

BEcause the *Tragoriganum* is joyned next unto the *Origanum*, I thinke it fitting for to shew you them in the same manner, yet in a distinct chapter by themselves, for that their face and property is a little differing.

1. *Tragoriganum Creticum.* Goates Organy of Candy.

This small low *Tragoriganum* of *Candy* hath divers small low branches, not above a foot high, somewhat woody, whereon are set at severall joynts two leaves, and sometimes more, which are somewhat broader, rougher, and harder than the leaves of Candy Tyme, and somewhat like unto Summer Savory, but of a sadder greene colour, the small hooded gaping flowers stand at the top of the branches, in severall distances about the stalkes, of a purplish red colour, the whole plant and every part thereof tasteth very hot and sharp, and smelleth very sweet, but somewhat strong and quick, soone piercing the sences, and abideth greene all the Winter if it be carefully preserved, but left without defence, it seldome abideth, the roote spreadeth with many small fibres thereat.

2. *Tragoriganum latifolium sive Marum Cortusi Matthiolo.* Broad leafed Goates Organy, or Marjerome.

This other Goats Marjerome is a fine small bushy plant, little above halfe a foot high, whose stalkes are not so wooddy, but tenderer like Marjerom, with many small smooth gentle leaves, two for the most part set together at a joynt, somewhat broader than our Mastick Tyme, of so strong, hot, and quick a scent, that being a little bruised and smelled unto, it pierceth the sences more than the former, and commeth somewhat neere unto the scent of Calamint or Pennyroyall; the flowers are small and purple, growing up to the toppes of the branches, from betweene the joynts; this bideth greene also like the former, but requireth as much care in the preserving it in the Winter, as the former: the root is a blackish bush of many fibres set together like Marjerome.

3. *Tragoriganum Hispanicum.* Spanish Goates Marjerome.

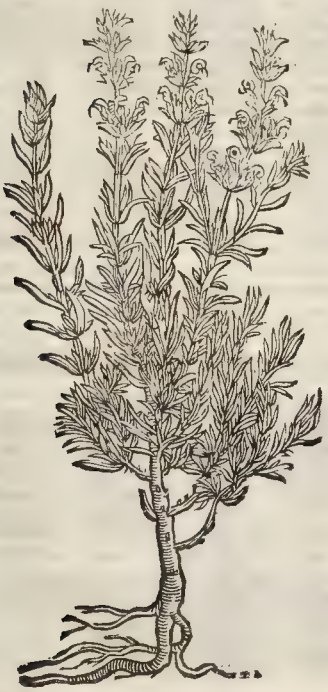
This Spanish kinde riseth up somewhat higher than the former, with whiter and harder stalkes, the leaves are whiter also, smaller, narrower, and longer than they, and more store usually at every joynt, smelling somewhat sweet, but nothing so strong or quick, nor tasting so hot as they: the flowers are white, and grow at severall distances towards the tops of the stalkes, but larger and more gaping, standing in browniſh greene huskes: this also abideth green in the winter, but is more hardly preserved than either of the former: the root is more wooddy, and lesse bushy than they.

4. *Tragori-*

1. *Tragoriganum Creticum.*
Goates Organy of Candy.

2. *Tragoriganum latifolium sive Marum Cortusi Matthiola.*
Broad leafed Goates Organy, or Marjerome.

3. *Tragoriganum Hispanicum.*
Spanish Goates Marjerome.



4. *Tragoriganum Matthioli.*
Goates Marjerome, with wilde Tyme leaves.

4. *Tragoriganum Matthioli.* Goates Marjerome, with wilde Tyme leaves.

Matthiolus first set forth this plant, calling it *Tragoriganum*, which he saith he doth assume to be so, having divers stalkes from a bushy root, and small leaves growing

ing thereon at severall distances, which are like unto the ordinary wild Tyme, or mother of Tyme: the flowers are purple, standing in rundles, at the toppes of the branches. This smelleth somewhat like Pennyroyall.

The Place.

This first groweth in *Candy* and in *Spaine* also, as *Clusius* saith. The second is not knowne (being not set down by *Cortusius*, which sent it to *Matthiolus*) where it groweth. The third *Clusius* saith he found in the Kingdome of *Valentia* in *Spaine*. The last, *Matthiolus* saith groweth in the Country of *Forojulium*.

The Time.

They all flower very late with us, and some so late, that we hardly see any flowers untill October, if we see any at all.

The Names.

It is called in Greeke τραγοριγανος (and in Latine *Tragoriganum*) *quasi hircum origanum dicas, quod pabulo gratum sit hircis, ut Onitis asinis, potius quam, quod hircum fœteat.* The first is called by *Pena* and *Lobel* in their *Adversaria Tragoriganum Cretense apud Venetos*, by *Clusius Tragoriganum 3 Hispanicum*; by *Caspar Bauhinus* in his *Pinax, Tragoriganum Creticum*: and it is likely to be the greater Tyme of *Candy*, that *Prosper Alpinus* setteth downe in his Booke of Ægyptian plants. The second is called by *Gesner, Tragoriganum alterum*, and so doth *Lobel*, which is that *Marum* that *Cortusus* sent unto *Matthiolus* for *Thymum Creticum*, and by that name of *Marum, Durantes, Lugdunensis*, and *Tabermontanus* doe call it, and *Bauhinus, Tragoriganum latifolium*. The third is the second Spanish *Tragoriganum* of *Clusius*, bearing white flowers, whom *Dodonæus* and *Camerarius* in his Epitome of *Matthiolus* upon *Dioscorides, Lugdunensis* and *Tabermontanus* doe follow. The last is the *Tragoriganum* of *Matthiolus*, whom *Durantes, Lugdunensis*, and *Tabermontanus* doe follow, and *Bauhinus* calleth *Tragoriganum Serpillifolium*. To show you likewise how aptly these plants are called *Tragorigana*, and how they disagree, it were not amisse to give you the text of *Dioscorides* thereon. *Tragoriganum* (saith he) is a small bush or shrub, with leaves and stalkes like unto *Serpillum*, or *Origanum*, in some places it is found more fresh and greene, with broader leaves, and somewhat clammy. Another sort is found with slender branches, and small leaves, which some have called *Prassium*. All these Authors have delivered us these hearbs here mentioned, under the name of *Tragoriganum*, as supposing them to come neerest unto one or other of those of *Dioscorides*, both for their forme, sweetnesse of scent, and hotnesse in taste: and *Lobel* saith that among all the plants that are entituled *Tragoriganum*, hee could finde none that came neerer to those of *Dioscorides*, than those two sorts he alloweth of, and are the two first here set downe, the one called by the Venetians *Cretense*, and that other small low plant that *Matthiolus* setteth forth, under the name of *Marum*, which he saith he had from *Cortusus*. But because they are more hot and sharp than I suppose *Dioscorides* his to be, for he saith the drinke made of them is both mild and pleasant, or delectable; fit to be taken of those that have loathing stomacks; and moreover, that *Galen* saith that *Tragoriganum*, besides the quality of *Origanum*, hath some astriction or binding property in it also, which in my judgement abateth of the heate of them, making it the milder, but although I cannot absolutely subscribe unto them herein, yet I deny not any of them their due praises, nor their first founders their befitting honours. *Bellonius* at the latter end of the 62 chapter of his first booke of observations, saith that those of *Candy* and *Cythera*, doe call our Winter Savory by the name of *Tragarigoni*, which is *Tragoriganum*.

The Vertues.

Dioscorides saith they doe heate or warme the parts whereunto they are applyed, provoke urine, and are profitable to move the belly downewards, by purging choller, if the decoction thereof be taken inwardly; as also, that a decoction made thereof with vinegar, helpeth those that are troubled with the spleene; and taken in wine, helpeth those that have taken the venemous *Ixia* (which is the roote of the black Chamæleon Thistle, having as he saith, the taste and smell of Basill) procureth womens monethly courses, and given with honey in an Electuary, helpeth those that have a cough, and are short winded: the drinke thereof is milde and delectable, fit to be given to those that loath their meate, and have weake stomacks, or such as have sowre belchings, and for those vomitings that are procured by the tossings and aire of the Sea, and also for the heart-burning. *Galen* saith in his eighth booke of simple medicines, that it hath the same properties that the *Origana* have, but withall, hath a little astriction. *Pliny* in a manner hath the same things, for he saith, it provoketh urine, dissolveth tumors or swellings, and is especially good for those that have taken the poison of *Viscum*, (for so he termeth the *Ixia* of *Dioscorides*) in drinke, and for the biting of a Viper: for sowre belchings of the stomack, the heart-burning, and for coughes, Pluriſies, and shortnesse of breath.

CHAP. VIII.

Ocimum. Basill.

THere are divers sorts of Basill, the most whereof are very great strangers to our Nation, and but entertained by a few that are curious and industrious.

1. *Ocimum vulgare majus & minus.* The great and small common Basill.

The greater ordinary Basill riseth up usually but with one upright stalke, diversly branching forth on all sides, whereon are set two leaves at every joynt, which are somewhat broad and round, yet a little pointed, of a pale greene colour, but fresh, a little snipt about the edges, and of a strong heady scent, somewhat like a Pomecitrion, as many have compared it, and therefore called it *Citratum*: the flowers are small and white, standing at the tops of the branches with two small leaves at the joynt, in some places greene, in others browne, after which come black seed: the root perisheth at the first approach of winter weather, and is to be new sowne every yeare, if you will have it. The lesser kinde called small, fine, or bush Basill, groweth not so high, but is thicker spread with branches, and smaller leaves thereon, closer set together, and of a more excellent pleasant sweet scent by much: the flowers are white, and the seed black like the other, when it giveth seed with us, which is more seldome, for it hath not beene knowne to give ripe seed in our Country often, because it neither springeth nor seedeth so early as the former. Vnto these sorts of Basill I must adde the third, which is as it were the meane betweene them, being greater than the small one, and lesser in leaves than the great, and not growing so high, in other things differing not.

Minus.

Medium.

2. *Ocimum*

1. *Ocimum vulgare.* Ordinary Basill. 7. *Ocimum Minus.* The small Basil. 2. *Ocimum Maximum* The great Basil.

2. *Ocimum maximum Citratum.* The greatest Citron Basill.

This kinde of Basill differeth not in the manner of growing from the greater ordinary garden Basill: but brancheth forth like it, with leaves set by couples at the joynts, but much larger, and of a reddish colour in the hotter Countries, but not so in the colder, a little dented about the edges, of a very sweet scent, resembling a Citron pill, and therefore called *Citratum*; the flowers are white like the ordinary Basill, and the seed black like it, perishing also after it hath flowred and seeded.

3. *Ocimum caryophyllatum maximum.* The great Clove Basill.

There is another also of these greatest Basils that differeth not from the former, either in growing, or largenesse of leaves, or colour of the flowers, except that sometimes they are a little purplish, but in the smell of the whole plant, it hath a stronger and quicker scent, more neerely resembling Cloves, then the former, and is thereupon named *Caryophyllatum.*

4. *Ocimum Anisatum.* Aniseed Basill.

This Basill is of the kind of our ordinary garden Basill, and of a middle kinde, whose leaves are neither so great as the greater, nor so small as the small kindes, but of a middle size betweene them both, the difference whereof consisteth chiefly in the smell, which is like the smell of Aniseed.

5. *Ocimum Indicum.* Indian Basill.

The Indian Basill hath a square reddish greene stalke, a foot high, or better, from the joynts whereof spread out many branches with broad fat leaves set thereon, two alwayes at a joynt one against another, as the Basils have, but somewhat deepely cut in on the edges, and oftentimes a little crumpled, standing upon long reddish foot stalkes, of a darke purple colour, spotted with deeper purple spots, in some greater, in others lesse: the flowers stand at the tops of the stalkes, spike fashion, of a white colour, with reddish stripes and veines running thorow them, set or placed in darke purple coloured huskes: the seed is greater and rounder than any of the former, and somewhat long withall: the root perisheth like the rest. The whole plant smelleth strong like unto the ordinary Basill and Camfire put together.

5. *Ocimum Indicum.* Indian Basill.

6. *Ocimum Crispum.* Curld Basill.

This curled Basill is of the kinde of the Indian Basill, having such like large leaves cut in somewhat deepely on the edges, and curled or crumpled as they are sometimes, as also with swelling bunches like bladders on them, but wholly of a greene colour, without any spot on them, as the stalkes are also: the flowers hereof are likewise wholly white, without any spot in them: the smell hereof is somewhat strong, resembling the spotted Indian kinde, and is very likely to be but a degenerate kinde, risen from the seed thereof, being gathered in these colder Countries.

7. *Ocimum minus angustifolium.* Small dented Basill.

This small Basill groweth not so like any of the former Basills, or the small fine bush Basill, in the bushing branches thereof, but rather somewhat resembling the wild Basill, or *Clinopodium*, having fewer stalkes and branches, with small narrow leaves, a little snipt or indented about the edges, two alwayes set together at a joynt, but more sparsedly on the branches: the flowers grow at the tops of the branches, somewhat like unto Basil of a white colour, but bending a little more backward, the smell hereof is smaller than any of the other Basils.

The Place.

These plants grow onely in Gardens with us, as also in *Italy*, and other places where they are cherished; their naturall being not knowne to us: onely the Indian and curld Basill are said to come first from the West-Indies into *Spaine*, and from thence into other places.

The Time.

They all flower in the heate of Summer, and some of them later.

The Names.

There is some controversie among Writers concerning this plant, in three or foure particular matters: first, for the etymologie or derivation of the word, some thinking it to be derived from the Greeke word ὠκύς, and the Latine *ocyus*, that is, *a celeritate crescendi*, from the speedy springing of the seed (which is usually within three or foure dayes, if it be a hot and dry time without raine, for moysture turneth it into a gelly, as any one may see, that will looke on it after it hath taken wet) which is written with *o*. Secondly, as some thinke, from the Greeke word ἐλαίω *oleo*, which signifieth, to smell, or give a savour, as commonly taken in the worst sence, as in the best; and so would have the word to be *Ozimum*, of the sweet smell thereof. Thirdly, whether it should be *Ocymum*, as it is to be found in divers ancient Writers, or *Ocimum*. Fourthly, what *Ocymum* is of the ancient Writers, for by divers it is taken to be that kinde of graine called *Fagopyrum*, or *Tragopyrum*, in English Buckwheate, or else a kinde of medley of Corne or Pulse sowne together, as many ancient Writers have set it downe, as shall be shewed in his proper place, whereunto I shall referre you. And lastly, about the vertues as shall be shewed presently. It is called by the latter Greeke Writers, βασιλικὸν. *Basilicum*, because the smell thereof being so excellent, is fit for a Kings house. The first two sorts of these Bassils are by all Authors so called, as I doe. The second is the same *Ocymus* that *Prosper Alpinus* saith groweth in the Gardens of *Alexandria* in *Egypt*. The third is so called by *Lobel* and others. The fourth is onely set forth in the great Booke of the Bishop of *Eystot* his garden: the fift is called *Hispanicum*, by *Camerarius* and *Tabermontanus*, and *Indicum*, by *Clusius* and others. The sixt is as is said in the description, a degenerate kind of the last before it. The last is so called by *Estetensis*, as is here expressed. The Arabians call it *Berandaros*, and *Badobrog*, the Italians *Basilico*; the Spaniards *Albahaca*; the French *Basilic*; the Germanes *Basilgen*, and *Basilgram*; the Dutch *Basilicom*; and we in English Bassill.

The Vertues.

Bassill in all Countries for the most part is of little use in Physick, but rather used as a sweet smelling hearbe to sweeten or perfume any thing, or else used outwardly to comfort and warme cold members. *Dioscorides* saith that being eaten in any plentifull manner, it dulleth the sight, maketh the belly soluble, stirreth up wind, provoketh urine, with-draweth the milke, and is of hard digestion. *Galen* also saith it is accounted among those things that are hot in the second degree, but because it hath an excrementitious moysture joyned with it, it is not fit to be taken inwardly: and in another place, that it is an hearbe for sawce, or meate, hurtfull to the stomack, breeding ill juyce, and hard to be digested. It is held by *Crysippus* (as *Pliny* saith) who inveied bitterly against the use thereof, to be hurtfull both for the stomack, urine, and eye-sight: and besides, causeth a kinde of madnesse and lethargie, and other diseases of the liver, &c. And that those of *Affrica* say, that if any have eaten Bassill, that day he is stung by a Scorpion, that he cannot be saved: which saying is quite contrary to that of *Dioscorides*, that saith, from those of *Affrica*, that he shall have no paine or danger, that is stung by a Scorpion, if he have eaten Bassill before. *Pliny* setteth downe, that in his time it was defended from such calumnies as *Crisippus* cast upon it, and was commended to be profitable against the sting of Scorpions, and some other venemous Serpents; and found to be helpfull and wholsome for those are given to swouning, used with vineger, and smelled unto: used with oyle of Roses, or Mirtles, and Vineger, is good against the paines of the head, it is profitably applyed to those are troubled with the lethargie, the jaundise and dropsie. It is good to be put into the eares of young children with a little goose-grease, to helpe them of paines thereof: the juyce or the seed bruised put into the nostrils, procureth neesing: it is good also for the trembling of the heart, it provoketh Venery, and therefore was given to horses to make them apt to breed. Some of the ancient Writers likewise have set downe, that the seed is good to kill the wormes of the belly, to lessen the spleene, and that bruised and mixed with Oxegall, it taketh away the foule markes and scarres of ulcers, and other sores. And used with honey, it taketh away the discolourings and spots of the face. The Arabian Authors and Mesues chiefly have used the seed among other Cordiall Spices, for the comforting of the heart in the trembling thereof, and the expelling of Melancholy or sadnesse, that riseth without manifest cause. And for these causes chiefly the seed is used by our later Physicians for the most part: the fragrant smell of this hearbe so comfortable to the sences, reviving them as it were, when they are dull or distempered, may evidently declare a singular efficacy to be therein, and therefore not to be smally regarded. *Theophrastus* in his first booke, and eighth Chapter *de causis plantarũ*, saith that Bassill growing in a place too much exposed to the heate of the Sunne, changeth into *Serpyllum*, or wild Tyme, by the overmuch drynesse thereof, for the leafe becommeth smaller, and the scent the stronger thereby: but these Metamorphoses or changes of hearbs one into another, is very frequent both with him, *Pliny*, yea, and *Gallen* too, as well as divers others of the ancient Writers, which sheweth in what errours men of judgement and learning have beene conversant and confident in. Let me yet before I leave, relate unto you a pleasant passage betweene *Franciscus Marchio*, an Advocate of the state of *Genua*, sent in Embassage to the Duke of *Millan*, and the said Duke, who refusing to heare his message, or to agree unto the conditions proposed, brought an handfull of Bassill and offered it to him, who demanding of him what hee meant thereby, answered him, that the properties of that hearbe was, that being gently handled, it gave a pleasant smell, but being hardly wrung and bruised, would breed Scorpions: with which witty answer the Duke was so pleased, that he confirmed the conditions, and sent him honourably home. It is also observed, that Scorpions doe much rest and abide under those pots or vessels wherein Bassill is planted.

CHAP. IX.

Clinopodium. Field Bassill, & *Acinos.* Wild or Rough Bassill.

I Have as you see joyned both these together for the affinity, both of their name and nature unto the former Bassils, and betweene themselves, for that divers of our latter Writers doe confound them, the one calling that *Alcinos*, that another doth *Clinopodium*.

1. *Clinopodium minus sive vulgare.* Field Bassill, or Beds foote flower,

That *Clinopodium* that is taken by the best Writers and other Herbarists in these dayes, to come neerest unto the description

deſcription of *Dioſcorides*, is a ſmall low hearb not above halfe a foot high, having divers hard round branches, riſing from a ſmall wooddy root, with two ſmall leaves ſet at every joynt, being ſomewhat like the ſmall or fine Baſill, a little dented about the edges; and in ſome plants, and places a little hairie and rough, and in other leſſe, or not at all; the flowers grow at ſpaces with the leaves, like as Horehound doth, ſtanding in ſmall greene rough cuppes, which are of a purpliſh colour, and parted as it were into foure equall ſhort pieces at the end, like the foure ſquare foote of a Bed-ſtead, and not hooded or open with ſeverall leaves, like other hooded flowers: the ſeed is ſmall and round, growing in ſmall ſwollen huskes: the plant hath ſome ſmall heate, but more dryneſſe in the taſte thereof, ſweet alſo in ſcent, betweene Baſill and Calamint.

2. *Clinopodium Auſtriacum.* Auſtrian wild Baſill.

The Auſtrian wild Baſill hath divers ſlender hard foure-ſquare ſtalkes, not a foote high, whereon are ſet two greene leaves at every joynt, ſomewhat like the former Field Baſill, but ſmaller, being a little dented about the edges, which is forgotten in the figure: the flowers ſtand at the toppes of the ſtalkes, ſomewhat like unto the flowers of the former, but much larger, and of a violet purple colour, ſomewhat ſad for the moſt part, (but ſome plants are found with white flowers) hanging downewards, and bending alſo backwards for the moſt part, in like manner as the former: the ſeed is encloſed in ſuch like ſwollen huskes, blacke and round, three or foure together, like Calamint, or ſomewhat reſembling the other: the rootes are many, hard and black, with divers fibres annexed unto them.

3. *Clinopodium Alpinum.* Mountaine wild Baſill.

The Mountaine wild Baſill groweth with divers low and creeping foure-ſquare rough branches, having two ſmall rough leaves at every joynt, and ſome ſmaller alſo between them, growing all along the ſtalkes: the flowers are many growing in a head together, with the leaves among them;

1. *Clinopodium minus ſive vulgare.* Field Baſill, or Beds foot flower.

2. *Clinopodium Auſtriacum.* Auſtrian wild Baſill.

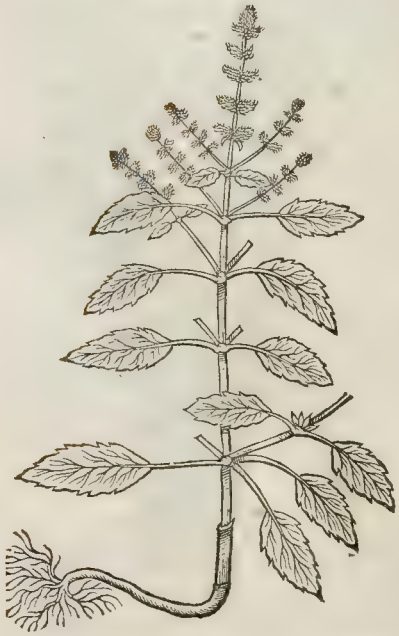
3. *Clinopodium Alpinum.* Mountaine wild Baſill.

at the toppes of the branches, very like unto the flowers of the first, but of a darke red colour: the rootes are many small blackish strings, which shoot forth under ground new sprouts, thereby creeping about and increasing plentifully, abiding with his greene leaves, which perish not.

4. *Acinos sive Clinopodium majus,* Great wild Basill, or Stone Basill.

Alind

5. *Acinos latifolia Columnæ.* Broad leafed wild Basill.



4. *Acinos sive Clinopodium majus.* Great wilde Basill, or Stone Basill.

This wild Basill hath foure-square hard, hairie, and hoary stalkes, a foote high, or more, set with two hairie greene leaves at a joynt, being covered also as the stalks, with an hoary downe somewhat larger than any of the former, comming neere unto the bignesse and fashion of the leaves of *Origanum*: the flowers grow in rundles, in more plenty than the former, of a purplish colour, and sometimes white, the husks whereof are somewhat larger and rougher: the roots are a bush of many strings set together at the head, which shoot forth suckets round about.

Of this kinde there is also another, whose stalkes are lower, the leaves lesser, and the huskes of the flowers smaller than the former, not differing in any other thing from it.

5. *Acinos Anglica Clusij.* Our English wild Basill.

The English wild Basill hath a few slender foure-square branches, not a foote long, lying on the ground, whereon grow divers small grayish greene leaves, two alwayes at a joynt set together, which are not much unlike the first Field Basill, but smaller, shorter, and fuller of juyce, and not dented about the edges at all, very like unto the last wild Basill, but smaller, of a certaine sweet scent, but not heady: from the middle of the branches up to the toppes, grow the flowers in rundles or spaces about the stalkes, being very like unto the first Field Basill, but of a more bluish purple colour, with a white eye or circle in every flower, and after they are past, come three or foure small seeds like the first, in the huskes where the flowers stood: it perisheth every yeare in my garden, and rayseth it selfe from its owne sowing.

6. *Acinos latifolia Columna.* Broad leafed wild Basill.

The great leafed wild Basill riseth from a bushy roote, with a rough or hayrie stalke, spreading forth into divers other branches, whereon grow larger leaves below, and smaller upwards, two together; at the setting on of the leaves, which are also rough or hairy, very like unto the leaves of the greater Basil, but somewhat smaller and longer, endented about the edges, and each of them standing on a long stalke, towards the tops the flowers grow much, and are many, spike fashion, of a purplish colour, very like unto the flowers of the garden Basill, after which come the seed vessels, containing within them small round blackish seed.

The Place.

The first groweth most usually in the borders of fields, even among the corne, as at *Sutton* in *Kent*, not farre from *Dartford*, at *Thetford* in *Norfolke*, and in other dry sandy and untilled grounds: The second groweth upon the hills that are neere the Baths at *Baden* in *Austria*, as *Clusius* saith, and upon Mount *Baldus*, as *Pona* of *Verona* saith. The third also groweth upon Mount *Baldus* in *Italy*, as the same *Pona* setteth downe, in the description of the hearbes growing thereon. The fourth is found sometimes in the corne fields of our owne Countrie, but more often in the more open Woods, and in Copses that have beene feld in many places of *England*. The fift *Clusius* saith he found likewise in *Kent*, while he stayed a while at the Lord *Cobhams*, wayting for his passage over Sea, but it is found in divers other places of *Kent*, and other parts besides. The last *Fabius Columna* saith, groweth plentifully at *Naples* in their Gardens.

The Times.

They doe all of them flower about the beginning of Iune, and their seed is ripe in August, and sometimes sooner.

The Name.

Clinopodium is called in Greeke κλινοπόδιον *quasi lectipes quod surculi (alijs ut Plinio, orbiculati florum ambitus) speciem pedum lecti præbeant*, in English Bedsfoot flower, because the branches say some (but *Pliny* saith, the round compasse of the flowers) doe resemble the feet of a bed, whereupon I have

so

ſo entituled the firſt, as moſt agreeing thereunto Ἄκινος ἢ ἀκῖνος, by *Dioſcorides herba odorata coronaria, ocimo ſimilis. Acinus* is a ſweet hearb fit for Garlands, and is like unto Baſill. *Pliny* ſaith *Acinos* that is called *Epipetron* never flowreth, therein confounding the *Epipetron* of *Theophraſtus*, which he ſaith never flowreth with *Acinus*, but *Dioſcorides* ſaith no ſuch thing, and therefore *Pliny* was much miſtaken herein, as he was in many other things. The firſt is called *Ocimum Silveſtre*, and *Clinopodium minus* or *vulgare* by *Lobel* and *Cluſius*; and *Acinos* by *Fuchſius in Iconibus*, and by *Dodonæus*: *Clinopodium* of *Turner*, and *Anguillara*: *Clinopodium majus* of *Camerarius*: *Pulegium petræum* of *Geſner*, *Clinopodium alterum*, or *pſeudo-clinopodium* of *Matthiolus*. *Ocimaſtrum* of *Fuchſius*. *Bauhinus* calleth it *Clinopodium arvenſe ocimi facie*, it is the *Baſilicum* 3. of *Tragus*, who calleth it alſo *Calamintha montana*, but of all other moſt improperly; in Engliſh, Field Baſill, becauſe it is chiefly found in the Fields, the Country people call this as well as the fift where it groweth, Horſe Time, and Poley mountaine. The ſecond *Cluſius* calleth *Clinopodium Auſtriacum*, and ſaith he might as well call it *Acinos Auſtriaca*. *Bauhinus* calleth it *Montanum*, in Engliſh Auſtrian wild Baſill. The third, *Pona* calleth *Clinopodium Alpinum*, having found it onely upon *Mons Baldus*, not farre from *Verona*, but why *Bauhinus* ſhould call it *Teucrium Alpinum coma purpurocærulea* in his Chapter of *Teucrium*, having called it *Clinopodium Alpinum hirſutũ*, among the other ſorts of *Clinopodium*, I ſee no reaſon, in Engliſh mountaine wild Baſill. The fourth is the firſt *Clinopodium vulgare* of *Matthiolus*, and called *Clinopodium majus* of *Camerarius*: *Lobel* and *Dalechampius* call it *Acinos*, and *Guilandinus Betonica Pauli*, it is the firſt Calamint of *Turner*, *Pulegium montanum* of *Lonicerus*, and *Polycnemon* of *Geſner*. *Bauhinus* calleth it *Clinopodium Origano ſimile*, in Engliſh great wild Baſill. The fift is thought by *Cluſius* to be the true *Acinos* of *Dioſcorides*, *Bauhinus* calleth it *Clinopodium ocimi facie alterum*. The laſt is called *Acinos* of *Fabius Columna*, in his *Phytobaſanos*, and ſaith it is generally called *Vrtichella* of the Neapolitans, becauſe it hath ſuch like roughneſſe and hairyneſſe, although not ſtinging as nettles have, and is an annuall plant to bee new ſowne every yeare. But it is much to bee doubted whether any of theſe hearbs be the right *Acinos* or *Clinopodium*, that *Dioſcorides* and *Theophraſtus* have ſet forth, in regard their temperature and qualities doe not agree as you ſhall heare preſently, although *Pena* and *Lobel* thinke their *Clinopodium* to be the right. The Italians call it *Clinopodio*, the Spaniards *Albahaca Sauvage*, the French *Baſilicq Salvage*, the Germanes wild *Baſilich*, the Dutch wild *Baſilicon*, and wee in Engliſh wild Baſill, Field Baſill, or as beforeſaid.

The Vertues.

Of theſe hearbs I know no author hath ſet downe any tryed remedy found by them, for in regard that *Galen* ſaith *Clinopodium* is of thin parts, and may be accounted to be in the third degree of heate and dryneſſe, being ſomewhat ſharpe in taſte, and a little bitter withall, neither of which as ſaith *Matthiolus* can be found in theſe, yet becauſe they doe ſo neerely in face and ſhew reſemble the true plants, they may beare their names untill they gaine truer and that the vertues are found out, whereunto they may be applyed. *Dioſcorides* ſaith that his *Clinopodium* is applyed to thoſe that are troubled with convulſions or crampes, ruptures or burſtings, or ſtrangury, that it is a remedy againſt the ſting or byting of venemous Serpents, and that it bringeth downe the courſes of women, and expelleth the dead child, and taketh away thoſe warts that are long, and hang downe, if it be drunke for certaine dayes together. It ſtayeth the looſeneſſe of the belly, if it be given after it hath beene boyled to the thirds in wine, to them that have no feaver, and in water to them that have a Feaver. Of *Acinos*, *Dioſcorides* writeth, that being drunke it ſtayeth both the fluxe of the belly, and the courſes in women, and healeth hot ſwellings, and thoſe are called Saint *Anthonies* fire. Where you may obſerve that *Acinos* ſhould not be *Clinopodium*, both in regard *Dioſcorides* maketh them two diſtinct plants, and beſides giveth them contrary qualities, for *Acinos* he ſaith ſtayeth the looſeneſſe of the belly, and the overmuch flowing of womens courſes, whereas hee ſaith *Clinopodium* procureth the courſes, and expelleth the birth, yet he ſaith alſo that it ſtayeth the looſeneſſe of the belly, and as *Galen* ſaith, is hot and dry in the third degree, and of thin parts.

CHAP. X.

Polium. Poley, or Polemountaine.

ALthough *Dioſcorides*, *Galen*, and *Pliny* have remembred but two ſorts of *Polium*, yet our later Writers have found out divers other ſorts, which they referre thereunto, ſome of them grow naturally neere the Sea, and therefore called of ſome *Polium maritimum*, others not onely neere the Sea, but upon the hills alſo, and therefore may as well be called *montanum*, as *maritimum*, and others farre off from the Sea, upon hills and mountaines, and therefore called more properly *Polium montanum*, as ſhall be ſhewed in this Chapter following.

1. *Polium montanum vulgare.* Our ordinary Poley mountaine.

This kind of *Polium* or Poley mountaine, that is moſt frequent in our gardens, is a ſmall low plant, having divers white or hoary round and hard branches (riſing from the root, which is ſomewhat long and hard, with a few fibres hanging thereat, not above a foot high.) whereon are ſet divers long and ſmall hoary leaves, overlayed as it were with a yellowiſh white downe, ſomewhat dented about the edges, and ſomewhat broader or greater than any of the others that follow, two alwayes ſet together on the ſtalkes as they grow up, at the tops whereof grow forth whitiſh or hoary yellowiſh heads, thruſting out many ſmall pale coloured flowers, and in ſome places more yellow, ſtanding in hoary huskes: the ſeed is ſmall and blackiſh: the whole plant ſmelleth ſweet, ſomewhat ſtrong and quick withall, the branches whereof being ſlipt and ſet will grow very well, thereby ſufficiently to be encreaſed, becauſe in our Land it ſeldome giveth perfect ſeed to bee ſowne: yet *Cluſius* ſaith, that hee had ſome plants raiſed from the ſeed of this kinde, that brought forth flowers more pale than the mother plant, and ſome more white, eſpecially on the outſide; being pale on the inſide: but *Bauhinus* in his *Pinax* addeth, that it gave ſome plants whoſe flowers were of a whitiſh purple colour, and is to bee accounted the fourth ſort of *Cluſius*, which I am ſure is not to be found in *Cluſius*, who in that place maketh no mention of any with a purple flower rayſed from ſeed.

2. *Polium montanum minus.* Small Spaniſh upright Poley mountaine.

This ſecond or ſmall Poley mountaine, riſeth up with many ſmall ſlender branches ſtanding more upright than the

1. *Polium montanum vulgare.*
Our ordinary Poley mountaine.

2. *Polium montanum minus.*
Small Spanish upright Poley mountaine.

the next, and not leaning downewards to the ground like it; nor much higher; whereon are set many hoary leaves, smaller than the next that followeth, and some small ones together with them, a little dented about the ends onely, and as hoary or rather more than it: at the toppes whereof stand longer and smaller heads of whiter flowers than the next, comming forth of hoary cuppes, larger and more spread than it also: the seed is blackish and small, yet greater than the former, although the plant be smaller; the roote is hard and wooddy like the former; the smell hereof is much more sweet than it.

3. *Polium montanum Monspeliacum.* Small French Poley mountaine.

This third and small Poley mountaine is very like the former, but that the branches stand not so upright, but leane more downewards, the leaves likewise are not fully so large, but as white and hoary, dented a little more about the edges: the hoary heads of flowers which are white, are smaller, and more closely compact, in other things this differeth not from the last.

4. *Polium maritimum Supinum.*
Creeping purple Poley mountaine.

5. *Polium montanum Supinum minimum.*
The smallest creeping white flowred Poley mountaine.

5. *Polium*

4. *Polium maritimum Supinum.* Creeping purple Poley mountaine.

Creeping Poley mountaine hath divers ſmall weake hoary branches lying upon the ground, which as they ſpread take roote at the joynts, being not a foot long, whereon doe grow many ſmall and long leaves, as white and hoary as any, a little dented alſo about the edges, but not eaſily to be ſeene, unleſſe one marke them well, and in the younger growne not at all: at the toppes of the branches grow ſmaller heads of hoary huskes, out of which come purpliſh flowers, and after them ſmall and blackiſh ſeed like the former.

Of this kinde there is another found, bearing white flowers, not differing in any other particular from it. *Flore albo.*

5. *Polium montanum Supinum minimum.* The ſmalleſt creeping white flowred Poley mountaine.

This ſmall kinde hath many ſmall weake branches, not halfe a foot long, lying creeping on the ground, ſhooting forth fibres at the joynts as they ſpread, in the ſame manner as the laſt doth, whereon are ſet in the ſame order, two leaves one againſt another, all along the branches, being ſmaller, harder, narrower, and greener than any of the reſt, without any denting at all about the edges: at the ends of the branches come forth, three or foure ſmall white flowers, like unto the other for forme and faſhion, but much ſmaller: the ſeed is not unlike the other: this hath little or no ſcent at all.

6. *Polium montanum lavendulæ folio.* Spike leafed Poley mountaine.

6. *Polium montanum lavendulæ folio.* Spike leafed Poley mountaine.

This Poley mountaine from a hard woody roote, ſpreading out many ſmall fibres ſendeth out divers weake branches, not fully able to ſtand, but rather lying downe, whereon are ſet many ſmall long leaves, two together, one againſt another, as in al the former, which are ſomewhat greene on the upper ſide, and hoary underneath, ſomewhat like unto the leaves of Roſemary or Lavender, and not a whit ſnipt about the edges; at the toppes of the branches ſtand forth many flowers, not buſhing as in many of the former, but looſely ſpread, which are of a white colour, not differing in forme from the other, but comming forth of a grayiſh huske, not ſo hoary as ſome of the former: the ſeed is black like the reſt: this kinde hath a ſmall ſweet ſcent, nothing ſo pleaſant as moſt of the other: *Lobel* ſaith it hath little or no ſcent at all: *Matthiolus* ſaith that it ſmelleth well, though not ſo pleaſant as his former, and that it is of leſſe vertue and efficacy than it.

7. *Polium latifolium incanum Creticum.* Candy Poley with hoary broad leaves.

The branches of this Poley are round and hoary, about a foote high, ſpread into other ſmaller branches, ſet with two leaves at each joynt, which are ſomewhat broad and round, and dented at the edges like Germander, or the Ivie leafed Chickweed, of a yellowiſh greene on the upperſide, and hoary underneath, without any manifeſt taſte: the flowers have not beene obſerved.

8. *Polium anguſtifolium Creticum.* Vpright narrow leafed Candy Poley.

This Candy Poley groweth almoſt two foote high with upright hard round wooddy ſtalkes, whereon are ſet ſmall and long leaves almoſt round pointed, very like unto the common *Polium*, but much ſmaller, & not dented about the edges at all: the flowers and ſeed are like the common ſort, the whole plant is very ſweet.

9. *Polium montanum pumilum tenuifolium Africum.* The ſmall African dwarfe Poley.

This ſmall creeping Poley, hath many very ſmall and hoary white leaves, ſet together at a joynt all along the ſtalkes by diſtances, the flowers are ſmall and yellowiſh growing at the toppes: the roote is ſomewhat wooddy as all the reſt of the plant is, and ſomewhat ſweet alſo.

The Place.

The firſt as I ſaid being the moſt common in this Land, *Cluſius* ſaith he found in the Kingdomes of *Granada* and *Valentia*. The ſecond *Cluſius* ſaith he onely found growing upon the hills in *Spaine*. The third he likewiſe ſaith groweth as well in the Kingdome of *Valentia* in *Spaine*, as at *Mompelier* in *France*. The fourth groweth alſo in a Province of *Spaine*, and neere unto *Venice* alſo, upon the Adriatick ſhore. The fift groweth neere *Vienna* in *Auſtria*, and on the hills in *Savoy*, neere the Lake *Lemanus*. The ſixt groweth in divers places of *Germany*, as upon the hills of *Hamborough*, the hills neere *Turin*, and neere *Noremberg* alſo, as *Camerarius* ſaith. The ſeventh as *Bauhinus* ſaith came to him from *Honorius Bellus* out of *Candy*, where the eight alſo groweth all along the Sea ſide, and upon Mount *Baldus* alſo, as *Pona* ſaith: the laſt was gathered neere *Tunis* in *Barbary*, by *Boelius*, and brought to Doctor *Lobel* and us.

The Tyme.

They doe moſt of them flower in Iuly and Auguſt, yet ſome later than others.

The Names.

Polium is called in Greeke πόλιον *ſic dictum propter canitiem* πολὸς *enim canitiem vel canum ſignificat, quia capitulum habet canorũ hominis inſtar capillatum*: becauſe it is like unto the hoary haires of a mans head: but this is referred to the toppes or heads, and not ſo directly to the leaves as *Pliny* would have it, although the leaves alſo are ſomewhat white and hoary; in Latine *Polium*, & thereafter all other Nations call it according to their dialect. The firſt is called *Polium montanum vulgare*, and *Polium montanum luteum* by *Lobel* and *Pena* in their *Adverſaria*, as alſo in his obſervations

8. *Polium angustifolium Creticum.*
Vpright narrow leafed Candy Poley.

9. *Polium montanum pumilum tenuifolium Africum.*
African dwarfe Poley.

ſervations, for they anſwer one another, ſo that by the name of *Lobel* (where I name him alone thorowout all this booke) I doe not drowne the name of *Pena*, nor the name of *Lobel*, when I name *Pena* alone: but for brevities ſake name one in ſtead of both. It is the firſt of *Dodonæus* in his Hiſtory or *Pemptades* in Latine, which I uſe onely here alſo. And the third of *Cluſius* in his Hiſtory of more rare plants, which I chiefly meane, when I cite him through all this worke, becauſe both his Spaniſh and Pannonick obſervations are included therein, unleſſe I recite his particular obſervations. The ſecond is the ſecond kinde of *Cluſius*, in his Spaniſh obſervations, and the firſt with *Matthiolus*. The third is the firſt with *Cluſius*, and the ſecond with *Dodonæus*, called *minus* and *mediterraneum* of *Lobel*, and *montanum album* of *Bauhinus* in his *Pinax*. The fourth is the fift and ſixt kindes with *Cluſius*, the one with a purple, the other with a white flower, and called of *Lobel* alſo *Venetum*, of *Bauhinus* in his *Pinax*, *Maritimum ſupinum venetum*. The fift is the eight ſort with *Cluſius*, the fourth with *Dodonæus* called *repens*, and ſo likewiſe by *Bauhinus*, and *montanum ſupinum minimum* of *Lobel*. The ſixt is the ſeventh with *Cluſius*, and called *Polium recentiorum femina lavendulæ folio* of *Lobel*, and is the ſecond of *Matthiolus*, and called *Polium lavendulæ folio* of *Bauhinus*. *Bauhinus* firſt mentioned the ſeventh, and *Pona* in his Italian *Baldus* the eighth, and taketh it to be the ſecond *Polium* of *Dioſcorides*, the laſt is not mentioned by any Author before. *Fabius Columna*, as I ſhewed you in the firſt Chapter, would faine make *Polium* to be the true Hiſope of *Dioſcorides*, but I know not that any doth conſent unto that opinion, for by the judgement of the beſt, this hearbe is the true *Polium* of all the ancients, as well in face as qualities, and therfore cannot be Hiſope, beſides, the taſte hereof is very loathſome to the ſtomack, which *Dioſcorides* alſo remembreth, but Hiſope as he ſaith doth helpe to expectorate flegme, &c. and no pectorall hearbe that I know doth trouble the ſtomack, by the loathſome bitterneſſe thereof, as this doth.

The Vertues.

The decoction of this hearbe drunke while it is warme, as *Dioſcorides* ſaith, helpeth thoſe that are ſtung or bitten by venemous creatures, yea as he ſaith, the fumigation or ſmoke thereof driveth them away, and ſo doth the hearbe being ſtrowed or layd in Chambers: and although it trouble the ſtomack, and cauſe ſome paines in the head, yet it helpeth the Iaundiſe, and thoſe that are hydropick, or are troubled with the diſeaſes of the ſpleene, it moveth the belly, and bringeth downe the feminine courſes, and doth conſolidate or ſoder, or cloze the lips of cuts or wounds. *Galen* thus ſaith of *Polium*, in his eighth Booke of ſimples. It is bitter in taſte, and ſharpe or quick on the tongue alſo, and therefore it freeth the inward parts from all obſtructions, and provoketh both urine and the feminine courſes: being greene and applyed to great cuts or wounds, it cloſeth them, eſpecially that greater kinde; and being dry, it healeth grievous ſores or ulcers, and this the leſſer kinde doth beſt performe. The leſſer *Polium* which we uſe in Antidotes, or Counter-poyſons (as Mithridatum, *Venice* Treakle, and ſuch like) is the more ſharpe and bitter, and is accounted to be dry in the third degree, and hot in the ſecond.

CHAP.

CHAP. XI.

Dictamnus. Dittany, *& Pseudodictamnus.* Baſtard Dittanie.

I Have thought good in writing of the true Dittany, to make mention of the Baſtard kindes thereof, in the ſame Chapter, both becauſe the face of them, that is the forme and colour of the leaves are very like, and that other good Authors doe the like, reckoning them as kindes thereof.

1. *Dictamnus Creticus.* Dittany of Candy.

1. *Dictamnus Creticus.* Dittany of Candy.

Dittany of Candy hath divers hard and browniſh, yet ſomewhat hoary ſtalkes riſing from the roote, ſet full of leaves, two ſtanding together one againſt another, all along the branches, which are broad and thick, and almoſt round, ſo hoary, white, and covered over with a woolly downe, that they have no ſhew of greeneſſe in them, as moſt other hoary or woolly hearbes have, at the toppes of the branches come forth ſcaly heads, made as it were of many thin leaves like unto ſcales, purpliſh on the outſide, and paler on the inſide, from among which come forth gaping flowers, of a pale purpliſh colour, and after them ſmall browniſh ſeed: the root conſiſteth of many blackiſh ſtrings or fibres, from a harder long root: the whole hearb is of a quick or firy ſcent, eſpecially if it be freſh, and likewiſe of a hotter taſte, being new, then old, for it much decayeth in keeping: this is very tender, and hardly to be kept a winter in theſe colder Countries, ſo that it ſeldome commeth to ſhew any flower, but if you doe tranſplant ſome of the branches by ſlipping and ſetting them in Auguſt, they will better endure the following winter, with a little coverture, and may happen to give flowers the yeare following.

2. *Pſeudodictamnus.* Baſtard Dittany.

Baſtard Dittany riſeth up much higher than the former, the branches are a foote and a halfe long many times, as I have obſerved in mine owne Garden, whereon are ſet ſuch like hoary and round leaves, as the true hath, but neither ſo thick in handling, nor ſo thick ſet on the branches, but more ſparſedly, yet two alwayes together one againſt another: from the middle of theſe branches to the toppes of them, come forth the flowers round about the ſtalkes at the joynts with leaves, which are gaping like the former (and as Penny-royall, Mints, Calamint, and divers the like hearbs have) of a delayed purpliſh colour, ſtanding in hoary huskes, after which come the ſeed, which is greater and blacker than the former, the root hereof is not ſo black, but more hard and wooddy, ſhooting downe deepe into the ground, with divers ſprayes ſpreading from it: this hearbe is ſomewhat hot and ſharpe, but not by halfe ſo much as the former: this doth well endure with us in our Gardens, if the Winter be not too violent ſharpe and long, or if there be ſome care taken of it at ſuch a time; it groweth very well alſo of the ſlips being put into the ground about the middle of Aprill, and a little defended from the heate of the Sunne, for a time after the ſetting, and now and then watered in the meane time.

3. *Pſeudodictamnus alter Theophraſti Pona.* Another Baſtard Dittany.

This other baſtard Dittany riſeth up with many ſquare hoary ſtalkes more than a foote high, ſet with two leaves at a joynt like the other, but ſomewhat larger and longer, toward the toppes whereof with the leaves come forth hoary huskes, like unto thoſe of *Meliſſa Molucca levis*, the great Aſſirian Balme, but ſhallower, out of which ſtarte gaping flowers mixed of white and red: the foote ſpreadeth many fibres: this ſmelleth reaſonable ſweet, and abideth the Winter as the other, and is in like manner encreaſed by ſlipping.

As for that hearbe which is called by many *Dictamnus albus*, and *Dictamnum album*, and by *Matthiolus*, *Bauhinus* and others, placed with theſe kindes of Dittany together, although they doe all acknowledge that it hath no face or reſemblance unto them, and is called *Fraxinella*, which hath ſome diverſitie therein, as I ſhall ſhew you in another place.

The Place.

The Ile of *Creete* or *Candy* hath beene thought by the elder Writers, to be the onely place in the whole world, where the true Dittany did grow, and that not generally through the whole Ile, but in one corner of Mount *Ida*, called *Dictæa*, which ſupplyed the uſes of all parts, as *Theophraſtus* at large hath ſet downe, in his ninth Booke, and ſixteenth Chapter, the knowledge whereof was utterly loſt, and periſhed with our fore-fathers, and but within a ſmall ſpace of time, or few yeeres ſince revived and reſtored to us againe: for *Monardus* of *Ferrara* writeth, that in his time it was not knowne, as he ſetteth it downe in his ninth Booke and third Epiſtle: his words are theſe, *Dictamno niſi rurſus Venus ab Ida ſylva deportet omnino deficimus*: but *Cluſius* ſaith in his Appendix *altera* (which is joyned with his bookes of Exoticks) that it was ſignified unto him, that it was found alſo in the Ile of *Sardinia*, having leſſer and whiter leaves than that of *Candy*, and exceeding ſweet

2. *Pseudodictamnus.* Baſtard Dittany.

3. *Pseudodictamnus alter Pona.* Another Baſtard Dittany.

withall. The firſt Baſtard Dittany groweth in many places, as *Dioſcorides* ſaith, and as *Lobel* ſaith he underſtood by ſome Italians on *Monte negro* neere *Piſa* and *Ligorne* in the Florentine Dominions. It is ſufficient frequent in many places of *Italy* in their Gardens, for we have had the ſeed thereof among others very often from thence, and abideth well in our Gardens alſo: the laſt, as *Pona* in his Italian *Baldus* ſaith, groweth in the Iland *Cerigo*, and brought from thence to *Signor Contareno* to *Padoa* to furniſh his Garden.

The Time.

The true Dittany (as I ſaid) hardly flowreth with us at all, and when it doth, it is very late, not bringing any ſeed, but *Dioſcorides* (as it is found in the old Copies extant) writeth that it beareth neither flower nor ſeed, even as he had ſaid before of *Nardus montana*, but *Matthiolus* defendeth him, ſaying, that it was moſt likely to be the ſlippe or errors of the Writers that ſet downe φέρει for συμφέρει that is *fert* or *profert*, for *confert*, as thus, *nec flores, nec fructum, vel ſemen fert*, or *profert*, for *nec flores, nec fructum, vel ſemen confert*, for *Theophraſtus* ſaith, *lib. 9. cap. 16. Vſus foliorum non ramorum nec fructus eſt*, and *Virgil* and others (although *Pliny* following the corrupted text of *Dioſcorides*, ſaith it beareth no flowers, nor ſeed, nor ſtalke, whereof it is a wonder, having borrowed ſo much out of *Theophraſtus*, which acknowledgeth it) doe remember the flowers of Dittany, and ſo doth *Galen* alſo in the *Emplaſtrum de Dictamno*, whereof *Damocrates*, as he ſaith gave him the receit. The firſt Baſtard Dittany flowreth with us all the latter part of the Summer, but ſeldome giveth us any good ſeed. The laſt hath not as yet beene ſeene in *England*.

The Names.

It is called in Greeke γλήκων ἀγρία *Pulegium ſylveſtre*, by *Dioſcorides* Δίκταμνος, by *Theophraſtus* Δίκταμνον, ſome alſo Δίκταμος and Δίκταμον, in Latine alſo *Dictamus* and *Dictamnum*, ἀπὸ τῦ τίκτειν *Cornario dici videtur, quod τικτοσῶν γυναικῶν βοηθεῖ ταῖς mulierum faciles partus promittat, aut dolores penitus ſedat Dioſcoride & Theophraſto*: the firſt is called by all Writers *Dictamus* or *Dictamnus Creticus*, or *Dictamum*, or *Dictamnum Creticum*: the ſecond likewiſe is called by all Writers *Pſeudodictamnus*, or *Pſeudodictamus*, or *Pſeudodictamum*: *Anguilara* ſaith it is called by the Greekes now a dayes *Caliximathia*: *Pona* would make it to be the Gnaphalium of *Dioſcorides*; the laſt is onely ſet out by *Pona*, who taketh it to bee the *Dictamnum alterum*, of *Theophraſtus* and *Dioſcorides*. The Arabians call it *Meſcatramſir Anegen Araba* or *Buri*, the Italians *Dittamo*, and other Nations much thereafter according to their Dialect, and we in Engliſh Dittany, but not Dittander, as ſome too fooliſhly would make it.

The Vertues.

It is availeable as *Dioſcorides* ſaith, for all the purpoſes that the planted or garden Penny-royall is uſed, but with farre more efficacy, for it not onely expelleth the dead child being drunke, but being applyed unto the place (as in a Peſſary) or the fumes thereof taken hot, or burnt, and taken underneath: the juyce hath a purging quality applyed with Barley meale: It draweth forth thornes out of the feete, or any other part of the body being applyed to the place: for as it is reported that the wild Goates in *Candy*, being wounded by the Hunters with arrowes, doe by eating this hearbe drive them forth, and are thereby cured. It is held to be very profitabe for thoſe that are troubled

with

with the ſpleene, by leſning the ſwelling thereof. It haſteneth on the birth, and as *Theophraſtus* ſaith, cauſeth ſpeedy delivery, or at leaſt eaſeth much of the paines in travaile: and the juyce thereof drunke in Wine is a preſent remedy for thoſe that are bitten by any venemous Serpent. The hearb is ſo powerfull againſt the poyſon of all beaſts that are venemous, as that it doth drive them away by the very ſmell, and killeth them if they touch it where it is hung: the juyce thereof is alſo a preſent remedy for all wounds made with Iron, if after the putting of it into the wound, ſome of it alſo be taken in drinke. The Baſtard Dittany is uſed for all the purpoſes that the former is, but with much leſſe effect. *Pliny* ſetteth downe in a maner all that is formerly ſaid in ſeverall places of his books: that it procureth the monethly courſes of women, and is ſo effectuall to expell the dead birth, that it is dangerous to bring it into the chambers of women that are with child.

CHAP. XII.

Pulegium. Penny-royall.

THere are divers ſorts of Penny-royall, ſome that grow wilde in many places of this Land, yet are nurſed every where in Gardens; the other more rare, and therefore preſerved onely by thoſe that are curious.

1. *Pulegium vulgare.* Common Penny-royall.

1. *Pulegium vulgare.* Common Penny-royall.

This common Penny-royall is ſo well knowne to all, that I ſhall not need to ſpend much time in the deſcription of it, having many weake round ſtalkes divided into ſundry branches, rather leaning or lying on the ground, than ſtanding upright, whereon are ſet at ſeverall joynts ſmall roundiſh darke greene leaves: the flowers are purpliſh that grow in Gardens for the moſt part, yet ſome that grow wilde are white, or more white than purple, ſet in rundles about the toppes of the branches: the ſtalkes ſhoot forth ſmall fibres or rootes at the joynts as it lyeth upon the ground, faſtning it ſelfe therein quickly, and overſpreading any ground, eſpecially growing in the ſhade or any moiſt place: and is increaſed by breaking of the ſprouted ſtalkes and thruſt into the earth.

2. *Pulegium regium vulgare majus.* Great Penny-royall.

There is a greater kinde than the ordinary ſort, found wild with us, which ſo abideth being brought into Gardens, and differeth not from it, but in the largeneſſe of the leaves and ſtalkes, in riſing higher, and not creeping upon the ground ſo much; the flowers whereof are purple, and growing in rundles about the ſtalkes like the other.

3. *Pulegium denſis ſurculis.* Thick or double Penny-royall.

This ſort differeth little from the former, the leaves are ſomewhat ſmaller and thicker ſet on the ſtalkes, and the branches grow cloſer together.

4. *Pulegium mas flore albo.* White flowred Penny-royall.

This Penny-royall groweth more upright with his ſtalkes than the former, and ſometimes a foot higher alſo, having leaves thereon ſet by couples like it, and in ſome places other ſmaller leaves likewiſe growing with them, the flowers alſo grow in rundles or wharles round about the ſtalkes at ſeverall joynts, but are wholly white, and ſo abide being planted in gardens, the ſmell whereof, the taſte and uſe is altogether like the other; the rootes likewiſe creepe under ground, as the former.

5. *Pulegium anguſtifolium ſive Cervinum.* French or Harts Penny-royall.

This fine Penny-royall hath creeping rootes under ground, but ſhoot forth longer ſprouts than the former, from whence ſpring forth many tall upright hard ſtalkes, whereon are ſet at equall diſtances many ſmall long and narrow leaves, all along the branches up to the toppes: the flowers grow round about the ſtalkes at the joynts with the leaves, at many ſpaces up to the toppes, of a pale purpliſh colour; the ſmell and taſte hereof is much more pleaſing and ſtronger alſo.

6. *Pulegium foliis Nummularia.* Round leafed Penny-royall.

This round leafed Penny-royall groweth almoſt as upright as the laſt, with ſlender ſtalkes, having the leaves ſet by couples at each joynt, and are ſmall and round like unto thoſe of Hearb two pence, but farre leſſe: the flowers ſtand in rowes compaſſing the ſtalkes as the other doe, of a pale bluiſh colour: the ſmell hereof is much more pleaſant than the common ſort.

The Place.

The firſt is common in many moiſt and watry places of the Land, and for the uſe kept in Gardens. The ſecond is found wild in *Eſſex*, in divers places of the highway betweene *London* and *Colcheſter*, and thereabouts, more abundantly than in other Countries, and from thence brought and planted in many Gardens of *Eſſex*. The third

4. *Pulegium mas flore albo.*
White flowred Penny-royall.

5. *Pulegium angustifolium sive Cervinum.*
French or Harts Penny-royall.

hath beene also found in some places of our Land, and brought into Gardens. The fourth *Pena* saith he found not onely upon a plaine in *Piemont*, on the borders of the highway betweene *Riolio* and *Taurinum*; but in divers other places also. The fift groweth in abundance in the wet fields and moorish grounds about *Mompelier*, where they use almost no other sort, although they have them in plenty also. The last grew in the Garden of *Padoa*, but where naturally, we have not understood.

The Time.

They doe all flower in the later end of Summer; about the moneth of August and sometimes later.

The Names.

It is called in Greek γλήχων & βληχων α βλαυλ *balatu, quoniam dum floret, a pecore & capris gustatum balatum concitet, vel ut scribit Pena, Plinio & Dioscoride authoribus, quod pulmonibus pituitam crassam farctamque extundat*, that is, from bleating, because it causeth Sheepe and Goats to bleat when they are eating of it; but *Pena* saith, rather from the effect of causing thick flegme, to be expelled out of the lungs which stuffed them: in Latine *Pulegium* and *Pulejum* also, *quod flos recentis herbæ incensus pulices necat odore*; because it killeth fleas being burned. The first is well knowne every where: but the second being not knowne in other Countries, as I thinke hath no other name then that which is set downe in the title. The third is as little knowne out of our Country I thinke as the former. The fourth is the *Pulegium mas Plinij*, which he saith hath white flowers, as he calleth the ordinary *famina*. The fift is called by them of *Mompelier*, and by *Gesner Pulegium Cervinum*, and of *Dodonæus Pulegium alterum foliis oblongis*, of *Lobel Angustifolium sive Cervinum Monspelliense*, *Bauhinus* calleth it *Pulegium angustifolium*: the last *Bauhinus* onely maketh mention of in his *Pinax* and *Prodromus*. The Arabians call it *Alnam* & *Alnegan*, the Italians *Pulegio*, the Spaniards *Poleo*, the French *Poulier*, the Germanes *Poley* and *Hartz Poley*, the Dutch *Poley*, and wee in English Penny-royall, Pudding grasse, and Pulioll-royall, and in the West parts, as about *Exeter* Organs.

The Vertues.

Dioscorides saith that Penny-royall rarifieth or maketh thin thick flegme, it warmeth the coldnesse of any part whereunto it is applied, and digesteth raw or corrupt matter, being boyled & drunk, it provoketh womens monthly courses, expelleth the dead child and after-birth, and stayeth the disposition to vomit, taken in posset, that is water and vineger mingled: it allayeth the gnawing of the stomack; being mingled with Honey and Aloes and drunke, it causeth flegme to be avoyded forth of the lungs, and helpeth crampes, (which place is observed by *Cornarius* in his third Booke, and 31. Embleme to be erroneous, for who ever used Aloes in any medicine that was to expectorate flegme, but in stead of ωσλα ἀλόης it should be written ωσπα ἄλος, and so *Pliny* expresseth it in *lib.* 20. *cap.* 14, *Hepaticis cum melle & sale bibendum datur, pulmonum vitia excreabilia facit*, with honey and salt, it is a safe and good medicine for the lunges) it avoydeth melancholy by the stoole: drunke with wine it helpeth such as are bitten or stung with venemous beasts: applyed to the nostrils with vineger, it reviveth those that are fainting or sounding: being dryed and burnt, it strengthneth the gums: it is helpfull to those that are troubled with the gowt, applyed of it selfe to the place untill it wax red: applyed in a cerot or a plaister, it taketh away spots or markes in the face; it much profiteth those that are spleenetick or livergrowne being applyed with salt: the decoction helpeth those that have itches, if the places affected bee washed therewith: being put into bathes for women to sit therein, it helpeth the swelling and hardnesse of the mother, and when it is out of its place. Some copies doe adde that if the greene hearbe be bruised and put into vineger, it clenseth foule ulcers, and causeth the matter to digest, it taketh away the markes or bruises of b'owes about the eyes, which we call blacke and blue eyes, and all discolourings of the face by the fire, yea and the leprosie, being drunke and applyed outwardly: being boyled in wine with

with honey and ſalt it helpeth the toothach: it helpeth the cold griefes of the joynts, taking away the paines, and warming the cold parts, being faſt bound to the place after a bathing, or having beene in a hot houſe. *Pliny* addeth hereunto that Mints and Penny-royall agree very well together in helping faintings or ſwonings being put into vineger, and put to the noſtrils to be ſmelled unto, or a little thereof put into the mouth. It eaſeth the headach, and the paines of the breaſt and belly, ſtayeth the gnawing of the ſtomack, and the inward paines of the bowels, being drunke in wine provoketh vrine, and womens courſes, and expelleth the after-birth and dead child: it helpeth the falling-ſickneſſe being given in wine: put alſo into unwholſome and ſtinking waters, that men muſt drinke (as at Sea in long voyages) it maketh them the leſſe hurtfull; it leſneth the fatneſſe of the body being given with wine, (but here *Pliny* is ſuppoſed to have miſ-interpreted the Greeke word, tranſlating it *Salſitudines corporis* for tis thought to be ἀνίαν that is *anxietatem*, which *Hippocrates in Aphoriſm. 56. lib. 7.* ſaith, is taken away by drinking it in an equall proportion of wine and water) it helpeth crampes or the convulſions of the ſinewes being applyed with honey, ſalt, and Vineger. It is very effectuall for the cough, boyled in milke, and drunke, and for the ulcers or ſores of the mouth. Thus ſaith *Pliny*. *Galen* ſaith that being ſharpe and ſomewhat bitter, it heateth much, and extenuateth alſo. And in that it heateth, much may be knowne by this, that it maketh the place red where it is applyed, and raiſeth bliſters if it be ſuffered to lie long upon it: And that it doth extenuate, is ſufficiently ſeene by this, that it doth cauſe thick and tough flegme to be avoyded forth of the lungs and cheſt, and that with eaſe: as alſo that it procureth the feminine courſes; *Matthiolus* ſaith (and ſo doth *Caſtor Durantes* alſo) that the decoction thereof drunke helpeth the jaundiſe and dropſie, and all paines of the head and ſinewes that come of a cold cauſe, and that it helpeth to cleare and quicken the eye-ſight. It was uſed as *Durantes* ſaith, in ſtead of *Dictamus Cretenſis* (for it ſhould ſeeme in his time alſo the true *Dictamus* was not knowne, which was in *Anno* 1585.) who ſaith, that bruiſed, and with vineger applyed to the noſtrils of thoſe that have the falling-ſickneſſe, or the lethargie, or put into the mouth, helpeth them much, and applyed with barly meale it helpeth burnings by fire; it bringeth the looſned matrix to its place, and diſſolveth the windineſſe and hardneſſe thereof, eaſeth all paines and inflamations of the eyes, and comforteth and quickneth the eye-ſight being put therein, as alſo put into the eares eaſeth the paines of them.

CHAP. XIII.

Mentha. Mintes.

THere are many ſorts of Mints, ſome chiefly nouriſhed up in Gardens, others growing wilde, either on the mountaines (which for their rarity and diverſitie are brought alſo into Gardens) or the wet and overflowne mariſhes, or the Water it ſelfe.

1. *Mentha Romana anguſtifolio ſive Cardiaca.* Hart Mint, or Speare Mint.

This Mint hath divers round ſtalkes, and longer and narrower leaves ſet thereon, than the next Mint, and groweth ſomewhat lower and ſmaller, and of a darker greene colour than it; the flowers ſtand in ſpiked heads at the tops of the branches, being of a pale bluſh colour, the ſmell or ſcent hereof is ſomewhat neere unto Baſill. It encreaſeth by the root underground, as all the others doe.

2. *Mentha Cruciata.* Croſſe Mint.

The Croſſe Mint hath his ſquare ſtalkes ſomewhat hoary, and the leaves thereon hairy alſo, rougher, broader, and rounder than the former, which ſtand on all ſides thereof one againſt another, two at a joynt, ſo that they repreſent a croſſe, thereby giving it the name: the flowers ſtand in ſpiky heads, of a purpliſh colour, ſomewhat deeper than it.

3. *Mentha fuſca ſive vulgaris.* Red or Browne Mints.

This Mint hath ſquare browniſh ſtalkes, with ſomewhat long and round pointed leaves, nicked about the edges, of a darke greene, and ſometimes reddiſh colour, ſet by couples at the joynts, and of a reaſonable good ſcent: the flowers are reddiſh, ſtanding by ſpaces about the tops of the ſtalkes: the roots runne creeping in the ground as the reſt doe, and will as hardly be extirped as the reſt.

4. *Mentha Criſpa.* Criſpe or Curld Mint.

The greateſt difference in this kinde of Mint from the laſt, conſiſteth firſt in the leaves, which are almoſt as round as the laſt, but more rough or crumpled, or as it were curld: then in the flowers which are purpliſh ſtanding in rundles about the toppes of ſtalkes: and in the ſmell hereof which commeth neereſt unto Balme.

5. *Mentha Criſpa Danica aut Germanica ſpecioſa.* The great Curld Mint of Germany.

This brave Mint creepeth with his rootes as the others doe, having divers high ſtalkes riſing from them, which

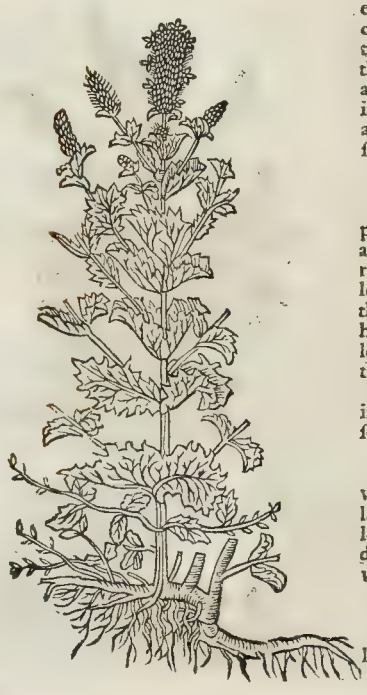
1. *Mentha Romana anguſtifolio ſive Cardiaca.* Hart Mint, or Speare Mint.

ſoone

2. *Mentha Cruciata.* Croſſe Mint.

4. *Mentha Criſpa.* Criſpe or Curld Mint.

5. *Mentha Criſpa Danica aut Germanica ſpecioſa.* The great Curld Mint of Germany.



Mentaſtrum niveum Anglicum. Party coloured Mints.

ſoone divide themſelves into branches with two leaves at every joynt, ſomewhat broad and large, but more deepely cut in at the edges, and as it were curld or crumpled together, eſpecially the lower leaves, for thoſe that riſe up with the ſtalke are not ſo much torne or cut in on the edges, but are a little deeper dented than the former: the flowers ſtand in ſomewhat larger and rounder ſpiky heads than others, of a pale purpliſh colour: the ſcent whereof is pleaſant, but not ſo quicke or hot as ſome of the former.

6. *Mentaſtrum hortenſe ſive Mentha ſylveſtris.* The Manured wild Mint.

This wilde Mint that is nurſed up in Gardens hath creeping rootes as other Mints have, and ſquare ſtalkes which are hoary, and a little hairy alſo, whereon are ſet larger and rounder leaves than in the former, of an hoary white colour covered as it were with downe: the flowers ſtand at the toppes of the branches, in longer and more ſlender ſpiky heads than any of the former, and are of a pale purpliſh colour, the ſcent hereof is more ſtrong, full, and heady, but nothing ſo pleaſant as the others.

Of this kinde is the party coloured Mints which are kept in Gardens, having divers leaves parted, white and greene, ſome more or leſſe than others.

7. *Mentaſtrum folio longiore.* Long leafed Wild Mints.

This Wild Mint hath ſquare browniſh ſtalkes, and ſomewhat broad, but longer leaves growing on them than the laſt, and nothing hoary at all, but rather of a dull greene colour: the flowers ſtand at the tops of the branches in rounder tufts, of a pale purpliſh colour: the ſcent hereof is ſomewhat more pleaſant than the other.

8. *Mentaſtrum montanum ſive Pannonicum.* Hungarian Wild Mints.

This Hungarian kind hath ſquare ſtalkes, and ſomewhat large leaves ſet thereon by couples at every joynt, as the other

6. *Mentaſtrum hortenſe, ſive Mentha Sylveſtris.*
The Manured wilde Mint.

6. *Mentaſtrum nivcum Anglicum,*
White Mints, or Party coloured Mints.

8. *Mentaſtrum montanum ſive Pannonicum.*
Hungarian Wild Mints.

thers are, which are more green than the laſt, & dented about the edges alſo: the flowers are more white than the laſt ſtanding about the ſtalkes at ſeveral ſpaces, and ending in ſmall long ſpikes: the root is hard, ſhooting forth many ſtrings, more like unto Nep than Mint, as the whole face thereof doth reſemble, according to the minde of *Cluſius*, and is of an hot and ſhatpe taſte, ſmelling ſomewhat like the wild Mints.

9. *Mentaſtrum tuberoſum Clusy.* Cluſius his knobbed Wilde Mint.

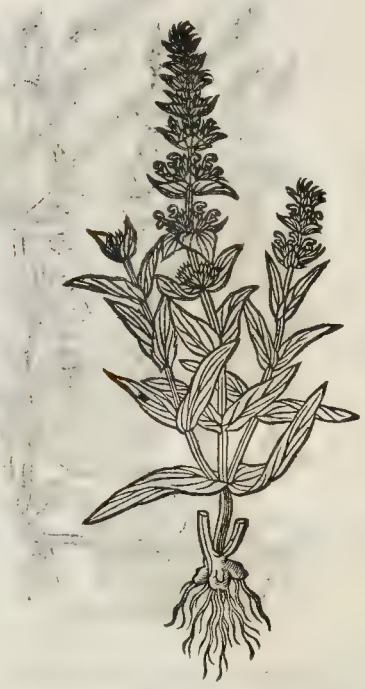
This kinde of wild Mint hath ſquare hairy greene ſtalkes full of joynts, with two leaves ſet thereat, which are long rough dented about the edges, and ſomewhat hoary, or of a whitiſh greene colour, and of an unpleaſant ſmell, the toppes of the branches doe end in ſpikes of hoary leaves, among the which the flowers ſtand at diſtances, with two leaves at a ſpace, of a whitiſh colour, after which followeth ſmall black ſeed, the root is ſomewhat like a reddiſh root, browniſh on the outſide, having certaine tuberous heads joyned thereunto, which being ſeparated, will grow into plants.

10. *Mentaſtrum geniculata radice.* Wilde Mints with joynted roots.

This kinde of Mint hath his roote ſomewhat thick, and ſet with joynts or knees at certaine ſpaces, and ſhooting foorth fibres thereat; the ſtalke riſeth not a foot high, being ſomewhat hard, rough and ſquare, whereon are ſet at the joynts two long darke greene leaves being ſoft in handling, but a little wrinkled and dented about the edges: the flowers ſtand at the tops of the branches in ſhort tufts or ſpikes like unto Nep, of a pale purpliſh colour: after which come ſmall round ſweet ſmelling ſeed like unto the whole plant.

11. *Men-*

9. *Mentaſtrum tuberoſum Cluſij.*
Cluſius his knobbed wild Mints.



11. *Mentaſtrum hirſutum.*
Hairy wild Mints.

This wild Mint hath ſquarē hairy ſtalkes with many branches riſing from the roote, higher and greater than the ordinary wilde Mint, having hayrie long leaves ſet thereon at a joynt, and many purpliſh flowers at the tops.

12. *Mentaſtrum rotundifolium minus.*
Small round leafed wild Mints.

The ſtalke hereof is ſquare, hairy, and reddiſh, about a foote high, having two leaves at a joynt, ſomewhat long and round, ſoft, hairy, and dented about the edges, of a ſad greene on the upper ſide, and hoary under-neath: from the joynts riſe ſome branches ſet with the like leaves, and round heads of flowers at the toppes, of a purpliſh colour: the ſcent hereof is not very pleaſant, but rather ſtrong and heady.

The Place.

The firſt foure ſorts are onely found planted in Gardens with us, and the fift found firſt wilde both with us, and elſewhere, but for eſpeciall reſpects brought into gardens. The other ſorts were likewiſe wild by nature in their places, but now are cheriſhed with the lovers of plantes in many places.

The Time.

All the ſorts of Garden, as well as wild Mints, flower not untill the beginning of Auguſt for the moſt part, but the garden Mints for the moſt part ſeldome doe give any good ſeed, but recompence the defect by the increaſe of the root, which is ſo plentifull, that being once planted in a garden, they are hardly rid out againe, every ſmall piece thereof being left in the ground increaſing faſt enough.

The Names.

Mentha was called by the old Græcians μίνθη as *Pliny* recordeth, but of the later Greekes ἡδύοσμος *ab odoris bonitate vel jucunditate*, becauſe it is ſo ſweet. The Arabians call it *Nabat naho*: the Italians *Mentha*: the Spaniards *Yerva buena*: the French *Menthe*: the Germanes *Muntz*: the Dutch *Mint*, and ſo doe we. The firſt of theſe garden Mints is called *Romana anguſtifolia ſive Cardiaca*, and called by *Bauhinus Mentha hortenſis verticillata ocimi odore*, (but how truely I cannot ſee, becauſe it beareth ſpiked heads) who ſaith alſo, it is the *Ocimoides repens* that *Gerard* hath ſet out, for that no other *Ocimoides* of any other Author agreeth thereunto. The ſecond is called *Cruciata* of *Lobel*, *& rotundifolia altera ſpicato flore*, in Engliſh Croſſe Mint. The third is uſually in our gardens by the name of red Mints: the fourth is called *Mentha criſpa*, and *Balſamita* of *Camerarius*, and *Siſymbrium hortenſe* of *Matthiolus*, and called by *Bauhinus Mentha criſpa verticillata*, and is the *vulgata ſerpens rotundiore folio Pulegij flore* of *Lobel*, in Engliſh Curld or Criſpe Mint. The fift is the beſt and trueſt Curld Mint, which *Lobel* ſhewed, but did not ſet forth. The ſixt is that kinde of wild Mints which is planted in gardens, and called of ſome Horſe Mint; (from whence hath come our white or party coloured Mints, to be ſeene in many gardens) and as I thinke is called by *Lobel Siſymbria Menta agreſtis*, for it anſwereth very well thereunto, although *Lobel* ſaith, it is all one with the *Mentha cruciata*. The ſeventh is called by *Lobel Mentaſtrum aliud & Mentaſtrum Campenſe* of *Lugdunenſis*, it is the *Syſimbrium ſylveſtre* of *Matthiolus*, very well ſet forth in his ſmall *Icones*. The eighth and ninth *Cluſius* hath ſet forth, calling the eighth *Montanum*, or *Pannonicum*, and the other *Mentaſtrum tuberoſa radice*, but referreth it rather to a kinde of *Cattaria tuberoſa*, and by that name I have often received it among other ſeeds from *Italy* and other places, whereunto it doth moſt fitly agree. The tenth *Bauhinus* hath written of, and ſet the deſcription thereof in his *Prodromus*, by the name of *Mentha geniculata radice*, and ſaith, hee received it both by the name of *Mentha tuberoſa*, and *Nepeta anguſtifolia odorata*, from ſeverall places. The eleventh is called by *Lobel Calamintha tertia Dioſcoridis*, *& Mentaſtrifolia aquatica hirſuta*, by *Lugdunenſis Mentaſtrum minus ſpicatum*, by *Camerarius Mentaſtrum aliud hirſutum*, and by *Bauhinus Mentha paluſtris folio oblongo*: The laſt is called by *Bauhinus Mentha rotundifolia paluſtris minor*.

The Vertues.

The garden Mints in generall, yet the sweeter sorts, that is, the Speare Mint, and Hart Mint, are more usually taken for all the uses whereunto Mints doe serve; *Dioscorides* saith it hath a heating, binding, and drying quality, and therefore the juyce taken with vinegar stayeth bleeding. It stirreth up venery or bodily lust, and as hee saith killeth the round wormes, which hath not usually beene knowne to take effect with any, two or three branches thereof taken with the juyce of sowre Pomegranats staieth the hickock, vomitings, and allaieth choller, it dissolveth impostumes being layed to with barly meale: it is good to represse the milke in womens breasts when they are swolne therewith, or otherwise, for such as have swollen, flagging, or great breasts, applyed with salt, it helpeth the byting of a mad Dogge, with Meade or honied water it easeth the paines of the eares: applyed to the privie parts of a woman before the act of generation, hindreth conception, which is contradicted as you may read a few lines below, and rubbed upon the tongue, taketh away the roughnesse thereof. It suffereth not milke to curdle in the stomack, if the leaves hereof be steeped or boyled in it before yee drinke it. Briefly, it is very profitable to the stomack, and in meates is much accepted. It is of especiall use to stay the feminine courses when they come too fast, as also to stay the whites, for which purpose no other hearbe is more safe and powerfull, for by taking it often it hath cured many. Applyed to the forehead or the temples of the head it easeth the paines thereof. It is also good to wash the heads of young children therewith, against all manner of breaking out therein, whether sores or scabs: and healeth the chaps of the fundament. It is profitable also against the poison of venemous creatures. The distilled water of Mints is availeable to all the purposes aforesaid, yet more weakely: but if a spirit thereof bee rightly and chimically drawne, it is more powerfull than the hearbe it selfe, in regard the spirit and strength of a great deale is brought into a small proportion; foure ounces thereof taken as *Matthiolus* saith, doth stay bleeding at the nose, which may be thought incredible to a great many. It is much commended to be available in venereous causes, although *Pliny* in his *lib.* 20 *cap.* 14. doth write to the contrary: but *Galen* in his sixt Booke of Simples, doth render a reason of the faculty hereof very worthily, where he saith, some doe call that *Mentha odorata*, sweet Mint, which by others is called ἡδύοσμος *Hedyosmos*: but there is another Mint which is not sweet, which they call *Calamintha*: both of them are sharpe in taste, and hot in quality, yea even in the third degree of heat, but *Mentha odorata* is weaker and lesse heating, so that I may well say that the one seemeth to be as it were the tame, and the other the wild: wherefore by that humidity it hath gained by manuring, it provoketh to Venery, which thing is common to all hearbes that have in them an humidity halfe digested and windy: by reason of which temperature being mingled with Barley meale it is used to ripen impostumes, which you cannot doe with *Calamint*, because it heateth and digesteth more, then such things as should ripen impostumes doe require. It hath also in it a little bitternesse, and some tartnesse, by reason of the bitternesse it killeth the long wormes of the belly, and by the tartnesse it stayeth the vomiting of blood: while it is fresh, if it bee taken with *Oxycratum* (which some take to be sower milke, and others to be *Posca*, that is vineger and water mingled together.) It is of as great tenuity as any hearb whatsoever: these are *Galens* words. *Simeon Sethi* saith it helpeth a cold liver, and strengtheneth the stomack and belly, causeth digestion, stayeth vomitings and the hickock, is good against the gnawings of the heart, and stirreth up the appetite, it taketh away the obstructions of the liver, and stirreth up bodily lust; but thereof too much must not be taken, because it maketh the blood thin and whayish, and turneth it into choler, yea, and causeth the blood which is of very thin parts, after it is separated, to become thick and melancholick: and therefore cholerick persons must abstaine from it: it is a safe medicine for the byting of a mad Dogge, being bruised with salt and laid on; the powder of it being dryed and taken after meate, helpeth digestion, and those that are splenetick, taken with wine it helpeth women in their hard and sore travels in child-bearing: it is also thought to be good for bleare eyes applyed to them; and that the decoction of them being drunke, doth helpe the bleedings at the mouth speedily, or presently. It is good against the gravell and stone in the kidneys and strangury. It is also comfortable for the head and memory, not onely to be smelled unto, but chiefly to be applyed unto the head and temples, and easeth the head-ach: the decoction thereof cureth the gums and mouth that is sore, if it bee gargled therewith, and mendeth an ill savoured breath, as also with Rue and Coriander, causeth the uvula or palate of the mouth that is downe, to returne to its place againe, the decoction thereof being gargled and held in the mouth. *Aristotle* and other in the ancient times forbade Mints to be used of Souldiers in the time of warre, because they thought it did so much incite to Venery, that it tooke away, or at least abated their animosity or courage to fight. Divers have held for true, that Cheeses will not corrupt, if they be either rubbed over with the juyce or the decoction of Mints, or they laid among them. And some againe, that if the juyce of Mints be put into the milke whereof you meane to make Cheese, that although yee put rennet thereto, it will never draw to curds whereby to become Cheese. The vertues of the wild Mints are more especially to dissolve winde in the stomack, to helpe the chollick and those that are short-winded, and are an especiall remedy for those that have venerous dreames and pollutions in the night, used both inwardly, and the juyce being applyed outwardly to the testicles or cods; the juyce thereof dropped into the eares easeth the paines, and destroyeth the wormes that breed in them; they are good against the venemous bytings of Serpents, and as it is said, killeth them by the fume thereof, or by the scent of them being layd in any place, the juyce laid on warme helpeth the Kings-evill, or kernels of the throat, the decoction, or the distilled water helpeth a stinking breath, which proceedeth from the corruption of the teeth, and snuffed up into the nose purgeth the head. *Pliny* saith, that in the time of Great *Pompey*, it was found out by experience of one, to cure the Lepry by eating the leaves, and applying some of them to his face, and to helpe the scurfe or dandroffe of the head used with vineger.

CHAP.

CHAP. XIIII.

Calamintha. Calamint, or Mountaine Mint.

ALthough divers Authors doe confound Calamint (calling it Catmint) with Nep, which is more properly called Catmint, yet I thinke it better to intreat of them a part, then to joyne them both in one Chapter.

1. *Calamintha vulgaris.* Common Calamint.

Altera minor.

1. *Calamintha vulgaris.* Common Calamint.

The ordinary Calamint that groweth usually abroad in the dry grounds with us, is a small hearbe seldome rising above a foot high, with square hoary, and wooddy stalkes, and two small hoary leaves set at a joynt, about the bignesse of Marjerome, or not much bigger, a little dented about the edges, and of a very fierce and quick scent, as the whole hearb is: the flowers stand at severall spaces of the stalkes, from the middle almost upwards, which are small and gaping like unto those of Mints, and of a pale bluish colour, after which follow small round blackish seed: the root is small and wooddy, with divers small sprigs spreading within the ground, and dyeth not, but abideth many yeares.

There is another of this sort which is like unto it in all things, but somewhat lesser, differing chiefly in the flowers which are not so large by the halfe, which noteth it to be a differing species.

2. *Calamintha montana præstantior.* The greatest Calamint, or Mountaine Mint.

This sweet Calamint riseth up to be a foot and a halfe high, with his square hard, and hoary stalkes, which are many, and slenderer than those of the wild Mints, whereon are set at every joynt two small and somewhat round leaves deepely dented about the edges, yet larger than those of the former wilde kinde, being somewhat hairy, and not so hoary, but rather of a fadie greene colour, of a very sweet scent, not strong or heady as the other: the flowers are gaping, and like the other, but larger, and of a purple colour, after which commeth the seed, which is black, small, and round, somewhat like unto Purslan seed, the root is wooddy, but abideth and shooteth forth new branches every yeare.

3. *Calamintha altera odore Pulegij foliis maculosis.* Spotted Calamint.

This spotted Calamint differeth not much from our ordinary wild Calamint, but that it groweth not so great and high, having square hard hoary stalkes, and hoary leaves thereon like it, but spotted here and there, and of a strong scent like unto Penny-royall: the flowers grow in the same manner, but smaller, and of a pale purplish colour.

4. *Calamintha minor incana.* Small Calamint.

This hoary small Calamint hath small low and slender hoary stalkes not above a foot high, whereon are set two leaves at a joynt, as in the other sorts, but smaller and more hoary, even smaller than the least bush Basill: the flowers are very small, but like the last, and of a lesse heady scent.

5. *Calamintha arvensis verticillata sive aquatica Belgarum Lobelij.* Field Calamint with whorled coronets.

This small Field Calamint sendeth forth divers square hoary stalkes full of joynts, and two small and almost round hoary leaves set thereat up to the toppes, somewhat like unto the leaves of Penny-royall, of a quicke and sharpe, yet sweet scent like thereunto also: towards the toppes of the stalkes and branches stand with the leaves many purplish flowers divers set together in a whorle or coronet: the root is small and abideth long, not perishing after seed time.

The Place.

The first groweth on heaths and upland dry grounds in many places of the Land: the second on the Euganæan hills neere *Padoa*, and on the hills neere *Vicenza* in *Italy*, and on the Rocky shadowie cliffes of *Sevena* in *Province* of *France*, as also in *Germany*, and other places, and in *England* also, as *Lobel* saith hee observed. The third *Pena* saith he found on certaine Hills in *Lombardy*, and in sundry places of our owne Land, yet seldome spotted. The fourth *Camerarius* saith he had the seed from *Candy*. The last groweth in divers fields of our owne Land, as well in moist medowes, as plowed grounds.

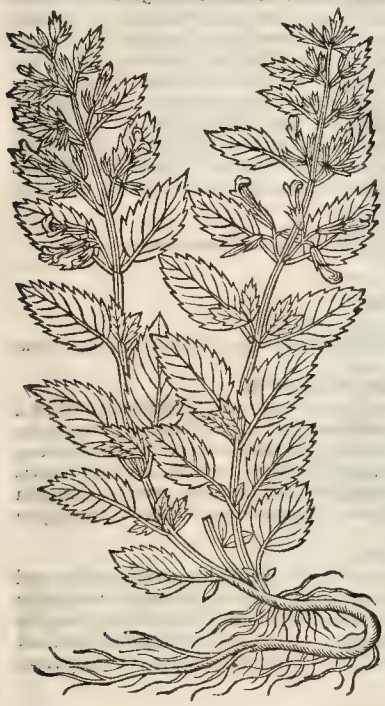
The Time.

They doe all flower in July, and their seed is quickly ripe afterwards.

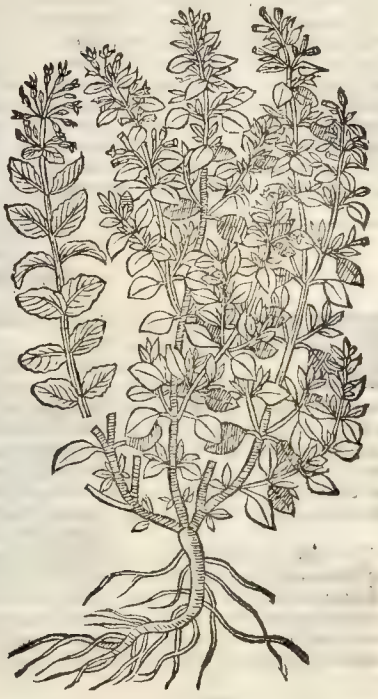
The Names.

It is called in Greeke καλαμίνθη *quasi bona vel utilis Mentha*, a good or profitable Mint. The first is called *Calamintha vulgaris & montana vulgaris* by most Authors: and the lesser of this sort *Bauhinus* calleth *Calamintha vulgaris exiguo flore* The second is called of *Lobel*, *Camerarius*, and others *Calamintha montana præstantior*, as the best of all the sorts of Calamints, in English as it is in the title, *Gerard* giveth the figure of this for *Scorodonia*, or *Salvia agrestis*,

2. *Calamintha montana præstantior.*
The greateſt Calamint, or Mountaine Mint.



4. *Calamintha minor incana.*
Small Calamint.



5. *Calamintha arvenſis verticillata ſive aquatica Bel.*
Field Calamint with whorled coroners.

agreſtis, for hereunto that figure is nothing like. *Bauhinus* calleth it *Calamintha magno flore*. *Pona* in the deſcription of *Mouns Baldus* in many places doth take it to be the *Meliſſophyllum Fuchsij*. The third is called by *Lobel* as it is in the title. *Matthiolus* and *Camerarius* call it *Calamintha altera*, and ſay that the Italians doe call it *Nepotella*. *Cordus* upon *Dioſcorides* calleth it *Nepeta agreſtis*, and *Bauhinus* alſo calleth it *Calamintha Pulegij odore ſive Nepeta*, *Gerard* giveth the figure of *Calamintha montana præſtantior* for this: in Engliſh Spotted Calamint, for a diſtinction from the others, although it hath but ſometimes ſmall ſhew of ſpots with us. The fourth is called by *Lobel Calamintha ſecunda incana*, and by *Camerarius Calamintha Cretica*, but by *Bauhinus Calamintha incana ocimi folijs*, in Engliſh Small Calamint, becauſe it is the leaſt of all the reſt. The laſt is called by *Lobel Calamintha aquatica Belgarum an Polycnemon quaſi multitibia*. *Calamintha aquatica Matthioli* by *Lugdunenſis*. *Calamintha arvenſis* by *Geſner in hortis, & Tabermontanus*: by ſome *Mentha aquatica exigua & Pulegium ſylueſtre*, and by *Bauhinus Calamintha arvenſis verticillata*.

The Vertues.

Calamint is very hot and ſharpe, the heatbe onely is uſed, the root is unprofitable. The decoction thereof drunke, bringeth down womens courſes, and provoketh urine. It is profitable for thoſe that are burſten, and thoſe that are troubled with convulſions or crampes, with ſhortneſſe of breath, and with cholerick torments and paines in their bellyes and ſtomacks, it helpeth the yellow-jaundiſe alſo, and ſtayeth vomiting being taken in wine, taken with ſalt and honey it killeth all manner of wormes in the body. It helpeth ſuch as have the lepry, either taken inwardly drinking Whey after it, or the greene hearbe applyed outwardly: if it bee applyed in wooll as a peſſary to the privie parts of a woman, it draweth downe the courſes, and eaſeth paines of the mother, but killeth the birth, and therefore to bee refuſed of women with child. It driveth away venemous Serpents, being either burned or ſtrewed in the chamber. It taketh away black and blue ſpots and

markes in the face, and maketh black ſcarres to become well coloured, if the greene hearb and not the dry be boyled in wine, and laid to the place, or the place waſhed therewith being laid to the huckle-bone or haunch where the paine of the Sciatica reſteth, by continuance of time it ſo healeth the place, that it draweth forth and ſpendeth the humours that were the cauſe of the paine. (This was a courſe held in *Dioſcorides* time, but our Phyſicians and Chirurgians doe not ſo uſe it now adayes.) It killeth the wormes of the eares if the juyce be dropped into them, the leaves boyled in wine and drunke provoketh ſweat, and openeth the obſtructions both of the liver and ſpleene: it helpeth alſo them that have a tertian ague (the body being firſt purged) by taking away the cold fits that goe before it: the decoction hereof with ſome Sugar put therto afterwards, is very profitable for thoſe that be troubled with the overflowing of the gaule, and that have an old cough, that are ſcarce able to breath by the ſhortneſſe of their winde, that have any cold diſtemperature in their bowels, and are troubled with the hardneſſe of the ſpleene; for all which purpoſes both the powder called *Diacalamenthes*, and the compound Syrupe of Calamint, which are to be had at the Apothecaries are moſt effectuall.

CHAP. XV.

Nepeta. Neppe or Calamint.

THere are divers ſorts of Neppe, ſome vulgar, and others more rare, which I intend to bring to your knowledge, which are theſe.

1. *Nepeta major vulgaris.* Common Garden Nep.

The Common garden Neppe ſhooteth forth hard foure-ſquare ſtalkes with an hoarineſſe on them, a yard high or more, full of branches, bearing at every joynt two broad leaves, for forme and largeneſſe, ſomewhat like unto Balme, but longer pointed, ſofter, whiter, and more hoary, nicked alſo about the edges, and are of a ſtrong ſweet ſcent, not offenſive to any, but very pleaſing to Cats, who will rub themſelves thereon all over: the flowers grow in large tufts at the toppes of the branches, and underneath them likewiſe on the ſtalkes many together, of a white purple colour: the rootes are compoſed of many long ſtrings and fibres, faſtning themſelves ſtrongly in the ground, and abide with greene leaves thereon all the Winter.

2. *Nepeta media.* Middle ſized Neppe.

This other Nep hath likewiſe ſquare hard ſtalkes, not ſo great as the former, but rather more in number, and ſometimes as high: the leaves are ſmaller by almoſt the halfe, harder, greener, and nothing ſo ſtrong in ſcent, ſet by couples upon the ſtalkes, which branch not in that manner: the flowers are fewer, ſmaller, and growing onely by ſpaces along them up to the toppes, of a faint purpliſh colour, gaping like the other, and after them ſuch like ſmall round ſeed in the huskes, the rootes are greater, longer, and more wooddy, abiding many yeares in the ground, but holding no greene leaves thereon in the winter.

3. *Nepeta minor.*
Small Neppe.

3. *Nepeta minor.* Small Neppe.

This ſmall Neppe hath divers foure-ſquare hard and hoary ſtalkes riſing from the root, which dye not after ſeed-bearing, but ſhoote freſh branches not above a foote high, with two ſmall long and narrow leaves, ſnipt or dented about the edges, and hoary alſo, of a ſtronger ſcent than the common, and of a hotter taſte, the ſtalkes ſhoote forth into many branches, at the toppes whereof ſtand many ſmall gaping white flowers, ſpike faſhion like the ordinary, after which come ſmall blacke ſeed like the other.

Caſper Bauhinus in his *Prodromus Theatri Botanici* ſetteth downe a ſmall Neppe, which he ſaith doth differ from this of *Cluſius*, but the deſcription thereof doth ſo neerely reſemble it, that I am more than halfe perſwaded it is the very ſame.

4. *Mentha Cataria minor Alpina.* Small Mountaine Neppe, or Catmint.

In the ſame place he ſetteth downe another Neppe, ſmaller than his former, with ſquare browniſh ſtalkes of a foot height, branching forth, whereon are ſmaller leaves ſet then the former, being ſomewhat broad, almoſt three ſquare and hoary; the flowers are ſmall and whitiſh, ſet or placed ſpike faſhion at the tops, like unto the common kinde.

5. *Nepeta peregrina latifolia.* Strange Neppe with broad leaves.

This ſtrange Neppe hath a ſquare hoary ſtalke, ſpreading into branches on all ſides from the bottome to the toppe, ſet with two leaves at every ſpace, which are broader than the next that followeth, but yet are not much broader, but longer than the ordinary Neppe, dented about the edges, and of an hoary greene colour: the flowers ſtand in ſpaces about the toppes of the ſtalkes, almoſt of a pure white colour like in forme unto the common Neppe, but larger: after which commeth the ſeed which is blacke like it alſo; the ſmell of the whole plant is ſtronger and ſharper, but more pleaſing than it.

6. *Nepeta*

5. *Nepeta peregrina latifolia.*
Strange Neppe with broad leaves.

6. *Nepeta peregrina anguſtifolia.* Strange Neppe with narrow leaves.

This other Neppe is of the ſame kind with the former, and differeth from it onely, in that the leaves are ſmaller and narrower, but neither in colour or ſmell, or any other thing differing.

The Place.

The firſt and ſecond growe wild in other Countries, but are nurſed up onely in Gardens in ours, as all the reſt are: the third, the fift and the ſixt doe grow in *Spaine*: for from thence the ſeed came that brought foorth theſe goodly plants. The fourth *Bauhinus* ſaith groweth upon ſome hilly grounds about *Naples*, from whence hee received ſeed.

The Time.

They doe all flower in Iuly, or thereabouts, with the ordinary ſort.

The Names.

The ordinary garden ſort is called of ſome *Cataria*, and *Cattaria*, and of others *Mentha Cataria*, and *Mentha felina*, becauſe as I ſaid before, Cats delight both to ſmell and eate thereof, and gladly rub themſelves againſt it, but of moſt with us *Nepeta*. *Gerard* ſaith that our *Nepeta* is called *Pulegium ſylveſtre*, but hee is therein much miſtaken, for *Dioſcorides* ſaith that the Latines did call that in his time *Nepeta*, which he calleth his ſecond *Calamint*, and was called alſo of ſome *Pulegium ſylveſtre*, but *Dioſcorides* his 2. Calamint is not our *Nepeta* uſed in theſe dayes, as any of judgement may ſoone perceive, that readeth and marketh *Dioſcorides* his deſcription thereof. And *Matthiolus* alſo taxeth *Braſavolus* who fell into the ſame errour, he being chiefly deceived by the miſtaking of the name; for the Italians call that manured kind of Calamint *Nepotella*, as *Matthiolus* ſaith, which was derived from the *Nepeta*, and *Braſavolus* would faſten it upon this hearbe which they call *Herba Gattaria*. The firſt of theſe is the *Herba gattaria* of *Matthiolus*: *Geſner in hortis* tooke it for a kinde of Calamint, *Tragus*, *Cordus*, and others call it *Nepeta*. *Lobel Cattaria* and *Mentha Cataria*, and generally with us *Nepeta*, in Engliſh Nep, or Cat Mint: the ſecond I doe not finde mentioned by any Author, but it is continued in my Garden to this day under that name. The third *Luſius* calleth *Cattaria tenuifolia Hiſpanica*, and *Camerarius Nepeta minor*. *Bauhinus Mentha Cattaria minor*, in Engliſh ſmall Neppe, or Catmint. The fourth he calleth *Mentha Cataria minor Alpina*, in Engliſh Small mountaine Nep or Cat Mint. The fift is called by *Lobel Mentha Cataria peregrina latifolia* of *Tabermontanus Mentha felina ſatvia latifolia*; of *Gerard Cattaria altera*, and of *Beſlerus* in his garden of the Biſhop of *Eyſtot*, *Nepeta peregrina*, in Engliſh ſtrange Neppe with broad leaves. The laſt is called by *Lobel Mentha Cattaria peregrina anguſtifolia*, of *Dodonæus Cattaria folio longiore*: of *Gerard Salvia Romana*, for the figure thereof anſwereth thereunto, and not unto any *Cattaria*: of *Bauhinus* himſelfe *Mentha Cataria anguſtifolia minor*, in Engliſh as it is in the title.

The Vertues.

Neppe is generally uſed for women to procure their courſes when they are ſtayed, to uſe inwardly, or outwardly, to bathe them in the decoction of it, with other hearbes convenient for the purpoſe, or with it alone, or to ſit

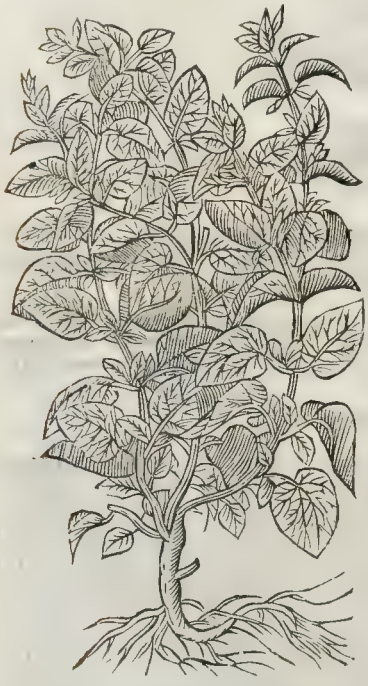
over the hot fumes thereof, for it not onely warmeth and comforteth the coldneſſe, but dryeth the overmuch moiſture of the mother, which may be one cauſe of ſterility or barrenneſſe, and by the frequent uſe of it, to cauſe them to be more fruitfull that were hindred, and alſo for the wind and paines of the mother, or riſing of it. It is alſo uſed in paines of the head that come from any cold cauſe, as catarrhes and thin rheumes, and for ſwimmings and giddineſſe thereof. It is alſo of eſpeciall uſe for the windineſſe of the ſtomack or belly. It is effectuall for any cramps or cold aches to diſſolve the cold and wind that affecteth the place, and to bring warmth and comfort thereunto afterwards, It is uſed for colds or coughes, and ſhortneſſe of breathing. The juyce thereof drunke in wine is profitable for thoſe that have caught ſome bruiſe by any accident. The greene hearbe bruiſed and applyed to the fundament, there abiding for two or three houres eaſeth the ſharpe paines of the piles, the juyce alſo is effectuall for the ſame purpoſe, being made up into an oyntment and applyed. A Decoction thereof alſo is commended to waſh the head, to take away the ſcabs thereof, and may be effectuall for other parts of the body alſo. *Lobel* ſaith the two greater ſorts of ſtrange Neppe are more effectuall to all the purpoſes than the ordinary kinde is uſed for. The vertues of the former two leſſer ſorts are not certainely knowne, but are thought to conduce to the like effects.

CHAP. XVI.

Meliſſa. Balme.

BEſide the ordinary which uſually groweth in all our gardens, there are ſome other ſorts of Baulme, as they are entituled by divers Authors for the ſweet ſcent of them comming neereſt, is that of our ordidinary Baulme, of all which I meane to entreate in this place.

1. *Meliſſa vulgaris.* The common garden Baulme.



1. *Meliſſa vulgaris.* The common Garden Baulme.

The common garden Balme hath divers ſquare greene ſtalkes, with round hard darke greene leaves pointed at the ends, and a little dented about the edges, ſet by couples at the joynts, of a ſweet ſmell, comming neereſt to a Citron or Lemmon, the flowers are ſmall and gaping, growing at the toppes of the ſtalkes, of a pale Carnation colour, almoſt white: the rootes faſten themſelves ſtrongly in the ground, and endureth long, the leaves and ſtalkes dying downe yeerely.

2. *Meliſſa Turcica flore cæruleo.* Turky Baulme with a blue flower.

This Baulme riſeth up with one ſquare browniſh greene ſtalke, two foot high at the leaſt in any good ground and higher ſometimes, ſpreading with two branches from every joynt where the leaves are ſet, up almoſt to the toppe: the leaves are narrower and longer than thoſe of the ordinary Baulme, and more dented in about the edges, of as ſweet a Lemon ſcent, or rather more than it, rough alſo, and of as ſad a greene colour: the flowers are gaping or hooded, growing at the toppes of the branches, at certaine diſtances, of a blue or purpliſh blue colour, ſtanding in rough ſharpe pointed huskes, after which commeth the ſeed which is black and roundiſh, with a white ſpot in every of them, plainely to be ſeene while they are freſh, but not ſo eaſily diſcerned when they are dry. The root periſheth every yeare, and muſt be ſowne a freſh in the Spring time, if any bee deſirous to have it.

3. *Meliſſa Turcica flore albo.* Turky Baulme with a white flower.

This other Baulme differeth not from the former, either in growing, or height, or forme of leaves and flowers, or in the good ſmell thereof, or in the durability, for it is equall thereunto in all theſe properties: the onely difference is, in that the leaves hereof are of a freſher greene colour, and that the flowers are of a perfect white colour; the ſeed whereof doth not degenerate as in many other hearbes it hapneth, but keepeth conſtantly his kinde, for any thing I could obſerve in it theſe twenty yeeres and upwards, ſince I firſt had it and ſowed it.

4. *Meliſſophyllum Fuchſij.* Vnpleaſant Baulme.

Vnto the kindred of Baulmes I thinke good to adjoyne this plant more for the formes ſake of the leaves from whence *Fuchſius* firſt gave it the name, then for any other correſpondence it hath therewith, but as it is at this time, take it with this deſcription. It hath divers hairy ſquare browne ſtalkes riſing from the roote, halfe a yard high, whereon are ſet two leaves at ſeverall ſpaces, at the contrary ſides of them, ever up to the toppes of the ſtalkes, which are broader and ſomewhat longer than the ordinary Baulme, and of a ſad greene colour, betweene which leaves at every joynt with them, from the middle of the ſtalke upward on each ſide thereof, commeth forth larger flowers, and longer than in Baulme, more like unto thoſe of the yellow *Lamium*, or dead Nettles, as ſome compare them, or unto thoſe of mountaine Calamint, as others doe, of a pale purpliſh colour on the lower part, and

2, 3. *Melissa Turcica flore & albo.* Turky Baulme with blue and with white flowers.

4. *Melissophyllum Fuchsij.* Vnpleasant Baulme.

and whitish above, this hath no such good scent therein as the Baulme hath, but is rather of a stronger unpleasant scent, for which cause I have so entituled it.

5. *Melissa Molucca lævis sive Syriaca lævis.* Great Assirian Baulme.

This hearbe *Matthiolus* and others make a kinde of Baulme from the forme of the leaves chiefly: it riseth from seed with a round hollow stalke out of the ground, to bee two foote high or thereabouts, branching forth diversly on all sides up to the toppe, whereon are set shorter and rounder leaves, at the end of long foote stalkes, somewhat lesse dented about the edges then in the common Baulme, and not at all sharpe on the edges, as in the next: at the joynts of the stalke from the middle thereof upwards, come forth round about it, certaine hard whitish skins small and round at the bottome, and wide, open at the brims like unto a bell, having five corners for the most part: from the bottome of each of these commeth forth one flower somewhat small, and like unto the flower of common Baulme, almost white, or with a small shew of blush therein, and after they are past, in the bottome of the same skinny bells grow the seed (but seldome one of ten commeth to be ripe with us) which is whitish and cornered: the smell hereof is nothing like Baulme, but rather fulsome, the taste thereof is bitter: the roote perisheth every yeare.

6. *Melissa Molucca asperior sive Syriaca asperior.* Prickly Assirian Baulme.

This other Assirian Baulme riseth a little higher, and groweth somewhat greater than the former, but after the same fashion; the leaves hereof are somewhat longer and sharper on the edges, the huskes likewise in which stand these skinny bells, at the corners of them are sharpe pointed, and of a paler white colour: the flowers and seed are all alike, and perisheth likewise at the first approach of any cold night: this hath a little better scent to commend it than the former.

7. *Cardiaca.* Motherwort.

As these three last had little likenesse with Baulme, more than in the forme of the leaves, and the properties as you shall heare anon; so this, besides the properties answerable to the rest in comforting the heart, hath no shew of affinity, no not in the leaves: but because some have put it to the kindred of the Baulmes, and others to Nettles, and others to Horehound. I have thought it best for the vertues sake (whereunto none of the Nettles or Horehounds are answerable) to set in the end of the Baulmes, and to be as it were a bridge to passe from them to the Horehounds, whereunto in face it hath the more resemblance. It hath a hard square browniſh rough strong stalke, rising to bee three or foure foote high at the least, spreading into many branches, whereon grow leaves on each side with long foote stalkes, two at every joynt, which are somewhat broad and long, as it were rough or crumpled, with many great veines that shew themselves therein, of a sad greene colour, and deepely dented in about the edges, and almost torne or divided: from the middle of the branches up to the toppes of them, which are very long and small, grow the flowers round about them at distances, in sharpe pointed rough hard huskes, which are more purple or red than in any of the former Baulmes, or in any Horehound, but in the same manner and orme, and roughnesse as the Horehounds: after which come small round blackish seed in great plenty: the roote

5. *Melissa Molucca laevis sive Syriaca laevis.*
Great Assirian Baulme.

6. *Melissa Molucca asperior sive Syriaca asperior.*
Prickly Assirian Baulme.

7. *Cardiaca.* Motherwort.

sendeth forth a number of long strings, and small fibres, taking strong hold in the ground, of a darke yellowish, or browniſh colour, and perisheth not as the other, but abideth as the Horehound, the smell likewise is not much differing from it.

The Place.

The first is onely to be found in gardens: the two next growes naturally in *Moldavia*, which is under the Turkish Dominion. The third at the foote of divers hills both in *Germany* and *Narbone* in *France*. The fourth and fifth as *Matthiolus* thought in the *Molucca* Ilands which are in the East-Indies, but therein he was much mistaken, yet he saith they came from *Constantinople*, others and that more truely say, that *Martinellus Sequinus* an Italian sent them to *Venice* out of *Syria*. The last groweth among rubbish, and by the sides of walls and hedges in many places beyond the Seas, but not with us that I have knowne or heard, but onely in Gardens where it hath beene once sowne or planted.

The Time.

The three first and the last flower somewhat earlyer in the Summer, than the two Assirian kindes, which flower very seldome before the middle of August, so that it hardly giveth any good seed, although the two former and the last doe plentifully.

The Names.

Balme is called in Greeke μελισσόφυλλον ἢ μελίφυλλον *Melissophyllum*, or *Meliphyllum*, *id est apum folium*, *quod apes eo valde delectantur*, *in Latine Melissa*, *& Citrago*, *ab odore Citri*, *Apistrum quod apibus sit gratissima*, *& Melissophyllum*, of the effect being good for Bees. The first is called *Melissa*, or *Melissophyllum* generally by all writers: the second and third are called *Melissa Moldavica & Turcica* by most Writers; *Bauhinus* calleth it *Melissa Turcica peregrina folio oblongo*: the third *Cordus* and *Fuchsius* take to bee the true

true *Melissophyllum*, & thereupon it is generally called *Melissa*, or *Melissophyllum Fuchsij* by most writers, although it have not the smell of Baulme, nor good to rub hives withall, as the true Baulme: *Lugdunensis* saith it is the *Calamintha præstantior* which *Pena* and *Lobel* have described and set forth more exactly: but he is therein much deceived, for *Fuchsius* saith his hath blacker and larger leaves than Baulme, & that *Calamint* hath smaller and whiter: only *Bauhinus* and *Clusius* referre it to the *Lamia*, *Bauhinus* calling it *Lamium Montanum Melissæ folio*, and saith withall, that the varying thereof may be referred, to the variable sorts of the *Lamia Pannonica* of *Clusius*: it is called in English as it is in the title, untill a more exact or truer name may be given it, for I cannot consent to *Bauhinus* and *Clusius*, to call it *Lamium*, seeing so many Authors call it *Melissa*. The fourth *Matthiolus* calleth *Melissa Constantinopolitana*, or *Melissophyllum Constantinopolitanum & lave* is added by *Dodonæus*, for hee maketh no mention of any prickles in that, which grew in the Emperours Garden, but that which *Alphonsus Pantius* of *Ferrara* sent him as he saith, the leaves were prickly: assuredly that kind that I have had growing in my garden at severall times, had no prickles either on leafe or huske, although *Bauhinus* saith hee never saw any that was without some sharpe thornes, and therefore it should seeme, that *Lobel* maketh the one kind lesse sharpe or thorny than the other, and calleth it *Cardiaca Melica sive Molucca minus aspera, & Molucca Syriaca*. *Bauhinus* calleth it *Melissa Moluccana odorata*, as he doth the fifth *Melissa Moluccana fœtida*, making the one to be sweet, and the other stinking. *Lobel* calleth it *Molucca asperior Syriaca*, and saith moreover that it is called *Maselue* of the Turkes: *Cæsalpinus* would referre both these kindes unto the *Alissum* of *Dioscorides* and *Pliny*; and *Bauhinus* saith they are like to the *Alissum* of *Galen*. They have their English names over their heads. The last is called *Cardiaca* of most of our later Writers, for it is likely it was not knowne to them of ancienter ages, yet *Dodonæus* formerly tooke it to be a *Sideritis*. *Tragus* to be a wilde Baulme. *Brunfelsius* to bee *Marrubium mas*. *Anguillara* to bee *Licopsis* or *Branca lupina*, & *Bauhinus* calleth it *Marrubium forte primum Theophrasti*: *Cæsalpinus* thinketh that it is the *Alissum* of *Galen* and *Ætius*. We doe call it Motherwort in English, as truely from the effects to helpe the Mother, as they call it *Cardiaca* from the effects to helpe the heart, as you shall heare by and by: the Arabians call Baulme *Bederengie*, *Bedarungi*, *Cederenzegum*, *Turungen* or *Trungian* and *Marmacor*: the Italians *Melissa*, *Codronella*, and *Aranciata*: the Spaniards *Torengil & yerva cidrera*: the French *Melisse & Poncirade*: the Germanes *Melissen*, *Binenkraut*: and the Dutch *Melisse & Honichbaum Consille degreyn*, and we in English Bawme, from the singular effects therein, in imitation of the true naturall Baulme.

The Vertues.

The Arabian Physicians have extolled the vertues of Baulme, for the passions of the heart in a wonderfull maner, which the Greekes have not remembred: for *Serapio* saith, it is the property of Baulme, to cause the minde and heart to become merry, to revive the fainting heart falling into swounings, to strengthen the weakenesse of the spirits and heart, and to comfort them, especially such who are overtaken in their sleepe, therewith taking away all motion of the pulse, to drive away all troublesome cares and thoughts out of the minde, whether those passions rise from melancholly or black choller, or burnt flegme, which *Avicen* confirmeth in his booke of medicines proper for the heart, where he saith that it is hot and dry in the second degree, that it maketh the heart merry, and strengthneth the vitall spirits, both by the sweetnesse of smell, austerity of taste, and tenuity of parts, with which qualities it is helpfull also to the rest of the inward parts and bowels. It is to good purpose used for a cold stomack to helpe digestion, and to open the obstruction of the braine. It hath a purging quality therein also saith *Avicen*, and that not so weake, but that it is of force to expell those melancholly vapours from the spirits, and from the blood, which are in the heart and arteries, although it cannot doe so in the other parts of the body. *Dioscorides* saith that the leaves drunke in wine and laid to, is a remedy against the sting of Scorpions, and the poison of the *Phalangium*, or venemous Spider, as also against the bytings of Dogges, and commendeth the decoction thereof, for women to bathe or sit in to procure their courses, and that it is good to wash the teeth therewith when they are full of paine, and that it is profitable for those that have the bloody flixe. The leaves also with a little *Niter* are taken in drinke against a surfet of *Mushroms*, it helpeth the griping paines of the belly, and is good for them that cannot take their breath, unlesse they hold their necks upright, being taken in a Lohoc or licking Electuary: used with salt it taketh away wennes, kernels, or hard swellings in the flesh or throate, it clenseth foule sores, and is an helpe to ease the paines of the gowt. *Galen* saith in his seventh Booke of Simples, that Baulme is like unto Horehound in qualities, but weaker by much, and therefore few will use Baulme when Horehound is so plentifull, and neere at hand to be had every where. *Pliny* saith in *lib. 20. cap. 11.* that in *Sardinia* it is poyson, wherein it is very probable that he was much mistaken, and for *Sardonia herba*, which is called of some *Apium risus*, and of *Apuleius Apiastellum*, he tooke this *Apiastrum* or Baulme: the juyce thereof used with a little honey is a singular remedy for the dimnesse of the sight, and to take away the mistinesse of the eyes. It is of especiall use among other things, for the plague or pestilence, and the water thereof is used for the same purposes, It is also good for the liver and spleene. A Tansie or Caudle made with egges, and the juyce thereof while it is young, putting some Sugar and Rosewater unto it, is often given to women in child-bed, when the afterbirth is not throughly avoided, and for their faintings, upon, or after their sore travels. It is used in bathings among other warme and comfortable hearbes for mens bodies or legges in the Summer time, to comfort the joynts and sinews; which our former age had in much more use than now-adayes. The hearbe bruised and boyled in a little wine and oyle, and laid warme on a Bile will ripen and breake it. There is an ordinary *Aqua-vitæ* or strong water stilled, and called Baulme water used generally in all the Land, which because it hath nothing but the simple hearbe in it which is too simple, I will commend a better receit unto you. Take two pound of Baulme while it is young and tender, of Mints and Sage, of each one pound, bruise them well in a stone-morter, and put them into a pot or Limbeck, and put thereto of Aniseeds foure ounces; of Cloves, of Nutmegs, of Cinamon, of Ginger, of Cubebes, and of Galanga, of each one ounce, being all a little bruised and put into two gallons of good Sacke if you will have it excellent good, or else into foure gallons of Ale, and so still it as *Aqua-vitæ* is distilled, and let it distill as long as you shall finde any strength in the water, yet so that the latter water bee not so weake, to make all the rest white: whereunto put a pound of Sugar, shaking it well before you set it away, and after it hath rested so one moneth, you may use of it as occasion shall require: for it is of especiall use in all passions of the heart, swounings and faintings of the spirits, and for many other purposes, whereunto the hearbe is here declared to be availeable.

The

The hearbe is often put into oyles or ſalves to heale greene wounds, and it is very probable the name of Baulme, was given to this hearbe, from the knowledge of the healing properties of the true and naturall Baulme. It is alſo an hearbe wherein Bees doe much delight, both to have their Hives rubbed therewith to keepe them together, and draw others, and for them to ſuck and feed upon; and is a remedy againſt the ſtinging of them. The Turkey Baulme is of as good effect to all the purpoſes aforeſaid, as the ordinary. The Aſſirian Baulme is of excellent vertue to expell any poiſon or venome, as alſo againſt the plague or peſtilence uſed inwardly and outwardly, it killeth the wormes, and helpeth the jaundiſe, and the paines of the Mother, for it openeth obſtructions, warmeth the cold parts, rarifyeth and clenſeth. Motherwort is held of the later Writers, to bee of much uſe for the trembling of the heart, and in faintings and ſwounings, from whence it tooke the name *Cardiaca*: the powder thereof to the quantity of a ſpoonefull drunke in wine, is a wonderfull helpe to women in their ſore travels, as alſo for the ſuffocations or riſings of the Mother, and from theſe effects it is likely it tooke the name of Motherwort with us It alſo provoketh urine, and procureth the feminine courſes, clenſeth the cheſt of cold flegme oppreſſing it, and killeth the wormes of the belly. It is of good uſe to warme and dry up the cold humours, to digeſt and diſperſe them that are ſettled in the veines, joynts, and ſinewes of the body, and to helpe crampes and convulſions, &c. ſe

CHAP. XVII.

Marrubium. Horehound.

HOrehound is divided into two ſorts by *Dioſcorides*, *Theophraſtus*, and *Pliny*: that is, into black Horehound, which they call *Ballote*, our ſtinking black Horehound, and into white, which is the ordinary Horehound that is in uſe in our Apothecaries ſhops, & with all others: but there are ſome other ſorts found out, which doe well agree with them in the outward face, and peradventure in the vertues alſo, whereof I meane to entreate in this place, referring ſome of the other hearbs unto that *claſſis*, that is, proper for them, where they ſhall be remembred.

1. *Marrub. album vulgare.*
Common Hore-hound.

1. *Marrubium album vulgare.* Common Horehound.

Common Horehound groweth up with ſquare hoary ſtalkes, halfe a yard or two foot high, ſet at the joynts with two round crumpled, or as it were rough leaves, of a ſullen hoary greene colour, of a reaſonable good ſcent, but of a very bitter taſte, the flowers are ſmall, white, and gaping, ſet in rough hard prickly huskes, round about the joynts with the leaves, from the middle of the ſtalkes upwards, wherein afterwards is found ſmall round blackiſh ſeed: the root is blackiſh, hard and wooddy, with many ſtings thereat, which dyeth not, but abideth many yeares.

2. *Marrubium Hiſpanicum Candidum.* White Spaniſh Horehound.

This Spaniſh Horehound hath divers foure-ſquare ſtalkes, more white and hoary than the ordinary Horehound, whereon are ſet the leaves by couples, which are ſomewhat longer, thicker, whiter, & more woolly alſo than it, & a little dented about the edges: the flowers grow towards the toppes of the ſtalkes in rundles, at the ſeverall joynts with the leaves, which are of a pale purpliſh colour like the common ſort, ſtanding in the like rough huskes: the ſeed is blacke like it alſo, and ſo are the rootes: the whole plant is of a ſtronger and better ſcent than ours. *Gerard* hath ſet forth this Horehound, and is the ſecond with him: but his deſcription doth wholly anſwere to his fourth, which is the Horehound of *Candy*.

3. *Marrubium Creticum.* Sweet Candy Horehound.

Candy Horehound hath more crooked and ſlenderer ſtalkes than the laſt, being round and not ſquare, whereon doe grow ſometimes broader, and at other times and places, ſmaller, longer and narrower leaves than it, for theſe are accounted but one kinde, more dented about the edges, ſet by couples, more white or hoary than the former Horehounds, as the ſtalkes are alſo, which branch forth into many ſlender branches, having flowers at ſpaces like the former, but ſmaller and ſet in ſmaller and ſharper huskes, which are purpliſh alſo like it; the ſeed is like it alſo, and the root baſheth forth with many fibres: the ſcent of this is much better than ours, and equall, if not beyond the other.

4. *Marrubium Creticum anguſtifolium inodorum.* Vnſavory Candy Horehound.

This Candiot differeth from the laſt onely in theſe particulars: it hath ſhorter, narrower, and rounder pointed leaves than the former, and is without any good ſmell.

5. *Marrubium album villoſum.* French Horehound.

This ſmall Horehound riſeth not up above a foot high, with his wooddy round, white, hoary ſtalkes ſpreading into divers branches, whereon are ſet thick leaves in the ſame manner as the former, but ſmaller and rounder, a little notched at the edges, and ſo white, ſmooth and woolly underneath, as no Cotton weed is more, but ſomewhat

3. *Marrubium Creticum.*
Sweet Candy Horehound.

what blackiſh and rugged on the upper ſide: the flowers ſtand at diſtances at the toppes of the branches, of a pale purpliſh colour, in the like rough huskes.

6. *Marrubium album Criſpum.* Curld White Horehound.

Curld Horehound hath hard round white woolly ſtalkes: the leaves are ſmaller than the laſt, a little crumpled and curld at the edges, and a little dented alſo, of a grayiſh colour on both ſides, but not ſo woolly as the laſt: the flowers ſtand in the ſame manner as the reſt, in prickly huskes, but whiter than any of the former.

7. *Marrubium nigrum Hiſpanicum, vel Ocimaſtrum Valentinum Clusij.* Spaniſh black Horehound.

There are two other ſorts of hearbs, which although they bee no Horehounds, yet for their likeneſſe are referred by others therunto, as not knowing better unto what other Tribe or Family they ſhould be joyned. The firſt of them riſeth up with ſquare hairy ſtalkes a foote high, the leaves grow by couples at the joynts, ſomewhat long and round pointed, thinner and fuller of veines than the wild blacke Horehound; like unto the middle kinde of Baſill ſaith *Cluſius*, but *Lobel* ſaith like unto black Horehound, but longer, and of no ſcent at all (ſaith *Cluſius*, but *Lobel* ſaith of the ſmell of *Stœchados* or *Caſſidony*.) The flowers grow at the toppes of the ſtalkes in wharles or rondels, of a white colour ſaith *Cluſius*, ſtanding in prickly huskes; but *Lobel* ſaith of a purpliſh colour (if that of *Lobel* be the ſame with this of *Cluſius*, whereof I am in ſome doubt, in regard both the ſmell of the leaves, and the colour of the flowers, which are two eſpeciall parts of the plant, are ſo differing one from another) the ſeed is black like the other, and growing in the like prickly huskes; the roote is ſmall, and with long ſtrings like unto the wild Nettle, or the white Archangell.

7. *Marrubium nigrum Hiſpanicum, &c.*
Spanish black Horehound.

8. *Marrubium nigrum longifolium, &c.*
Black French Horehound with long leaves.

8. *Marrubium nigrum longifolium, ſive Herba Venti Rondeletij & Monſpelienſium.* Blacke French Horehound, with long leaves.

This other plant that is referred by ſome to the black Horehounds, hath many ſquare rough ſtalkes, riſing to the heigh

height of a cubit or two foote, ſpreading into divers branches, ſet with two long and ſomewhat broad leaves at every joynt, longer, and broader, than Sage leaves, and longer pointed; dented about the edges, of a ſad over-worne greene colour, which in the Winter time remaining withered on the branches without falling away, are to be ſeene full of holes, as if they had beene eaten with wormes, all the ribbes and veines abiding as they grew untill the froſts doe cauſe their ſtalkes to fall away: the flowers are of a purpliſh colour greater than any of the Horehounds and more gaping; after which come the ſeed in hard prickly huskes like unto Horehound: the roote is thicke, ſpreading with many blackiſh ſtrings, whereby it taketh ſtrong hold in the ground, and dyeth not, but ſhooteth a freſh every yeare, this hath no ſcent either good or ill to be found in it.

The Place.

The firſt is found in many places of our Land in dry grounds, and waſte greene places: the ſecond came from *Spaine*, and being ſowne of the ſeed, abideth. The third in like manner was ſowne of ſeed that came from *Candy*, as the fourth was alſo. The fift was found growing about *Paris* in *France*. The ſixth in *Germany*. The ſeaventh in *Spaine*, and the laſt about *Mompelier* in fat grounds, and ſometimes in the wheate fields.

The Time.

They doe all flower in Iuly, or thereabouts, and their ſeed is ripe in Auguſt.

The Names.

Horehound is called in Greeke πράσιον, and in Latine *Praſium & Marrubium, videtur autem inquit Pena, Praſinus viror aut certe vinoſus odor, appellationem dediſſe Marrubio tam nigro fœtido quod Ballote dicitur, quam albo odoro: Pliny* hath committed many faults in tranſlating the Greeke word *Praſium*, ſetting downe *Praſum id eſt porrum* for it. The firſt is generally called *Marrubium* by moſt of our moderne Writers: but *Praſium* by *Anguillara*: the ſecond is called by *Lobel Marrubium candidum alterum Hiſpanicum*, Of *Cluſius Marrubium alterum Pannonicum*, and of *Camerarius Marrubium Creticum*. Of *Dodonæus Marrubium Candidum*, and of *Bauhinus Marrubium album latifolium peregrinum*. The third is called by *Lobel Marrubium Creticum angustiore folio*, Of *Camerarius Marrubium Creticum aliud*, *Marrubium Creticum* of *Dodonæus*, *Lugdunenſis*, and others. Of *Bauhinus Marrubium album angustifolium peregrinum*. The fourth is called in the great Booke of the Biſhop of *Eyſtot* his garden, *Marrubium Creticum angustifolijs inodorum*, and by *Bauhinus Marrubium album peregrinum brevibus & obtuſis folijs*. The ſifth is called of *Bauhinus Marrubium album villoſum*, and maketh a doubt if it ſhould not be *Praſium* of *Dioſcorides*, in Engliſh French Horehound, or white hairy Horehound. The ſixth is alſo called by *Bauhinus Marrubium criſpum*, in Engliſh Criſpe or Curld Horehound. The ſeventh is called by *Cluſius Ocimaſtrum Valentinum*, becauſe as he ſaith, the learned at *Valentia* in *Spaine* did ſo call it: by *Lobel Marrubium Hiſpanicum odore Stœchadis*. Of *Tabermontanus* and *Gerard Marrubium Hiſpanicum*; and of *Bauhinus Marrubium nigrum latifolium*. The laſt is called by the Apothecaries of *Mompelier*, *Herba Venti & Rondeletij*; others call it *Sideritis Monſpelienſium*, *& Parietaria Monſpelienſium*, as *Lugdunenſis* ſaith, and ſo ſaith *Cordus* alſo. *Lobel* maketh a queſtion or quære if it be not the *Othonna* of *Dioſcorides*, rather than the *flos Africanus* which uſually carrieth that title. *Bauhinus* calleth it *Marrubium nigrum longifolium*, in Engliſh, Black French Horehound, untill a fitter may be given it.

The Vertues.

The ſecond and third ſorts of Horehound, becauſe they are neareſt unto the firſt, or wilde kinde, are found to bee as effectuall for the purpoſes whereunto the wild is aſſigned, having the ſame properties, and as *Dioſcorides* ſaith, a decoction of the dryed hearb with the ſeed, or the juyce of the greene hearbe taken with honey, is a remedy for thoſe that are purſie, and ſhort winded, for thoſe that have a cough, and for ſuch as by long ſickneſſe, or thinne diſtillations of rheume upon the lungs are waſted and fallen into a conſumption: it helpeth to expectorate tough flegme from the cheſt, being taken with the dryed roote of *Iris*, or *Orris*: it is given to women to bring downe their courſes, and to expell the afterbirth, as alſo to them that have ſore and long travels; it is alſo given to them that have taken poiſon, or are bitten or ſtung by any venemous Serpents or beaſts. but it hurteth the bladder and the reynes: the leaves being uſed with honey doe purge foule ulcers; ſtay running or creeping ſores, and the growing of the fleſh over the nailes; it helpeth alſo the paines of the ſides: the juyce thereof with wine and honey helpeth to cleare the eye-ſight, and ſnuffed up into the noſtrils helpeth to purge away the yellow jaundiſe, and either of it ſelfe, or with a little oyle of Roſes being dropped into the eares, eaſeth the paines of them. *Galen* ſaith that by reaſon of the bitterneſſe, it openeth the obſtructions both of the liver and ſpleene, purgeth the breaſt and lungs of flegme, and procureth womens courſes, and uſed outwardly, it both clenſeth and digeſteth. A decoction of Horehound, ſaith *Matthiolus* is availeable for thoſe that have bad livers, and for ſuch as have itches and running tetters, the powder thereof taken, or the decoction killeth the wormes; the greene leaves bruiſed and boyled with old Hogs lard into an oyntment, healeth the bytings of Dogges, abateth the ſwellings of womens breaſts; and taketh away the ſwelling and paines that come by any pricking of thornes, or any ſuch like thing. Vſed with vineger it clenſeth and healeth tetters. If ſaith *Matthiolus*, you boyle two ounces of freſh Horehound in three pints of good white wine, with the roots of *Bugloſſe*, *Elecampane*, and *Agrimony*, of each one dram and a halfe; of *Rubarbe* and *lignum aloes*, of each one dram, untill halfe be conſumed and ſtrained, hereby is made a moſt excellent medicine to helpe the yellow jaundiſe, that commeth by the obſtruction of the veſſels, and overflowing of the gall, if two ounces thereof (having a little Sugar put to it to ſweeten it) be taken faſting for nine dayes together: but he counſelleth, that if they that ſhall take this medicine have an ague, the decoction muſt bee made with water, and not with wine: the decoction thereof is a ſingular helpe for women that are troubled with the whites, if they ſit over it while it is warme: the ſame alſo healeth any ſcabs, whether they be dry or moiſt, if the places be bathed therewith, being ſtamped and put into new milke, and ſet in any place overpeſtered with flies, it will ſoone deſtroy them all. There is a ſirope made of Horehound to be had at the Apothecaries much uſed, and that to very good purpoſe for old coughes to rid the tough flegme; as alſo for old men and others, whoſe lungs are oppreſſed with thinne and cold rheume to helpe to avoid it, and for thoſe that are aſthmatick, or ſhort-winded. The other ſorts are not uſed, or their properties are not expreſſed by any.

CHAP. XVIII.

Stachys. Base Horehound.

I Must needs adjoyne these Base Horehounds unto the former, for the neare affinity that some of them especially, have both in face, smell and vertues, referring the *Sideritides* to another place, which some have joyned with these.

1. *Stachys Dioscoridis.* The true Base Horehound.

1. *Stachys Dioscoridis.* The true Base Horehound.

This kinde of wilde Horehound hath divers soft woolly greene leaves lying upon the ground, and abiding all the Winter, somewhat broad and long, of about two inches in breadth, and three in length, smooth, and not dented at all, or very little about the edges: from the middle whereof riseth sometimes but one stalke, and sometimes more, carrying divers such like leaves thereon, but lesser, set by couples: about the middle of the stalkes, and so upwards come foorth divers purplish flowers, standing in softer huskes than the former Horehounds have, at the joynts with the leaves compassing the stalkes, the tops whereof are small and long, ending as it were in a spike, after which come blackish round seed: the root is made of divers blackish strings which perisheth not after it hath given seed: the smell hereof is small with us, and not so pleasant as others say it is, for any thing that I ever could observe. *Camerarius* and *Lobel* say that there is of this kind that beareth yellow flowers, which yet I never saw.

2. *Stachys major Germanica.* Great Dutch Base Horehound.

This great base wilde Horehound hath greater and longer hoary leaves, somewhat like unto great Sage leaves, for the colour on both sides, but larger and a little dented about the edges; the stalkes are square and hoary, set with such like leaves at the joynts, & purplish flowers with them round about the stalkes towards the tops, which are greater as all the rest of the plant is, and hath a stronger and worse scent than the other.

3. *Stachys sive Pseudo Stachys Cretica.* Candy Base Horehound.

Base Horehound of Candy hath divers very hoary foure-square stalkes rising from a small wooddy roote, whereon are set two small long and narrow leaves at the joynts, compassing the stalkes, without any foote stalke, of an hoary ash-colour, somewhat hairy and hard in handling, but those that are next the ground are much longer, every one with a long foot stalke, which together with the leafe is an hand-breadth in length, when as they are scarce an inch in breadth, of little or no scent at all for the most part, yet some have beene observed to be sweeter than others of this kinde: the flowers are small and purple, standing in prickly huskes round about the stalkes at severall distances: after which commeth the seed which is small, blackish and round.

4. *Pseudo Stachys Alpina.* Mountaine Base Horehound.

The Mountaine Base Horehound from a hard browniſh yellow roote, spreading into many long and thick strings, sendeth forth divers rough hairy and hoary leaves, covered with a soft white woolly downe, somewhat like unto Horehound, but thinner, being three inches broad, and foure inches long, with long foot-stalkes, and a little dented about the edges, of a little heady smell; among which rise up foure square hairy stalkes, a cubite and a halfe high; at the joynts whereof grow two such like rough wrinkled leaves, but longer than those below, whereat likewise spring forth small branches on both sides; at the toppes of the stalkes and branches stand the flowers in rundles, of a whitish red colour, placed in somewhat rough huskes, wherein after the flowers are past, grow the seed, which is small, blacke and round. This kinde hath beene observed to grow higher with larger leaves, and without that heady strong smell that is in the former.

5. *Stachys Lusitanica.* Portugall Base Horehound.

This small and low Base Horehound lyeth for the most part, or at the least leaneth to the ground, having many small round hairy white branches, not above halfe a foote long, set with two very small long, hoary and woolly leaves, almost round at the ends, and not dented at all, of a very sweet and pleasant smell, especially in the hot Country where it groweth: the flowers grow at the toppes compassing the branches, so hid under the leaves, that they can scarsebe discerned: the roote is small and long, with some fibres thereat.

6. *Stachys spinosa.* Thorny Base Horehound.

Thorny Base Horehound hath many small and long hoary white leaves lying upon the ground, somewhat like unto the small Sage, without any foote-stalke at them, and without any denting at the edges, which so abide the first yeare of the springing all the Winter: but in the Spring following, there shooteth foorth divers small and slender stalkes, not above a foote high, as hoary as the leaves, on which are two alwaies set at the joynts, much smaller than the lower-most: the stalkes breake out at the severall joynts with the leaves into divers other small bran-

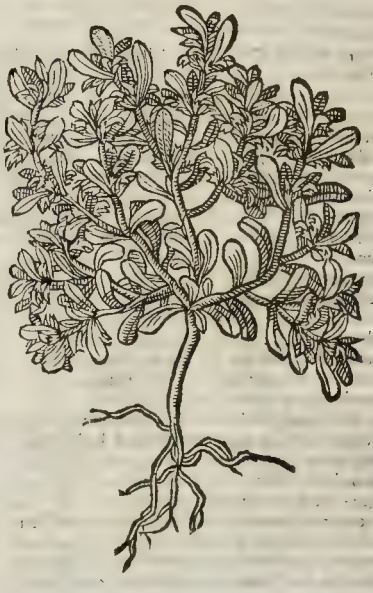
Great Dutch Base Horehound.

5. *Stachys Lusitanica.*
Portugall Base Horehound.



6. *Stachys Spinosa.* Thorny Base Horehound.

ches, ending all of them in sharpe thornes, whereof the middlemost is the biggest and strongest: the flowers are of the bignesse, forme, and colour of the flowers of Spanish Germander, or rather of Sage, but somewhat paler, and the upper part thereof somewhat more bowed downeward, standing thinly scattered on the branches, very quickly fading and falling away: it seldome beareth seed, in regard it flowreth so late with us, but when it doth, it is black, and somewhat uneven or rugged, and not round: the roote is very great for the smalnesse of the plant, and wooddy, dispersing it selfe into many sprayes under ground: the whole and every part thereof, hath no good scent to commend it.

The Place.

The first groweth plentifully in *Italy*, as *Matthiolus* saith: and in the fields about *Rome*, as *Castor Durantes* saith: and in *Germany* also, as others have set it downe. The second is naturall of *Germany*, as *Tragus*, *Lonicerus*, *Camerarius*, *Thalius*, *Gesner*, and others doe set it downe. The third from the seed that came out of *Candy*, did the plant spring. The fourth groweth upon a small hill in *Germany*, called *Wasserfall*. The fifth groweth in *Portingall*, as *Lobel* first relateth it. The sixt and last *Honorius Bellus* found in *Candy*, and sent the seed to *Clusius*, who saith that hee had the figure and some notes thereof also sent him from *Iacobus Plateau*, who had not thought that *Clusius* had seene any such plant before.

The Time.

The foure first doe all flower about the middle or end of July, but the other two are very late, not flowring for the most part untill September, whereby no hope of seed could be expected.

The

The Names.

The first *Matthiolus* in his latter Edition calleth *Stachys*, and judgeth it to be the true *Stachys* of *Dioscorides*, although in the former editions he had set forth the second with an opinion that it had beene the right, and *Dodonæus*, *Lugdunensis*, *Tabermontanus*, and *Gerard* call it *Stachys*, also *Camerarius* calleth it *Stachys minor*. *Gesner* calleth it *Stachys floribus gratioris odoris*. *Lobel* calleth it *Stachys lychnitis*, & *Stachys spuria Flandrorum*. *Cæsalpinus* calleth it his *Salvia sylvestris tertia*, and *Bauhinus Stachys Italica minor*, in Englisth the lesser, or Italian base Horehound. The second is called by *Matthiolus Pseudo-Stachys*, and so doth *Lugdunensis*, but divers others call this *Stachys*, and judge it contrary to *Matthiolus* his last opinion to be the truer *Stachys* of *Dioscorides*. *Gesner* calleth it *Stachys Germanica*, and *Camerarius*, *major sive Germanica*. *Cæsalpinus* calleth it *Salvia sylvestris*, *Thalius in Hercynia sylva*. *Marrubium montanum album*, *Fabius*; *Columna*, *Sideritis Heraclea*, and *Bauhinus Stachys minor Germanica*, in Englisth Great Base Horehound. The third is called by *Bauhinus Stachys*, and *Pseudo-Stachys Cretica*, and saith it was sowne for *Marrubium Creticum*. The fourth is called by *Lonicerus Sphacelus forte Theophrasti*. *Cæsalpinus* calleth this *Salvia sylvestris nigrior*. *Tabermontanus* and *Gerard* call it *Salvia Alpina*, and *Bauhinus Pseudo-Stachys Alpina*, in Englisth Mountaine Base Horehound. The fift *Lobel* calleth *Stachys Lusitanica*, and *Lugdunensis* doth the like, in Englisth *Portugall* Base Horehound. The sixt from *Candy*, was sent unto *Clusius* by the name of *Gaiderothymo*, which signifyeth Asses Time, whereunto it hath no correspondency. *Clusius* first called it *Stachys spuria*, and *Bauhinus Stachys spinosa Cretica*, in Englisth Thorny Base Horehound.

The Vertues.

Dioscorides and *Galen* both speaking of this kinde of Horehound, called *Stachys*, say it is of a hot and sharpe quality, a little bitter, and in the third degree of heat: and therefore the decoction thereof is profitable to procure womens courses, and to expell the after birth, and that it causeth abortion in women, that is, to miscarry in child-bearing; or to come before their time: it also provoketh urine being stopped, if the parts be fomented with the decoction thereof, or the party doe sit over the warme fumes.

CHAP. XIX.

Salvia. Sage.

I Have to shew you here many differences of Sage worthy of observation, because other Authors have recorded some of them to other hearbes.

1. *Salvia major vulgaris.* Ordinary Garden Sage.

Versicolor.

Our ordinary Sage is reckoned to bee of two sorts, white and red (yet I thinke they both rise from one and the same plant slipped and set) both of them bearing foure-square wooddy stalkes, in some whiter greene, in others redder, as the leaves are also, standing by couples at the joynts, being somewhat long and broad, rough and wrinckled, of a strong sweet scent: at the tops of the stalkes come forth the flowers set at certaine spaces, one above another, which are long and gaping, like unto the flowers of Clary or dead Nettle, but of a bluish purple colour, after which come small round seed in the huske that bore the flower: the roote is woody, with divers strings at it: it is more usually propagated by slips, pricked or thrust into the ground in the Spring time, than of the seed. Of this kinde are the two sorts of party-coloured Sage, the one white and greene: the other whitish red and greene in most of the leaves.

2. *Salvia maxima sive latifolia.* Great white Sage.

This great Sage differeth not from the common or ordinary great Sage for the manner of the growing, or the colour of the leaves, or sweetnesse of the whole plant, the chiefe differences consist first in the leaves, which are much larger, and a little dented about the edges, and sometimes much more, making them seeme curled; divers of the leaves being foure inches long, and three inches broad; and in the flowers, some plants bearing purplish flowers like the ordinary, and others milke white flowers which is the more rare.

3. *Salvia major Cretica latifolia, & angustifolia aurita, & non aurita, pomifera & non pomifera.*

Great Sage of Candy with broad and narrow leaves, and bearing eares and apples, and that beare none.

This great Sage hath many square hard hoary stalkes, especially when they are young, but turning almost round when they grow old, rising both greater and higher in the hot Countries than with us, whereon are set two leaves at a joynt, one against another, in some like our ordinary Sage but larger, in others somewhat smaller and longer; in many plants of both sorts there will bee small pieces of leaves growing on both sides at the bottome of the leaves, and in some plants or places there will be none of these pieces or eares to

bee ſeene, (which hath cauſed ſeverall Authors to give ſeverall figures) which are very hoary underneath, and more greene on the upperſide, having as it were the hoaryneſſe rubbed off from them, of a much ſtronger ſcent than the common: the ſtalkes branch forth on all ſides, towards the toppes whereon ſtand the flowers at diſtances, like unto the flowers of ordinary Sage, but of a pale or whitiſh purple colour: after which come great heads of ſeed ſtanding in the ſame huskes or cuppes that bore the flowers before, which are ſo much ſwollen, that they ſeeme to be berryes, with three or foure great ſeeds in them. Theſe kindes likewiſe beare in the hot Countries of *Egypt*, *Candy*, *&c.* at the joynts, and ſometimes betweene the joynts of the ſtalkes, certaine excreſcences like unto ſmall Apples or berryes bigger than Piſtack nuts, of an inch thickneſſe at the leaſt, and covered with much downe or cotton, ſomewhat rough in handling, of a taſte not ſo hot, but more binding than the Sage, and not unpleaſant, which the people uſually eate with bread, but in other colder Countries it never beareth any.

2. *Salvia pomifera.* Sage bearing apples.

4. *Salvia minor pinnata.* Sage of Vertue.

Flore albo.

4. *Salvia minor, ſive pinnata.* Small Sage, or Sage of Vertue.

This leſſer Sage groweth like unto the firſt great white Sage, but that the branches are long and ſlenderer, the leaves alſo whitiſh, and never red, and much ſmaller or narrower, having for the moſt part at the bottome of each leafe, on each ſide a ſmall piece of a leafe, which maketh it ſeeme like finnes or eares: the flowers alſo are of a bluiſh purple colour, but leſſer. Of this kinde there is one that beareth white flowers, differing in nothing elſe from the other.

5. *Salvia minor aurita odoratiſſima Hiſpanica.* The ſweeteſt ſmall Spaniſh Sage with eares.

This Spaniſh ſmall Sage is in moſt things ſo like the ordinary ſmall Sage with eares, called Sage of Vertue, that unleſſe it bee well heeded or marked, it will bee thought all one with the other, but herein conſiſteth the difference, it ſeldome groweth to be ſo great, the leaves are ſomewhat ſmaller and greener, or not ſo white, it is more tender to keepe, and doth quicklier periſh in the Winter, unleſſe it be better defended than the other; and the ſmell hereof is farre more milde, ſweet, and pleaſant, yet ſomewhat quicker wirhall than the former, which is eaſily diſcerned by any that can judge of ſcents; and laſtly, ſome kinde hereof beareth white flowers, an other blue.

6. *Salvia Cretica anguſtifolia non aurita.* Small Candy Sage without eares.

This ſmall Candy Sage riſeth up with divers hard ſtalkes, of a browniſh colour, having the leaves ſet thereon by couples, which are much narrower than in any other Sage, and without any eares at all ſet unto them, of a whitiſh greene colour like the ſmall Sage, and a little dented or crumpled about the edges; this brancheth forth plentifully, bearing purple flowers at the toppes in ſpikes, without any leaves among them, the roote is hard and wooddy, ſpreading under ground diverſly.

7. *Salvia minor altera flore rubente.* Small red flowred Sage.

This ſmall Sage differeth little in the forme of growing or bignes, or colour of the leaves from the ordinary ſmall Sage, but that it hath not eares ſo frequently with the leaves as it hath: the chiefeſt difference from all others is that the flowers are red, and that both ſmell and taſte are like unto Woormewood.

8. *Salvia lanuginoſa anguſtifolia.* Small woolly Sage.

This woolly Sage hath divers round ſtalkes a foote and a halfe high, ſo hoary and woolly, that they are ſoft therewith, though underneath they be wooddy, which ſpread into many branches, with leaves ſet thereon like the other, which are thick, narrow, ſhort, and very hoary, white and rough, of two inches long, and halfe an inch in breadth, ſmelling like unto Tanſye: the flowers ſtand in ſpikes at the toppes of the branches, of a purpliſh colour, like unto the flowers of dead Nettle or Archangell, with many ſmall long threads in the middle.

9. *Salvia folio ſubrotundo.* Round leafed Sage.

This Sage hath many ſquare hoary ſtalkes with leaves ſet thereon in ſuch manner as the others are, which are rough or crumpled like the leaves of ordinary Sage, but thinner, and much whiter, round alſo like unto the leaves of Violets, or round rooted Birthwort, yet ending in a point: in other things it differeth not from the ordinary common Sage.

10. *Salvia fruticoſa lutea anguſtifolia, ſive Phlomis Lychnitis Dioſcoridis Cluſio.* The greater yellow wilde Sage with narrow leaves.

This kinde of Sage (for thereunto I thinke it fitteſt to referre it, and not to any Mullein as others doe, for which I ſhall ſhew you the reaſon preſently hereafter) hath many very hoary and woolly leaves, the lower ſides eſpecially more than the upper, longer and narrower alſo than thoſe of the ſmall Sage, among which riſe up ſquare hoary and hairy ſtalkes about a foote high, whereon doe grow ſuch like long hoary leaves as grow below, two alwayes ſet together one againſt another at the joynts; where the flowers ſtand at ſpaces, about the toppes of the ſtalkes with two leaves under them, broad at the bottome, and compaſſing the ſtalkes, being ſhorter than the reſt: the flowers are large, open, and gaping, like unto Sage, or ſomewhat more like unto thoſe of the dead Nettle, or Archangell,

of

6. *Salvia Cretica angustifolia non aurita.* Small Candy Sage without eares.

10. *Salvia fruticosa lutea angustifolia sive Phlomis lichnitis, &c.* Yellow wilde Sage with narrow leaves.

of a yellow colour comming forth out of hoary woolly huskes, covered with pale coloured haires, the toppes by reason of the length and weakneſſe bending a little downewards, after which come browniſh ſeed incloſed in woolly huskes: the root is blackiſh and wooddy.

11. *Salvia fruticosa lutea latifolia sive Verbascum sylvestre quartum Matthioli.* French or yellow wilde Sage with broad leaves.

Although divers Authors doe account this hearbe a *Mullein*, and ſo doe number it among the kindes thereof, yet I thinke it more proper to put it among the Sages: for *Lobel* and *Pena* in their *Adverſaria* ſay, that it is called wilde Sage in the Gardens of *Italy*, *France*, *England*, and the *Netherlands*: and in regard that the leaves and flowers both of this, and the precedent doe rather reſemble Sage than *Mullein*, this the greater Sage, and the former the leſſer, I ſee no reaſon why theſe ſhould be called Mulleins, or referred unto them rather then unto Sage, ſeeing none of the Mulleins that are properly ſo called, have hooded or gaping flowers like unto Sage, Archangell, and the like: but all of them are compoſed of five leaves, laid open like unto the Campions, and many other ſuch like flowers. Take therefore the deſcription thereof here in this manner. It hath divers ſquare wooddy hoary ſtalkes, whereon grow at ſeverall ſpaces, rugged, hoary, broad, and almoſt round pointed leaves, many ſet together, very like unto the great Sage, but greater: the flowers grow likewiſe in rundles or ſpaces towards the toppes of the ſtalkes, very like alſo unto the flowers of Sage, or Archangell, but of a yellow colour: the ſeed is greater than of any Sage, ſomewhat browniſh and round like the laſt: the root is wooddy, with divers ſtrings and fibres faſtned unto it: the whole plant ſmelleth ſomewhat ſtrong and heady. *Gerard* ſetteth downe another ſort hereof, which hee ſaith is more ſweet, but I mervaile where he had any relation of another, there being but one ſort that ever I could heare of, or know.

12. *Salvia minor lutea Cretica.* Small yellow Sage of Candy.

This ſmall Sage groweth with three or foure ſtalkes that are hard, ſquare, and hoary, about a foote or more high, parted into other ſmaller branches, at whoſe joynts being ſeparate farre in ſunder, come uſually two, and ſometimes three or more, rough ſmall hoary leaves, very like unto the ſmall Sage leaves, and at them likewiſe towards the toppes of the ſtalkes, ſtand divers ſmall gaping flowers very like unto thoſe of Sage, but of a gold yellow colour, the ſeed is ſmall, black, and ſomewhat long: the roote is wooddy and ſlender, the whole plant is of little ſweet ſcent, but ſtiptick or aſtringent in taſte. *Alpinus* calleth this *Verbaſculum Salvifolium*, and differing in the ſmalneſſe from the other *Salvifolium*, which is foure times bigger, and would referre it to *Dioſcorides* his *Verbaſcum ſylveſtre*, amending the text which is ſomewhat faulty, in ſaying *ramos habet circum virgas veluti Marrubium*: but *Marrubium* hath not *ramulos*, but *flores circum virgas*: and ſo it is moſt likely the text ſhould runne, but I ſuppoſe it is moſt like unto a ſmall Sage, whereunto I therefore referre it, becauſe no *Verbaſcum* hath gaping flowers.

The Place.

The firſt groweth in *Spaine* and *Narbone*, *&c.* and ſo doe the fourth and fift. The ſecond groweth well in *England*

11. *Salvia fruticosa lutea latifolia sive Verbascum sylvestre, &c.*
French or yellow wild Sage with broad leaves.

12. *Salvia minor lutea Cretica.*
Small yellow Sage of Candy.

with many that have it, and is likely to be that sort which *Clusius* saith he found in *Austria* with white flowers, and may also be *Gerards* his *Alpina*, but that the figure doth better represent an *Horminum* than Sage. The third as is said, is naturall to the hot Countries of *Egypt*, *Candy*, *&c.* but will not abide with us, nor ever beare those apples. The fourth is in many of our gardens, and as *Clusius* saith, groweth plentifully in *Spaine*, and so doth the fift. The fift came out of *Spaine*, and is the sweetest of all other, yet it differeth as I said, from the former small Sage, which groweth in *Spaine* likewise abundantly. The sixt was raised from the seed that came out of *Candy*, whereof *Clusius* maketh mention, that he received the figure thereof set forth to the life in colours, from *Iacobus Plateau*, as it grew with him. The seventh *Bauhinus* saith he first saw in an Apothecaries Garden in *Bassil*, and afterwards in the Duke of *Wittenbergs* Garden at *Mont Belgard*, but from whence it was brought to them, he doth not declare. The eighth *Bauhinus* saith he received from Doctor *Neudorfferus*, and saith no more. The ninth hee saith likewise hee had from an Apothecarie at *Smalcald*: the two next throughout *Spaine* and *Portugal* plentifully: and the eleventh about *Mompelier* also: the last grew in *Candy*. All these sorts will grow by the slippes taken from them, and planted in March or Aprill.

The Time.

Most of these sorts of Sage doe flower in Iuly, or about the time of the ordinary Sage, yet some of them flower not untill August. All of them also doe beare seed, but the small ordinary Pigge Sage, or Sage of vertue, which although I doe acknowledge to give seed in some places, and in some yeares, yet most commonly, and with many it doth not, nor the smeet small Spanish kinde.

The Names.

Sage is called in Greeke ἐλελίσφακος. The pale ash-coloured dry and withered deformity of the leaves of Sage, especially on the dry and burnt hills in the hot Countries where it groweth naturall, was the cause to give it that name, as if you should call it, scorched or consumed by blasting, for ἐλελίζειν doth signifie *intorquere*, and *contrahere* to bee drawne together, or wound within it selfe, and σφάκος or rather σφακελος doth signifie that disease in plants, which the Latines call *sideratio*, a blasting, that is, when the hearbe or tree by the extreame heate of the Sunne in the Dog-dayes, or otherwise piersing into it, and drying up the moisture that nourished it, seemeth to grow faint and dry, or as it were scorched. It might saith *Pena* be fitly so named, from the helpe this hearbe giveth to those parts of a mans body, that seeme to be as it were dead by some blasting, in restoring the naturall heat and vigour to the part, in which quality it excelleth, giving a friendly and beneficiall comfort to the vitall spirits; and therefore the Latines called it *Salvia, quia salvos homines & incolumes efficiat*, because it maketh men safe and sound in health. And the Latine verifyer from hence tooke his occasion to say, *Cur moritur homo cum Salvia crescit in horto.* And Sage in English, from the property in comforting and strengthening the head and memory, to make men sage or wise, of the French word *Sauge*; or from the Latine *Salvia*, to say safe, and altered into Sage. *Pliny* in his 21. Booke, 16. chap. hath foulely erred in mistaking the Greeke word σφακος, and translating it φακος which is *Lens*, for he there saith,

that

that *Elilisphacos*, with the Greekes is *phacos* with others. The one is more gentle than the manured lentell, with a leſſer, dryer, and ſweeter leafe; and the other kinde that is wilde, is of a more grievous ſcent, &c. too much here to recite and ſet downe, and to little purpoſe. The firſt is generally called *Salvia major & latifolia*, by almoſt all Authors: the ſecond *Cluſius* ſaith he firſt ſaw in *Auſtria*, and *Bauhinus* that he had it firſt from *England*, and called it *Salvia latifolia ſerrata*: the third is called *Salvia pomifera & baccifera*, or *baccata & Cretica*, or *Cretenſis*, to ſhew the kinde, *Lobel* calleth it *Coccifera*, *Matthiolus Salvia fructum inſtar gallæ ferens*, and *Anguilara Salvia Græca*, which he ſaith they uſually call φλόμιδα *Phlaſcomelea*: the fourth is called *Salvia nobilis* by *Geſner & minor*, by *Matthiolus* and divers others, *anguſtifolia*, and *tenuifolia* by ſome others, *aurita* alſo, or *auriculata*, or *pinnata* by others: the fift *Camerarius* calleth *Salvia Hiſpanica odoratiſſima*, but *Bauhinus Salvia folio tenuiore*, the old *Gerard* calleth it *Salvia Indica*, but his Correcter confoundeth it with the ſeventh following as you ſhall heare: the ſixt *Cluſius* ſetteth forth with this title, *Salvia Cretica anguſtifolia*, and *Bauhinus Salvia anguſtifolia ſerrata*: the ſeventh *Bauhinus* onely hath remembred unto us by the name of *Salvia minor altera*, and I adde thereunto *flore rubente*, to make it the better knowne, for it is ſcarce knowne to many: this is that Sage that I ſaid before Maſter *Iohnſon* that corrected *Gerard* hath erred exceedingly, in confounding this with the fift, which is the ſame that Maſter *Cannon* ſhewed him and gave me, whoſe ſcent is farre ſweeter than the ſmall Pigge Sage, and much differing from the ſcent of Wormewood, if he had as duely enformed his ſmell thereof, as hee did his ſight of the flower: the eighth *Bauhinus* alſo giveth the name of *Salvia anguſtifolia lanuginoſa*, and in Engliſh ſmall woolly Sage: the ninth likewiſe hath his name in the title, *Bauhinus* giving the Latine, and I the Engliſh: the tenth is called by *Cluſius Phlomis Lychnitis*, and referreth it to the *Lychnitis* called alſo *Thryallis* by *Dioſcorides*, and by the Caſtilians in *Spaine Candilera*, and thoſe of *Granado Menchera*: *Lobel* calleth it *Verbaſcum ſylveſtre folijs ſalviæ tenuifoliæ*, and *Bauhinus Verbaſcum anguſtis ſalviæ foliis*, who ſaith it is alſo called of ſome *Angarathi*: but *Geſner in hortis Germaniæ* calleth it *Salvia ſylveſtris Monſpelienſium*, and therefore I have placed it in the number of the Sages, and altered the title in Latine, and call it thereafter, in Engliſh, the greater yellow Sage with narrow leaves: the eleventh is called by *Matthiolus* alſo *Verbaſcum ſylveſtre*, being his fourth, and from him *Anguilara*, *Caſtor Durantes*, *Cluſius*, and others do call it *Verbaſcum* 4. *Matthioli*: *Camerarius Verbaſcum ſylveſtre foliis ſalviæ*, and *Lobel Verbaſcum fruticoſum ligoſum & flore luteo*, who ſaith as I ſhewed you in the deſcription, that it is called a wilde Sage in *Italy*, *France*, the Low-Countries, and *England*, for we call it French Sage, and why then he and they ſhould call it, as the next going before this, *Verbaſcum Mullein*, I ſee no cauſe more than that the leaves in both are woolly like Mullein, and may ſerve as a weeke for Lampes, as the Spaniards doe with the laſt before this, and as Mullein leaves may doe, but that is not a ſufficient cauſe in my judgement, to make them of the tribe of Mulleins, other things not concurring as the flowers whereof I have ſpoken before. Let others of knowledge bee judges herein. It is called in Engliſh as I ſaid, French Sage, and wooddy Mullein, and this may as fitly bee called the great yellow wilde Sage with broad leaves, as the former is called the greater yellow wilde Sage with narrow leaves; The laſt is called *Verbaſcum ſalvifolium* by *Proſper Alpinus* in his Booke *De plantis exoticis*, but becauſe the flowers of this are more like a Sage than a Mullein, as in the former I have rather referred it to theſe than to them. *Bauhinus* would ſeeme to make our ordinary Sage to bee the *Sphacelus* of *Theophraſtus*, (for *Dioſcorides* maketh no mention of *Sphacelus*) ſet downe in his 6. Booke and 2. Chapter: whereof he ſpeaketh in this manner, *Sphacelus & Salvia*, differ one from another; as if you would call the one the tame manured Sage, and the other the wilde: the leafe of *Sphacelus* is ſmoother and narrower, and leſſe unſeemely, or not ſo ill-favoured: but Sage is more rough. *Lugdunenſis* doth make the ordinary ſmall Sage to be it, and *Matthiolus* ſeemeth to ſay the ſame: *Guilandinus* as is ſet downe in the Chapter going before, thinketh the great *Stachys* to be it. *Dodonæus* judgeth the *Salvia agreſtis*, or *Scorodonia*, Wood Sage to be it, and ſome others thinke *Colus Iovis*, or *Jupiters* diſtaffe, a kinde of wild Clary ſet downe in the next Chapter to be it. So that among ſuch variety of opinions among learned men, it is very hard for me to ſet downe which is the trueſt: yet I will make bold to ſcan them all a little, and laſtly ſhew you my judgement. Firſt, for *Bauhinus* that ſeemeth to judge our ordinary Sage to bee the *Sphacelus*, which if it ſhould be ſo, I would faine have him ſet downe; what ſort ſhould be his Sage, that muſt be by *Theophraſtus* judgement more rugged than *Sphacelus*; for I thinke none of the Sages is more rugged than the ordinary: For *Dalechampius* and others that thinke the ſmall Sage to bee *Sphacelus*, and ſay it is peculiar to the *Sphacelus* to have eares; ſurely I thinke that if *Theophraſtus* had meant that Sage, he would not have forgotten to ſpecifie the eares, which is ſuch a manifeſt diſtinction from the other, and from all other hearbes almoſt, that he might ſoone have put it out of all queſtion, if he had but ſo ſet it downe, beſides his *Sphacelus* hath a ſmoother leafe, and not ſo ill-favoured as the Sage, but the leafe of the ſmall Sage, is almoſt as unſightly for the ſmalneſſe as the greater: for *Guilandinus* that taketh the great *Stachys* or baſe Horehound to bee *Sphacelus*, the greatneſſe of the leaves and whole plant, and the reſemblance more neare an Horehound than a Sage, will make any the more to decline from this opinion; for it ſeemeth by *Theophraſtus* that *Sphacelus* ſhould be a kinde of Sage, in that it ſhould no otherwiſe differ from it, but in the ſeemelineſſe, ſmoothneſſe, and ſmalneſſe of the leafe. For *Dodonæus* who would make the *Scorodonia* or *Salvia agreſtis* to be *Sphacelus*, and ſtrengthneth his opinion with theſe reaſons, that the leafe of the *Sphacelus* is more narrow or ſmall, (for ſo I tranſlate the word *contractius*) and leſſe unſeemely than Sage, ſuch as the wooddy Sage hath, and maketh the Greeke word βαρύτερον to ſignifie a more grievous ſmell, as well as a more rugged or crumpled leafe, that he might make the wood Sage to bee anſwerable unto *Sphacelus*, and to be leſſe grievous in ſmell, as well as leſſe rugged in forme to the Sage: but although it be called *Salvia & agreſtis* with him, and *ſylveſtris* with *Tragus* and others, yet it is alſo referred by the beſt Authors unto the ſecond *ſcordium* or *ſcordotis*, water Germander of *Pliny*, and of *Valerius Cordus*, called *Scorodonia*, of the ſmel of Garlicke, whereof this wood Sage hath a ſmack, which even *Dodonæus* himſelfe deſcribeth to have larger, but ſhorter leaves than Sage, both which I thinke cannot agree unto *Sphacelus*, for it is ſaid to have ſmaller leaves than Sage, and the ſmell hereof cannot be ſaid to bee leſſe grievous than that of Sage. Now for thoſe that would have *Colus Iovis* to be *ſphacelus*, their opinions have farre leſſe ſhew of reaſon than any of the other going before, for the forme and largeneſſe of the leaves and ſtalkes is greater than Sage, and is differing from any good ſcent, drawing neerer unto a wild Clary, (whereof good Authors make it a kind) than to any Sage. Now to ſhew you my opinion, which of theſe come neereſt to the truth, I muſt a little before hand ſcan the words of *Theophraſtus*, which you may read in the ſame Booke and Chapter within a few lines after it; for in deſcribing the next hearbe *Marrubium*, Horehound to be of two kindes; when hee hath

shewed you the first, he saith of the second, *alterum rotundius squallensque vehementer sicut Sphaceli, &c.* which is, the other kinde, hath a rounder leafe than the former, and of an exceeding foule unseemely, or ill-favoured forme or colour (for the word *squallens* may be referred to both) like unto *Sphacelus*: so that it seemeth that the leaves of the other Horehound should be as unseemely in shew as the *Sphacelus*, which words seeme to contradict the former concerning *Sphacelus*, to be smoother, smaller, and lesse unseemely than Sage, for thereby the leaves of *Sphacelus* should have a neater forme and colour than Sage, and hereby they should bee worse, or as bad in shew as Horehound, which all know to be of no good colour or shew: to reconcile these descriptions it is necessary, seeing an Author of so great learning and judgement, should not vary in his owne writing (but this is not observed or remembred by any Author that I have read) therefore it is the best way to say, that even *Sphacelus* is very deformed and unseemely, but in comparison of Sage, which is more dry and deformed, *Sphacelus* is smoother and lesse deformed. So that considering all these herbes that the severall Authors doe make to be *Sphacelus*, I find none that can be more fitly referred thereunto than the *Salvia minor*, the lesser Sage: notwithstanding that *Theophrastus* hath omitted the eares, and that *Dodonæus* contrarieth it, for that it is as deformed as the greater Sage, for both *Matthiolus* in his last Edition upon more mature deliberation no doubt, and *Dalechampius*, or the Author of *Lugdunensis* hath expresly set it downe so, and *Theophrastus* may be excused for not remembring the eares, and *Dodonæus* answered that by *Theophrastus* judgement even *Sphacelus* according to the Greeke name before shewed, which is *Sideratio* in Latine, is exceedingly deformed, or unseemely, as well as the great Sage, though in comparison of the one with the other, the greater Sage is the more dry and rugged. Sage is called by the Arabians *Aelisfacos* and *Elifacos*, by the Italians *Salvia*, and *Salva* by the Spaniards, as well as *Salvia*: by the French *Saulge*: by the Germanes *Salbey*: of the Dutch *Savie*, and by us in English, Sage.

The Vertues.

A decoction of the leaves and branches of Sage made and drunke, saith *Dioscorides*, provoketh urine, bringeth downe the feminine courses, helpeth to expell the dead child, and is a remedy against the prickes of the Puffen or Forkfish, and causeth the haires likewise to become blacke: it stayeth the bleeding of wounds, and clenseth foule ulcers or sores: the decoction of the leaves and branches made with wine, doth take away the itching of the cods, if they be bathed therewith. *Galen* saith it is of a manifest heating quality, and a little binding, and *Ætius* saith the same also, but he further saith, that some report that the fumes thereof being taken when it is burnt, doth stay the immoderate fluxe of womens courses, and all other fluxes of theirs: *Agrippa* saith that if childing women whose wombes be too moist and slippery, not able to conceive by reason of that default, shall take a quantity of the juyce of Sage, with a little salt, for foure dayes before they company with their Husbands, it will helpe them to conceive, and also for those that after they have conceived, are subject often to miscarry upon any small occasion, for it causeth the birth to be the better retained, and to become the more lively: therefore in *Cyprus* and *Ægypt*, after a great plague, women were forced to drinke the juyce of Sage, to cause them to be the more fruitfull. *Orpheus* saith, that three spoonefuls of the juyce of Sage taken fasting with a little honey, doth presently stay the spitting or casting up of blood: For them that are in a consumption, these Pills are much commended. Take of Spiknard and Ginger of each two drammes, of the seed of Sage a little tosted at the fire eight drammes, of long pepper twelve drammes, all these being brought into fine powder, let there bee so much juyce of Sage put thereto, as may make it into a masse, formable for pills, taking a dramme of them every morning fasting, and so likewise at night, drinking a little pure water after them. *Matthiolus* saith, that it is very profitable for all manner of paines of the head, comming of cold and rheumaticke humours, as also for all paines of the joynts, whether used inwardly or outwardly, and therefore it helpeth such as have the falling sickenesse, the lethargie or drowsie evill, such as are dull and heavie of spirit, and those that have the palsie, and is of much use in all defluxions or distillations of thin rheume from the head, and for the diseases of the chest or brest. The leaves of Sage and Nettles bruised together, and laid upon the impostume that riseth behind the eares, doth asswage and helpe it much: also the juyce of Sage taken in warme water, helpeth an hoarsenesse and the cough: the leaves sodden in wine and laid upon any place affected with the Palsie, helpeth much, if the decoction be drunke also. Sage taken with Wormewood is used for the bloody fluxe; *Pliny* saith it procureth womens courses, and stayeth them comming downe too fast; helpeth the stinging and bytings of Serpents, and killeth the wormes that breed in the eares, and also in sores. Sage is of excellent good use to helpe the memory, by warming and quickning the sences, and the conserve made of the flowers is used to the same purpose, as also for all the former recited diseases: they are perswaded in *Italy* that if they eate Sage fasting with a little salt, they shall be safe that day, from the danger of the byting of any venemous beast: they use there also never to plant Sage but with Rue among it, or neare it, for feare of Toades and other Serpents breeding under it, and infecting it with their venemous spittle, &c. the danger whereof is recorded in *Boccace*, of two Friends or Lovers, that by eating the leaves of that Sage under which a Toade was found to abide, were both killed thereby, and therefore the Poet joyneth them both together to have wholesome drinke, saying; *Salvia cum ruta faciunt tibi pocula tuta.* Sage hath beene of good use in the time of the plague at all times, and the small Sage more especially (which therefore I thinke our people called Sage of Vertue) the juyce thereof drunke with vineger. The use of Sage in the Moneth of May, with butter, Parsley, and some salt, is very frequent in our Country to continue health to the body: as also Sage Ale made with it, Rosemary, and other good herbes for the same purpose, and for teeming women, or such as are subject to miscary, as it is before declared. Gargles likewise are made with Sage, Rosemary, Honisuckles, and Plantaine boyled in water or wine, with some Honey and Allome put thereto, to wash cankers, sore mouthes, and throats, or the secret parts of man or woman as need requireth. And with other hot and comfortable herbes to be boyled, to serve for bathings of the body or legges, in the Summer time, especially to warme the cold joynts or sinewes of young or old, troubled with the Palsie or crampe, and to comfort and strengthen the parts. It is much commended against the stitch or paines in the side comming of winde, if the grieved place be fomented warme with the decoction thereof in wine, and the herbe after the boyling be laid warme also thereto.

CHAP.

CHAP. XX.

Horminum. Clary.

THere are divers sorts of Clary, some manured onely, called Garden Clary, others growing wilde whereof I shall here shew you many, collected from sundry parts.

1. *Horminum sativum vulgare sive Sclarea.* Garden Clary.

Our ordinary Garden Clary hath foure-square stalkes, with broad, rough, wrinckled, whitish, or hoary greene leaves, somewhat evenly cut in on the edges, and of a strong sweet scent, growing some neare the ground, and some by couples upon the stalkes. The flowers grow at certaine distances, with two small leaves at the joynts under them, somewhat like unto the flowers of Sage, but smaller, and of a very whitish or bleack blue colour: the seed is brownish, and somewhat flatt, or not so round as the wild, the rootes are blackish, and spread not farre, and perish after the seed time: it is most usuall to sow it, for the seed seldome riseth of it owne shedding.

1. *Horminum Sativum vulgare sive Sclarea.* Garden Clary.

2. *Horminum genuinum sativum Dioscoridis.* The true garden Clary of *Dioscorides.*

This small Clary riseth up but with one square hairy stalke, about halfe a yard high, (as farre as ever I could yet observe) divided into severall square branches, whereon are set at every joynt two leaves one against another, which are somewhat broad and round, a little rugged like unto Horehound, but more greene than white, and of a reasonable good and small scent; at the toppes of the stalkes stand divers leaves, one row under another, of a very fine deepe purple violet colour, yet the lowest are paler than the uppermost, and seeme a farre of to be flowers, but nearer observed are discerned to bee but the toppe leaves, the flowers comming forth under them at spaces about the stalkes, of a whitish purple colour, smaller than any of the sorts of Clary, standing in brownish purple huskes, which after the flowers are past, while the seed ripeneth, turne themselves downeward, whereby the seed is lost, if it be not gathered in fit time: the roote is small and perisheth every yeare, requiring to bee new sowne in the Spring, for it seldome commeth of the seed that it shed, the Frosts and Winter most likely killing it.

3. *Horminum Syriacum.* Assirian Clary.

Assirian Clary is somewhat like unto Garden Clary, having a squire stalke about two foote high, very little hairy, divided towards the toppes into smaller branches, whereon doe grow at the joynts two rough leaves, those below being larger than those above, and somewhat smoother, as long and large as a mans hand, unevenly waved about the edges: the flowers are like unto Garden Clary, for the gaping forme, but smaller, and of a white colour, after which come small flat grayish seed, having red ribbes and black lines on them, when it is in flower, it smelleth pretty and sweet, but else not.

4. *Horminum Germanicum humile.* Low Germane Clary.

This small low Clary of *Germany* hath square and somewhat hairy stalkes, a cubit high, whereon doe grow large leaves, very like unto our garden Clary, two growing at a joynt on the contrary part thereof, one unto another, which are very rough and hairy, somewhat torne in on the edges, and deepely dented likewise, both lesse hoary, and of a lesse strong scent than it; the flowers grow at spaces about the stalkes to the toppes, bowing their spiky heads, which are of a purple colour, not much bigger than Lavender flowers, after which come small blackish seed; the root is of the thicknesse of a mans thumbe, blacke on the outside, with divers fibres set thereto, which perisheth not, but abideth many yeares.

5. *Horminum sylvestre vulgare.* Our ordinary wild Clary, or *Oculus Christi.*

The wild Clary (that groweth in many places of this Land) hath many square stalkes, two or three foote high, whereon doe grow broad darke greene leaves, dented about the edges, somewhat rugged and hard in handling, the flowers grow along towards the toppes of the stalkes, like unto the gaping or hooded flowers of the garden Clary, but smaller, and of a bleack blue colour, after which come round browniish seed: the roote is long, tough, and black, with divers fibres annexed to it, whereby it taketh fast hold of the ground: this hath a strong smell therein, but nothing so quick as our garden Clary. There is another kinde hereof, the toppes of whose stalkes are purplish, with flowers of a deeper purple colour, and somewhat larger leaves. And another likewise hereof, differing onely in that the tops of the stalkes are green, and not purple, the flower of a pale blue colour, and the leaves a little torne in on the edges.

6. *Horminum sylvestre incanum flore albo.* Hoary wild Clary with a white flower.

This white Clary differeth little from the former, but onely that this hath more hoary leaves than it, a little deeper indented into the edges, and the flowers are wholly white.

7. *Hormi-*

3. *Horminum genuinum ſativum Dioſcoridis.*
The true garden Clary of *Dioſcorides.*

4. *Horminum Germanicum humile,*
Low Germane Clary.

7. *Horminum ſylveſtre Italicum.* Italian wild Clary.

7. *Horminum ſylveſtre Italicum.* Italian wild Clary.

This Clary groweth with ſuch like ſquare high ſtalkes as the former, whereon grow in the like manner two leaves at a joynt, which are greene, but more rugged or fuller of wrinckles, & ſomewhat longer, ending in a longer point: the flowers likewiſe ſtand at the toppes of the ſtalkes and branches, in ſpaces or diſtances like the other, and hooded or gaping as they are, but ſmaller, and of a red colour: the ſeed is ſmall and blacke, ſtanding in the browniſh huskes, that conteined the flowers, in the like manner as all the reſt doe: the roote is living, and periſheth not after ſeed bearing.

8. *Horminum ſylveſtre Lavendulæ flore.* Wild Clary with Spike flowers.

This wild Clary groweth like unto the ordinary wilde Clary, with ſquare hairy ſtalkes as high as it, ſet with harder narrower and ſmoother leaves, deeplier endented about the edges, and rounder pointed, the flowers are much eſſe than they; and neither in bigneſſe or colour, much differing from the flowers of Spike or Lavender, growing in ſpaces as the reſt doe: the ſeed and rootes differ not, nor the ſmell hereof much, from the other wild indes.

9. *Horminum ſylveſtre ſalviſolium.* Sage leafed wild Clary.

The Sage leafed Clary hath low ſquare ſtalkes, not much above a foot and a halfe high, whereon grow two hard rugged leaves at a joynt, very like unto Sage leaves, but not hoary at all, of a darke greene colour, dented about the edges: the flowers grow at ſpaces round about the ſtalkes, of a faire purple violet colour in ſome, and more pale in others, or almoſt of an aſh-colour in others: the ſeed is black, and ſo is the root without, but yellow within, and abideth without periſhing, as moſt of theſe wilde kindes

8. *Horminum ſylveſtre lavendulæ flore.*
Wilde Clary with Spike flowers.

9. *Horminum ſylveſtre ſalvifolium.*
Sage leafed wilde Clary.

kindēs doē, thē ſmell hereof is morē pleaſing and leſſe heady than moſt of thē othērs.

There is another of this kinde that differeth chiefly from it, in that it groweth much higher, and hath thicker ſtalkes, larger and thicker leaves alſo, ſpotted with divers white ſtrakes, and ſpots therein, elſe in forme and colour both of leaves and flowers, there is no difference. *Salvifolium alterum.*

10. *Horminum ſupinum Creticum.* Low Candy Clary.

The low Clary of Candy hath divers leaves lying upon the ground, having every one a long foote-ſtalke ſomewhat ſmall toward it, and growing broader to the middle, ending in a ſmall point, and three or foure inches long, rough or rugged, or ſnipt about the edges: the ſtalkes are ſomewhat cornered, on which doe grow ſuch like leaves, ſet by couples as in the reſt, and towards the toppes white flowers, very like for forme and colour unto the flowers of Garden Neppe, yet without any ſweet ſcent to commend it.

11. *Horminum anguſtifolium laciniatum.* Torne and narrow leafed Clary.

This Clary is ſmall and low alſo, growing not above a foote high with his ſtalkes, which are ſquare and hairy, ſeldome divided into branches; the leaves that are ſet thereon by couples, as in the other ſorts, are ſomewhat ſmall and hairy, about one inch in breadth, and three in length, torne in deepely on the edges, eſpecially the loweſt; but thoſe that grow up higher are but onely waved, or groſely endented like the leaves of *Scolopendrium*, or Milt waſte, the flowers are ſmall and white, ſtanding in rundles about the toppes of the ſtalkes, ending in a long ſpike, which bendeth downēwards with the length: after which come black ſeed.

12. *Horminum luteum ſive Colus Iovis.* Yellow wilde Clary, or *Iupiters* diſtaffe.

This kinde of yellow wilde Clary, hath divers large hoary, or whitiſh greene leaves, dented about the edges, ſtanding upon long foote-ſtalkes, riſing from the roote, which are broader at the bottome, ſmoother alſo, and ſomewhat fat or clammy in handling, as the ſquare ſtalkes alſo are, and ſomewhat hairy, that ariſe from among them to the height of two or three foote, whereon are ſet by couples ſuch like leaves as grow below, but ſomewhat leſſer: at the toppes of the ſtalkes the flowers come forth, ſet at ſpaces, which are gaping, and like unto Clary, but of a faint yellow colour, after which come browniſh black ſeed; the roote is compoſed of many long ſtrings, whereby it taketh ſtrong hold in the ground, and abideth many yeares: both leaves and flowers ſmell ſomewhat ſtrong.

13. *Sclarea Æthiopica ſive Æthiopis laciniatis, & non laciniatis foliis.* Plaine and jagged Æthiopian Clary.

The nearer reſemblance that both theſe Ethiopian hearbs have, the one being ſet forth in my former Worke, under the name of Aethiopian Mullein, hath made me upon more mature cogitation and deliberation, to what *genus* or kind they ought to be beſt referred, rather to joyne them to this tribe of the Claries, and eſpecially to our common garden Clary, than to the *Verbaſca Mulleins*, as all Authors before me have done; for although they may be Wolleins in regard of their woollines, yet the whole forme and frame of leaves, flowers and ſeed are more like unto the garden Clary, as alſo the time of abiding and periſhing, as the Clary doth after ſeed-bearing, which few of the other wild Claries doe: and ſurely Mulleins they cannot properly be, in regard of their hooded or gaping flowers, which no Mulleins properly ſo called have, as I have ſhewed more largely in the Chapter of Sage going before, and in

12. *Horminum luteum sive Collis Jovis.*
Yellow wilde Clary,or *Iupiters* distaffe.

12. *Coli Jovis flores.*
The flowers thereof.

13. *Sclarea Aethiopica sive Aethiopis non laciniata.*
Plaine Aethiopian Clay.

in this. The description hereof is in this manner. Each of them have divers very large leaves spread upon the ground, every one nigh a foote long, and almost halfe a foote broad, ending in a point, in the one smooth, and in the other very much torne in on the edges on all sides, and dented thereabouts, both also of a whitish hoary greene colour, with much white hoarinesse or woollinesse upon them: in the middle whereof riseth up a hoary square stalke, divided toward the toppe into sundry small branches, whereon are set divers smaller leaves, and at the toppes divers large white hooded flowers, the one like the other, set at distances about the branches: after which come the seed, two alwayes joyned together in one seed vessell, which are browniſh, the one like the other also. The plants doe both die after seed time, which is usually the second yeare after the springing.

The Place.

The first is planted onely in Gardens, and so is the second in these Westerne parts of *Europe*, both on this side and beyond the *Alpes*, by the judgement of the best Authors. The third was first brought by *Aludanus* into these parts out of *Syria*. The fourth is wilde in many places of *Germany*. The fifth is wild in our owne Country, almost every where by the way sides, and so is the other of this kind with the purple stalkes, but the other with greene stalkes groweth in *Hungary*, and divers other places in *Germany*. The sixth *Clusius* first found in the Medowes neare *Sopronium* in *Hungary*. The seventh was sent out of *Italy*, and as it is likely is originally of that Country. The eighth grew with *Clusius* of the seed hee received out of *Spaine*, but yet as he saith he found it likewise neare the riding place at *Greenewich*. The ninth groweth in *Hungary* almost every where in their Vineyards, and by the way sides. The tenth grew of the seed was sent out of *Candy*. The eleventh both at *Mompelier* and in *Candy*. The twelfth

through-

throughout al *Hungary* in great plenty; and in *Austria*, & in many other places. The last as *Dioscorides* saith, on Mount *Ida* in *Phrygia*, and in *Messenia*, but of late dayes gathered from some of the Hills of *Greece* and *Illyria*, that are neare the Sea, but is chiefly kept in Gardens.

The Time.

They all flower in the Summer Moneths of June and July, yet some a little later than others, and their seed is ripe in August, or thereabouts.

The Names.

These are called in Greeke ὁρμίνον ἀπὸ τοῦ ὁρμᾶν *quod πρὸς τὴν συνουσίαν παροξυνᾷ ad venerem stimulat*, as *Dioscorides* saith: for ὁρμᾶν signifieth *impetu quodam ferri quemadmodum in venerem proni*: becaufe it provoketh to venery. And *Gaza* that tranſlated *Theophraſtus* into Latine, tranſlateth the word into *Geminalis*, from the fruitfulneſſe it cauſeth moſt likely in bearing twinnes, in Latine alſo *Horminum*. We call it in Engliſh Clary, of the Latines *Scarlea*, or *Sclarea*, which as *Anguillara* ſaith, is ſo called of the Ethiopians, and is alwayes taken for our ordinary Garden Clary, *quaſi* Cleere eye. The firſt ordinary Clary is *Cluſius* his firſt kinde of wild Clary: with *Matthiolus*, *Camerarius*, *Geſner* and others called Sclarea and *Sclarea hortenſis*, with *Lobel Scarlea*; with *Tragus Gallitricum ſativum*, and with *Lugdunenſis* and *Gerard Gallitricum*, *Horminum*, and *Orminum* with *Cordus* and others: but *Ruellius* and *Fuchſius* take it to be the Garden *Horminum* of *Dioſcorides*, which *Matthiolus* contrarieth, and *Dodonaus* taketh it to be *Horminum ſylveſtre* of *Dioſcorides*, and *Dalechampius* upon *Pliny*, *Scordium alterum Plinij*: by *Fracaſtorius Sideritis Heraclea*; of *Dodonaus* and *Durantes Orvala*, and is called likewiſe by ſome others *Centrum Galli*, and *Matriſalvia*. It is taken of ſome to be the *Scoparia* whereof *Pliny* maketh mention among the *Sideritides*, and ſome his *Tuſſilago altera*; others take it to be *Phorbion* of *Galen* or *Baccharis* of *Dioſcorides*, & ſome *Alectorolophus* of *Pliny*: *Pliny* as I ſhewed you before in the Chapter of Horehound, miſtaketh every where the Greeke word πράσιον which is Horehound, as if it were πράσον *porrum* Leekes, for here he ſaith that Clary hath the leaves of Leekes, reciting the words of *Dioſcorides*, when as he ſhould have ſaid like unto Horehound. The ſecond kinde here ſet downe, is called by *Matthiolus Horminum domeſticum*, and by *Lacuna*, *Anguillara*, *Dodonaus*, *Lobel*, *Caſalpinus*, *Caſtor Durantes*, *Lugdunenſis*, *Camerarius*, *Tabermontanus*, and *Bauhinus*, *Horminum* or *Horminum ſativum*, or *Horminum verum*, (although *Gerard* againſt the authority of ſo many worthy and learned Writers ſaith, they are deceived without ſhewing his reaſons how, and calleth it wild Clary with purple leaves) in Engliſh The true Garden Clary of *Dioſcorides* and others. The third is called *Horminum Syriacum*, both by *Camerarius* and *Bauhinus*, and was brought out of *Syria* by the name of *Biſarmar* or *Biſermas*, and called alſo *Aman* by ſome, in Engliſh Aſſirian Clary. The fourth is called by *Cluſius* in his Pannonick obſervations, *Horminum ſylveſtre latifolium Pannonicum primum*, and is his third *Horminum ſylveſtre*, in his Hiſtory of plants: in Engliſh Germany Clary. The fifth is our ordinary wild Clary called *Oculus Chriſti*, and *Horminum ſylveſtre vulgare*: of *Fuchſius*, *Cordus*, *Geſner*, *Lonicerus*, *Turner*, *Lobel*, *Camerarius*, *Lugdunenſis*, *Cluſius*, and others. *Gerard* his figure of *Colus Iovis* is the true figure of this wilde Clary. *Brunfelſius* calleth it *Salvia agreſtis*: and *Beſler* that ſet forth the Garden of *Eyſtet*, *Salvia agreſtis flore purpureo*. *Tragus* and *Geſner Salvia ſylveſtris & vera*. It is likely alſo to bee *Dodonaus* his fourth *Orvala ſylveſtris*. *Caſalpinus* ſaith, it is the common *Gallitricum* in *Italy*. *Tabermontanus* calleth it *Sclarea ſylveſtris*. And ſome would make it to be *Pliny* his *Alectorolophus*, and others to be a kinde of *Verbenaca recta*, upright Vervaine: and of *Bauhinus Horminum pratenſe foliis ſerratis*. The ſixth is called by *Cluſius Horminum ſylveſtre 4. niveo flore*, and is the other ſort of his fourth wild kinde in his Hiſtory of plants. *Gerard* his figure of *Horminum ſylveſtre*, is the true figure of this plant. *Tabermontanus* calleth it *Sclarea ſylveſtris flore albo*, and the great Booke of *Eyſtetenſis Salvia agreſtis flore albo*, in Engliſh hoary wild Clary with a white flower. The ſeventh is the fourth ſort of the fourth kinde of wild Clary by *Cluſius*, of *Bauhinus Horminum majus foliis profundius inciſis*: in Engliſh Italian Clary with a red flower. The eight is *Cluſius* his firſt ſort of the fourth kind of wild Clary which hee had from *Spaine* by the name of *Baccharis*, and groweth at *Greenewich* alſo. *Tabermontanus* calleth it *Sclarea Hiſpanica*, and *Gerard Gallitricum alterum*, of *Bauhinus Horminum ſylveſtre lavendulæ flore*: and *Cluſius* ſaith it is the *Sideritis quernifolio* of *Lugdunenſis*, in Engliſh wild Clary with ſpike flowers. The ninth is the *Horminum ſylveſtre* of *Matthiolus*, *Caſalpinus*, *Caſtor Durantes* and *Lugdunenſis*, *Tragus*, calleth it *Salvia ſylveſtris adulterina*, of *Lobel* it is called *Verbaſcum nigrum ſalvifolium purpureo flore*: and ſo alſo of *Lugdunenſis*, it is *Dodonaus* his *Orvula altera*, and *Cluſius* his fift kinde of wilde Clary, whereof there are two ſorts, the one greater than the other, as is ſet downe in the deſcriptions. *Bauhinus* calleth them *Horminum ſylveſtre ſalvifolium majus & minus*. The tenth is *Cluſius* his ſixth kinde of wilde Clary which he called *Horminum minus ſupinum Creticum*, and in Engliſh Candy Clary. The eleventh is called by *Bauhinus Horminum anguſtifolium laciniatum & foliis Scolopendriæ* at *Mompelier*, it was as hee ſaid, ſent him likewiſe by the name of *Horminum Creticum album*. The twefth is called by *Lobel*, *Cluſius*, *Camerarius*, *Lugdunenſis*, *Eyſtetenſis*, and *Gerard Colus Iovis*. *Dodonaus* calleth it *Orvala tertia*. *Caſalpinus Melinum*, *Dalechampius* and *Lugdunenſis Galeopſis lutea*, and is *Cluſius* his ſecond wild Clary. Some call it *Camphorata*, ſome *Sphacelus*, and others thinke it to be *Stachys Plinij*. *Bauhinus* calleth it *Horminum luteum glutinoſum*. Some others alſo call it *Horminum luteum*, and *Horminum Tridentinum*. The thirteenth is of two ſorts, the one called *Æthiopis*, and the other *Æthiopis altera*, and by *Bauhinus* who onely hath written thereof, *Æthiopis laciniato folio*, which I have called in Latine *Sclarea Æthiopica laciniata*, as I doe the other *Æthiopis ſive Sclarea Æthiopica non laciniata*, for the reaſons before alleaged: in Engliſh Plaine and jagged Ethiopian Clary: The Italians call Garden Clary *Sclarea*, *Sclareggia*, *& Schiaria*, and *herba di S. Giovanni*, and thereon in Latine *herba S. Ioannis*, and the white Clary *Horminio*: the French call the garden kinde *Orvale & toute bonne*, and the wilde ſort *Orvale Sauvage*: the Germanes call the one *Scarlack*, and the other wilder *Scarlack*: the Dutch *Scarley*, and wild *Scarley*: in Engliſh Clary, and wild Clary, and *Oculus Chriſti*.

The Vertues.

Our garden Clary (as I ſaid before) that *Dodonaus* thinketh to be the right wilde Clary of *Dioſcorides*, becauſe it is of greater ſcent and vertue than any of the other ſorts, which are called wild Clary, for *Dioſcorides* ſaith that the wild kind is more effectuall than the tame or garden kinde) is of moſt uſe in all Chriſtian Countries, I thinke for any inward cauſe, for the true kinde of *Dioſcorides*, and the reſt of the wild kindes here ſet downe are leſſe uſed, as I thinke, and to leſſe effect: but the ſeed thereof chiefly, as well as of our garden Clary, is uſed to be put into the

eyes

eyes to cleare them from any moates, or other such like things are gotten within the liddes to offend them, as also to cleare them from white or red spots in them. The Muccilage of the seed of either sort made with water and applyed to tumors or swellings, disperseth and taketh them away, and also draweth forth splinters, thornes, or other things gotten into the flesh, the leaves used with vineger either by it selfe, or with a little honey, doth helpe hot inflammations, as also Biles, Felons, and the hot inflammations that are gathered by their paines, if it be applyed before they be growne too great. The powder of the dryed leaves put into the nose provoketh neesing, and thereby purgeth the head and braines of much rheume and corruption. It provoketh to venery, either the seed or the leaves taken in wine. It is in much use with men or women that have weake backes, to helpe to strengthen the reines, either used by it selfe, or with other hearbes that conduce to the same effect, and in tansies often, or the fresh leaves fried in butter, being first dipped in a batter of flower, egges, and a little milke, served as a dish to the Table, is not unpleasant to any, but specially profitable for those, for whom, as I said, it is convenient. *Lobel* and *Pena* saith, that some Brewers of Ale and Beere in these Northerne regions (I thinke they meane the Netherlands, for so *Dodonæus* meaneth) doe put it into their drinke to make it the more heady, fit to please drunkards, who thereby according to their severall dispositions, become either dead drunke, or foolish drunke, or madde drunke. It bringeth downe womens desired sickness, and expelleth the secondine, or after birth. It is used in *Italy* to bee given to women that are barren through a cold and moist disposition, to heate and dry up that moisture, and to helpe them to be fruitfull, and stayeth the whites, it helpeth also a cold stomacke oppresse, with cold flegme, purgeth the head of rheume and much corruption, the overmuch use hereof offendeth the head, and is hurtfull for the braine and memory. Yellow Clary, or *Iupiters* distaffe is hot and drying, and the juyce is of especiall good use to clense and heale foule ulcers. The Ethiopion Clary is commended for the roughnesse of the throat, and to helpe to expectorate the rotten and purulentous matter in the Plurefie, or in other coughes, either the decoction of the roote drunke, or made into an Electuary with honey. *Dioscorides* saith also, it is good for those that are troubled with the Sciatica.

CHAP. XXI.

Verbascum. Mullein.

MAny of the *Verbasca* Mulleins that are properly so called, doe grow wild in divers and severall places in our owne Country, and therefore are not usually brought into gardens, yet becaufe some of them are more rare, and seldome met withall, I thinke it not amisse to shew you all of them here, with those also that have beene sent us from beyond Sea.

1. *Verbascum album vulgare sive Tapsus barbatus communis.* Common Mullein.

1. *Verbascum album vulgare sive Tapsus barbatus communis.* Common Mullein.

The common white Mullein hath many faire large woolly white leaves lying next the ground, somewhat longer than broad, pointed at the ends, and as it were dented about the edges: the stalke riseth up to bee foure or five foote high, covered over with such woolly leaves as the lowest, but lesser, so that no stalke can bee seene for the multitude of leaves thereon up to the flowers, which come forth on all sides of the stalke, without any branches for the most part, and are many set together in a long spike, in some of a gold yellow colour, in others more pale, consisting of five round pointed leaves, which afterwards give small round heads, wherein small browniſh seed is contained: the roote is long, white and wooddy, perishing ever after it hath borne seed.

2. *Verbascum Danicum humile.* Dwarfe Mullein of Denmarke.

This small Mullein groweth like the ordinary Mullein with yellow flowers, having such like woolly leaves growing thick together at the bottome, but much smaller: the stalke riseth not up above a foote high at the most, set with some leaves thereon from the bottome: the flowers are very large for the proportion of the plant, and yellow like the ordinary, differing in no other thing from it.

3. *Verbascum mas foliis longioribus.* White Mullein with long leaves.

This Mullein hath many thicke white woolly leaves lying upon the ground, like unto the common white Mullein, but that they are somewhat narrower, and thereby seeming longer: from among which riseth up a round hard woolly stalke, about three foote high, set with the like leaves, as grow below, but smaller unto the middle thereof, where it beginneth to give flowers, and in some plants and places to divide it selfe into branches, whereon are set many flowers, growing round about the stalkes or branches thicke together, consisting every one of five round pointed leaves, of a whitish colour, and in some plants and places more yellow, with a few yellow threads in the middle: in whose places afterwards come round hard seed vessels, very like

unto

unto the ſeed veſſell of Foxe-gloves, or Finger-flowers, but not ſo long, wherein is contained very ſmall and browniſh ſeed: the roote is ſomewhat long, thicke and hard, but not wooddy, with divers long fibres ſet thereunto.

4. *Verbaſcum femina flore albo vel pallido.* Sweet white Mullein.

The ſweet white Mullein hath white hoary and woolly leaves like the other, but longer, narrower, and more indented about the edges, and not ſo many growing below on the ground; the ſtalke is woolly, and riſeth higher than the former, having greater flowers growing at the toppes, much ſweeter alſo than it, and of a white colour; wherein ſometimes ſome reddiſh lines are to bee ſeene therein: in other things this differeth not from the former.

5. *Verbaſcum nigrum vulgare.* Ordinaty black Mullein.

Our ordinary black Mullein hath leaves nothing woolly or hairy, but of a darke greene colour ſomewhat large, longer pointed, and dented unevenly about the edges, the ſtalke riſeth almoſt as high as the common white Mullein, and uſually parted at the toppes into ſome branches, bearing long ſpiky heads of gold yellow flowers, and in ſome tending to purple like the other, with ſome threads in the middle, which are reddiſh in ſome, and purpliſh in others: the ſeed is like the other: the roote periſheth after ſeed time as the other doth: the whole plant hath a ſtronger or more grievous ſmell in it than the white kinde.

5. *Verbaſcum nigrum vulgare.* Ordinary blacke Mullein.

6. *Verbaſcum nigrum odoratum.* Sweete black Mullein.

This black Mullein hath foure or five leaves lying upon the ground ſomewhat long and broad, ending in a long point, ſomewhat hard, and as it were crumpled, of a darke greene colour, without any manifeſt dents or notchings about the edges: from among which riſeth up a round hard greene ſtalke three foote high, oftentimes without any branches, but more often divided into two or three branches, whereon grow many yellow flowers ſmaller and thicker ſet together, that is, two or three at a place; than in any other, and ſmelling pretty ſweet, which fall away without giving of ſeed in the moſt that I have obſerved, or very ſeldome bearing ſmall ſeed in round ſmall heads: the roote is ſomewhat great and long, with divers fibres annexed unto it, and periſheth not, but abideth many yeares.

7. *Verbaſcum laciniatum.* Iagged Mullein.

This jagged Mullein hath large and long leaves unevenly cut in on the edges, ſeeming to bee waved, ſomewhat like the leaves of Horned Poppy, of a darke greene colour, and a little hairy withall: the ſtalke is ſmall and greene, but high, and branched diverſly, bearing ſmaller yellow flowers, and more ſparſedly ſet than in the other blacke ſorts, the ſeed and roote are not unlike the others. *Lobel in Adverſaria* ſhould ſeeme to ſet out this plant as *Bauhinus* and other doe intimate, and as himſelfe doth demonſtrate it to be *Verbaſcum aliud Matthioli*: but his deſcription both of the order, forme, and colour of the flowers in his, is much differing from this: for he ſaith the flowers are ſet under the ſtalkes, as Sage or wild Clary are, and of the ſame forme and colour, and thereupon giveth it the title of *Verbaſcum pupureum Erucæfolium*. as it is to be amended: and in his obſervations, *Verbaſcum ſylveſtre ſalvifolium laciniatum.*

8. *Verbaſcum Salvifolium exoticum Ciſtoides.* Sage-leafed Mullein.

This ſtrange Mullein hath from a wooddy roote, divers white hoary leaves like unto Sage leaves, but whiter, thicker, and rounder pointed, every one having a long foote ſtalke, from among which riſe up divers hoary white round ſtalkes, ſet here and there with ſuch like whitiſh leaves, but a little ſmaller and narrower: at the toppes of the ſtalkes ſtand divers flowers, one above another, conſiſting of five round pointed leaves, of a yellow colour, with a few reddiſh threads thereon.

9. *Verbaſculum foliis Salviæ tenuifoliæ Syriacum.* Small Sage-leafed Mullein of Syria.

Although I never ſaw this plant, yet becauſe *Lobel* who firſt ſet it forth, entituleth it *Phlomos*, and placeth it among the *Verbaſca* Mulleins, I can doe no leſſe then ſhew you it alſo with them, with this my note of *Verbaſculum*, rather than *Verbaſcum*, from the poſture of the flowers differing from all the other. Take therefore this ſhort deſcription of *Lobels*, untill a more exact may be given. It hath long, narrow, and pointed leaves like unto the leſſer, or Pigge Sage, all hoary as the ſquare ſtalkes are, which have alſo much woollineſſe on them: the flowers are yellow, many ſtanding together, at their toppes ſomewhat like to thoſe, of the wild Campion, or Flower of *Briſtow*, called by divers Noneſuch.

The Place.

The firſt groweth by the ſide wayes and Lanes in many places in this Land: the ſecond in the fields betweene *Cronenberg* and *Hafnia*, neare *Elſenore* in *Denmarke*, there obſerved by *Lobel*. The third and fourth doe grow but in ſome places of our owne Country, ſo that one ſhall hardly finde a plant in a great way. The fift in many places likewiſe, both in *Kent*, *Surrey*, *Eſſex*, and elſewhere, The ſixt is ſometimes alſo to be found wild abroad, but

7. *Verbascum laciniatum.*
Iagged Mullein.

8. *Verbascum Salvifolium exoticum Cistoides.*
Sage leafed Mullein.

9. *Verbasculum foliis Salviæ tenuifoliæ Syriacum.*
Small Sage leafed Syrian Mullein.

yer ſcarſely to be mēt with, and indeed unleſſe one well exerciſed in the knowledge of plants, doe light upon it, and know it, it will ſcarſe be regarded of a great many others. The ſeventh *Lobel* ſaith he found neare the ruines of an old Church, by the Bathes at Bathe in *England*. The eight is a ſtranger to us, we have onely the knowledge that it groweth at *Padoa*, or thereabouts, in a garden of a Signor *Clariſſimo* of *Venice*, called *Contareni*. And the laſt is a greater ſtranger than it.

The Time.

All theſe Mulleins doe flower about Iuly, except the eighth and the laſt of whoſe time we are as yet ignorant, but hope ſhortly to be ſo well informed that we may informe others.

The Names.

Verbaſcum is called in Greek φλόμος from φλέγω *uro* & φλὸξ φλογὸς *flamma*, for that it ſerved as a weeke to put into lampes to burne; and of the Latines *Candela regia* and *Candelaria*, becauſe the elder age uſed the ſtalkes dipped in Suet to burne, whether at Funeralls or otherwiſe, and ſo likewiſe the Engliſh name Higtaper, for Hightaper, the h being left out, uſed in the ſame manner, as a Taper or Torch. It hath alſo ſome other names in Latine, as *Thapſus Thlapſus*, and *Tapſus barbatus*, and *Lanaria*, in Engliſh alſo ſome call it Torches, ſome Bullockes longwort, ſome Hares beard, and ſome *Iupiters* ſtaffe: The firſt is called *Verbaſcum mas*, and *Verbaſcum mas latifolium* of moſt Writers. The ſecond hath no other name than is in the title. The third is called by ſome *Verbaſcum mas* and by ſome *Fœmina & e converſo*, *Lobel* calleth it in his obſervations *Verbaſcum fœmina*, and in his *Icones*, he calleth it *Phlomos alter*, *Verbaſcum lychnite Matthioli*: of *Fuchſius* it is called *Verbaſcum candidum mas*: of *Dodonæus* in French, of *Turner* and *Geſner*, in *hort.* it is called *Verbaſcum album fœmina*: and of *Dodonæus* in Latine *Verbaſcum anguſtius*; in Engliſh, white Mullein with long leaves. The fourth is called by *Lobel Tapſus barbatus maximus odoratus meridionalium* (and not *Septentronalium* as *Bauhinus* hath it)

it) *flore albo*, in Englifh Sweet white Mullein. The fift is called *Verbafcum nigrum* of all others. The fixt is not fet forth by any other Author that I can finde than by *Bauhinus*, who onely remembreth it, as a kind of his firft yellow *Blattaria*, or peradventure that *Blattaria* of *Plmy* with many branches: for the common blacke wilde Mullein is not this, but another plant, and therefore the name in the title is fufficient for it. The feventh is called by *Matthiolus Verbafcum aliud*, and *Lobel* fo faith alfo, and may be his *Erucæfolium*, or *Salvifolium laciniatum*, as I faid in the defcription. *Lugdunenfis* calleth it *Verbafcum laciniatum Matthioli*, and *Camerarius Verbafcum folio papaveris cornuti*. The eighth *Lobel* calleth *Verbafcum fylveftre falvifolium exoticum*, and *Bauhinus Verbafcum fubrotundo falviæ folio*, and faith he had it out of *Contarenus* his garden, by the name of *Verbafcum Ciftioides*: in Englifh I have called it Sage, leafed Mullein, becaufe I judge it may be a Mullein, in regard the flowers are *Ciftus* fafhion which is anfwerable to the reft of the right Mulleins. The laft is called by *Lobel Phlomos lychnitis altera Syriaca*, *Lugdunenfis* & *Bauhinus*, *Verbafcum folio Salviæ tenuifoliæ*. It is called by the Italians *Verbafco*, and *Taffo barbaffo*: by the Spaniards *Verbafco*: by the French *Bouillon*: by the Germanes *Wulkraut*: by the Dutch *Woolle cruydt*: and we in Englifh Mullein, &c. as is aboveſaid.

The Vertues.

Mullein is commended by *Dioſcorides* againſt laskes and fluxes of the belly, if a ſmall quantity of the root be given in wine: the decoction thereof drunke is profitable for thoſe that are burſten, and for thoſe that have crampes and convulſions; and likewiſe for thoſe are troubled with an old cough: the decoction thereof gargled, eaſeth the paines of the toothache. If the ſeed and flowers hereof, together with the flowers of Camomill, and the powder of dryed Venice Turpentine, be caſt upon a few quick coales in a chafing-diſh, or ſuch like other thing ſet into a Cloſe-ſtoole, and the party ſitting bare over the fumes, that is troubled with the piles or falling downe of the fundament, or any the paines of that place, doth give much eaſe and helpe: as alſo for thoſe that have a great deſire to goe often to the ſtoole and can doe nothing, eſpecially to ſuch as have the bloody Flixe. An oyle made by the often infuſion of the flowers, is of very good effect for the piles alſo. The decoction of the roote in red wine, or in water, if there be an ague, wherein red hot ſteele hath beene often quenched, doth ſtay the bloody flixe. The ſame alſo openeth the obſtructions of the bladder and reines when one cannot make water. A decoctian of the leaves hereof, and of Sage, Marjerome, and Camomill flowers, and the places bathed therewith, that have their veines and ſinewes ſtarke with cold, or with crampes, doth bring them much eaſe and comfort. It is ſaid that there is not a better remedy found out for the hot gowt then to drinke three ounces of the diſtilled water of the flowers every morning and evening for ſome dayes together. *Arnaldus* ſaith, that if two drams of the juyce of the rootes of Mullein before it beare ſtalke, be taken in a draught of Muſcadine at every time, for three or foure times one after another, an houre before the fitt of the quartane ague commeth upon any, it ſhall ſurely helpe them. The juyce of the leaves and flowers being laid upon rough warts, as alſo the powder of the dryed rootes rubbed on, doth eaſily take them away, as *Matthiolus* ſaith, although it will doe no good to thoſe that are ſmooth: and that the powder of the dryed flowers is an eſpeciall remedy for thoſe are troubled with belly aches, or the paines and torments of the collick. The decoction of the root hereof, and ſo likewiſe the leaves is of great effect to diſſolve the tumors or ſwellings, as alſo the inflammations of the throat. The ſeed and leaves boyled in wine, and after laid to any place that is prickt with a thorn, hath a ſplinter, or ſuch like thing got into the fleſh, draweth thē forth ſpeedily, eaſeth the paines, and healeth them alſo. The leaves being bruiſed wrapped in double papers, and covered with hot aſhes and embers, to bake a while, and then taken forth and laid warme upon any botch or boyle that hapneth in the groine or ſhare, by filthineſſe or otherwiſe, doth diſſolve and heale them. The ſeed hereof bruiſed, boyled in wine, and laid upon any member out of joynt after it is ſet in againe, taketh away all ſwellings and paines thereof. The leaves and toppes of the leſſer white Mullein boyled in water, and laid upon the places pained with the gowt, doth wondrouſly eaſe them. The diſtilled water of the flowers hereof dropped into the eyes, taketh away the watering of them, as alſo taketh away that redneſſe of the face, is called in Latine *Gutta Roſacea*, and in Engliſh, the Roſe, if it bee waſhed therewith often, having a little Camphire diſſolved in it. The water is likewiſe uſed againſt running or creeping ſores, or any other deformity of the skin. The flowers bruiſed and made up into an oyntment with the yolke of an egge, a few crummes of bread, and the juyce of leekes laid upon the painefull piles when they ſwell, doth eaſe the paines exceedingly, and helpe to bring them into their right place. Country men doe often give their Cattell that are troubled with coughes, the broth of the hearbe to drinke with good ſucceſſe, as alſo to thoſe that by caſualty, or through looſeneſſe and weakeneſſe, voyd out their guts behind them. The leaves alſo a little bruiſed, and laid or bound to a Horſe foote that is grievouſly prickt with ſhooing, doth wonderfully heale it in a ſhort ſpace *Dioſcorides* ſaith it was a report in his time, that if dryed figges were lapped in the leaves of female Mullein. which is that with large and white flowers, they will not putrifie at all. The golden flowers of the blacke Mullein boyled in lye, dyeth the haires of the head yellow, and maketh them faire and ſmooth. The leaves boyled in wine and a little honey put to it, is fit to waſh and cleanſe foule ulcers, and boyled in vineger, doth helpe greene wounds. Taken alſo with Rue it is a remedy againſt the ſtinging of Scorpions.

CHAP. XXII.

Blattaria. Moth Mullein.

Blattaria is certainely a kind of black Mullein, and therefore to follow next, whereof there are ſundry varieties as ſhall be ſhewed.

1. *Blattaria lutea odorata.* Sweet yellow Moth Mullein.

This ſweet Moth Mullein hath ſundry grayiſh greene leaves lying on the ground, ſomewhat long and broad, and little or nothing ſnipt about the edges, but pointed at the ends: the ſtalkes are two or three foote high, with ſome ſmaller leaves on them, branching forth from the middle upwards into many long branches, ſtored with many ſmall pale yellow flowers, of a ſmall ſweete ſcent, yet ſtronger than in the others, and ſeldome giveth ſeed, but abideth in the roote, which few or none of the other doe.

1. *Blattaria lutea odorata.*
Sweet yellow Moth Mullein.

Flora viridi.

3. *Blattaria flore luteo.*
Yellow Moth Mullein.

5. *Flore alio.*
and White.

Flore cæruleo.

2. *Blattaria lutea major sive Hispanica.* The greater yellow Moth Mullein.

This Spaniſh kinde hath longer and greener leaves than the former, rounder alſo at the ends than the next that followeth: the ſtalke is ſtronger and higher than it alſo, whereon beſides the leaves grow toward the toppe many gold yellow flowers, conſiſting of five leaves a piece, as all the reſt doe, not ſo thicke ſet as the former, but a good deale larger, with ſome purpliſh threads in the middle, formed ſomewhat like unto a flye, after which come in their places round heads, two or three, or more ſometimes together, but moſt uſually one, wherein lye ſmall dusky ſeed: the roote is not great, or full of fibres, but periſheth every yeare, after it hath given ſeed, except that it abide ſometime in a milde winter.

3. *Blattaria lutea minor sive vulgaris.* The ordinary yellow Moth Mullein.

This yellow Moth Mullein (that is moſt frequent in our gardens) hath ſuch like long leaves as the laſt, but narrower and roundly dented about the edges: the ſtalke is uſually ſingle, and without branches, whereon ſtand ſuch like gold yellow flowers, but leſſer, with the like purple threads in the middle: the ſeed veſſels are ſingle, and the ſeed ſmall, both ſo like the laſt, that they cannot be diſtinguiſhed: the roote likewiſe periſheth every yeare after ſeed time.

4. *Blattaria flore luteo purpurascente.* Cloth of Gold Moth Mullein.

The greateſt notes of difference betweene this and the laſt deſcribed, conſiſteth firſt in the flower, which is a yellowiſh purple, or the ground yellow, overſhadowed with a bright crimſon colour, which is of much delight: the threads in the middle are not ſo purple red as in the former, but neare unto the colour of the flower: ſecondly, it ſeldome beareth ſeed: thirdly, it doth longer abide in the roote, although in a hard Winter it will periſh like the two laſt: this out of doubt hath beene raiſed from the ſeed of the laſt. *Lobel* ſetteth forth a ſort hereof with greene flowers which I never ſaw.

5. *Blattaria flore albo.* White Moth Mullein.

The leaves of this Moth Mullin are of a little freſher green colour, and ſharper dented about the edges, in other things it differeth not from the ordinary yellow, but that the flowers are pure white, and hath the like purple threads like flyes creeping up as it were in the middle of the flowers.

6. *Blattaria flore purpureo.* Purple Moth Mullein.

The leaves of this purple Moth Mullein are broader, ſhorter, and of a grayer greene colour than the former, and without any denting for the moſt part, yet pointed at the ends: the ſtalke riſeth not ſo high as the former, but ſometimes branched, bearing ſuch like flowers: of a faire deepe blue or purple colour, tending to redneſſe, the threads in the middle of the flower being yellow: the ſeed veſſels hereof are ſmaller than in the former: the roote is long, thick, and blackiſh on the outſide, abiding ſundry yeares, and riſeth plentifully from the ſhedding of it owne ſeed.

The blue Moth Mullein differeth in nothing from the laſt, but in the colour of the flower, which is of a paler bluſh violet colour.

7. *Blattaria Cretica incana rotundo laciniato folio.* Hoary Candy moth Mullein with round torne leaves.

This Candy Mullein hath round hoary ſtalkes, riſing up to the height of a foot and a halfe, whereon are ſet divers leaves without order, which are long, and as it were torne into ſmaller leaves, for every leafe hath ſmall pieces of leaves, ſet on each ſide of the middle ribbe thereof, ſeparated from the end leafe, which is ſomewhat broad, round, and a little dented about the edges, the whole leafe is very hoary, covered as it were with a woolly downe (eſpecially in the hot Country where it groweth, but here it is hoary, white, and not ſo woolly) from the middle of the ſtalke upwards it breaketh forth ſometimes into branches, whereon doe grow yellow flowers, very like unto the flowers of the yellow *Blattaria*, but

6. *Blattaria flore purpureo.*
Purple Moth Mullein.

7. *Blattaria Cretica incana rotundo laciniato folio.*
Hoary Candy moth Mullein with round pointed leaves.

but ſmaller: after which comẽ ſmall round heads, containing ſmall browne ſeed, both heads and ſeed being ſmaller than thoſe of the other Blattaries: the root periſheth with us at the firſt approach of winter, and ſeldome giveth ripe ſeed, becauſe it flowreth ſo late, whereby we are to ſeeke of new ſeed every yeare.

8. *Blattaria Cretica incana longiore laciniato folio.* Hoary Candy Mullein with long leaves.

This other Candy Mullein is in manner of growing, hoarineſſe of leaves, yellow colour of the flowers, and in other things like unto the former, the onely difference, in this from the other is, in that the end leafe hereof upon every ſtalke is more long than the former, (which is as broad as long, making it ſeeme almoſt round) and the heads of ſeed are ſomewhat longer alſo.

9. *Blattaria altera folio rotundo flore luteo.* Round leafed Moth Mullein.

The firſt leaves of this Mullein are ſomewhat long and pointed at the end, but thoſe that are ſet upon the ſtalkes, are all round pointed, and not ſo long every one, compaſſing the ſtalke at the bottome of the leafe, and are of a darke greene colour on the upperſide, and grayiſh or hoary underneath: at the ſetting on of every leafe unto the ſtalke, come forth likewiſe two other ſmaller leaves, and from the middle of them ſhoot forth two or three flowers upon ſmall long foot-ſtalkes, which are yellow, with purple threads in the middle of them, like unto the other Blattarias: the heads and ſeed are ſmall like unto the other, and the roote periſheth after ſeed time, as moſt of them alſo doe, and often groweth by the ſhedding of it owne ſeed.

10. *Verbaſcum fruteſcens ſpinoſum, ſive Blattaria Cretica ſpinoſa.* Thorny Moth Mullein of Candy.

I was in ſome doubt with my ſelfe whether this plant ſhould belong to the *Verbaſca*, as ſome would have it, or to the Blattaries, but finding it more agreeing with theſe than with them, although it bee wooddy or ſhrubbie, I have here placed it in his proper place, as I thinke. It riſeth up with many ſmall hoary hard and wooddy branches, ſpreading round about the roote, not above a foote and a halfe high, dividing it ſelfe into many ſlender branches, which are tender and greene while they are young, but quickly after turne hard and hoary, every ſprigge of the branches ending in a ſharpe thorne; the leaves are many ſet together at ſpaces of the ſtalkes and branches, ſomewhat like unto the leaves of the Sea-ſtockgilloflower; but much ſmaller and ſhorter, a little torne about the edges, but towards the toppes ſmaller and ſmaller, and not cut in at all, and of an hoary colour: towards the tops of the branches alſo come forth many flowers, diſperſedly ſet thereon (and not as the *Blattaries* or *Verbaſcas* doe, in a long ſpike) but conſiſt of five round pointed yellowiſh leaves, with ſome purple threads in the middle of them, like unto the *Blattaria*: after which come ſuch like round hard heads, containing ſmall browne ſeed like unto them alſo: in *Candy* and other warme Countries, when it is growne old, it beareth a great buſhy and thorny head, as it is here expreſſed: the roote is hard, long and wooddy, ſpreading much under ground, and abideth many yeares in the naturall places of thoſe warme Countries where it groweth, but muſt have ſome coverture or defence with us againſt the extremities of our Winters, elſe it will hardly endure.

10. *Blattaria Cretica ſpinoſa.*
Thorny Moth Mullein of Candy.

10. *Summitates Blattariæ ſpinoſa cum jam adoleverit planta.*
The tops of the thorny moth Mullein when it is grown old.

The Place.

The firſt, third, and fift ſorts have beene found in ſeverall places of our Land, as well in *Kent* on *Black-heath*, and neare *Detford*, as in other places: the other 3. of the firſt ſixe ſorts are onely nurſed up with us in gardens, their naturall place being not knowne, but the other ſorts that follow, except the ninth, doe grow in *Candy*, and from thence have beene ſent by *Honorius Bellus*, an Italian Phyſition, in his time abiding in *Candy*, to divers perſons in *Italy*, as to *Iohannes Pona* of *Verona*, and others there, and to *Cluſius*, and *Plantean* in the Low-countries, and to *Bauhinus* and others: The ninth *Bauhinus* ſaith he onely found in his Apothecaries garden in *Baſil*.

The Time.

They all flower in Summer, and give their ſeed preſently after.

The Names.

The name *Blattaria* in Latine hath beene impoſed hereon from *Blattis in ſe contrahentibus*, as *Pliny* ſaith (for it hath no Greeke name.) The firſt ſixe or ſeven ſorts have their names in their titles, as moſt Authors call them, but the ſeventh being the firſt *Candy* kind, *Honorius Bellus* firſt wrote of, and called it *Auturus*, or *Arcturus*, and ſaith he is bold ſo to doe, not knowing better whereunto to referre it, (although it doth not throughly agree to the *Auturus*, or *Arcturus* of *Dioſcorides*) which he ſent to *Cluſius*. I finding it better to agree with *Blattaria*, than any other plant, have put it under that tribe, and have given it an Engliſh name, according to the reſt of the *Blattarias*, Hoary Candy Moth Mullein with round pointed leaves. *Bauhinus* in his *Pinax* calleth it *Verbaſcum humile Cretieum laciniatum*, and the Italian *Pona*, *Verbaſcum fruticoſum auriculatum*. *Columma* ſaith it was ſent unto him with the name of *Marum Creticum*, but he calleth it *Verbaſcum Braſſicæ folio*, and referreth it to that *Verbaſcum* of *Dioſcorides*, that hath the leafe of a Colewort. The eighth *Pona* in his Italian *Baldus* calleth *Artur; ſecunda ſpecies*. The ninth *Bauhinus* calleth *Verbaſcum folys ſubrotundis flore Blattariæ*, and I in Engliſh Round leafed Moth Mullein. The laſt is called in *Candy Galaſtivida quaſi lactea ſtivida*, as *Honorius Bellus* ſaith, that ſent it to *Cluſius* (but *Bauhinus* calleth it *Glaſtivida*) who thereupon finding the leaves to be like unto Sea Stockgilloflower, called it *Leucoium ſpinoſum Creticum*, but withall ſaith it is in flower differing from them, becauſe all the kindes of Stockgilloflowers have but foure leaves in every flower, and this hath five. Some others therefore would give it a more proper name as they thinke, and call it *Verbaſcum frutescens ſpinoſum Creticum incanum*, from the hoarineſſe of the leaves and ſtalkes, but I thinke it may more fitly be raunged with the *Blattarius*, as I ſaid before, for the reaſons there expreſſed, in Engliſh Thorny Moth Mullein of *Candy*.

The Vertues.

I can finde no Author hath ſpoken of any other properties belonging to any of theſe Blattaries, then thoſe *Pliny* doth aſcribe to the ordinary ſort, that is, to gather Mothes unto it, whereſoever it is layed.

CHAP. XXIII.
Stœchas. Cassidony.

THere are two kin'des of *Stœchas*, one with a purple flower, the other with a yellow, of each whereof there are divers sorts; *Heliochrysum* also is added unto them, by *Bauhinus* and others, that entitle many sorts of *Chrysocome* with that name, but I doe not so thinke it fitt.

1. *Stœchas vulgaris.* The ordinary Cassidony or French Lavender.

The common Sticadove as we call it in some places, or French Lavender that groweth with us, is a more tender plant than lavender, and more like an heath, than a bush or shrub, not above a foot and a halfe high, having many narrow long whitish greene leaves like unto Lavender, but softer and smaller, set at severall distances about the stalkes, which spread into sundry branches, at the tops whereof stand long and round, and sometimes foure-square heads, of a darke greenish purple colour, compact of many scales, from which come forth the flowers of a bluish purple colour, after which follow seed vessels, which are somewhat whitish when they are ripe, containing blackish browne seed within them: the roote is somewhat wooddy, and will hardly abide our cold Winters, except in some places, or before it have flowred: the whole plant is somewhat sweet, but nothing so much as Lavender.

2. *Stœchas vulgaris flore albo.* White flowred Cassidony.

This Cassidony differeth not from our ordinary garden Cassidony in any other thing so much as in the flowers, for although the leaves grow thick together upon the branches, being a little greener, and not altogether so white, and the heads short likewise, yet the flowers starting from among the scales, are larger than in the other, and of a pure white colour, which is very rare to meete with.

3. *Stœchas longioribus ligulis.* Cassidony with long leafed heads.

This Cassidony likewise differeth very little from the ordinary kinde: the chiefest differences noted betweene them are these; the toppes of the branches are bare, without leaves upon them, for an hand breadth in length or more, unto the heads: and the heads of these are not fully so large as in the other, but longer, and have divers hard, stiffe, and longer skinny purplish leaves rising above the heads of them, than at any time seene in the other, which in some places have a shew of some short pieces like unto thinne skinny leaves, of a purple or blue colour, the flowers, seed, and rootes are alike, and so is the smell.

1. *Stœchas Vulgaris.*
The ordinary Cassidony or French Lavender.

4. *Stœchas serrata folio.* Cassidony with dented leaves.

This dented Cassidony hath such like square brittle slender hoary branches, whereon are divers long narrow leaves set, many growing together, which are dented or notched about the edges, and as it were curled or crumpled, greene on the upper side, and hoary underneath, of a hot taste, somewhat bitter: the toppes of the branches end in somewhat long square stalkes, naked, and without leaves unto the spiky heads, which are scaly, slenderer and longer than in the other; the flowers are like unto the other, but of a more purple colour; at the toppes of the heads stand such like skinny leaves, of a bluish purple colour as the former hath, the seed and rootes doe not differ.

5. *Stœchas viridis Dalechampij.* Yellow Cassidony with greene heads.

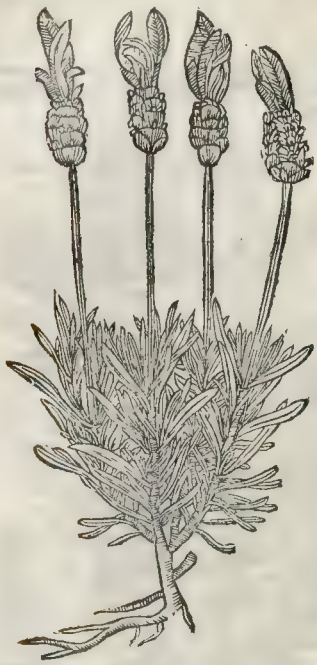
I doe place this Cassidony betweene both these sorts, because it doth in some things partake with both, the description whereof is in this manner. It hath many greene stalkes, and wooddy like the rest, whereon grow the leaves at spaces, many set together, whereof the two outermost are longer than the other, all of a pleasant greene colour, at the toppes of the branches stand such like scaly heads as the former, but longer, from which come forth yellow flowers round about the heads, at the toppes whereof stand two long greene leaves.

6. *Stœchas Rosmarini facie Cretica.* Candy Rosmary like Cassidony.

From the seed sent out of *Candy* by the name of *Stœchas* rose this fine plant, so like in face or forme unto the ordinary Stœchas, or Cassidony, that any at the first sight would surely say it were the same; rising up with a stalke, not much higher than Cassidony, divided from the very ground into divers branches, and they againe and againe into many lesser, leaning downewards a little, beset at every joynt, sometimes with two, and sometimes with three or foure small and narrow long leaves, of a grayish greene colour, smelling somewhat sweet: at the joynts with the leaves toward the toppes of the branches grow forth small flowers, very like unto Rosemary, both for colour, forme, and bigneſſe, after which succeed small round heads, or seed vessels, no bigger than Pepper-cornes, wherein are conteined small seed: the roote is slender and wooddy, divided into severall sprayes: the whole plant is of an obscure gray colour, and smelleth somewhat like Stœchas, but more weakely, tasting a little bitter, with small heat, but more astringency.

7. *Chryso-*

3. *Stœchas longioribus ligulis.* Cassidony with long-leafed heads.



4. *Stœchas serrato folio.* Cassidony with dented leaves.

6. *Stœchas Rosmarini facie Cretica.* Candy Rosemary like Cassidony.

7. *Stœchas Citrina hue Coma aurea.* Golden or yellow Cassidony.

7. *Chryſocome ſive coma aurea & Stœchas citrina vulgaris.* Golden tufts, or golden Caſſidony.

This golden Caſſidony hath ſundry hoary branched ſtalkes, with long and narrow whitiſh leaves, diſperſedly ſet thereon unto the toppes, where the flowers appeare in umbels, each branch bearing a large tuft of ſcaly yellow flowers, like a looſe or ſparſed umbell, keeping their colour long before they wither, and being gathered in a fit dry time when they are in their perfection, will ſo abide, and be kept a long time after: the ſeed is red, ſmaller than Marjerome, and ſharper: the roote is ſmall and black: the whole plant is of a ſtrong ſweet ſcent, not unpleaſant.

8. *Chryſocome ſive Stœchas Citrina Cretica.* Candy golden Caſſidony, or Goldilocks.

This Candiot groweth very like the former, but with ſmaller long leaves, all hoary, the flowers are in larger umbels, greater alſo, and of a more ſhining pale gold colour, which will abide, being gathered in the beauty as the other. There is another ſort called *Elichryſum Orientale* by *Bauhinus*, differing little from this laſt ſort, but in the ſcaly heads of flowers, which are greater and longer than they, and in the whole plant which is taller and more hoary. *Elichryſum Orientale.*

9. *Chryſocome Cretica altera ſive Hiſpanica.* Spaniſh Golden Caſſidony.

9. *Chryſocome Cretica altera ſive Hiſpanica.* Spaniſh golden Caſſidony.

This other Candior or Spaniard, which you will, groweth ſometimes but with one ſtalke, or elſe with more, halfe a yard high, covered with an hoary downe, having ſundry long and narrow leaves on them, ſometimes diſperſedly ſet, and ſometimes more together, greene on the upperſide, and hoary underneath: at the toppes grow ſmall branches, bearing one or two ſcaly long heads of yellow flowers, ſomewhat like to thoſe of Maudeline, conſiſting of many threds or thrums.

10. *Stœchas citrina altera odora.* Sweet yellow Caſſidony.

The yellow ſweet Caſſidony is a ſmall low plant, not riſing above a foote and a halfe high at the moſt, with divers ſlender branches ſomewhat hoary, whereon are ſet ſmall long and narrow leaves, of a darke or more ſullen hoary colour, then thoſe of the former golden Caſſidony, at the toppes of the long divided ſtalkes, ſtand ſingle heads of yellow ſcales, nothing of ſo lively a yellow colour as they, nor ſo round, but a little longer than round, with a few threads or thrums at the tops, which bring forth ſmall browne ſeed, wrapped in ſome downe: the roote is black, but ſmaller and ſlenderer than it: this hath a leſſe heady ſcent than the other, yet not unpleaſant.

11. *Stœchas Citrina modora.* Vnſavory yellow Caſſidony.

This ſmall Caſſidony hath divers low hoary ſtalkes, not aboue a foote high, whereon doe grow ſmall long hoary leaves, broader and larger than the laſt: at the toppes of the ſtalkes ſtand moſt commonly two heads, yet ſometimes but one, which are greater and longer than the laſt, and the ſcales likewiſe longer, and ſomewhat of a browniſh greene with the hoarineſſe, from whence riſe many pale yellow threads or thrums, which when they are paſt, the ſeed ripening, is incloſed in downe, and blowne away with the wind: the roote is leſſe than the laſt, and blackiſh, but not leſſe wooddy: this whole plant and every part is utterly without any ſcent to bee perceived in it.

12. *Stœchas Citrina ſylveſtrior.* Wilde yellow Caſſidony.

This wilde Caſſidony (for thereunto I referre it) hath a round hairy ſtalke, ſtored with moſt pure white wooll, divided at the toppes into ſeverall ſhort branches, the leaves that ſtand on them are ſomewhat longer and larger than the laſt; greene on the upperſide, and grayiſh, hoary, and woolly underneath, and a little endented about the edges, the ends of the branches are naked without leaves, for foure inches long, bearing at the toppes of every of them one ſcaly head, with divers yellow threads or thrums in the middle, like unto the laſt, but ſomewhat larger.

13. *Stœchas Citrina Cretica flore amplo.* Candy unſavory yellow Caſſidony with large flowers.

This brave ſilver-like plant groweth very high and tall, having a ſtraight round ſtalke that is white or hoary, and of a fingers thickneſſe, ſpreading ſundry branches, ſo thick ſet with ſmall long and hoary leaves, many together at ſpaces, that they cover and hide the branches almoſt wholly, and are more like unto Caſſidony than Lavender-cotton leaves, whereunto *Alpinus* doth liken them, but not dented about the edges: the upper part of the ſtalkes divide themſelves into ſmall ſprigges, bearing each of them, on a long ſlender ſtalke, a large yellow flower, like unto a ſingle Marigold ſtanding in a greene huske, wherein after the flower is withered and paſt, groweth ſmall long ſeed like unto Sow-thiſtle ſeed: the roote is long, white, and tender: this plant hath neither ſcent or taſte much to be perceived in it, ſaving a little bitterneſſe, whereby the Natives finde it effectuall to kill the wormes, to provoke urine, to open obſtructions, and to helpe the jaundiſe, and the powder of the dryed hearbe, or the juyce thereof, to cleanſe and heale foule ulcers and ſores.

14. *Stœchas purpurea odorata.* Sweet purple Caſſidony.

I doe acknowledge that I doe not pleaſe my ſelfe, but others, in the placing of this plant in this place, and by this name, for although it hath a face or ſhew in ſome things like unto the yellow unſavory Caſſidony, yet in other things it ſo farre differeth, that I might in my judgement, more truely place it with the *Iaceas* Knapweeds, than with theſe, as the deſcription following will ſhew to any that will duely conſider it, which is thus. It riſeth to the height almoſt of a cubite, leaning or bending downe the branches, whereby it ſpreadeth in compaſſe more than in height, from a long hard blackiſh root, ſhooting forth wooddy and hoary branches, whereon doe grow many long and narrow leaves, of a darke greene colour on the upperſide, and a little hairy withall, but of an hoary white on the under-

13. *Stœchas Citrina Cretica flore amplo.*
Candy unſavory yellow Caſſidony with large flowers.

underſide, and very woolly, and a little dented about the edges: at the toppes of the branches come forth ſometimes but one, but more often two long heads together, compoſed of many ſcales, at the toppes whereof ſtand the flowers, which are nothing but long threads or thrums, of an excellent purple colour, as ſweet in ſcent, as pleaſant to the ſight: after the flowers are paſt, in thoſe ſcaly heads grow the ſeed wrapped in downe, which is ſomewhat like unto the ſmall Pine Thiſtle ſeed.

The Place.

The firſt Caſſidony or Stœchas which is uſed by Apothecaries and others in Phyſick, groweth in *Arabia*, as well as in *France* or *Spaine*, or upon Mount *Garganus* in *Italy*, which is called in the Italian tongue *Monte Sancto Angelo*. The ſecond was found in *Morena*, a place in *Caſtile* or *Spaine*. The third is found in many places, both in *France* and *Spaine* promiſcuouſly among the other common ſorts. The 4. *Cluſius* ſaith is very rare to meet with, for that he onely found naturall on the toppe of the Calpe. The fifth *Dalechampius* only hath ſet forth, without naming the place where it grew. The ſixth as *Lobel* ſaith groweth in the *Province* of *France*, in *Spaine* alſo, and nigh the *Rhine* in *Germany*, but leſſe ſweet: the ſeventh and eighth in *Candy* and *Spaine* likewiſe: the ninth and tenth *Lobel* ſetteth forth to grow about *Mompelier* in *France*, and *Cluſius* ſaith hee found them in *Spaine* and *Portugal*. The eleventh grew on the Hills neare *Terracinum* in *Italy*: the 12. was found among the low Skarlet Okes and Strauberry trees in the Mountaine *Cœtius* neare *Mompelier*: the 13. in *Candy*: and the laſt in *France*.

The Time.

Although divers of theſe have beene obſerved to bee in flower in March and Aprill, according to the climate where they grow naturall, yet in our Gardens of theſe more Northerly countries, the former three ſorts flower not untill May or Iune, and the reſt flower not untill Auguſt for the moſt part, if they doe abide, for they are all of them very tender, and muſt bee kept with great care and looking to.

14. *Stœchas purpurea odorata.*
Sweete purple Caſſidony.

The Names.

It is called *κοναὶ* in Greeke, and *Stœchas* in Latine, and moſt commonly *Stichados* by the Apothecaries, and *Stœchas Arabica*, becauſe the beſt was brought out of *Arabia*. *Dioſcorides* ſaith it tooke the name *Stœchas* from the Ilands called *Stœchades* where it groweth, which are over-againſt *Marſelles*, yet *Marſelles* is two dayes journey from the Sea, and thoſe Ilands doe lye neare unto the Country of *Olbia*. *Galen* ſaith it groweth in every Country, and as well in *Candy*, as the Ilands *Stœchades*, in Engliſh it is called Sticadove, Caſſidony, and French Lavender, but the *Stœchas Citrina* is ſo called upon the correſpondency and likeneſſe of the properties and temperature, as well as of the forme of leaves and heads: it is alſo called *Coma aurea*, *Chryſocome*, and *Tinearia*. Old *Gerard* was very confuſed in the figures of the two chapters of *Elichryſum*, and *Stœchas Citrina*, or *Chryſocome*. For his *Coma aurea*, is *Matthiolus* his *Elichryſum verum*, and his *Stœchas Citrina Matthiolus* his *Elichryſum Italicum*, which is *Cluſius* his *Stratiotes Millefolia flore luteo*: his *Cryſocome*, or *Amaranthus luteus*, is *Stœchas Citrina vulgaris*: his *Amaranthus Galeni*, is *Stœchas Citrina altera odorata* of *Lobel*: the deſcription of moſt are according to *Lobel*: in Engliſh alſo they have divers names as golden Tufts, Goldilocks, Golden flower, gentle Golden flower of life, and yellow Caſſidony, by which I rather entitle theſe plants, then by the others. The firſt is called *Stœchas purpurea*, and *Arabica*, or *Stœchas* by *Matthiolus*, the ſecond *Bauhinus* onely mentioneth, *Cluſius* calleth the third *Stœchas longioribus ligulis*, and *Lobel Stœchas nudis cauliculis ſummis*, *Lugdunenſis Stœchas capitulis foliatis*, and *Bauhinus Stœchas caulis*

culis

culis non foliatis, in Englifh Caſſidony with long leafed heads. The fourth is called by *Cluſius Stœchas criſpo folio*, by *Dodonæus* and *Bauhinus Stœchas folio ſerrato*, of *Gerard* and his Corrector *Stœchas multifida*, but the figure is that of *Lavendula multifido folio*, as *Cluſius* giveth it, for there are not two *Stœchades* with divided leaves. *Lugdunenſis* ſetteth it downe for *Succudas* of *Avicen*, according to *Myconus* judgement, in Engliſh Caſſidony with dented leaves. The fift beſides the name in the title, is called by *Bauhinus Stœchas viridis capitulo oblongo*. The ſixth is called by *Alpinus lib. de plantis exoticis Roſmarinum Stœchadis facie*, but becauſe it doth come nearer to *Stœchas* than to Roſemary in my opinion, I have referred it thereunto. The ſeventh is called *Stœchas Citrina* by moſt Authors, by *Lobel Chryſocome*, and *Coma aurea ſive Amaranthus luteus* by *Fuchſius* and others, and taken by thoſe of *Mompelier* to be the right *Chryſocome* of *Dioſcorides*, excepting one ſmall word wherein there might be a fault alſo, *Cæſalpinus*, and *Bauhinus* entittle it *Elichryſum*, whereas *Dioſcorides* his *Helichryſum*, differeth from his *Chryſocome*, in having Southernewood like leaves, (and therefore I referre *Helichryſum* rather to the Milfoiles, as you ſhall finde it there among them. The eighth is called *Eliochryſum* by *Honorius Bellus*, and the other ſort thereof, *Elichryſum Orientale* by *Bauhinus*, and by *Camerarius* in Epitome, *Stœchas Citrina comis grandioribus*. The ninth may be as well the *Chryſocome peregrina ſecunda* of *Cluſius*, as his *quinta Crea-tica*, for he ſaith they are very like. The tenth is the *Stœchas Citrina altera*, and *altera odora* of *Lobel*, by *Cluſius Chryſocome peregrina prima*, by *Lugdunenſis Ageratum aliud quorundam*, and by *Bauhinus Elichryſum ſylveſtre anguſtifolium capitulis conglobatis*. The eleventh *Lobel* calleth *Stœchas Citrina altera inodora*, and is *Cluſius* his *Chryſocome peregrina tertia*, which *Lugdunenſis* ſetteth downe, for *Gnaphalium marinum Dalechampij* and *Bauhinus* calleth *Elichryſon ſylveſtre flore oblongo*. The twelfth *Bauhinus* calleth *Elichryſo ſylveſtri flore oblongo ſimilis*, in Engliſh it wild yellow Caſſidony. The thirteenth *Alpinus lib. de exoticis plantis*, calleth *Santulina Cretica*, but I, as it is in the title, for the reaſon expreſſed in the deſcription. The laſt was ſent by *Pilliterius* from *Mompelier*, by the name of *Stœchas purpurea odorata*, who ſaid it was to be referred to the *Stœchas Citrina altera inodora*, becauſe it was ſo like it, but yet was a differing ſort from it: the cauſes that make me diſcent from that opinion, whereof I ſaid ſomething before in the deſcription, I will here ſet downe: by the deſcription you finde it hath a ſcaly head, and purple thrummes riſing in the midſt of it, which is the flower (and ſuch have the flowers of all the *Iaceas*) and the ſeed likewiſe incloſed in the heads among the downe, are like unto the ſeeds of the ſmall low Pine Thiſtle, which are like the ſeeds of other Thiſtles, that is flat, hard, and ſhining, and ſuch are moſt of the ſeeds of the *Iaceas Cyanus*, and ſome others: but none of the *Stœchades* have thrummes for their flowers, and none of the other *Stœchades purpurea*, or *Citrina*, have ſuch like ſeeds, and theſe two things cauſe me to thinke it fitter to be referred to the *Jaceas* whereunto it is like both in flower and ſeed. There is a controverſie betweene *Molinæus* the Author of the great Herball named *Lugdunenſis*, and *Pena* and *Lobel* which ſhould be the true *Chryſocome* of *Dioſcorides*. *Lobel* and *Pena* in their *Adverſaria*, ſtriving to make *Stœchas Citrina vulgaris*, called *Coma aurea*, and of ſome *Tinearia* and *Amaranthus luteus*, and taken of *Dodonæus* to be *Eliochryſon* of *Theophraſtus*, and *Ageratum* of *Dioſcorides*, to bee the true *Chryſocome* of *Dioſcorides*: and *Molinæus*, in folio 780. contradicting and confuting them *Lobel* and *Pena* in the deſcription of *Stœchas Citrina*, ſay that the golden yellow toppe or head of tufted flowers thereof hath cauſed the name of *Chryſocome*, which our age could not hitherto know, in wanting the knowledge of the true Hiſope, unto whoſe tufted toppes it was by *Dioſcorides* compared: but now that the true Hiſope is declared and ſet forth (which they make to be the Winter or Por-Marjerome of our Country, as I have ſhewed you in the firſt Chapter of this Booke) with whoſe tufted toppes or umbell of flowers, they compared the flowers of the yellow Caſſidony, they are perſwaded that the *Stœchas Citrina* is the true *Chryſocome* of *Dioſcorides*, but yet afterwards they ſay that one word or two in *Dioſcorides* deſcription of *Chryſocome* doth hinder it, and that is that the rootes of *Chryſocome* (ſaith *Dioſcorides*) are ſmall like unto the rootes of Black *Hellebor*, and the taſte thereof reſembling *Cyperus*, of a ſweet, but auſtere taſte, for which they think there may be ſome fault in the text of *Dioſcorides*. Thus you ſee the ſcope and drift of their reaſons to be, that becauſe few did know what hearb was the true *Chryſocome* of *Dioſcorides* (who cõpared the tufted heads of flowers thereof unto Hiſope) & that thereby it was manifeſt, that our Hiſope not having any tufted head or unbell of flowers, but a ſpiked head was not the true Hiſope of *Dioſcorides*, and therefore they having ſhewed what was the true Hiſope, would alſo declare this yellow Caſſidony, whoſe tufted head of flowers is like unto that of their Hiſope, to be the true *Chryſocome* of *Dioſcorides*: Vnto all which allegations *Molinæus* thus anſwereth. That firſt he would examine whether our ordinary Hiſope be the true Hiſope of *Dioſcorides*, and what part thereof is compared or referred to the *Chryſocome*, and then whether this *Stœchas Citrina* bee the true or no. There are ſaith he, two ſorts of Hiſope well knowne to us, the one tame, or of the garden, with a ſpike of blue flowers, which is the more bitter: and the other wilde with a red flower, which is leſſe bitter. Now they that deny either of theſe to be the true Hiſope of *Dioſcorides*, are led by this reaſon: that the leaves of each of them are long and narrow, not like unto any of the kindes of *Origanum*, which are round, and by *Dioſcorides* compared to the leaves of Marjerome, Pennyroyall, and Dittany. This ſaith he, hath troubled many that did not know a third kind, (which is the round leafed Hiſope (declared in the firſt Chapter of Hiſope) ſet forth by him, and like the other two ſorts, but that the leaves are round like unto *Origanum* or Marjerome. If this kinde of Hiſope had beene knowne to them, they would not have called for an hearb out of *England*, to ſupply the place of the right Hiſope, ſeeing it hath a place of it owne, even among the ſorts of wild *Origanum* or Marjerome, whereunto it is like, but ſomewhat altered by manuring from that which is common. But this their Hiſope or Pot-Marjerome hath no *corymbi* tufts or umbells, they are rather a heape of flowers gathered together, as the wild *Origanum* or Marjerome hath, for no man did ever attribute any ſuch heads or tufts as are called *corymbi*, unto any of them. This knot being untied, it followeth (ſaith he) that we try whether the *Stœchas Citrina* be *Chryſocome*. In this their plant there is no likeneſſe of leaves, of neither of the ſorts of Hiſope to bee ſeene, to wit, either of the long or of the round leafed ſort, beſides the buſhy toppe of leaves and ſtalkes of flowers of this *Stœchas Citrina*, looſely ſet together, is not a cloſe tuft of heads, ſuch as *Corymbus* (which is a cloſe umbell or tuft of heads or ſeeds, ſuch as the Ivie hath) is uſually ſaid to bee; but are onely a few yellow golden round ſhining bullets, or heads at the toppes: the roote alſo thereof hath no thicke and ſmall ſtrings as *Helleborus niger* hath; nor is like to *Cyperus*, nor hath an auſtere ſweet taſte, all which *Chryſocome* hath: He therefore (I meane the foreſaid *Molinæus*) ſaith that hee hath often in revolving theſe doubts, ſuggeſted to thoſe Herbariſts that have knowledge in plants, that hearbe which the French call *Targon*, and ſome in Latine *Targun*, *Tarchon*, *Tragum*, and *Dracohortenſis*, in Engliſh *Tarragon*, and which *Ru-*

ellius

ellius too credulous of fables, thought was produced from the ſeed of Flaxe put into the roote of an Onion to bee very agreeable to the deſcription of *Chryſocome*, in the toppes ſet with many corymbi or tufted heads: in the leaves like unto the ordinary long leafed Hiſope: and in the roote branching as *Helleborus niger*, of the colour of *Cyperus*, of a taſte not unpleaſant, which is ſomewhat auſtere with the ſweetneſſe, by which quality it is profitable to the diſeaſes of the liver and lungs. This (ſaith he) ſeemeth probable to me, and therefore I could not bee ſilent therein, ſetting forth the nature of *Chryſocome*, leaving it to the judgement of thoſe that are more learned. I have, I confeſſe beene a little too prolixe or tedious in this narration, but I was rather willing to ſet forth the whole minde of the man, then to abridge any of his reaſons, that comparing both his negatives and affirmatives, yee may agree or diſcent from them: For my owne part ſeeing *Cluſius* and others, doe account the *Stæchas Citrina*, to be *Chryſocome* of *Dioſcorides*, and miſ-like of this opinion of *Targum*; I can doe no leſſe, and thinke there is farre leſſe reaſon in any to ſuppoſe *Targum* to be *Chryſocome*, than *Stæchas Citrina*. for *Dioſcorides* in the deſcription thereof, mentioneth no likeneſſe of leaves, but of the toppes of tufted heads to be like unto Hiſope, and the ſmall rootes unto thoſe of *Helleborus niger*, equalling *Ciperus*. The Arabians call *Stæchas Aſtochodos*, and *Aſtochodes*: the Italians *Stæche* and *Stæchade*: the Spaniards *Cantueſſo*: the French *Stichades*: the Germanes *Stichas kraut*: the Dutch *Stichas cruÿt*: and we in Engliſh Sticadove Caſſidony, and French Lavender. The *Stæchas citrina* is called by the Italians *Amaranthо giallo*, by the Germanes *Motten blumen*, and *Rhein blumen*.

The Vertues.

The decoction of our garden Caſſidony is as effectuall as Hiſope for the diſeaſes of the breaſt, that is, for coughs and colds. It is put into Antidotes, that is ſuch medicines, as are remedies againſt infection and poiſon. It is of a mixt temperature, as *Galen* ſaith, to wit, of a ſmall earthly cold eſſence, from whence it hath the quality of binding; and of another more earthly extenuated, from whence it is bitter, by the mixture of both which, it openeth obſtructions, and freeth the body from them, it extenuateth, cleanſeth, and ſtrengthneth all the inward parts and bowels, as alſo the whole frame of the body. *Meſues* ſaith it cleanſeth, purgeth, and reſolveth all obſtructions of the liver, ſpleene, and of the other inward parts; it hindereth putrefaction, and correcteth their intemperature; by that ſmall aſtringent quality that is in it. it ſtrengthneth the braine and ſinewes, the heart, and all the other inward parts: It purgeth black choller and fegme, as well from the head and braine, as the ſinewes, and other the inſtruments of the ſences, and comforteth them alſo. It is very effectuall in all cold griefes, uſed in drinkes, baths, or fomentings. An oyle made therewith and fomented, giveth as it were life to the braines and ſinewes, by warming and comforting them. Taken with vineger of Squilles, it helpeth the falling ſickneſſe, and ſwimming of the head, and is helpfull for all other paines of the head and ſtomack; with *Lapis Cyaneus*, or *Sal Indicum*, it helpeth thoſe that are melancholick, whom feares and terrours doe accompany. Taken with the juyce of Bugloſſe and of Pipins, it helpeth the ſadneſſe of the heart, and melancholy; it eaſeth the paines of the ſinewes, arteries, muſcles, and joynts, taken in what manner you will: the fumes thereof taken into the noſtrils, openeth them when they are cloſed: Taken in a Syrupe or any other forme, it helpeth the quartane ague, and all other day agues, eſpecially in thoſe that are flegmatick. It is eſpecially hurtfull to thoſe that are hot, dry, and cholerick, becauſe it troubleth the ſtomack, and provoketh both thirſt and fainting: but becauſe it worketh ſlowly, ſome *Sal gemma* is added unto it to quicken it, or elſe ſometimes the *Myrobalani Indi*, or *Chebuli*, to make it the more forcible, and ſometime Squilles are added, eſpecially in the griefes of the head; It is made the ſtronger, if it be ſteeped or boyled in whey: it is the leſſe hurtfull if it be boyled with wine, the juyce of Pipins, and a few Raiſons of the Sunne. Caſſidony and a little Spike or Lavender, ſteeped in old oyle, is of much good uſe, and of great effect for all the cold cauſes aforeſaid. The heads of Caſſidony are of more force than the leaues; *Pliny* ſaith it provoketh womens monethly courſes and urine: It is of eſpeciall good uſe for the cold griefes of the mother, and for women with child. The other yellow *Stæchas* or Caſſidony, is much about the ſame temperature and vertues, ſerving very well for moſt of the affects before ſpecified, as you ſhall heare: It is ſomewhat bitter and binding, and therefore it warmeth, dryeth, openeth and cleanſeth, where cauſe requireth. The toppes or flowers ſteeped or boyled in wine, openeth all obſtructions of the liver and gall, and therefore helpeth the jaundiſe and dropſie; and is very profitably taken of thoſe that have the falling ſickneſſe, and for all other the diſeaſes of the braine, proceeding of a cold cauſe, as catarrhs, rheumes, and diſtillations, and alſo all old griefes of the head, that are continuall; and the Palſie alſo, whether yee take the decoction of the hearbe, or the powder thereof in Oxymel or Rhodomell; it likewiſe killeth the wormes of the belly. It being boyled in lye is very profitable for all thoſe diſeaſes of the head, to waſh it therewith, and beſides cleanſeth the head of ſcurffe, dandraffe, and ſuch other things as offend it, and killeth lice therein. The decoction of the hearbe openeth and cleanſeth the reynes, and uritory parts, cauſing abundance of urine, eſpecially in them whoſe urine was ſtopped before. The flowers are very profitably uſed in all thoſe bathings, that are applyed to the obſtructions, and cold griefes of the mother. *Pena* ſaith he hath by good experience found it effectuall in the diſeaſes of the liver, which proceed from the bad concoction therein, by reaſon of clammy humours, and thick vapours, that paſſe thorow the tunicles thereof; it is not without danger given to thoſe whoſe lungs are enflamed: but is eſpecially good for all thin, ſowre, and ſalt flegme oppreſſing them. *Cluſius* ſaith that they of *Spaine* uſed the decoction of the Spaniſh ſort againſt the wind collick with good effect.

CHAP. XXIIII.

Lavendula. Lavender.

THere are two ſorts of Lavender or Spike, or Lavender Spike, that is a leſſer and a greater, of each whereof there are ſome diverſities, as ſhall be ſhewed.

1. *Lavendula major ſive vulgaris.* Garden Lavender.

Our ordinary Lavender riſeth up with a hard wooddy ſtemme above the ground, parted into many ſmall branches, whereon are ſet whitiſh long and narrow leaves by couples, one againſt another, from among which riſe up naked ſquare ſtalkes, with two leaves at a joynt, and at the toppes divers ſmall huskes ſtanding round about them, formed in long round heads or ſpikes with purple gaping flowers ſpringing out of each of them: the roote is wooddy,

wooddy, and ſpreadeth in the ground: the whole plant is of a ſtrong ſweet ſcent, but the heads of flowers much more, and more piercing the ſences, which are much uſed to bee put into linnen and apparell. There is alſo a kinde hereof that beareth white flowers, and ſomewhat broader leaves but it is very rare, and kept but with a few with us, being more tender, and not ſo able to endure our cold Winters.

2. *Lavendula minor ſive Spica.* Small Lavender or Spike.

The Spike or ſmall Lavender is very like unto the former, but groweth not ſo high, neither is the head or ſpike ſo long, but ſhorter and ſmaller, and the flowers of a deeper purpliſh blue colour: the leaves alſo are a little harder, whiter, and ſhorter than the former: the ſcent alſo is ſomewhat ſharper and ſtronger. This is nothing ſo frequent with us as the firſt, and is nurſed up but with few, that take delight in rare hearbes and plants, and kept in a warmer place.

3. *Lavendula minor flore albo.* Small white Lavender or Spike with a white flower.

This ſmall Lavender is in all things like unto the other ſmall Lavender, but that the whole plant is ſmaller, and the flowers are white, which maketh it to differ from the other.

4. *Lavendula folio multifido.* Iagged Lavender.

This ſmall Lavender riſeth up with ſquare rough and hoary branches, to the height of a foote and a halfe, bearing thereon many hoary whitiſh leaves, very much jagged or torne on the edges, into many parts unto the middle ribbe, and each part cut or jagged, of a ſharpe taſte, and a pleaſant ſcent, yet much weaker than in the other ſmall Lavender: from among which riſe foure-ſquare hoary ſtalkes, without any leaves on them unto the toppes, where they beare ſmall ſpikes of purple flowers, like unto the ſmall Lavender or Spike, but that the flowers ſeeme to ſtand ſquare, or in foure parts or corners: the roote is hard and wooddy like unto the other.

The Place.

The three firſt ſorts are found naturally in many places of *Spaine* and *Narbone* in *France*, where the other groweth, although both ſorts with white flowers, are much more rare, and ſeldome, and nurſed up as I ſaid with us in their Gardens that are curious. The laſt was found by *Cluſius* both about *Malaca* in *Spaine* and *Murcia* in the Realme of *Granado*: it groweth alſo ſometimes in the gardens of thoſe that are curious of all rare hearbs and plants.

The Time.

Theſe all flower about the end of Iune, and beginning of Iuly, and although *Cluſius* ſaith hee found the laſt about *Malaca* in flower in February, and in March about *Murcia*, yet it doth not flower in theſe colder Countries untill Iune at the ſooneſt, or Iuly.

The Names.

Lavender is called in Latine *Lavandula*, and *Lavendula*, and of ſome *Lavanda, quia lavacris expetitur*, becauſe it was much uſed in waſhings. The ordinary great Lavender is called by *Matthiolus*, *Nardus Italica*, and *Pſeudonardus*. *Tragus* calleth it *Spica*, *Nardus Germanica*, but moſt other Authors *Lavendula major mas*; as they doe the ſmaller, *minor & femina*. *Dalechampius* upon *Pliny* would make it to bee *Caſſia alba*, as hee would alſo have Roſmary to be *Caſſia nigra*, and of ſome to be the *Iphium* of *Theophraſtus*. It is thought of many, to be the *Cneorum* that *Pliny* ſaith *Higinus* called *Caſia*, which was frequently planted in the gardens of *Italy* for their Bees to feed on, and was alſo uſed in garlands, whereof *Virgil* in his *Georgicks* and *Bucolicks* maketh mention, before *Higinus* or *Plinies* time, in theſe verſes.

Tum Caſiæ, atque aliis intexens ſuavibus herbis
Mollia luteola pingit vaccinia caltha. and againe
Vix humiles apibus caſias, roremque miniſtrat. and
Nec circum caſiæ virides, & olentia latè
Serpylla, & graviter ſpirantis copia thymbræ
Floreat, irriguumque bibat violaria fontem.

1. *Lavendula major ſive vulgaris.* Garden Lavender.

Flore albo.

4. *Lavendula folio multifido.* Iagged Lavender.

Anguil-

Anguillara is of opinion that Lavender should be the *Cneorum album* of *Theophraſtus*, and that Roſmary should be his *Cneorum nigrum*, which *Matthiolus* confuteth ſufficiently, from the deſcription of the parts, which can bee no wayes like them; *viz.* that both ſorts of *Cneorum* have flexible branches, fit to binde other things withall, which neither Lavender nor Roſmary can doe; that the one ſort of *Cneorum* hath a good ſcent, and the other without ſcent, although *Anguillara* would pervert the word, to make the blacke have a good ſcent, as well as the white, which cannot ſtand with the ſcope of the text; and that both of the *Cneora* doe flower after the Autumne quarter, which Lavender doth not; and Roſmary, although it doe ſo, yet it flowreth firſt in the Spring; and laſtly, that the rootes of *Cneorum* deſcend deepe into the ground, whereas neither Lavender nor Roſmary doe ſo. The lagged Lavender is called by *Cluſius*, as it is in the title, and others ſince his time, doe ſo entitle it likewiſe, yet, as I ſaid before, the figure of *Stœchas multifida* in *Gerard*, both old and new, is the true figure of this *Lavendula folio diſſecto*, as *Bauhinus* calleth it, and therefore I mervaile that Maſter *Johnſon* did not ſee, or would let paſſe ſuch an error, that had corrected farre leſſer.

The Vertues.

Lavender is of eſpeciall good uſe for all the griefes and paines of the head and braine, that proceed from a cold cauſe; as the Apoplexie, falling ſickneſſe, the drowſie or ſluggiſh malady, crampes, convulſions and palſies, as alſo thoſe that are given to faint often. It ſtrengthneth the ſtomack, and freeth the liver and ſpleene from obſtructions, provoketh womens courſes, and expelleth the dead child, and the ſecondine or after-birth. The flowers of Lavender ſteeped in wine, helpeth them to make water that are ſtopped; as alſo that are troubled with the winde or collick, if the places be bathed therewith. A decoction made with the flowers of Lavender, Horehound, Fennell, and Aſparagus rootes, and a little Cinamon, is very profitably uſed, to helpe the falling ſickneſſe, and the giddineſſe or turning of the braine. It is good to garble the mouth with the decoction of the flowers, againſt the paines of the teeth. Two ſpoonefuls of the diſtilled water of the flowers taken, doth helpe thoſe that have loſt their ſpeech or voyce, reſtoring it them againe. It helpeth alſo the tremblings and paſſions of the heart, and the ſwoonings and faintings thereof likewiſe, not onely drunke, but even applied to the temples, or to the noſtrils to be ſmelt unto, as alſo tyed to the arteries: but where the body is repleate with blood and humours, it is not ſafe to uſe it, becauſe of the hot and ſubtill ſpirits wherewith it is poſſeſſed. The leſſer Lavender is much commended in all the diſeaſes of the mother, as the ſtrangling or ſuffocation, the diſlocation or diſplacing, &c. for women to be bathed therewith, as alſo to helpe forward their travaile; The oyle chimically drawne from Lavender, which is uſually called oyle of Spike is of ſo fierce and piercing ſpirits, that it is to bee uſed with great reſpect, and but ſome few drops uſed with other things, either for inward or outward griefes.

CHAP. XXV.

Roſmarinum. Roſmary.

THere was formerly but one ſort of Roſmary knowne, but we have now more diverſity, than hath beene extant before, which ſhall be declared in this Chapter.

1. *Libanotis coronaria ſive Roſmarinum vulgare.* Ordinary Roſmary.

1. *Libanotis coronaria ſive Roſmarinum vulgare.* Ordinary Roſemary.

Our ordinary garden Roſmary is ſo well knowne I thinke, to all manner of perſons being continually in their hands, that I ſhall ſcarſe need to deſcribe it, yet not to paſſe it over ſo ſlightly. It is well obſerved in our owne Land in divers places (as Noblemens gardens, &c.) where it hath ſtood long, as well as in the naturall places, that it groweth in time to a great height, with a great and wooddy ſtemme, of a cloſe firme ſubſtance, and whitiſh (fit to make Inſtruments of, &c. being cut into long thin boords for the purpoſe) branching forth into ſundry armes, and from them againe into many other ſmaller branches, at the joynts whereof, are ſet at ſeverall diſtances, many long and very narrow leaves, greene above, and grayiſh underneath, and with them all all along the ſtalkes towards the toppes, divers ſmall gaping flowers, of a pale bleake bluiſh colour, ſtanding in whitiſh huskes: the ſeed is ſmall and reddiſh, but ſeldome doth any that is ſowne in our Country endure the firſt Winter without extraordinary care, and therefore is uſually encreaſed by ſlipping: the whole plant doth ſmell exceeding ſweet.

2. *Roſmarinum ſtiatum ſive aureum.* Gilded Roſmary.

This Roſmary differeth not from the former in any thing but in the leaves, which are edged or ſtriped, or pointed with a faire gold yellow colour, which ſo continueth all the yeare throughout, yet freſher in Summer than in Winter.

3. *Roſmarinum latifolium.* Broad leafed Roſemary.

This alſo groweth like the former, but wee have not ſeene it growne ſo great in our Country, nor with ſuch wooddy branches, and is more tender to keepe: the leaves are larger, and of a more deepe ſhining greene colour on the upperſide, and little or nothing whitiſh underneath, more thinly alſo or ſparſedly ſet on the ſtalkes: the flowers likewiſe differ not from the precedent.

4. *Roſ-*

4. *Roſmarinum flore duplici.* Double flowred Roſemary.

The double flowred Roſemary thus farre differeth from the former, that it hath ſtronger ſtalkes while it is young then the laſt, or not ſo eaſie to breake, fairer alſo, and larger leaves than the firſt, and the flowers double like as the Larkes heele or ſpurre: and all this narration is but by information, not ſight.

5. *Roſmarinum ſylveſtre Matthioli.*
Matthiolus his wild Bohemian Roſmary.

5. *Ledum Sileſiacum cluſii.*
Wilde ſweete Sileſia Roſemary.

5. *Roſmarinum ſylveſtre Bohemicum Matthioli ſive Ledum Sileſiacum Clusij.* Wild ſweet Sileſia Roſmary.

This wild ſweet Roſemary of *Sileſia* riſeth with wooddy aſh coloured branches, two foote high or more, which ſhoote forth other branches of a purpliſh colour covered with a browniſh yellow hoarineſſe, on which are ſet many narrow long greene leaves, like unto thoſe of Roſemary, but covered with the like hoarineſſe as the ſtalkes are, eſpecially in the naturall place, but not ſo much, being tranſplanted and folding their ſides ſo cloſe together, that they ſeeme nothing but ribbes or ſtalkes, of an excellent pleaſant and ſweet ſcent: at the ends of the branches grow certaine browniſh ſcaly leaves, out of which ſpreadeth a tuft of many flowers, conſiſting of five white leaves a piece, with ten white chives or threads in the middle, and in ſome plants with ſixe leaves and 12. threads or chieves, after which follow long and five ſquare heads, ſpotted with ſilver like white ſpots while they are greene, but grow browniſh when they are ripe, and turne downe their toppes, opening their huskes at the ſtalkes, leſt the ſeed which is as ſmall as duſt, ſhould ſuddenly fall out: the roote is wooddy with ſhort ſprayes.

6. *Roſmarinum ſylveſtre ἄσαυρ.* Vnſavory wild Roſmary.

Becauſe this plant doth ſo nearely reſemble Roſmary, I have thought it meete to joyne it with the reſt, although it be not ſweet like them: It groweth above a foote high, having divers reddiſh branches which divide themſelves into other ſmaller, of a whitiſh colour, ſet confuſedly with long and narrow leaves, greene on the upperſide, and hoary underneath, like thoſe of the dwarfe willow, of no pleaſant ſcent at all, but of an aſtringent taſte: at the toppes of the branches ſtand divers heads, compoſed of many ſhort ſcales, out of which thruſt forth ſundry flowers, ſtanding on long foote ſtalkes made of five leaves a peece, of a fine delayed reddiſh, or fleſh-colour, after which riſe ſhort five ſquare heads with blunt points, containing ſmall pale coloured ſeed.

7. *Roſmarinum ſylveſtre minus noſtras.* Our wild Roſmary.

Our wilde North-Country Roſmary groweth not ſo high, with ſmaller leaves, nothing ſo great and long as Roſmary leaves, but thicker and ſhorter, of a darke greene ſhining colour above, and ſomewhat yellowiſh greene underneath, ſet very ſparſedly on very ſlender and pliant blackiſh greene twigges, at the toppes whereof grow the flowers, not out of ſcaly heads as in the former, as farre as I could perceive by thoſe plants, that were ſent me and others out of *Lancaſhire*, of a reddiſh colour: the whole plant hath as little ſcent as the laſt, which is none at all that I could perceive.

6. *Rosmarinum sylvestre ἄσαμον.*
Vnsavory wilde Rosemary.

7. *Rosmarinum sylvestre minus nostras.*
Our wilde Rosemary.

The Place and Time.

The ordinary Rosemary groweth in *Spaine* abundantly neare the Sea side, the scent whereof is many times felt by those in the Shippes that passe by, many leagues off from the Land, in *Province* also of *France*, and sundry other those hot Countries, but will not abide (unlesse kept in stowes) the Winter in divers places of *Germany*, *Denmarke*, and those other Northerly Regions: the fift in *Silesia*, *Bohemia*, and the parts there abouts: the sixt in the same places with the fift, the last in divers places of *Lancashire*, and *Yorkeshire*, bordering there. The first flowreth in Aprill and May with us, and sometimes in August againe, the others not untill August.

The Names.

It is called in Greeke Λιβανωτις *Libanotis*, & στεφανωματικὴ *Stephanomatica* is added thereunto, to distinguish it from the other *Libanotides*, that are umbelleferous plants; in Latine *Rosmarinus* & *Rosmarinum quasi Rosa marina*. *Cordus* on *Dioscorides* calleth it *Libanotis Coronaria* according to the Greeke: *Dalechampius* on *Pliny* taketh it to be the *Casia nigra* of *Theophrastus*, and *Anguillara* to bee the *Casia* of *Hyginus* acceptable to Bees, and therefore sowne neare their Hives, as also to be the *Cneorum nigrum* of *Theophrastus*, and Lavender to be his *album*, but *Matthiolus* hath confuted that errour, as is shewed in the Chapter before: some as *Bauhinus* noteth it, would make it to bee the Hebrewes Hisope, as if their Hisope differed from the Hisope of all other Nations, but without true judgement. *Gesner in hortis* calleth the first *Rosmarinus minor sive tenuifolius*, as he doth the third *Rosmarinus alter ignobilior*, and *Cordus in historia*, *Rosmarinus syl. seu major*: the fift is called *Rosmarinum sylvestre & Bohemicum*, by *Matthiolus Rosmarinum sylvestre*; by *Dodonaus* in his Dutch Herball, *Ledum Silesiacum* by *Clusius*; *Ledum foliis Rosmarini alterum* by *Lobel*, and *Chamepence* by *Cordus* on *Dioscorides*, and in his History also, because the narrow long leaves being folded together, do represent the Pine or Pitch tree leaves. The sixt is called by *Clusius* as it is in the title: the last is not remembred by any before. The Arabians call it *Elkia gaber*, the Italians *Rosmarino*, the Spaniards *Romero*, the French *Ronarin*, the Germanes *Rosemarin*, the Dutch *Rousmaryn*, and we in English Rosmary.

The Vertues.

Rosmary is an hearbe of as great use with us in these dayes, as any other whatsoever, not onely for Physicall, but civill purposes: the civill uses as all know, are at Weddings, Funerals, &c. to bestow upon friends: the Physicall remedies, both for inward and outward diseases are many and worthy, for by the warming and comforting heate thereof it helpeth all cold diseases, both of the head, stomack, liver, and belly: the decoction thereof in wine helpeth the cold distillations of the braine into the eyes, &c. and all other cold diseases of the head and braines, as the giddinesse or swimming therein, drowsinesse or dulnesse of the minde and senses like a stupidnesse, the dumbe palsie, or losse of speech, the lethargie and falling sickenesse, to be both drunke, and the temples bathed therewith: it helpeth the paines in the gummes & teeth by rheume falling into them, or by putrefaction causing an evill smel from them, or a stinking breath: it helpeth also a weake memory by heating and drying up the cold moistures of the braines, and quickning the senses: it is likewise very comfortable to the stomack in all the cold griefes thereof, and to stay the proneness to casting, causing the stomack the better to containe and to digest the meate, either the decoction or powder taken in wine: it is a remedy for the windinesse in the stomacke or bowels, and expelleth it power-

powerfully,as alſo the hypochondriack paſſion,and winde in the ſplene: it helpeth alſo thoſe thot are liver-grown, by opening the obſtructions thereof, by warming the coldneſſe extenuating the groſſneſſe,and afterwards binding and ſtrengthening the weakneſſe thereof: it helpeth dimme eyes, and to procure a cleare ſight, if all the white it is in flower, one take of the flowers faſting with bread and ſalt: both *Dioſcorides* and *Galen* ſay, that if a decoction be made thereof with water, and they that have the yellow jaundiſe, doe exerciſe their bodies preſently after the taking thereof, it will certainely cure it, the flowers and the conſerve made of them, is ſingular good to comfort the heart, and to expell the contagion of the peſtilence, to burne the hearbe in Houſes and Chambers in the time of the infection to correct the aire in them: both the flowers and the leaves are very profitable for women that are troubled with the whites, if they be daily taken: the dried leaves ſhred ſmall and taken in a Pipe like as Tobacco is taken, helpeth thoſe much that have any Cough or Tiſick, conſumption, by warming and drying the thinne diſtillations, which cauſe thoſe diſeaſes: the leaves are much uſed in bathings, and made into oyntments or oyles, is ſingular good to helpe cold benummed joynts, ſinewes or members. The chymicall oyle drawne from the leaves and flowers,is a ſoveraigne helpe for all the diſeaſes aforeſaid, to touch the temples and noſtrils with a drop, two or three for all thoſe diſeaſes of the head and braines, ſpoken of before, as alſo to take a drop two or three,as the cauſe requireth for the inward griefes, yet muſt it be taken with diſcretion, leſt it doe more harme than good, for it is very quick and piercing, and therefore but a little muſt be taken at once. There is another oyle made by inſolation in this manner: take what quantity you will of the flowers and put them into a ſtrong glaſſe cloſe ſtopped, and digeſt them in hot Horſe dung for 14. dayes, which then being taken forth and unſtopped, tye a fine linnen cloth over the mouth, and turne the mouth downe into another ſtrong glaſſe, which being ſet in the Sunne, an oyle will diſtill downe into the lower glaſſe, to be preſerved as precious for divers uſes, both inward and outward, as a ſoveraigne Baulme to heale the diſeaſes before ſpoken of, to cleare a dimme ſight, and to take away ſpots, markes and ſcarres in the skin. The Roſmary of *Sileſia* is by often experience found to bee good for the ſhrinking of the ſinewes, for the Patient to ſit often in the decoction thereof, and to bathe the affected parts.

CHAP. XXVI.

Ledum Alpinum ſive Roſa Alpina. The ſweet Mountaine Roſe.

1. *Ledum Alpinum ſive Roſa Alpina.* The ſweet Mountaine Roſe.

BEcauſe both *Cluſius* and others,referre this plant for the ſweetneſſe thereof,to the family of the *Ciſtus Ledum*, as he did the laſt in the foregoing Chapter, and called it *Sileſiacum*, neither of which I dare doe, not thinking them (although ſweet) to belong thereunto, elſe I had not placed them here,but with the other ſorts of *Ledum*. I thinke it meet to ſpeake hereof among the ſweet hearbs, whoſe deſcription is thus. It hath ſundry ſlender hard ſtalkes, 2. foot long or thereabouts, lying for the moſt part on the ground, covered with an aſh coloured barke, at the ends whereof are ſet without order many hard leaves,like unto thoſe of the Italian dwarfe Bay of a ſhining greene colour on the upperſide, and paler underneath, ſometimes pointed, and ſometimes round at the ends, and ſomewhat hairy about the edges as the young ſhot ones are likewiſe, of an aſtringent taſte; at the ends of the branches breake forth a tuft of hollow flowers like Bells hanging downe their heads, and divided at the brimmes into five parts, of a deepe red colour on the outſide, ſprinckled with many ſilver-like ſpots, as the ſtalkes of them are alſo, but of a paler red colour on the in-ſide with divers threads in the middle, and of a pretty ſweet ſcent, after which come five parted heads, containing within them very ſmall brownish ſeed like duſt, which being rubbed while they are greene, are of ſo ſtrong a ſcent that they offend the ſences: but *Lobel* ſaith his beareth red berries like Aſparagus,which *Cluſius* ſaith his doth not: the root is long,hard,and wooddy: the branches doe often take roote as they lye on the ground, and abide greene all the Winter. There is another of this kind,as *Cluſius* ſaith he obſerved,that had fewer, but greater leaves, harder and longer pointed, not hairy on the edges, and of a yellowiſh darke ruſty colour underneath, and the like flowers,not elſe differing: Vpon theſe branches & the leaves ſometimes are found certaine ſmall excreſſences or knots, like Peaſe, or ſometimes as bigge as Haſell Nuts, rugged or uneven on the outſide, of a reddiſh or ſometimes paler colour and ſpongie, white within, aſtringent in taſte, which ſupplieth the office of galls.

The Place and Time.

Both theſe ſorts are found on the toppes and on the declining of ſundry Hills in *Germany* and *Auſtria*, among the ſtones as *Cluſius* ſaith, and on the Hills neare *Trent* and *Verona*, as *Lobel* ſaith. They flower in Iune and Iuly, their ſeed is ripe in the end of Auguſt.

The Names.

Theſe plants being lately found and made knowne to us, have received ſundry names, as every one in his opini-

on thought fitteſt, *Viſſes Aldrouandus* calleth it *Nerium Alpinum*, *Geſner* and *Camerarius in horto*, *Balſamum Alpinum*, and ſo doth *Lobel* alſo, who alſo calleth it *Chamerhododendros Alpina odora*, as hee doth the other ſort hereof *Chamalaea folio ſerui leuiſci folia minus odora*: *Cluſius Ledum Alpinum*: *Caſalpinus Rhododendron Alpina quibuſdam*. *Geſner* himſelfe calleth it in his Booke *de lunarijs Nereum Alpinum*, *in hortis Germania*, and in *Deſcriptione montis fracti*, *Roſa Alpina* from the vulgar, who call it *Alproſen* and *Bergroſen*, he maketh it alſo in the Chapter of *Chamerium*, to be his third ſort. *Lugdunenſis* would referre it to the *Evonimus* of *Theophraſti*, but *Cluſius* ſheweth the error of that opinion: but it is very likely that *Lobel* his, differeth from this of *Cluſius*, as I ſhall ſhew you in the Chapter of Boxe.

The Vertues.

Cluſius ſaith he could not underſtand, of any other uſe that this plant might be put unto, then that the Diers there, uſed the ſmall galles that grow on it, to dye a black colour like unto other galles.

CHAP. XXVII.

Coſtus hortorum major. Coaſtmary. And *Coſtus hortorum minor ſeu Ageratum.* Maudeline.

I Muſt joyne both theſe ſweet hearbes together, both for the likeneſſe of their flower, and neereneſſe of their names: of the former there is but one ſort, but of the other there are divers, whereof I doe intend to ſhew you the knowledge in this place.

1. *Coſtus hortorum major.*
Coſtmary or Alecoaſt.

1. *Coſtus hortorum major.* Coſtmary or Alecoaſt.

Coſtmary or Alecoaſt hath many broad and long pale green leaves, dented or nipped about the edges, every one upon a long foot-ſtalke, among which riſe up many round greene ſtalkes, with ſuch like leaves thereon, but leſſer up to the toppe, where it ſpreadeth into three or foure branches, every one bearing an umbell or tuft of gold yellow flowers, ſomewhat like unto Tanſie flowers, but leſſer, which afterwards are the heads containing ſmall flat long ſeed: the roote is ſomewhat hard and ſtringie, which being divided with the heads of leaves, may bee replanted in the Spring for increaſe.

2. *Ageratum vulgare ſive Coſtus hortorum minor.* Common Maudeline.

Common Maudeline hath ſomewhat long and narrow leaves ſnipt about the edges, the ſtalkes are two foote high, bearing at the toppes many yellow flowers ſet round together, and all of an equall height, in umbels or tufts like unto Tanſie, after which followeth ſmall whitiſh ſeed, almoſt as great as Wormſeed: the whole hearbe is ſweet and bitter, being as well gained by ſlipping as ſowing.

3. *Ageratum flore albo.* White Maudeline.

This Maudeline hath wooddy ſtalkes, and many ſmall leaves thereon like the other, but ſomewhat ſmaller and leſſe dented or notched in on the edges, at the toppes of the ſtalkes grow many flowers, as it were in a tuft together, like unto the common Maudeline, but wholly white, except a little ſhew of yellow in the middle; the ſcent of the whole plant is not ſo ſtrong as the other; the roote is ſmall and ſtringie like the other alſo.

4. *Ageratum minus.* Small Maudeline.

This other ſmall Maudeline hath divers hoary ſtalkes, not riſing much above a foote high, beſet as thick with leaves as the former or fuller, upon all ſides of the ſtalkes, which are ſmaller, longer, narrower, and whiter than the other, and not dented at all about the edges, ſomewhat like unto the leaves of yellow or golden Caſſidony, here before deſcribed: at the toppes of the ſtalkes ſtand many yellow flowers, thicke thruſt together, in an umbell or tuft, very well reſembling the firſt or common garden Maudeline, of a reaſonable good and quicke ſcent, which turne into downe, and is carryed away with the winde, the roote is ſmall and white with many fibres annexed unto it.

5. *Ageratum purpureum.* Purple ſweete Maudeline.

This rare and dainty plant hath many ſmall leaves lying upon the ground, round about the toppe of the roote, ſomewhat like unto the leaves of the firſt Maudeline, here ſet forth, nicked on the edges towards the points of them, and not backwards, ſomewhat bitter in taſte, yet not ſo much as the common, from among the leaves ariſe many ſmall ſtalkes, beſet with ſuch like leaves as grow below, but ſomewhat ſmaller unto the very toppes, where many flowers ſtand one above another, every one upon a ſhort foot-ſtalke, conſiſting of five ſmall greene leaves, of an excellent violet-like purple colour, comming forth of ſmall greene huskes, of ſo excellent a dainty ſweet ſcent, that it paſſeth the Violet in ſcent, and to be compared with Muske: after the flowers are paſt, there ariſe ſmall long ſeed veſſels, bearing ſmall ſeed therein: the roote is yellow, ſmall and ſhort, buſhing forth many ſmall fibres, whereby it taketh faſt hold of the ground.

6. *Age-*

3. *Ageratum vulgare sive Costus hortorum.*
Common Maudeline.

4. *Ageratum minus.*
Smal' Maudeline.

5. *Ageratum purpureum.*
Purple sweet Maudeline.

6. *Ageratum Ferulaceum.*
Fennell leafed Maudeline.

6. Ageratum Ferulaceum. Fennell leafed Madeline.

This rare hearbe is to be joyned with the Maudelines, for that the flowers decay not being gathered, and kept for a long time. It hath many Fennell-like leaves lying upon the ground, round about the roote, which shooteth forth divers crested or cornered stalkes, a foote and a halfe high, whereon doe grow at certaine distances, on each side one above another, such like leaves compassing the stalke at the foote of them, as Fennell doth: at the toppes of the stalkes stand large umbels of flowers, some of the stalkes rising lower than others, yet all making a round compassed tuft of yellow flowers, very like unto the flowers of Groundsell for the forme, but of a more excellent gold yellow colour, which being gathered before they grow to full maturity, will abide a long time in their perfect beauty, which hath caused the name, and to be joyned with them: the roote is somewhat long, black and wooddy, rugged also, and a little writhed with divers fibres growing to it.

The Place.

The first three sorts have beene found naturall in divers rough untilled places of *Tuskanie* in *Italy*, and *Narbone* in *France*, but in gardens onely with us. The fourth groweth on dry grounds, and often out of old mud and stone walles. The fift groweth upon the rockes in clifts, where it hath but a small crust of earth upon it, the roote growing sometimes into the chinkes, and moistned onely by the vapours of some waters, passing neare it, or the dew and moisture from the rockes. The last groweth in dry and hungry grounds, and among the Pine tree-woods.

The Time.

They doe all flower in Iune and Iuly in most places where they are planted and prosper.

The Names.

Coastmary or Alecoast in English, is called in Latine by some *Costus hortorum major*, and by others *Balsamita major*, *Mentha Graeca*, *Mentha Romana*, *Mentha Corymbifera major*, *Mentha Saracenica*, *Ovaria* by *Gesner in hortis*, *Herba Mariæ* by *Cæsalpinus*, and *Lassulata* by others as the Italians doe, the Germanes *Frauwen muntz*, the French *Coq & Baume*, as the Dutch doe Balsome. But *Ageratum* is called Ἀγήρατον in Greeke, *quasi non senescens*, or *senectutem non sentiens*; because it (*scilicet* the flowers gathered in a fit time) waxe not old or decay by age: *Matthiolus*, *Gesner*, *Lacuna*, *Castor Durantes*, *Lugdunensis*, *Camerarius*, and *Tabermontanus* doe call it *Ageratum*, *Dodonæus Balsamita fœmina & minor*, and *Costus hortensis minor* by *Gesner*, *Mentha corymbifera minor* by *Cordus*, by *Cæsalpinus Camphorata*, *Herba Iulia* by *Auguillara*, *Gesner in hortis Germaniæ*; and *Eupatorium Mesnes* by *Tragus Gesner in hortis*, *Matthiolus* and *Lonicerus*; in briefe most of the best later Writers, judge it to be the true *Ageratum* of *Dioscorides*, though some would disprove it: and likewise the true *Eupatorium* of *Mesnes*, although *Dodonæus* denyeth both the one and the other: For the *Eupatorium* of *Mesnes* and *Avicenna* (saith he) differ not, and that of *Avicen* and *Dioscorides* are both of them but one plant, even the ordinary Agrimony, but *Matthiolus* hath answered both these controversies in my judgement so sufficiently, in his answere to *Andreas Marinus*, as nothing can be better; And in conclusion saith, they are no Practitioners in Physicke, that shall deny the *Eupatorium* of *Mesnes*, to be the *Ageratum* of *Dioscorides*. The second *Ageratum* with white flowers, is the second *Ageratum* with *Matthiolus* and *Lugdunensis*, and called *Ageratum floribus candidis* by *Lobel*, *Tabermontanus* and *Camerarius*: the third is the third *Ageratum* with *Matthiolus* and *Lugdunensis*, and called *Ageratum minus* by *Lobel Camerarius*, and *Iabel montanus*, and by *Bauhinu*, *Ageratum folijs non serratis*: the fourth is the *Ageratum purpureum* of *Lugdunensis*, which as he saith some Germanes called *Moschatella cærulea*, yet is not the *Moschatella* of *Cordus*, *Bauhinus* calleth it *Ageratum serratum Alpinum*: the last is called by *Lugdunensis* *Ageratum ferulaceum*, but *Bauhinus* referreth it to the *Achillea montana Arthemisiæ tenuifoliæ facie* of *Lobel*, to the *Achillea montana* of the same *Lugdunensis* and *Tabermontanus*, and to the *Chrysanthemum Alpinum secundum* of *Clusius* (but in my opinion it is not that *Chrysanthemum* of *Clusius*, for we have had it growing in our gardens from the seed, sent us by the name of *Chrysanthemum tenuifolium*) and therefore hee himselfe calleth it *Chrysanthemum Alpinum foliis Abrotani multisidis*.

The Vertues.

The ordinary Costmary as well as Maudeline (as some of the other are sure of the same quality) provoketh urine abundantly, & mollifieth the hardnes of the mother. *Galen* saith it is hot in the first degree, & dry in the second, that it digesteth, and after a sort gently dissolveth inflāmations, it gently purgeth choler and flegme, that it extenuateth that which is grosse, cutteth and divideth that which is tough and glutinous, cleanseth that which is foule, and hindereth putrefaction or corruption, it dissolveth without attraction, openeth obstructions, and healeth their evill affects, and is a wonderfull helpe to all sorts of day agues; It is astringent to the stomack, and strengthneth the liver, and all the other inward parts, and taken in whey it worketh the more effectually. Taken fasting in the morning, it is very profitable for the paines in the head, that are continuall, and to stay, dry up, and consume all thin distillations or rheumes from the head into the stomack, and helpeth much to digest raw humours that are gathered therein; It is very profitably applyed to those that are fallen into a continuall evill disposition of the whole body, called *Cachexia*, taken especially in the beginning of the disease. In briefe it is an especiall friend and helpe to evill, weake, and cold livers. The seed is familiarly given to children for the wormes, and so is the infusion of the flowers in white wine, and given to them to the quantity of two ounces at a time. It maketh an excellent salve to cleanse and heale old ulcers, being boyled with Oyle-olive and Adders tongue with it, and after it is strained, to put a little Waxe, Rossen, and Turpentine, to bring it into a convenient body.

CHAP. XXVIII.

Tanacetum. Tansie.

THere are two sorts of Garden Tansies, whereof the one is called ordinary or common Tansie, and the other curld or double Tansie: but there are some others also to be spoken of here in this Chapter.

1. *Tanacetum vulgare & crispum.* Ordinary and curld Tansie.

Our garden Tansie hath many hard greene leaves, or rather wings of leaves, for (although they bee two

1. *Tanacetum vulgare & crispum.*
Ordinary and curld Tanſie.

two ſorts, yet one deſcription may ſerve them both) they are many ſmall ones ſet one againſt another all along a middle ribbe or ſtalke, and ſnipt about the edges; in one ſort the leaves ſtand cloſer and thicker, and ſomewhat crumpled, which hath cauſed it to be called double or curld Tanſie; in the other ſort thinner and more ſparſedly ſet; it riſeth up with many hard ſtalkes, whereon grow at the toppes of the branches gold yellow flowers like buttons, which being gathered in their prime, will hold the freſh colour a long ſeaſon: the ſeed is ſmall, and as it were chaffie: the robte creepeth under ground, and ſhooteth up againe in divers places: the whole hearbe both leaves and flowers are of a ſharpe ſtrong bitter ſmell and taſte, but yet pleaſant and well to be endured.

2. *Tanacetum verſicolor.* Party coloured Tanſie.

The party coloured Tanſie is in roote, leafe and flower, altogether like the other common garden Tanſie; the onely difference betweene them, conſiſteth in this, that upon the firſt ſhooting up of the heads of leaves, they are almoſt all white, and after they are growne great, there will bee many leaves, remaining white, among the greene, which maketh it the more delightfull, ſeeming like unto a party coloured Feather, in regard of the fine cut leaves of white and greene.

3. *Tanacetum lanuginoſum.* Woolly Tanſie.

Woolly Tanſie from a thick blackiſh ſpreading roote, ſendeth forth divers winged leaves, ſomewhat like unto the former Tanſie and neare unto the leaves of Yarrow, (whereof ſome would make it a kinde) of a very ſweet ſcent, and withall very woolly, ſet cloſe together about the roote, among which ſpring up divers woolly ſtalkes, having a few ſuch like leaves upon them, and at the toppes many tufts of yellow flowers.

4. *Tanacetum minus flore albo.* Small white Tanſie.

Small white Tanſie hath divers winged leaves lying upon the ground, round about the toppes of the roote, very much cut or divided into parts, ſomewhat reſembling both Tanſie and Yarrow, of a pale greene colour, being both leſſe bitter in taſte, and leſſe hot, or ſtrong in ſmell than Tanſie: from among which leaves riſe divers low ſtalkes, beſet with ſmaller leaves up to the toppes, where the flowers ſtand in tufts, the borders being of a white colour, and the middle thrum yellow, the roote is long and wooddy, ſhooting divers wayes.

5. *Tanacetum Alpinum.* Mountaine Tanſie.

The Mountaine Tanſie hath many winged leaves lying upon the ground, compaſſing the toppe of the roote, very like unto the ordinary Tanſie, in the diviſion of the leaves, and of a deepe greene colour, as bitter in taſte, but more pleaſant in ſcent than it: from whence riſe up the ſtalkes, little above a foote high, here and there ſet with the like leaves, but ſmaller; the flowers at the toppes are like unto Camomill flowers, with a border or pale of white leaves, and a yellow thrumme in the middle: the roote is ſmall and ſhort, ſomewhat thicke at the head, and ſmaller downewards, with divers ſmall fibres thereat

6. *Tanacetum inodorum.* Vnſavory Tanſie.

Vnſavory Tanſie hath his large winged leaves, very neare reſembling Tanſie, lying upon the ground, and among them round hard greene ſtalkes, with very few and ſhorter leaves thereon, at the toppes whereof ſtand divers flowers, upon ſhort foote-ſtalkes, very like unto the flowers, of the great white Daiſy, and as large, conſiſting of foureteene or ſixteene leaves, as a pale or border, about a yellow thrumme in the middle: the roote ſpreadeth under the upper part of the earth, and goeth not farre downe: the whole is altogether without any ſcent therein at all, yet the leaves are of a hot and ſharpe taſte, quickly piercing the tongue.

There is another of this kinde of unſavory Tanſie, whoſe leaves are more looſely ſpread, although as much divided, and the flowers being white, are as ſmall as Feverfew.

The Place.

The ordinary Tanſie groweth in ſome places beyond Sea by the hedges and ditches ſides, and in the borders of fields, the curld Tanſie is peculiar to our owne Land, and ſo is the ſecond, and likely to be a degeneration from the ordinary ſort by accident, and nurſed up in our owne Country, where the ſlips doe often looſe, and ſometimes keepe their kinde. The third groweth about *Mompelier* in *France*, and in other places. The fourth groweth as well in *Germany* as in *Italy*, in divers places. The fift groweth on the high and ſnowy Hills on the Alpes, among the Switzers. The laſt groweth in *Hungary*, *Auſtria*, *Germany*, and about *Valentia*, and in the Country of *Daulphine* in *France*.

The Time.

They doe all flower in the Summer Monethes of June and July.

The Names.

Tanſie is called *Tanacetum*, corruptly taken, as *Fuchſius* thinketh, from *Tagetes*, or *Apuleius* his *Arthenſia Tragantes*, and *Athanaſia* peradventure of *Athanatos ſine morte*, or *non moriens*, becauſe the yellow flowers gathered in due time, dye not of a long time after, like as divers of the other hearbes laſt remembred; *Tabermontanus*

3. *Tanacetum lanuginosum.* Woolly Tanſie.

4. *Tanacetum minus flore albo.* Small white Tanſie.

5. *Tanacetum Alpinum.* Mountaine Tanſie.

6. *Tanacetum inodorem.* Vnſavory Tanſie.

tenus calleth the ordinary Tanſie, *Arthemiſia Dioſcoridis*, and the double Tanſie *Arthemiſia ſativa Anglica*. The ſecond hath no other name then is in the title, except that ſome doe call it white Tanſie, becauſe many of the leaves will bee white. The third is called *Tanacetum Lanuginoſum* of *Lugdunenſis*; *Bauhinus* in his *Pinax* would referre it to the *Stratiotes Millefolia flavo flore* of *Cluſius*, and *Millefolium luteum* of *Lobel*, but I thinke he is therein miſtaken, for the leaves of *Stratiotes* being much ſmaller, and having no ſcent declare it ſo. It may be alſo the *Heliochryſum Italicum* of *Matthiolus*, but not any *Achillea*, whoſe deſcriptions yee ſhall have in another part hereafter. The fourth is called by *Dodonaus Tanacetum minus flore albo*, of *Lobel Tanacetum minus candidis floribus*: (but it is not likely to be the *Achyllea* of *Matthiolus*, *Caſtor Durantes* and others, who follow the deſcription of *Dioſcorides* and *Matthiolus*; the flowers of whoſe *Achyllea* are of a whitiſh purple, with ſome yellow ſpots in them) for that it hath both the forme and the ſmell of Tanſie, but ſomewhat weaker. The fift by *Lugdunenſis* is called *Tanacetum parvum Alpinum*, and ſaith that the people in the Mountaines where it groweth, call it *Iva Moſchata*, and ſome *Anthemis Alpina: Geſner in hort.* calleth it *Tanaceto cognata herbula*, in Engliſh Mountaine Tanſie. The two laſt are called *Tanacetum inodorum* of moſt, yet ſome doe adde *Bellidis, majore flore*, and ſome *Bellis Tanacetifolio*: ſome have thought it to bee *Sideritis Italorum*, but *Pena* contradicteth it. *Cluſius* ſheweth the differences of the greater and the leſſer. Wee call it in Engliſh according to the Latine, Vnſavory Tanſie, and I place it here among the reſt of the ſweet Tanſies, for the names ſake, rayſed from the likeneſſe of the leaves, although it hath no ſcent. The Italians call it *Tanaceto*, and *Dancda*: the French *Tanaiſie*, and *Athanaſie*: the Germanes *Reinfarn*, becauſe the leaves reſemble Ferne, and the Dutch thereafter *Reyn vaer*, wee in Engliſh Tanſie.

The

The Vertues.

The decoction of the common Tanſie (and ſome of the reſt come neare in effect thereunto) or the juyce drunke in wine, is a ſingular remedy for all the griefes of the urine, to provoke it being ſtopped, to helpe thoſe that have the ſtrangury, and have weake reines and kidneies, and that cannot make their water but by drops. It is alſo very profitable to diſſolve and expell winde, whether in the ſtomack, belly, or bowels; and to procure womens monethly courſes, and to expell windineſſe in the mother. If it be bruiſed and ſmelled unto often, as alſo applyed to the lower part of the belly, it is aſſuredly found to be profitable for ſuch women as are given to miſcarry in childbearing, to cauſe them goe out their full time, without danger or loſſe; it is uſed alſo againſt the ſtone in the reines with good ſucceſſe, eſpecially to men. It is much uſed both in Lent and in the beginning of the Spring, while the hearbe is young and tender, to make cakes thereof with egges fried, which are called Tanſies, and are very profitable for thoſe ſtomackes, that are troubled with bad humours cleaving thereunto, both to helpe to digeſt them, and by clearing the ſtomack of them, to carry them away downeward. The ſeed is much commended and very profitably given to children for the wormes; and the juyce in drinke is as effectuall; being boyled in oyle, it is very profitably applyed to comfort the ſinewes that are ſhrunke by crampes, or are in paine through cold: It is ſaid alſo, that the roote preſerved in Sugar, is a remedy for them that have the gowt, if they take thereof faſting for a certaine time together.

CHAP. XXIX.

Matricaria. Featherfew.

THere are divers ſorts of Featherfew to bee entreated of here, as ſhall hereafter follow.

1. *Matricaria vulgaris ſimplex.* Common Featherfew.

Common Featherfew hath many large freſh greene leaves, very much torne or cut on the edges: the ſtalkes are hard and round, ſet with many ſuch like leaves, but ſomewhat ſmaller, and at the toppes ſtand many ſingle flowers, upon ſeverall ſmall foot-ſtalkes, conſiſting of many ſmall white leaves, ſtanding round about a yellow thrumme in the middle: the root is ſomewhat hard and ſhort, with many ſtrong fibres at it: the ſcent of the whole plant is very ſtrong and ſtuffing, and the taſte very bitter.

2. *Matricaria flore pleno.* Double Featherfew.

This differeth very little from the former but in the flowers, which are very thicke and double, with white leaves, ſo that onely a little yellow ſpot is to be ſeene in the middle.

1, 3. *Matricaria vulgaris ſimplex & bullatis floribus aureis.* Ordinary & naked Featherfew. 2. *Flore pleno.* Double Featherfew.

3. *Matricaria bullatis floribus aureis.* Naked Featherfew.

This kinde differeth not from the former, but that it hath his flowers, without any of the pale or border of white leaves about it, and therefore being naked, and without thoſe leaves, I have named it naked Featherfew, as an eſpeciall difference from the former.

4. *Matricaria grati odoris.* Sweet Featherfew.

This other Featherfew differeth not from the firſt, either in roote, leafe, or flower, being in all things ſo like, that there can be no difference perceived betweene them, untill you ſmell thereunto, and then it is ſoone found to bee of a more pleaſant ſofter ſmell, which ſo abideth in the kind, and is not ſo made by art, or degenerated by any caſualty, but the worke of nature onely.

5. *Matricaria inodora.* Vnſavory Featherfew.

The Vnſavory Featherfew is a ſmall low plant, rather ſpreading than riſing high into many branches, whereon are many leaves ſet, here and there without order, every one being ſmaller, ſhorter and thicker than the leaves of the common Featherfew, but cut in on both ſides, ſomewhat like unto it, of no ſmell at all: the flowers are white with a yellow thrumme in the middle like the other, which have a certaine heavie dull ſcent, but very weake, the roote is buſhy like the former.

6. *Matricaria ſive Parthenium tenuifolium.* Fine-leafed Featherfew.

This Featherfew hath a few leaves below, riſing from the roote, as ſmall and fine as Fennell, and very like unto Sotherne wood, but ſmelling ſo like Featherfew, and bitter withall, that even thereby it may eaſily be knowne, to what ſtocke or tribe it doth belong, from among which riſe divers browniſh round and hard ſtalkes, to the height of halfe a yard or more, whereon grow diſperſedly ſuch like leaves: at the toppes of the ſtalkes ſtand many ſmall white flowers, in an umbell, thicke ſet, or cloſe together, very like unto the flowers of Yarrow, that they may ſoone deceive him that heedfully doth not marke them: the roote is ſmall, white, and wooddy, with ſome ſmall fibres at it,

7. *Matricaria*

7. Matricaria sive Parthenium Alpinum Clusij. Mountaine Featherfew of *Clusius.* *8. maritimum.* *6. tenuifolium.*

7. *Matricaria sive Parthenium Alpinum Clusij.* Mountaine Featherfew of *Clusius.*

Mountaine Featherfew hath many slender weake greene branches trayling on the ground, and taking roote as they creepe thereon, very like unto Camomill, and not rising above a foote high, about which are set many leaves, almost as fine as Camomill, but cut in after the manner of Mayweed or Featherfew, and very neare of the same smell as Featherfew, being of a hot taste, but not unpleasant: at the toppes of the stalkes stand many flowers together, very like unto the former, but that the middle thrumme is smaller and paler, and the circling leaves not altogether so white, but as large, and somewhat rounder or closer set, of the same scent with the hearbe: the roote is composed of many small fibres shooting downe from a small head.

8. *Parthenium maritimum minimum.* Small Sea Featherfew.

I have thought fit to place this Sea plant, with the rest of the same tribe, as I meane to doe with as many as will abide the culture and manuring, to prosper in this garden, entending to shew you the rest in their convenient places: The roote is small spreading abroad many long fibres, from whence rise up slender weake branches lying upon the ground, diversly set without order, with many small whitish greene leaves, cut in or dented on the edges, very like in forme, unto the leaves of the great white Daisie, but much lesser and more full and fleshy, or thicker, of a strong fierce scent, somewhat like unto Featherfew, or rather unto stinking Maithes or Mayweed: at the toppe of every branch stand one or two flowers, somewhat like unto those of Featherfew or Mayweed, but smaller, and the bordering leaves also smaller, having a whitish greene head or huske of leaves under them.

The Place.

The first is found wilde in some places of this Land, as well as in others, yet for the most part it is nourished in gardens as well as the second, which as *Clusius* thinketh, is peculiar to us: the third grew in *Essex*, and was there found by a Gentleman called Master *William Coys*. The fourth grew in an Iland called *Ilva* in the Levant Seas, as *Camerarius* saith, but it hath beene found wild in our owne Country, as it hath beene affirmed unto mee, as well as the other naked kinde. The fift groweth in *Egypt*, as *Prosper Alpinus* saith, and is onely naturall to that Country. The sixth was found in *Spaine*, by *Myconus* a learned Physitian of *Barcinona*, and sent to *Molinæus* who composed the great Herball called *Lugdunensis*. The seventh *Clusius* found upon the Mountaines of *Stiria*, which are part of the Alpes. The last *Pena* saith grew plentifully neare the Fishermens Cottages, at the foote of *Mons Catius* in *Narbone* in *France*.

The Time.

They all flower in Iune and July, but the Sea plant is the latest.

The Names.

It is called in Greeke παρθένιον. *Parthenium quasi virginalis quia mulierum morbis uterinis medetur, & inde vulgo Matricaria.* It is called also *febrifuga* from whence I thinke our English name Featherfew, or Feaverfew is derived, it being good to expell feavers or agues. It is held by most of the later Writers to be the true *Parthenium* of *Dioscorides*, yet *Lobel* and *Pena* (even as *Brasavolus* and *Fuchsius* before them, whom *Matthiolus* doth confute) by many reasons alleadged doe shew, that both the face or forme of the leaves, compared by *Dioscorides* to Coriander but lesser, as also the properties given to *Parthenium*, can by no meanes be found in this *Matricaria*: but may all most truely and plainely be found in *Cotula fœtida*, or stinking Mayweed: the discourse is too long here to recite, I, therefore referre you to the place where you may read it a large, in the description of *Parthenium* in their *Adversaria*, as also in *Lugdunensis* in the Chapter of *Matricaria*. *Parthenium*, as *Galen* saith was called in his time, *Anthemis*, *Helxine*, *Linozostis* and *Amaracus*; and *Pliny* affirmeth, that *Helxine* was called *Perdicium* and *Parthenium*, and in another place he saith, that it was called *Leucanthemum* and *Tamnacum*, and that *Celsus* called it *Perdicium* and *Muralium*, so that hereby it may be seene, that *Parthenium* was a word applyed to many hearbes. *Fuchsius* would make *Matricaria* to be the second kinde of *Dioscorides* his *Arthemisia*, called *Leptophyllos*, that is *tenuifolia*, and *Parthenium* to be *Cotula fœtida*, which as I said before. *Matthiolus* disproveth: the second is so called by divers Authors as it is in the title, and by *Tabermontanus Arthemisia tenuifolia flore pleno*: the third is a species not spoken of by any Author before, as I take it. The fourth sort *Camerarius* calleth *Matricaria altera ex Ilva*, of *Tabermontanus Arthemisia tenuifolia odorata*, and *Bauhinus Matricaria odorata*; and we *Matricaria grati odoris*, because it is of so good a scent. The fifth *Prosper Alpinus* saith is called in *Egypt Achaovan*, and he thereupon called it *Parthenium inodorum*: in English Vnsavory Featherfew. The sixth was judged by *Myconus* that sent it out of *Spaine*, (as is before said) to be another *Parthenium*, σπερμόφυλλον. and it may be that of *Hippocrates*, which many judge to bee *Cotula fœtida*, *Bauhinus* calleth it *Matricaria foliis Abrotani*. The seventh *Clusius* calleth *Parthenium Alpinum Camerarius Matricaria sive Parthenium Alpinum*, and *Bauhinus Matricaria Alpina (hamameli foliis*. The last *Lobel* and *Pena* call *Cotula sive Parthenium marinum minimum*, and *Lugdunensis Parthenium maritimum minimum*. and is likewise

likewise the *Chamæmelum maritimum* of *Dalechampius*, set out in the same place of *Lugdunensis*, for they are both one, as may be gathered both by the figure and description, although the flowers in *Lobels* figure be more obscured: in English small Sea Featherfew. The Italians call it *Matricaria*, and *Amarella*: the French *Espargoutte*: the Germanes *Mutterkraut*, and *Meltram*: the Dutch *Modecruit*, and we in English as I said before, Featherfew, or rather Feaverfew.

The Vertues.

It is chiefly used for the diseases of the mother, whether it be the strangling or rising of the mother, or the hardnesse or inflammations of the same, applyed outwardly thereunto, or a decoction of the flowers in wine, with a little Nutmegge or Mace put therein, and drunke often in a day, is an approved remedy to bring downe womens courses speedily, and to warme those parts oppressed by obstructions or cold, as also helpeth to expell the dead birth and the afterbirth. For a woman to sit over the hot fumes of the decoction of the hearbe, made in water or wine, is effectuall also for the same purposes, and in some cases to apply the boyled hearb warme to the privie parts. The decoction thereof made, with some Sugar or honey put thereto, is used by many with good successe, as well to helpe the cough, and stuffing of the chest by cold, as also to cleanse the reines and bladder, and helpe to expell the stone in them. The powder of the hearbe, as *Dioscorides* saith, taken in wine, with some Oxymel, purgeth like to *Epithymum* both choler and flegme, and is availeable for those that are short winded, and are troubled with melancholy and heavinesse, or sadnesse of the spirits: It is very effectuall for all paines in the head, comming of a cold cause, as *Camerarius* saith, the hearbe being bruised and applied to the crowne of the head; It is also profitable for those that have the Vertigo, that is, a turning and swimming in their head. It is also drunke warme (I meane the decoction) before the accesse or comming of an ague, as also the hearbe bruised with a few cornes of Bay-salt (and some put beaten glasse thereto, but I see no reason wherefore) and applyed to the wrestes of the hand, to take away the fits of agues. Some doe use the distilled water of the hearbe and flowers, to take away freckles, and other spots and deformities in the face. And some with good successe doe helpe the winde and collicke, in the lower part of the belly, (and some say it is good also for the winde in the stomack) by bruising the hearbe, and heating it on a tyle, with some wine to moisten it, or fryed with a little wine and oyle in a Frying-panne, and applyed warme outwardly to the places, and renewed as there is need. It is an especiall remedy against *Opium*, that is, taken too liberally. It is an hearbe among others, as *Camerarius* saith, much used in *Italy*, fryed with egges, as wee doe Tansies, and eaten with great delight; the bitternesse, which else would make it unpleasant, being taken away by the manner of dressing.

CHAP. XXX.

Chamæmelum. Camomill.

HAve divers sorts of Camomill to shew you in this Chapter, some common and well knowne to most, others more rare, and heard of but by a few, and unto them I thinke it not amisse to joyne the Mayweeds, because they are as well the like stinking, as lesse or not sweet.

1. *Chamæmelum vulgare.* Ordinary Camomill.

Our ordinary Camomill is well knowne to all to have many small trayling branches, set with very fine leaves, bushing and spreading thick over the ground, taking roote still as it spreadeth: the toppes of the branches have white flowers with yellow thrummes in the middle, very like unto Featherfew, but larger, and not so hard, but more soft and gentle in handling, which give a small white seed, not observed by many, and being cast in the ground, will bring forth plants as other seed doth: the whole hearb is of a very sweet scent.

2. *Chamæmelum nudum,* Naked Camomill.

We have another sort of fine small Camomill in our gardens, although very rare, like unto the former, but with whiter, finer, and shorter leaves set on the stalkes, that rise somewhat higher, and beare naked small flowers, that is consisting onely of the yellow thrummy heads, without any pale or border of white leaves, smelling almost as sweet as the former.

3. *Chamæmelum flore pleno.* Double flowred Camomill.

The double Camomill groweth very like the single, but a little higher, and more upright, having fresher greene leaves, the flowers being composed of many rowes of white leaves, making them double, as we call them, & with a yellowish spot in the middle of each flower for the most part, which is of a sweeter scent than the single, but spreadeth on the ground in the same manner, and is more tender to bee kept in Winter: this also hath seed in the middle of the flowers, which being broken and cast into the ground, will produce double Camomill, even as double Featherfew will doe the like.

4. *Chamæmelum pumilum Africum.* Small Camomill of *Africa.*

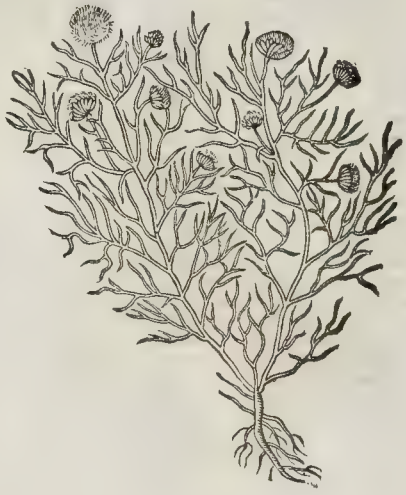
This small Camomill groweth lower than the former naked Camomill, with as fine small leaves, but longer: the flowers being yellow thrummy heads like it, but bigger, and without any pale or border of white leaves, smelling as sweet as the best Camomill.

1. *Chamæmelum vulgare.* Ordinary Camomill, & *flore pleno.* Double Camomill.

5. *Cha-*

2. *Chamæmelum nudum.* Naked Camomill.

4. *Chamæmelum pumilum Africum.* Small Camomill of *Africa*.



5. *Chamæmelum Hiſpanicum amplo flore.* Great Spaniſh Camomill.

This great Camomill groweth in the ſame manner as the ordinary Camomill doth, with greene ſtriped ſtalkes, of a cubite high, branching forth into many parts, whereon doe grow ſuch like leaves, and as finely cut in or divided, the ends whereof are blunter, and divided into two parts, and not very thicke ſet on the branches; at the tops whereof ſtand the flowers, each being foure times larger than the flower of the ordinary ſort: conſiſting of about twenty waved or endented leaves, of a very pale yellow colour almoſt white, for a pale or border, about a pale yellow thrum in the middle: after the flower is paſt the ſeed ripeneth in theſe heads, which is ſmall and yellowiſh like the ordinary ſort: the roote conſiſteth but of a few fibres, which dye every yeare, the plant being but annuall, and muſt be new ſowne in the Spring; it is of a good ſcent, ſomewhat reſembling the garden Camomill.

6. *Chamæmelum Hiſpanicum luteum odoratum.* Sweet yellow Spaniſh Camomill.

This yellow Camomill is like unto the garden Camomill in all things, ſaving the flowers which are wholly yellow, both the bordering leaves, which are of a ſhining yellow colour, about foureteene in number, and the middle thrum, but the whole flower is at leaſt twice as bigge as the flower of the ordinary ſort, and almoſt as ſweet, but leſſer almoſt by the halfe than the former.

7. *Chamæmelum Hiſpanicum incanum parvum.* Small hoary Spaniſh Camomill.

This ſmall Camomill groweth not to be above an hand breadth high, having ſome few hoary whitiſh greene finely cut leaves, lying upon the ground, being as ſmall and fine as thoſe of Southernwood, or fine Wormewood, from among which riſeth up a bare or naked ſtalke, without any leaves thereon, and one ſomewhat large flower, ſtanding at the toppe, having many white leaves, ſtanding about a pale yellow middle thrum; the whole plant and every part thereof, is as well without ſcent as without taſte.

8. *Chamæmelum Alpinum inodorum.* Vnſavory Mountaine Camomill.

Vnſavory Mountaine Camomill hath many hoary ſtalkes riſing from the roote, without leaves for a certaine diſtance, and then having many ſet together, ſmall toward the bottome, ſeeming to bee but as ſtalkes to the leaves, which are ſomewhat narrow, and deepely cut in on both ſides, as it were into deepe notches, being more thicke and full of juyce, then other ſorts are by much, among which riſe up divers other weake ſtalkes, without any cut leaves on them, and one ſomewhat large flower at the toppe of each, like unto a Camomill flower, but larger, the border of leaves being white, and the thrum yellow in the midde: the branches ſpread farre, and take roote in divers places: the roote is compoſed of a few whitiſh ſtrings, the plant hath little or no ſmell to commend it, and is a little bitter in toſte.

9. *Cotula fœtida, & non fœtida.* Mayweed with a ſtrong, and no ſcent.

Mayweed is ſo like unto Camomill, that I muſt needs joyne them together: but that which ſtinketh groweth more upright than either that which ſmelleth not, or the common Camomill, and neither of them creepe or runne on the ground, with the branches taking roote as Camomill doth: the leaves thereon are longer and greater than

Camo-

8. *Chamæmelum Alpinum inodorum.*
Vnſavory Mountaine Camomill.

9. *Cotula fœtida & non fœtida.*
Mayweed with a ſtrong and no ſcent.

Camomill, yet very like, but of a paler greene colour, the one ſort ſmelling ſtrong and unpleaſant, the other having no ſcent at all: the flowers of them both are very like unto Camomill, but larger both the white border and the middle yellow thrum, whereby and by the ſcent thereof they are onely to be diſcerned from Camomill for many doe gather the flowers of that which ſmelleth not, inſtead of Camomill flowers, either of ignorance or wilfulnes, and ſo ſell them promiſcuouſly to the Apothecaries, that know not this note of diſtinction.

Of this kinde there hath beene found oftentimes, and in divers places of this Land, a ſort with double flowers almoſt as large as double Camomill flowers. *Flore pleno*

The Place.

Small Camomill groweth familiarly wilde in many places (on greenes as they are called) of this Land, and with the Mayweed oftentimes that ſtinketh not, which groweth alſo among corne, as the ſtinking ſort doth: the naked and double ſort grow onely in gardens: the fourth was found by *Guillame Boel* in *Africa* by *Tunis*: the fifth, ſixth, and ſeventh in divers places in *Spaine*: the eighth in ſundry places of the *Alpes*: the laſt plentifully in our owne Land.

The Time.

They all flower in the Summer, yet ſome earlier than others.

The Names.

Camomill is called in Greeke Ἀνθέμις, *Anthemis* of *Dioſcorides*, and Ἄνθεμον of *Theophraſtus*, and this for a diſtinction Λευκάνθεμις of the whiteneſſe of the flowers: and χαμαίμηλον *quod mali odorem habeat*, of the ſcent of an Apple or Quince. It is called by ſome in Latine *Leucanthemum*, and *Anthemis*, but moſt generally *Chamæmelum*, and of ſome *Chamomilla*, as it is alſo in the Apothecaries Shops Some call the garden Camomill, both ſingle and double *Chamæmelum Romanum & odoratius & nobile*, thinking them to be ſweeter kindes than the wilde, when as that which groweth wild is uſually brought into gardens, and will by manuring become of as good a ſcent, or any other before in the garden. The reſt have their names in their titles, both in Latine and Engliſh, as much as is convenient, and that others have called them: but Mayweed as is beforeſaid in the laſt Chapter, is more truly taken to be *Parthenium* of *Dioſcorides*, yet generally called *Cotula*, taken as it is thought from the *Thuſcans Cauta*, the diminutive being *Cautula*, corruptly called *Coula*: by the Greekes κυνάνθεμις & κυνοβοτάνης *Cynanthemis & Cynobotane*, that is, *Camomilla canina & Canima herba*: the Germanes *Krottendill*: the Arabians call *Camomill Debonigi & Babunegi*: the Italians call it *Camamilla*: the Spaniards *Manzanilla*: the French *Chamomille*: the Germanes *Chamillen*, and the Mayweed *Krottendill*: the Dutch *Camille*: and we in Engliſh Camomill.

The Vertues.

A decoction made of Camomill, and drunke, taketh away all paines and ſtitches in the ſides. The flowers onely of Camomill beaten, and made up into balls with oyle, driveth away all ſorts of agues, if the party grieved bee annoynted with that oyle taken from the flowers, from the crowne of the head, to the ſoles of the feete, and after laid to ſweat in their bed, with ſufficient coverings upon them, and that they ſweat well: this is *Nicheſſor* an Egyptians medicine; which *Galen* ſeemeth to confirme, for he ſaith that the Sophi of the Egyptians conſecrated this hearbe to the Sunne, as a remedy for all ſorts of agues: but therein ſaith *Galen* they were deceived, for it heaeleth

leth onely thoſe that are already digeſted; but it is very profitable for all other ſorts of agues, that come eyther from ſlegme or melancholy, or from an inflammation of the bowels: for theſe (ſaith he) Camomill is a ſoveraigne remedy to be applied, when as they ſhall be concocted: and therefore there is nothing can be more acceptable and profitable to the *Hypochondria*; that is, the ſides, and that part where the liver and ſplcene lye, then it. The bathing of a decoction of Camomill taketh away wearineſſe, and eaſeth paines to what part of the body ſoever it be applyed, beſides, it comforteth the ſinewes that are overſtrayned, mollifieth all ſwellings, and thoſe that are not overhard, and rarifyeth thoſe that are bound together. It moderately comforteth all parts that have need of warmth, and digeſteth and diſſolveth whatſoever hath need thereof, by a wonderfull ſpeedy property. It eaſeth all the paines of the collick and ſtone, as alſo all paines and torments of the belly, and provoketh urine gently. The flowers boyled in poſſet drinke, provoketh ſweat, and helpeth to expell colds, aches, and paines whereſoever; the ſame is an excellent helpe to bring downe womens courſes; A Syrupe made of the juyce of double Camomill, ſaith *Bauhinus*, but of garden Camomill ſay *Pena* and *Lobel*, with the flowers and white wine, is a remedy againſt the jaundiſe and dropſie, that commeth by the evill diſpoſition of the ſpleene. The flowers boyled in lye is very good to waſh the head, and to comfort both it and the braine. The oyle made of the flowers of Camomill is much uſed, againſt all hard ſwellings, and paines, or aches, ſhrinking of the ſinewes, or crampes, or paines in the joynts, or any other part of the body; and helpeth to diſſolve wind, and paines in the belly, uſed in gliſters for that purpoſe: annoynted alſo, it helpeth ſtitches, and paines in the ſides. Mayweed is often uſed with good ſucceſſe for the ſame purpoſes that Camomill is, both to diſſolve tumours and winde, and to eaſe paines and aches, in the joynts, &c. eſpecially the ſtinking ſort, which is ſtronger in operation than the other.

CHAP. XXXI.

Ambroſia. Oke of Cappadocia.

ALthough there be extant with ſome Writers, two ſorts of *Ambroſia*, as *Matthiolus* in his laſt Edition, and three ſorts with *Lobel* in his obſervations, and ſo likewiſe with *Gerard*; yet finding both the ſorts in *Matthiolus*, and the later ſort in *Lobel* and *Gerard*, to be other hearbes, as I ſhall ſhew you in the ſixth place among the *Abrotana*, and not *Ambroſia*: I have here onely ſhewed you one, as *Dodonaus* before me hath done alſo, which is the firſt both with *Lobel* and *Gerard*, as the trueſt, and is thus to be knowne.

1. *Ambroſia hortenſis.* Oake of Cappadocia.

1. *Ambroſia hortenſis.* Oake of Cappadocia.

The Oake of Cappadocia from a long ſlender roote, buſhing forth with many fibres, ſendeth forth one hoary white ſtriped, or ſtraked ſtalke, riſing to be two foote high at the leaſt in any good ground, divided or ſpread into many branches, from the very bottome, whereon are ſet without any certaine order, ſomewhat large leaves, upon pretty long foot-ſtalkes, very much cut in on the edges, ſomewhat reſembling the diviſion of Mugwort leaves, eſpecially the ends of them, but much ſmaller than they, being all whitiſh or hoary upon the greene, and of a very pleaſing ſcent, not ſo hot or reſinous as Botrys or Oake of *Ieruſalem*: at the toppes of all the branches both great and ſmal, ſtand the flowers, which are ſmall round yellow moſſie buttons, never opening abroad, nor bringing any ſeed, but fall away as idle chaffe: but under theſe flowers from among the leaves, come forth ſmall ſhort ſtalkes, bearing two or three, or foure ſmall rough and pointed heads, without any flowers before them, wherein is contained ſmall round blackiſh ſeed, almoſt like the kernels or ſtones of Raiſons or Grapes.

The place.

This is ſaid to grow naturally in *Cappadocia*, but *Bellonius* ſetteth it downe to have found it in many places of *Aſia minor*, and is onely to be found in gardens thorowout all *Europe*.

The Time.

It flowreth not with us untill Auguſt, and hardly giveth us any perfect ſeed, for the leaſt cold night comming before it can ſeed, taketh it away, making it preſently to periſh, ſo that for the moſt part wee are to ſeeke for ſeed, from *Italy*, or other places.

The Names.

It is called in Greeke ἀμβροσία *quaſi* τὸ τῶν θεῶν βρῶμα, *Deorum cibus*, the meate of the Gods: for ſo Gentiliſme accounted of it, for the excellent fragrancy it yeldeth, and that mortall men did not make it their food, or becauſe, as they ſuppoſed, it did make men that did eate thereof, to bee of ſo long life, that they might be held to be immortall. *Anguillara*, *Geſner in hort.* and *Camerarius* ſuppoſe it to bee *Conyza Hyppocratis*. *Lugdunenſis* calleth it *Artemiſia monoclones*, but giveth two figures thereof, one with an upright ſtalke without any branches, and the other branched. *Geſner* likewiſe calleth it a kinde of *Artemiſia*, and ſome doe take it to bee the ſecond *Artemiſia* of *Pliny*, but *Dodonaus*, *Camerarius*, *Lobel*, and *Tabermontanus*, doe all call it *Ambroſia*,

Ambrosia, or *sativa & agrestis*: *Bauhinus* calleth it *Ambrosia maritima*: in English Oake of *Cappadocia*.

The Vertues.

The properties referred by this ancient Writers to this hearbe are scarce answerable to so glorious a title; for *Dioscorides* saith onely, it hath a property to repell, stay and bind those humours, that fall into any part of the body, being annoynted or outwardly applyed, and so saith *Galen* also, and more is not said by any Author thereof: onely *Pliny* in writing the words of *Dioscorides*, in stead of repelling, hath set downe discussing, as mistaking the Greeke word, and mis-interpreting it.

CHAP. XXXII.

Botrys. Oke of Ierusalem.

WEE have generally knowne but one sort of *Botrys*, which is a small low hearbe, but of late dayes there hath come to our knowledge, another sort more tall, and like unto a small shrubbe, because it is more wooddy.

1. *Botrys vulgaris.* Common Oke of Ierusalem.

The ordinary Oke of *Jerusalem* is a small bushy hearbe, full of branches, a foote and a halfe high, with some few, and not many leaves thereon, which at the first springing are reddish on the underside, and after grow to be of a yellowish greene colour, especially when they grow old, and in the time of the flowring and seeding; which are much cut in on the edges, like unto Grunsell but larger: the toppes of the branches, and so downe to the halfe of their height, is fully stored with small pale yellow flowers like unto the blossomes of Vines, which turne into small browneish seed: the roote is long and hard when it hath given seed, perishing yearely: the whole plant is of a resinous sweet scent, and while it is greene is somewhat clammy in handling.

1: *Botrys vulgaris.*
Common Oke of Ierusalem.

2. *Botrys Americana.* Indian Oke of Ierusalem.

This *Botrys* or Oke of *Ierusalem* riseth up higher, and the branches are more wooddy and durable: the leaves are somewhat like unto wild Arrache, but larger, and much cut in on the edges, like unto the former, the whole plant, both flowers and seed, is most like unto the former: and doth most likely abide the Winter of his naturall warme Countries, which are nothing so violent as ours, but will not doe so with us, without much care to preserve it; but doth spring of the seed sowne, as well as spilt, at, or before the gathering: the scent whereof is somewhat strong, but not unpleasant, very neare unto the other.

The Place.

The first groweth in *Italy* and *Narbone* in *France*, in divers places, as well by the water sides, as in the dry sandy grounds. The second is naturall of *Mexico* & *Virginia*, from whence it hath bin brought.

The Time.

They both flower and seed in August and September, and doe often raise themselves, of their owne sowing, especially the former.

The Names.

It is called in Greeke βότρυς and *Botrys* in Latine, *a floribus & seminibus in botryos formam ramulis insidentibus*, because the flowers, and so the seed also groweth like unto a bunch of Grapes. All Authors call it *Botrys*, yet *Eystetensis* calleth it *Artemisia Turcica*, and *Camerarius* saith that the Italians call it *Patientia*, *Cordus* upon *Dioscorides* calleth it *Ambrosia altera species*, and moreover saith, that in some Apothecaries shops in *Germany*, the seed thereof was taken for *Amomum*: *Dioscorides* saith, that in his time, the Cappadocians called it *Ambrosia*, and some others *Artemisia*. *Bauhinus* calleth it *Botrys Ambrosioides vulgaris*. And the other he calleth *Botrys Ambrosioides Mexicana*, and saith the seed was sent by the name of *Parote*: wee doe generally call it *Botrys fruticosa Americana*, as a distinction from the other: in English Shrubby Oke of *Ierusalem*.

The Vertues.

Dioscorides applieth it not to any other thing, then that it helpeth those that cannot take their breath, unlesse they hold their neckes upright, being taken in wine: but others have found out more especiall properties therein; for in that it both heateth and dryeth, attenuateth, cutteth, cleanseth, purgeth, openeth, and expectorateth tough flegme. It is very profitable for all the diseases of the chest or breast, troubled with flegme, whether it bee thin or tough, or rotten filthy corrupted matter to spit forth, as also for those that are short winded, or have the cough of the lungs, either the hearbe it selfe alone being boyled, and the decoction taken with Syrupe of Violets, or with Liquoris added into the decoction, and taken for divers dayes together. The greene hearbe is of especiall good use in the paines of the mother, to be heated on a tyle, and moistned with Muscadine, and laid hot to the belly. As also, if you take Oke of *Ierusalem*, Featherfew, and Camomill flowers, and fry them together with some oyle of

Lillies into a cake, and apply it warme to the belly, is an approved remedy for women in childbed, that feele any paines of the mother, after their delivery. The fumes of the decoction thereof alſo taken underneath, by ſitting over it helpeth to bring downe the courſes, and to expell the dead child. It is much uſed to be laid into Wardrobes or Preſſes, not onely to kill or drive away the mothes, but for the ſweet ſcent to perfume the garments.

CHAP. XXXIII.

Artemiſia. Mugwort.

THere are three or foure ſorts of Mugwort to be here declared, beſides a ſtranger lately come from *Virginia*, although *Pliny* and others doe reckon but two ſorts, one with broader, and another with ſmaller leaves.

1. *Artemiſia vulgaris.* Common Mugwort.

1. *Artemiſia vulgaris.* Common Mugwort.

The common Mugwort hath divers leaves lying upon the ground, very much divided or cut in deepely about the brims, ſomewhat like unto wormewood, but much larger, of a ſad or darke greene colour on the upperſide, and very hoary white underneath: the ſtalkes (doe grow in ſome to be purpliſh, and then the flowers are deeper coloured) riſe to bee foure or five foote high, whereon grow ſuch like leaves as thoſe below, but ſomewhat ſmaller, branching forth very much towards the toppe, whereon are ſet, very ſmall pale yellowiſh flowers like buttons, which fall away, and after them come ſmall ſeed, incloſed in ſmall round heads; the roote is long and hard, with many ſmall fibres growing from it, whereby it taketh ſtrong hold in the ground, but both ſtalke and leafe doe die quite down every yeare, and the roote ſhooteth anew in the Spring: the whole plant is of a reſonable good ſcent, and is more eaſily propagated by the ſlips, then by the ſeed.

2. *Artemiſia minor.* Small Mugwort.

This ſmall Mugwort is ſomewhat like unto the former, having ſuch like leaves, divided or cut in on both ſides, greene above, and whitiſh underneath, but much ſmaller than they: the ſtalke likewiſe (for oftentimes it hath but one) riſeth not ſo high, nor is ſo great, but bearing the like flowers, yet paler: the ſcent whereof is alſo a like.

3 *Artemiſia tenuifolia montana.* Fine Mountaine Mugwort.

The Mountaine Mugwort, is alſo not much unlike the former, having divers ſquare browniſh branches, not above a foot and a halfe high, whereon doe grow ſuch like leaves almoſt, but longer, narrower, and much more crumpled, or finely jagged on the edges; the flowers are pale and ſmall like the former: the roote is long and blacke, ſpreading in the ground.

4. *Artemiſia Polyſpermos.* Fruitfull Mugwort.

This kinde of Mugwort riſeth up uſuall but with one ſtalke, dividing it ſelfe from the bottome thereof into many branches, whereon are ſet ſomewhat ſparſedly, ſomewhat longer and larger leaves than the ſmall Mugwort, but more finely cut in on the edges, unto the middle ribbe, and ending in a longer point; the toppes of the branches, are more plentifully ſtored with flowers than the other ſorts, which turne into ſmall ſeed, bearing abundantly.

5. *Artemiſia Virginiana.* Virginian Mugwort.

This Virginian being ſo lately come to our knowledge, that we can ſcarce give a perfect deſcription thereof unto you riſeth up, ſomewhat higher and larger ſpread, with much divided leaves like the firſt but greater, the flowers hath not beene yet thorowly obſerved.

The Place.

The firſt groweth plentifully in many places of this Land, as well as in others, by the way ſides, as alſo by ſmall water courſes, and in divers other places. The ſecond likewiſe is found in ſome of thoſe places, but farre leſſe frequent. The other three are ſtrangers, and nurſed up with us onely in gardens.

The Time.

They all flower and ſeed in the end of Summer.

The Names.

It is called in Greeke ἀρτεμισία, and *Artemiſia* in Latine alſo, and recorded by *Pliny*, that it tooke the name of *Artemiſia*, from *Artemiſia* the wife of *Mauſolus*, King of *Caria*; when as formerly it was called *Parthenis*, *quaſi Virginalis* Maidenwort, and as *Apuleius* ſaith, was alſo called *Parthenium*: but others thinke it tooke the name from ἄρτεμις, who is called *Diana*, becauſe it is chiefly applyed to womens diſeaſes. The firſt is generally called of all Writers *Artemiſia & vulgaris*, becauſe it is the moſt common in all Countries. Some call it alſo *Mater herbarum*.

2. *Artemisia minor.* Small Mugwort.

3. *Artemisia tenuifolia montana,* Fine Mountaine Mugwort.

4. *Artemisia Polyspermos.* Fruitfull Mugwort.

4. *Artemisia Polyspermos.* Fruitfull Mugwort.

rum. The ſecond is called by *Matthiolus* and others *Artemiſia minor*, and ſo doe we. The third is called by *Lugdunenſis Artemiſia leptophyllos incana*, and in Engliſh Fine Mountaine Mugwort. The laſt is called by *Bauhinus Artemiſia Polyſpermos*, and the other by *Lugdunenſis Artemiſia Monoclonos quorundam alys Ambroſia*, in Engliſh Fruitfull Mugwort.

The Vertues.

Dioſcorides ſaith, it heateth and extenuateth. It is with good ſucceſſe put among other herbes, that are boyled for women to ſit over the hot decoction, to draw downe their courſes, to helpe the delivery of the birth, and to expell the ſecondine or afterbirth, as alſo for the obſtructions and inflammations of the mother; it breaketh the ſtone, and cauſeth one to make water where it is ſtopped: the juyce thereof made up with Myrrhe, and put under as a peſſary, worketh the ſame effect, and ſo doth the roote alſo, being made up with Axungia into an oyntment, it doth take away Wens and hard knots, and kernels that grow about the necke and throat, as alſo to eaſe the paines about the necke, but eſpecially and with more effect, if ſome field Daiſies be put with it. The herbe it ſelfe being freſh, or the juyce thereof taken, is a ſpeciall remedy, upon the overmuch taking of *Opium*: three drammes of the powder of the dryed leaves taken in wine, is a ſpeedy, and the beſt certaine helpe for the Sciatica. A decoction thereof made with Camomill and Agrimony, and the place bathed therewith while it is warme, taketh away the paines of the ſinewes, and the crampe. It is ſaid of *Pliny*, that if a Traveller binde ſome of the herbe about him, he ſhall feele no wearineſſe at all in his journey; as alſo that no evill medicine or evill beaſt ſhall hurt him that hath this herbe about him. Many ſuch idle ſuperſtitious and irreligious relations are ſet downe, both by the ancient and later Writers concerning this and other plants, which to relate, were both unſeemely for me, and unprofitable for you. I will onely declare unto you, the idle conceit of ſome of our later dayes concerning this plant, and that is even of *Bauhinus*, who glorieth to be an eye witneſſe of this foppery, that upon Saint *Johns* eve, there are coales to be found at mid-day, under the rootes of Mugwort, which after or before that time, are very ſmall or none at all, and are uſed as an Amulet to hang about the necke of thoſe that have the falling ſickneſſe, to cure them thereof. But Oh the weake and fraile nature of man! which I cannot but lament, that is more prone to beleeve and relye upon ſuch impoſtures, than upon the ordinances of God in his creatures, and truſt in his providence.

CHAP. XXXIIII.

Abrotanum. Sothernwood.

OF Sothernwood (which is the *Abrotanum mas*, as the late and beſt experienced Authors doe hold; the *famina* to be the Lavender Cotton, which ſhall be ſet downe in the next Chapter,) there are many ſorts, as they ſhall be declared in their order: of which number I have taken ſome from thoſe hearbes going before, as alſo from Wormewood that ſhall follow, becauſe I ſuppoſe they rather belong to this Tribe, than to any of the other, from whence I have taken them.

1. *Abrotanum mas vulgare*, Common Sothernwood.

1. *Abrotanum mas vulgare.* Common Sothernwood.

Our ordinary Sothernwood (which is the moſt common in gardens with us, and generally called Sothernwood: for the other ſorts are called by other names, for the moſt part, and not acknowledge to be of this kinde) riſeth up with many weake and wooddy branches bending downewards, if they be not held up, ſpecially while they are ſmall, for the elder ſtems are more ſtrong and great, ryſing in time to bee higher than any man, from which doe grow out many ſmall and long branches, whereon are ſet many ſmall fine and ſhort leaves, as fine as Fennell, but not ſo long, of a grayiſh or ruſſet greene colour, ſomewhat ſtrong, but not unpleaſant in ſmell, and of a ſtrong and ſomewhat bitter taſte: from the middle almoſt to the toppes of the upper ſprigges, ſtand ſmal round yellow flowers hanging like little buttons, which never open much, but paſſe away, and after them come the ſeed, which is ſmaller than that of Wormewood: the root groweth not very deepe, but is wooddy, with divers ſtrings annexed unto it: this loſeth all the leaves on the ſtalkes and branches every yeare, and ſhoot forth anew in the Spring.

3. *Abrotanum majus.* Great Sothernwood.

This great Sothernwood is altogether like the former, growing as high, or rather higher, and with leaves like thereunto, but ſomewhat larger and greener, of a ſtrong reſinous ſcent, not ſo pleaſant, but drawing ſomewhat neare unto the ſmell of Camfire or Francumſence, the flowers and ſeed differ not from the other, nor the roote, which is wooddy and runneth under ground in the ſame manner.

3. *Abrotanum arboreſcens.* Tree Sothernwood.

This rare kinde of Sothernwood groweth upright, with one ſtem or ſtalke, to the height of a man, if the lower ſmall ſprigges bee pruned from it in the growing, and ſhooteth forth many branches on all ſides, on which doe grow many leaves, very much cut in and divided, but are nothing ſo fine and

3. *Abrotanum arboreſcens.*
Tree Sothernwood.

4. *Abrotanum inodorum.*
Vnſavory Sothernwood.

and ſmall as the former, but yet a little quicker, and nearer reſembling Wormewood, as it is alſo in the taſte, and more aromaticall than Sothernwood: the flowers ſtand at the toppes of the branches, being more plentifull and larger than the former, but yellow like them, after which come the ſeed, which likewiſe is ſomewhat larger: the roote is wooddy, ſpreading many ſtrings and fibres: the plant is more tender than the others, and will require ſome care to preſerve it in the Winter more than they.

4. *Abrotanum inodorum.* Vnſavory Sothernwood.

Vnſavory Sothernwood ſpringeth up with many ſlender, but wooddy whitiſh ſtalkes for the moſt part, leaning or lying upon the ground, yet ſometimes ſtanding ſomewhat upright, upon which at ſeverall places, come forth many ſmall whitiſh leaves, not ſo ſmall or finely cut or divided as the common Sothernwood, but greater, of little or no ſmell at all, but of a hot taſte, drawing rheume into the mouth, to bee ſpit forth: from among which ſpring forth ſmall greeniſh purple branches, ſet with the like leaves, but ſmaller, and many ſmall pendulous greeniſh purple heads, along the ſprigges to the toppes, which when they open, ſhew out ſmall pale purpliſh flowers; the roote is ſomewhat wooddy, and brancheth forth divers wayes, with many ſmall ſtrings or fibres.

5. *Abrotanum humile odoratum.* Small ſweet Sothernwood.

This ſmall Sothernwood ſhooteth forth many ſmall wooddy branches, riſing ſeldome above halfe a yard high, but very thickly ſpreading into other ſmaller ſprigs, ſet full of ſmall leaves, ſomewhat longer, greater, and greener than the laſt: the toppes of the ſtalkes are ſtored with many ſmall round heads, which ſhew forth ſmall yellow greeniſh flowers: the roote ſpreadeth like the other: the whole plant as well leaves as flowers, and the ſprigges yeeld a very good ſcent and pleaſant ſavour, more than the other, ſomewhat inclining to Wormewood.

6. *Abrotanum campeſtre.* Field Sothernwood.

The Field Sothernwood hath many ſmall fine leaves, riſing from the roote, very like unto the leaves of common Sothernwood, but of a darke greene colour, and likewiſe many wooddy ſtalkes, about a foote high or more (yet ſometimes but one) divided diverſly, having ſuch like leaves growing thereon, as are below: the ſlender ſprigges are ſtored with plenty of ſmall round greene heads or buttons, which containe ſmall yellowiſh flowers like Sothernwood, and plenty of ſmall ſeed following them: the roote is long, thick, blacke, and wooddy, with divers fibres annexed thereunto: the ſmell hereof is more neare unto Mugwort, than Sothernwood.

7. *Abrotanum campeſtre incanum.* Hoary Field Sothernwood.

This other Field Sothernwood, is in all things like the laſt deſcribed wild Sothernwood, but that the leaves are of a whitiſh or hoary colour, and of a ſweet aromaticall ſcent and taſte, and that the roote is of a darke reddiſh colour on the outſide, with divers ſmall fibres growing from it.

The Place.

The firſt is uſually found in gardens but his originall is not ſet downe. The ſecond groweth in *Germany*, and brought into their gardens. The third came out of the Levant into *Italy*, from whence it hath beene ſent to divers other places, as well here, as to *Germany*, the Low-countries, &c. The fourth *Cluſius* ſaith he found in *Auſtria*, *Hungaria*,

5. *Abrotanum humile odoratum.* Small ſweet Sothernwood.

6. *Abrotanum campeſtre.* Field Sothernwood.

7. *Abrotanum campeſtre incanum.* Hoary field Sothernwood.

Hungaria, and other parts thereabouts. The fifth is onely found in the gardens of Herbariſts that are curious. The ſixth groweth in *Harcynia ſylva Sazonothurungica*, as *Iohannes Thalius* ſetteth it downe. And the laſt about *Lintz* in *Auſtria*, from whence, *Bauhinus* in his *Prodromus* ſaith, it was brought to him.

The Time.

Moſt of them doe flower in Iuly and Auguſt, yet ſome later, ſo that we ſeldome ſee them beare ſeed, eſpecially the greateſt.

The Names.

It is called in Greeke Ἀβρότονον διὰ τὸ πρὸς ὄψιν ἁβρὸν καὶ ἁπαλὸν φαίνεσθαι, ἄλλως τε καὶ τὸ δυσπέψαντον, *hoc eſt quod conſpectu tenerum molle & delicatum appareat: aut quod gravem acremve & difficilem halitum ſpirat*: in Latine after the Greeke *Abrotonum*, but more uſually *Abrotanum*. *Pliny* calleth this *mas Campeſtre*, and the *fœmina montanum*. The firſt is called generally by all Authors *Abrotanum mas*, and by *Cordus nigrum*, except *Dodonæus* in French, and *Anguillara* who call it *fœmina*, in Engliſh common Sothernwood. The ſecond is called by *Camerarius Ambrotanum magnum camphoratum quibuſdam Incenſaria*, and by *Bauhinus Abrotanum mas anguſtifolium maximum*: in Engliſh great Sothernwood. The third is called by *Anguillara Abſinthium del Comaſco*, and *Abſinthium arboreſcens* of *Lobel*, *Lugdunenſis*, *Tabermontanus*, and *Gerard*: but *Dodonæus* calleth it *Abrotanum fœmina arboreſcens*, and *Bauhinus* in his *Pinax*, *Abrotanum latifolium arboreſcens*, in Engliſh Tree Sothernwood. The fourth is called by *Dodonæus Abſinthium inodorum & inſipidum*: by *Lobel*, *Lugdunenſis*, and *Gerard*, *Abrotanum inodorum*: but *Cluſius* calleth it his ſecond *Arthemiſia tenuifolia*: all theſe Authors doe give one and the ſame figure for this plant: *Dodonæus* for *Abſinthium*, *Lobel* and others for *Abrotanum*, and *Cluſius* for *Arthemiſia*. *Bauhinus* calleth it *Abrotanum latifolium inodorum*: in Engliſh Vnſavory Sothernwood; for we have a Wormewood that is unſavory, differing from this, as ſhall be ſhewed you among the Wormewoods. The fift is called by *Dodonæus*

Dodonæus and *Lobel Abrotanum odoratum humile & denſe fruticoſum*: by *Tragus Abrotanum tertium*, and by *Bauhinus Abrotanum mas anguſtifolium minus*: in Engliſh Small ſweet Sothernwood, The ſixth is called by *Matthiolus* in his later Edition *Ambroſia altera*; whom *Lacuna*, *Lonicerus*, *Caſtor Durantes*, *Lugdunenſis* and *Camerarius* doe follow, and *Lobel Ambroſia tenuifolia*. *Geſner* calleth it *Ambroſia Leptophyllos*, and *Cluſius Arthemiſia tertia tenuifolia*, it is *Tragus* his *Abrotanum ſylveſtre quartum*: and *Tabernæmontanus*, *Gerard*, and *Bauhinus Abrotanum campeſtre*, in Engliſh Field Sothernwood. The laſt is called by *Bauhinus Abrotanum campeſtre incanum Carlinæ odoræ*: in Engliſh Hoary field Sothernwood. The Arabians call it *Cathſum Keſum*, or *Gaiſſum*: the Italians and Spaniards *Abrotano*: the French *Auronne & bois de S. Iean*: the Germanes *Stabwurtz*: the Dutch *Averonne*: and wee Sothernwood.

The Vertues.

Dioſcorides ſaith, that the ſeed bruiſed, heated in warme water and drunke, helpeth thoſe that are burſten, or are troubled with crampes, or convulſions of ſinewes, with the Sciatica, and with the difficulty in making water, and to bring downe womens courſes: the ſame taken in wine, is an antidote or counterpoiſon againſt all deadly poiſon, and driveth away Serpents, and other venemous creatures, eſpecially againſt Scorpions and poiſonfull Spiders; as alſo by the ſmell of the hearbe being burnt, or laid in places where they come: the oyle thereof being annoynted on places convenient, eſpecially the backe bone, before the fits of agues taketh them away: it is profitably laid to the eyes to take away the inflammation of them, if it be put with ſome part of a roaſted Quiſice, and boyled with a few crummes of bread: boyled with barly meale, it taketh away pimples, puſhes, or wheales, that riſe in the face, or other parts of the body. The ſeed as well as the dryed hearbe, is often given to kill the wormes in children: the hearbe bruiſed and laid to, helpeth to draw forth ſplinters, and thornes out of the fleſh: The aſhes thereof dryeth up and healeth old ulcers, that are without inflammation, although by the ſharpneſſe thereof it biteth ſore, and putteth them to ſome paines, as alſo the ſores that happen in the privie parts, of men or women. The aſhes likewiſe mingled with old Sallet-oyle (for we have neither the oyle of the ſeed of the Maſtick tree, which is much commended, nor the oyle of Cherua, or the great Spurge, called *Palma Chriſti*, nor ſome other that are uſed in other Countries) helpeth thoſe that have their haire fallen, or their heads bald, to cauſe the haires to grow againe, either upon the head or beard: Some ſay the juyce thereof with oyle doth the ſame. *Durantes* ſaith that the oyle made of Sothernwood, and put among other oyntments, that are uſed againſt the French diſeaſe, is very effectuall, and likewiſe killeth vermine in the head. The diſtilled water of the hearbe is ſaid to helpe them much, that are troubled with the ſtone, as alſo for the diſeaſes of the ſpleene and mother. It is generally held by all both old and new Writers, that it is more offenſive to the ſtomacke than Wormewood, becauſe it hath not that aſtriction in it. The Germanes commend it for a ſingular wound hearbe, as their name of *Stabwurt* given unto it doth teſtifie.

CHAP. XXXV.

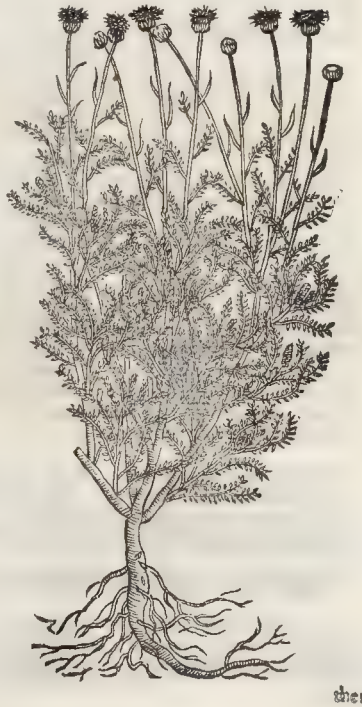
Abrotanum famina. Lavender Cotton.

THere are divers ſorts of Lavender Cotton, to be here remembred.

1. *Abrotanum famina vulgare.* Ordinary Lavender Cotton.

The ordinary Lavender Cotton hath ſundry wooddy brittle hoary branches, whereon are ſet many long foure-ſquare hoary or whitiſh leaves, dented about the edges: at the tops of the branches ſtand naked ſtalkes, bearing every one a large yellow head or flower, like unto Tanſie or Maudeline, but greater, of a gold yellow colour, abiding ſo a long time upon the ſtalkes, and being kept dry likewiſe: after which commeth ſmall darke coloured ſeed: the roote is wooddy, and ſpreadeth ſundry hard fibres: it is of a ſtrong ſweet ſcent, but not unpleaſant.

1. *Abrotanum famina vulgare.* Ordinary Lavender Cotton.



2. *Abrotanum famina magnum.* Great Lavender Cotton.

This Lavender Cotton is very like the ordinary Garden kinde, but not buſhing ſo thicke with ſtalkes, growing to have a great high and thicke ſtemme or ſtalke, not ſet with ſo many branches thereon, but ſomewhat bigger than the other, whereon grow foure-ſquare dented leaves like thereunto, but ſomewhat larger, thicker and greener: the flowers ſtand in the ſame manner every one upon his long ſtalke, being as yellow and large as they, which give the like ſeed: the roote ſpreadeth in the ground with hard wooddy branches, like the other, and endureth the extremities of Winter as well as the other: the ſmell of the whole plant, and every part thereof is ſtrong, but not ſo pleaſant to a great many, as the other: this will be propagated by ſlipping, as well as the other.

3. *Abrotanum famina Narbonenſe magno flore.* French Lavender Cotton.

The French Lavender Cotton groweth not to bee ſo high as the ordinary garden kinde, but hath many wooddy ſhort little branches, not above halfe a yard high, diverſly ſpread into many other ſmall ones, whereon are leaves like the o-

ther,

3. *Abrotanum fœmina Narbonense magno flore.* French Lavender Cotton.

ther, but somewhat smaller, and more thinly or sparsedly set on the branches, of a greenish white colour, neither so green as the last, nor fully so white as the ordinary, of a strong scent, somewhat like the ordinary kind: the flowers stand upon the toppes of the smaller sprigges, every one by it selfe, upon a bare or naked stalke, without leaves for a good space, which are of a paler yellow colour than they, and much larger, which give seed somewhat of a darker colour than it: the roote is as great and wooddy, and spreadeth much in the ground.

4. *Abrotanum fœmina Ericæ foliis.* Fine Lavender Cotton.

This Lavender Cotton groweth not so great or high, as the French kind, but hath many short wooddy branches, whereon doe sparsedly grow smaller, shorter, and finer whitish greene leaves, very like to the leaves of common Heath: the flowers are yellow standing in the like manner as the others doe: this hath a fine small scent to commend it, somewhat resinous, not very faintish or weake.

5. *Abrotanum fœmina foliis Rorismarini majus.* Rosmary leafed Lavender Cotton.

This kinde of Lavender cotton, shooteth forth from his wooddy roote, many slender hoary stalkes, little above a foote long, whereabout grow many very narrow small and flat leaves, like unto the leaves of Rosmary, which while they are young are more hoary white, and have but a small shew of denting about the edges: but when they are grown old, they are more greene, and the denting about the edges is more apparant, of a sweet scent, and bitter taste: from these stalkes come forth divers short sprigges, with very few leaves on them, on the toppes whereof stand severall yellow flowers, like unto Lavender cotton, but much larger, which die downe to the stalkes every yeare, after it hath borne seed, as the other kindes doe.

6. *Abrotanum fœmina foliis Rorismarini minus.* Small Rosmary leafed Lavender cotton,

There is no difference betweene this and the last, in the leaves and flowers, but in the smalnesse thereof, being more slender, low and small in every part, which is not by reason of the place (as being more dry and barren) where it groweth, but growing in the same place, with the former, is smaller, and the seed being sowne, retaineth still the same forme it had, in the naturall place.

7. *Abrotanum fœmina viridis minor.* Small greene Lavender cotton.

This small kinde of Lavender cotton is very like unto the last small kinde, but that it groweth somewhat greater and higher, having greene and not hoary stalkes at all, as the leaves also are, and a little longer, being as bitter in taste as it, but not of so sweet a scent: the flowers stand in the same manner upon slender stalkes, and of the same fashion, but of a paler yellow colour: the roote is wooddy like it, and full of small fibres.

8. *Abrotanum fœmina repens.* Creeping Lavender cotton.

This creeping Lavender cotton also, is a small low hearbe, whose branches stand not upright, but lie downe, or as it were, creepe upon the ground, and are as white and hoary, or rather more than the ordinary, and so are the small dented leaves also, but they are somewhat thicker and fuller: the flowers likewise are yellow like thereunto, but somewhat smaller; and the smell is not much unlike unto it also.

9. *Abrotanum peregrinum Lobelij Cupressi foliis.* Strange Lavender cotton.

This strange plant I have here inserted among the rest of the Lavender cottons, presuming it to be his right place, although *Lobel* giveth it the name of Sothernwood, with the face of Cypresse: but hee maketh no mention of any flowers, whether they are answerable thereunto, which might assure us of the truth, and put the rest out of all doubt: but as he setteth it downe, so doe I give it you here, the description thereof, untill I see the face thereof my selfe, to contrary or confirme the title. From a small roote riseth up many black hard slender stalkes, about a foote, or a foote and a halfe high, bearing many long, narrow, and flat leaves, interlaced or brayded like unto the leaves of the Cypresse or Savine tree, and dented about the edges: the flowers as I said, he doth not expresse, nor can I give you any further knowledge hereof as yet.

The Place.

The first groweth in *Germany*. The second in divers places in *Narbone* in *France*. The third is not knowne to us, whence it is naturall. The fourth, fifth, and sixth, *Clusius* found about *Salamanca* in *Spaine*. The seventh is unknowne whence it is: and the last it is likely by the title whereby it was sent, came out of *Egypt*. Many of them grow in the gardens of those that are curious Conservers of rare plants.

The Time.

They doe all, or most of them flower in Iuly and August.

The Names.

There is some controversie among Writers concerning the true *Abrotanum fœmina* of *Dioscorides*, some holding that which others refuse and confute; but by *Matthiolus*, and the most judicious of the later Writers, this is taken to bee the true *Abrotanum fœmina* of *Dioscorides*, although *Fuchsius* and *Dodonæus* doe deny it, unto whom also *Clusius*

Cluſius doth agree, ſaying that it cannot be that of *Dioſcorides*, which hath as hee ſaith, divided leaves like unto Sea Wormewood; and yet ſetteth downe both it and the reſt of that kinde, under the name of *Abrotanum fœmina*, which I thinke he would not doe, if he thought they had not ſome neare reſemblance; but *Matthiolus* doth ſhew againſt *Fuchſius*, that the plant which he ſetteth forth for *Abrotanum fœmina*, is farre unlike it (being the *Abſinthium Ponticum* of *Dodonæus* and others, whereof I ſhall ſpeake in the next Chapter) and that although *Fuchſius* doth ſet forth the true *Abrotanum fœmina* of *Dioſcorides*, yet it is under the name of *Chamæcypariſſus*, not knowing it to be the right: *Dodonæus* alſo (whom *Gerard* followeth in tranſlating his words, and his Corrector letteth them paſſe as currant) conteſteth that this Lavender cotton cannot bee *Dioſcorides Abrotanum fœmina*, but would make his greateſt and his ſmalleſt Sothernwoods to be it: which as all may well obſerve, differ very little either in leaves or flowers, from the ordinary *mas*; and therefore I the more mervaile that hee ſhould refuſe this, for the flowers ſake onely, ſeeing his *mas* and *fœmina* are ſo like in flowers; but *Dioſcorides* in deſcribing his *Abrotanum fœmina* ſaith, *floribus referta eſt, comantibus in ſummo fulgore auri*, which doth moſt lively expreſſe the flowers hereof, and cannot be referred to either of his Sothernwoods, and therefore he ſetteth forth this plant, and the divers kindes thereof, under the name of *Santolina*, which he would referre to *Eluchryſum*, and *Stœchas Citrina*, but how truely let others judge. The firſt is the *Abrotanum fœmina vulgare* by *Matthiolus* and divers others, and *Santolina* by *Anguillara*, as they call it in ſome places of *Italy*, and *Creſpolina* by *Cæſalpinus*, as they call it in other places of *Italy*. Some of the later Writers would make it to be the *Chamæcypariſſus herba* of *Pliny*, which may well be doubted of, ſeeing he is ſo briefe therein, giving onely the bare name, and a few properties: the ſecond is called by *Camerarius Abrotanum fœmina folijs magis viridibus*; whereunto *Cluſius* ſeemeth to agree, making it his ſecond *Abrotanum fœmina*. *Fabius Columna* maketh it to be an other ſort of *Polium*, but not ſo hoary as our ordinary Lavender cotton, in Engliſh great Lavender cotton. The third is called by *Cordus Santonicum majus*, by *Tabermontanus Abſinthium marinum primum*: by *Pena* and *Lobel* it is taken to bee the true *Seriphium* of *Dioſcorides*, yet ſay it hath the face of *Abrotanum fœmina*. *Dodonæus* calleth it his firſt *Santolina*: it is *Cluſius* his third *Abrotanum fœmina*, which he calleth *Narbonenſe*: *Columna* his *Polij altera ſpecies major*, and *Bauhinus* his *Abrotum fœmina flore majore*: in Engliſh French Lavender cotton. The fourth is *Dodonæus* his third *Santolina*, and *Bauhinus* his *Abrotanum fœmina folijs ericæ*, and called by ſome *Unguentaria Lutetianorum*, *Bauhinus* judgeth it to be *Chamæcypariſſus Dalechampij*, as it is ſet downe in *Lugdunenſis*, but by the compariſon of the deſcription thereof, I finde that that *Chamæcypariſſus* doth better agree with the ſecond Spaniſh *Abrotanum fœmina* of *Cluſius*, called *Salmanticenſis ſecunda*, in his Spaniſh obſervations. The fift is *Cluſius* his fourth kinde of Lavender cotton, and the firſt of his Spaniſh kindes, and called by *Bauhinus Abrotanum fœmina folijs Roſmarini majus*: the fixth is the ſecond Spaniſh *Abrotanum fœmina* of *Cluſius*, which *Bauhinus* calleth *Abrotanum fœmina Roſmarini folijs minus*: the ſeventh is the third *Abrotanum fœmina Salmaticenſis* of *Cluſius*, called by *Bauhinus Abrotanum fœmina viridis*. The eighth is *Dodonæus* his fifth *Santolina*, which *Bauhinus* calleth *Abrotanum fœmina repens caneſcens*, in Engliſh Creeping Lavender cotton. The laſt *Pena* and *Lobel* in their *Adverſaria* ſay, they received both the plant and ſeed from *Bolonia*, under the name of *Sabina Ægyptia*, and referring it hereunto, call it *Abrotanum peregrinum Cupreſſi folijs*, which *Bauhinus* thinketh to bee *Dodonæus* his fourth *Santolina*: but there is ſome doubt thereof, as I ſaid before in the deſcription, for *Dodonæus* giveth flowers to his fourth *Santolina*, with the leaves of Cipreſſe: but *Bauhinus* maketh two ſorts of this plant of *Lobel*, the one he calleth *Abrotanum fœmina folijs Cupreſſi*, and the other *Abrotanum Sabinæ folio*, and quoteth *Lobel* for both, when as *Lobel* doth acknowledge but one plant, although it be ſet downe in two ſeverall places of the *Adverſaria*, but not in his obſervations, as *Bauhinus* ſaith: *Gerard* his figure of *Chamæcypariſſus*, which he calleth Lavender cotton, is utterly falſe, being the figure of *Muſcus terreſtris clavatus*, and his whole Chapter a meere tranſcript of *Dodonæus* in moſt things thereof. The Italians call it in ſome places *Santolina*, and *Creſpolina* in others, as is before ſaid; the Spaniards *Yerva lombriguera*: the French *Petit Cyprez*, and *Cyprez de jardin*, and *Guarde robbe*: the Germanes *Garten Ciprez*: the Dutch *Cipres*, and we in Engliſh Lavender cotton.

The Vertues.

Dioſcorides, and ſo all other Writers doe generally ſay, that the vertues hereof and of the former Sothernewood are alike, working the ſame effects, and applyed to all the diſeaſes it is appropriate unto: but particularly it is obſerved by *Matthiolus*, that halfe a dramme of the pouder of the dryed leaves of Lavender Cotton, taken in a little of the diſtilled water of Fetherfew, every morning faſting, for ten dayes together at the leaſt, and afterwards every other day, is a very profitable medicine for women troubled with the whites to ſtay them. *Pliny* ſaith that his *Chamæcypariſſus* (which as I ſaid before, is taken by ſome to be this Lavender cotton) is good againſt the poiſon of all venemous Serpents and Scorpions being taken in wine. The ſeed is generally in all our Country given to kill the wormes, either in children or elder perſons, and accounted to be of as great force as Wormeſeed: the leaves alſo are good when ſeed cannot be had, but are not of ſo great vertue. *Cluſius* ſaith, that in *Spaine* they uſe the decoction of the Spaniſh kindes, to take away the itch and ſcabbes, in whomſoever have them, but he adviſeth, there ſhould be caution uſed in giving it.

CHAP. XXXVI.

Abſinthium. Wormewood.

ALthough *Dioſcorides* (and *Galen* alſo) make mention but of three ſorts of Wormewood, the one a common ſort, well knowne as he ſaith, the beſt growing in *Pontus* and *Cappadocia*. The other Sea Wormewood or *Seriphium*, and the third *Santonicum* of the Country beyond the Alpes in *France*, yet there hath ſince beene found out many hearbes, accounted to be kindes or ſorts of them, for ſome likeneſſe of face, or vertues, or both, as ſhall be declared hereafter.

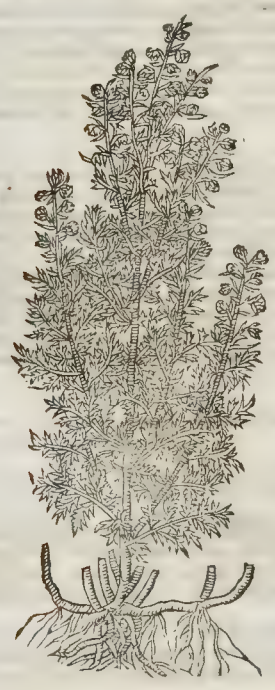
1. *Abſinthium vulgare*. Common Wormewood.

Common Wormewood is well knowne to have many large whitiſh greene leaves, ſomewhat more hoary underneath, much divided or cut into many parts, from among which riſe up divers hard and wooddy hoary ſtalkes,

1. *Abſinthium vulgare.* Common Wormewood.

Arboreſcens.

3. *Abſinthium Ponticum ſive Romanum vulgare.* Common Roman Wormewood.



two or three foote high, beſet with the like leaves as grow below, but ſmaller, divided at the toppes into ſmaller branches, whereon grow many ſmall buttons with pale yellow flowers in them, wherein afterward is conteined ſmall ſeed: the roote is hard and wooddie, with many ſtrings thereat: the ſtalkes hereof dye downe every yeare; but the roote holdeth a tuft of greene leaves, all the winter ſhooting forth new againe, which are of a ſtrong ſcent but not unpleaſant, and of a very bitter taſte. There is a Tree Wormewood like hereunto, but growing greater and higher in the warme Countries.

2. *Abſinthium Ponticum verum.* True Roman Wormewood.

This Wormewood hath more ſlender and ſhorter ſtalkes, by a foote at the leaſt than the former, and reaſonable large leaves, yet ſmaller, and more finely cut in and divided then it, but as white and hoary both leaves and ſtalkes: the flowers alſo are of a pale yellow colour, ſtanding upon the ſmall branches in the ſame manner; ſo that, but that it is ſmaller in each part, it is altogether like it: the rootes likewiſe are ſmaller, leſſe woody and fuller of fibres: the ſmell thereof is ſomewhat aromaticall ſweete, and the bitterneſſe is not ſo loathſome to taſte: Vnto this anſwereth the *Abſinthium Ponticum Creticum* of *Bauhinus*, but that it is in his owne Country more ſweet in ſcent, and little or nothing bitter in taſte, but ſomewhat altereth in another ſoyle.

3. *Abſinthium Ponticum ſive Romanum vulgare.* Common Romane Wormewood.

This is a ſmall low hearbe (if I may call it a Wormewood) with much more ſlender & ſhort ſtalkes than the laſt, whereon grow very ſmal and fine ſhort hoary white leaves, ſmaller and finer than thoſe of the fine Sothernwood, which grow at ſeverall joynts, many comming forth together, at the tops of the ſtalkes grow ſmall yellowiſh flowers, neither ſo many nor ſo great as the laſt: the roote from a ſhort head ſhooteth forth many long fibres, whereby it is nouriſhed in the ground, ſending forth divers ſprouts round about it, whereby it is much encreaſed: the ſmell hereof is faint, and farre weaker than the other, & the taſte thereof much leſſe bitter.

4. *Abſinthium tenuifolium Auſtriacum.* Five leafed Wormewood of *Auſtria*.

This ſmall Wormewood, hath many ſmall hard and ſtiffe hoary ſtalkes, whereon are ſet without order, ſmall and ſomewhat long hoary leaves, very like unto the leaves of Sea Wormewood: which ſtalkes are divided towards the toppes, into many other ſmall and ſlender branches riſing from the joynts, where the leaves doe grow with many ſmall heads, which ſhew forth many ſmall whitiſh flowers.

5. *Abſinthium inodorum.* Vnſavory Wormewood.

The Vnſavory Wormewood is in leafe ſo like the firſt common Wormewood, both for the whiteneſſe, largeneſſe, and diviſions thereof, that it cannot be knowne from it at all, unleſſe you make your noſe the judge of the ſcent, which in this is ſo ſmall, that it is generally ſaid to be without any at all: yet it hath in the heate of Summer, a ſmall weake ſmel, ſuch as is found in ſome of the Sothernwoods: the flowers and all things elſe are alike: but this is ſomewhat more tender to be preſerved in the Winter than the former.

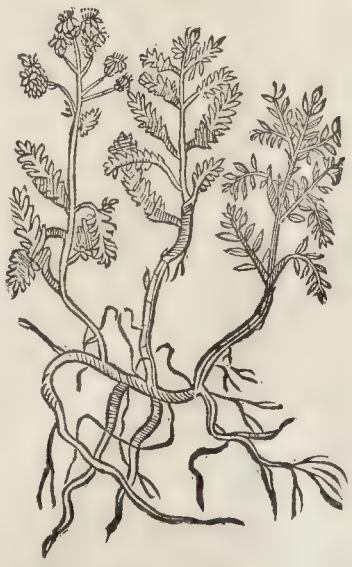
6. *Abſinthium album ſive Vmbelliferum.* White tufted Wormewood.

This white Wormewood hath his roote compoſed of many ſmall blacke fibres, which ſhooteth forth many heads, of long ſomewhat thick and broad hoary white leaves, cut in about the edges, in ſome places more than in others, narrower at the bottome, and broader at the point, made ſomewhat like unto the leaves of the great field Daiſie, but ſmaller: from ſome of theſe heads doe ſhoot forth, ſlender hoary ſtalkes, about a foote and a halfe high, ſet here and there with ſuch like leaves as grow below, but ſmaller: at the tops whereof ſtand many ſcaly ſilver white and greene heads, in a tuft together, out of which breake forth ſilver white ſmall flowers,

4. *Abſinthium tenuifolium Auſtriacum.*
Fine leafed Wormewood of *Auſtria.*

6. *Abſinthium album ſive Umbelliferum.*
White tufted Wormewood.

7 *Abſinthium umbelliferum tenuifolium.*
White tufted Wormewood with fine leaves.



flowers, made of many leaves ſtanding in a double row, in the middle tipt with a little yellow (the whole tuft of flowers doth ſomewhat reſemble the flowers of Yarrow: but much more pleaſant to behold) which ſtand a great while in flower, and afterwards turne into ſmall chaffy ſeed: this holdeth ſome heads on the leaves all the Winter, but are very ſmall untill the Spring begin to come on, which then ſhoote forth, and become as large as is expreſſed before, having little or no ſmell at all, but exceeding bitter.

7. *Abſinthium umbelliferum tenuifolium.* White tufted Wormewood with fine leaves.

This other white Wormewood, hath much ſmaller and finer cut leaves than the former, but as hoary white as the other: the ſtalkes are ſhorter, not riſing ſo high: the umbell or tuft of flowers is ſomewhat ſmaller alſo, but as white, ſo that it differeth in nothing from the former, but in the ſmalneſſe of the plant, and in the ſmall and fine diviſions of the leaves, neither hath it any more ſmell or leſſe bitter taſte. *Bauhinus* maketh two ſorts more of this kind, when as himſelfe ſaith in his *Prodromus*, that all the differences ariſe onely from the ſoyle and climate, which he hath obſerved both by ſight of the divers plants, and examining of them.

8. *Abſinthium album Valleſiacum.* The Valleſians white hearbe or Wormewood.

This white Wormewood hath many ſoft woolly and very white leaves, ſmall, long, and narrow, made very like unto our Sea Wormewood, in ſo much that *Camerarius in horto*, taketh it to be the very ſame, but that it hath a ſweeter ſcent, and not ſo ungratefull a taſte: the flowers are yellow that grow towards the toppes of the ſtalkes, which afterwards give ſmall ſeed like the other ſmall kindes.

9. *Abſinthium Alpinum incanum.* Hoary Mountaine Wormewood.

From a reddiſh fibrous roote ariſeth divers ſmall bending

ſtalkes

ſtalkes about a ſpanne high, ſet very ſparſedly, with very fine cut hoary leaves, like both for forme and colour to our ordinary Romane Wormewood: from the middle whereof upwards to the toppes, at the ſeverall joynts with the leaves ſhoote forth ſlender ſtalkes, bearing at the ends of them ſcaly heads, out of which come pale coloured flowers, and after them ſmall blacke ſeed, ſmelling like Tanſie, the whole plant ſmelleth and taſteth like Wormewood.

Bauhinus ſetteth forth another ſort, which he calleth *Abſinthium Alpinum candidum humile*, which ſhould bee here inſerted, but that I thinke it rather a *ſpecies* of the *Abſinthium umbelliferum*, becauſe hee ſaith it beareth heads like the *Stœchas lutea*, or *citrina*, and therefore I forbeare to recite it.

The place.

The firſt groweth as plentifully in *England*, in many places wild, as in other Countries. The ſecond is found upon divers high Mountaines, and not elſewhere wild, but is nurſed up in many gardens, both in *Italy* and *Germany*, and with ſome lovers of rare plants with us. The third *Cluſius* ſaith groweth plentifully in many places of *Hungary* and *Auſtria*, and in other places alſo, as other Writers doe ſet downe, it is much eſteemed in our Country, and therefore found in many Country gardens of our Land. The fourth *Cluſius* ſaith, he onely found in *Auſtria*, where women gather it and bring it to *Vienna*, for the uſe of the Apothecaries, or any elſe, promiſcuouſly with the other Ponticke or Romane Wormewood. The fifth is not knowne whence his originall was, but is onely kept in gardens as a rarity, and variety among others. The ſixt *Cluſius* ſaith he firſt found, onely on the high cliffes of *Auſtria* and *Stiria*, and afterwards on the Mountaines. The ſeventh groweth on Mount *Baldus*, and on *Serva* one of the Belluni Mountaines. The eighth groweth on the hills, among the Valeſians, as the laſt doth alſo.

The Time.

They doe all for the moſt part flower in Auguſt, yet ſome earlier, or later than others.

The Names.

Wormewood is called in Greeke ἀψίνθιον *quaſi* ἀπίνητον *impotabile ob amaritudinem, vel inguſtabile, quia illud non tangunt animalia in depaſcendis herbis. Dioſcorides* calleth it alſo βαθύπικρον *a profundo amarore*. The firſt is generally called *Abſinthium vulgare*, and of ſome *latifolium*, yet *Ruellius* calleth it *Ponticum*, and *Bauhinus* ſaith it is the *Ponticum ſive Romanum officinarum*, meaning his owne Country: for I am ſure it is not ſo called by any of our Apothecaries in their ſhops. The ſecond is ſcarce knowne to any in our Land, *Geſner in hortis* calleth it *Abſinthium commune minus ſive Alpinum*, *Camerarius* upon *Matthiolus Abſinthium montanum*, and ſo doth *Tabermontanus* who calleth it alſo *Romanum*, *Bauhinus* calleth it *Abſinthium Ponticum Montanum*, and *Gerard Abſinthium tenuifolium Ponticum Galeni*. The third is more frequent as I ſaid before, and uſually called *Abſinthium Ponticum*, or *Romanum*, of moſt Writers, judging it to bee the true *Abſinthum* of *Pontus*, that *Dioſcorides* and *Galen* doe commend: yet *Geſner* and *Lacuna* call it *Abrotanum fœmina*, and ſo doth *Fuchſius*, for which as I ſaid in the Chapter before, *Matthiolus* taxeth him of an error. *Tragus* calleth it *Abrotanum minus*, and *Cordus* upon *Dioſcorides Abrotanum album*. *Ruellius* and *Cæſalpinus* take it to be *Abſinthium Santonicum*: and *Lobel* and *Pena* in their *Adverſaria* ſet it downe for the *Abſinthium Gallatium Sardonium* of *Dioſcorides*, in Engliſh every where almoſt, Romane Wormewood, or Cypreſſe. The fourth is called by *Cluſius Abſinthium tenuifolium Auſtriacum*, and by *Lobel* and *Lugdunenſis Abſinthium Ponticum Tridentinum herbariorum*, by *Dodonæus Abſinthium Seriphium*, but his figure is the ſame, with *Gluſius* his *Auſtriacum*, *Lobel* his *Tridentinum*, and *Gerard* his *tenuifolium ſeu Romanum*, in Engliſh fine leafed Wormewood of *Auſtria*. The fift *Geſner in hort.* and *Lobel* in his obſervations call *Abſinthium inſipidum*, and *Bauhinus Abſinthium inſipidum Abſinthio vulgari ſimile*, in Engliſh Vnſavory Wormewood. The ſixth *Cluſius* calleth *Abſinthium Alpinum umbelliferum*. *Camerarius Abſinthium Pannonicum flore albo*, and *Lobel* and others *Abſinthium album*; in Engliſh white tufted Wormewood. The 7. is another kind hereof growing in other places, as *Bauhinus* hath well obſerved, and ſo ſetteth it downe in his *Prodromus*, for *Pona* ſetteth forth a 3. *ſpecies* in his Italian Booke, differing in nothing but the ſmalnes of leaves and flowers, *Lobel* calleth it *Vmbelliferum alterum Italicũ*. The 8. is called by *Geſner in hortis*, *Abſinthium Seriphiũ fœmina*, & in his Appendix *Abſinthiũ album e Valeſia*: for he ſaith in the ſaid Country of *Valeſia* it is called *herba alba*, *Weiſskraut*: *Camerarius* ſaith it is called by ſome *Abſinthium Santonicum*, & thinketh it may better be called *Santonicũ fœmina Valleſiana*, than *Seriphium* as *Geſner* doth, *Bauhinus* calleth it *Abſinthium Seriphium montanum candidum*. The laſt *Bauhinus* calleth *Abſinthium Alpinum incanum*, and ſaith it is the *Alpinum* 2. of *Pona*, in his Italian *Baldus*, becauſe *Pona* there ſaith it is very like that of *Geſner* & *Camerarius*, which is the laſt before this, but I cannot ſo thinke, for that of *Pona* is a *ſpecies* of the umbelliferous kinds. There is a controverſy among many learned men and Writers, as you may here well perceive, by their names they give to the ſeverall Wormewoods are extant: which ſhould be the true *Abſinthium Ponticum* that *Dioſcorides* preferreth, and *Galen* ſo much commendeth and preferreth before all others, both for the good ſmell, and aromaticall taſte, others being exceſſive bitter and lothſome, and that it hath leſſer leaves and flowers, but eſpecially for the aſtriction it hath more than others, which is ſo effectuall for the liver and ſtomacke. *Lobel* and *Pena* in their *Adverſaria* have ſcanned the matter, and anſwered all objections as I thinke at large, the ſumme whereof in briefe I will here ſet downe for all to underſtand: Firſt, for the kindes. *Dioſcorides* and *Galen* make but one kinde of *Abſinthium*, and not many, and but onely ſay, that the beſt in property groweth in *Pontus*, as they doe in divers other hearbes, ſhew in what place the moſt vigorous of that kinde doth grow, which property it obtaineth, more by the goodneſſe of the place, injoying the commodity of a free and cleare ayre, and other things correſpondent, then by the nature of the hearbe it ſelfe. Then for the ſcent, that it is more aromaticall than others, yet hereby they intimate that others are ſweet, although not ſo much, which is well knowne likewiſe to be the benefit of the place where it groweth, for ſome hearbes are more or leſſe ſweet, or more or leſſe ſtinking, which tranſplanted doe alter; as *Agrimony* and divers others are ſweet in ſome place, and nothing at all in others. Then the leaves have troubled many learned men, for they thinke it is a fault in the tranſcribers, to ſet downe leſſer for greater or longer, as it often hapneth in *Theophraſtus*. But more often in *Dioſcorides*, as in the Chapters of *Heleninm Meum* and others, & may be alſo in *Galen*, not by his owne fault, but by the tranſcribers: but *Galen* himſelfe in his Chapter of *Abrotanum* taketh away all theſe doubts, where he ſaith thus, there are three ſpecies or differences put under the name of one kinde of Wormewood, that which is called *Ponticum*, the ſecond *Santonicum*, and the third *Seriphium*: *Seriphium* and *Santonicum* are enemies to the ſtomacke, and trouble it: Wormewood onely among them named *Ponticum*, that is growing in *Pontus*, is pleaſing to the ſtomacke. From which place we may well gather that the ſtrife is appeaſed, concerning this matter, that

our

our common Wormewood is that Wormewood of *Dioscorides*, the best whereof as he saith, is that which groweth in *Pontus*, without naming either *species* or *genus*: so that it is for certaine that our common or Romane kinde, is not another from the *Ponticum*, and by reason of the place is more vigorous and effectuall, but not differing in property. *Galen* acknowledgeth that in this there is bitternesse, and an astriction gratefull to the stomacke, necessary for cholericke vometings, and to clense it from obstructions, by which it giveth strength and comfort thereunto: which things we see by infinite and daily experiments, even of the common people, as well as of Physitians, to, be effected by our common Wormewood, used either inwardly or outwardly: none findeth fault with the smell for it is of an aromaticall scent, and is very fit and apt to refresh the spirits of any: *Galen* in appointing that of *Pontus* to be used, doth it rather to exclude the *Santonicum* and *Seriphium*, then that which he simply calleth *Absinthium*: Thus much I thought good to relate out of *Pena* and *Lobel*, referring the rest to the learned, to be further satisfied, if they please to read the whole tractate: but by this is said you see, that the vertues of our common Wormewood are so excellent, that we need not seeke for another kinde to performe those, that are commended in Wormewood; and therefore I the more mervaile at our Apothecaries, that take the Sea Wormewood, in stead of the Romane or Ponticke, and use it rather than the common, onely because there is lesse bitternesse therein, than in the common, and therefore more pleasing to the taste, when as the properties are no way answerable. Neither can I commend the use of that fine leafed Wormewood, which is commonly called Romane Wormewood, to bee used in stead of the Ponticke, not having either that bitternesse or that astriction, which are both so comfortable to the liver and stomacke. Our common Wormewood hath beene observed to grow in *Pontus*, and the Countries there abouts, by *Bellonius* in his travels, as he setteth it downe in his 76. Chapter of his first Booke of observations, and elsewhere, and brought to *Constantinople* for their use there. And it is generally held, that the Arabian Physitians did first name it Romane, which *Dioscorides* named Ponticke, and from them, all others since have held it in so great account, imagining it to be a sort differing from the common. The Arabians call it *Affinthium*, the Italians *Assenzo*, the Spaniards *Assentios*, the French *Alvine* and *Absinse*, or *Absinthe*: the Germanes *Wermuet*, the Dutch *Alssem*, and wee Wormewood.

The Vertues.

Dioscorides saith that Wormewood is of an heating and binding property, that it purgeth choller, that cleaveth to the stomacke or belly: that it provoketh urine, that it helpeth surfeits, and that taken with *Seseli* and *Spica Celtica*, it easeth the paines of the stomacke, and the hard swellings of the belly: the decoction or the infusion thereof taken, doth take away the loathing to meate, and helpeth those that have the yellow jaundise: (for which purpose *Camerarius* in his *hortus medicus*, giveth a good receite. Take saith hee of the flowers of Wormewood, Rosemary, and blacke thorne, of each alike quantity; of Saffron halfe that quantity: all which being boyled in Renish-wine, let it be given after the body is prepared by purging, &c. A small draught thereof taken for some few dayes together, bringeth downe womens monethly courses: being taken with vinegar, it helpeth those that by Mushroms, are almost strangled: being taken in wine it is a remedy against the poison of *Ixia* (which as I said before, is the roote of the blacke *Chamæleon*, and with *Pliny* translated *viscum*, Misletoe or Birdlime) of Hemlocke, the biting of that small beast or Mouse which we call a Shrew, and of the biting of that Sea fish called *Dracomarinus*, which is called a Quaviver: it helpeth the Quinsie being annointed with it, and Niter mixed together: and taketh away wheales and pushes used with water: it taketh away the black and blue markes in the skinne, that come after bruising or beating, if it be mingled with honey and annoynted; as also it helpeth the dimnesse of the eyesight being used in the same manner: it helpeth sore and running eares, as also easeth the paines of them, if the hot vapours of the decoction, bee taken in thereat by a funnell or otherwise; it easeth the toothach: a decoction made thereof with cute or boyled wine, and annointed, easeth the paines of the eyes; it helpeth the paines of the heart and liver, being beaten and mixed with the *Ceratum Cyprinum*, and applyed to the place affected; as also applyed to the stomacke with Rosewater, it giveth much comfort to those that have lien long sicke: it helpeth those that are troubled with the swelling and hardnesse of the spleene, or those that have a hot sharpe water, running betweene the flesh and the skin, if it be used with figges, vineger, and the meale of Darnell: The wine that is made thereof, called Wormewood wine, is availeable for all these purposes, restoring many to health that have beene troubled with those diseases; so that they have no agues that take thereof. Being put into Chests, or Presses, or Wardrobes, it preserveth them from wormes and mothes, &c. and driveth away Gnats or Waspes, and such like, from any part of the body, if the skin be annoynted with the oyle thereof: the juyce is of like effect, but is not used so much in drinkes, for it troubleth the stomacke, and causeth headach; being put into the Inke wherewith Bookes are written, (or printed) it keepeth them from being eaten with Mice. *Galen* in his sixth Booke of simples maketh mention of Wormewood in this manner. Wormewood hath a binding, a bitter, and sharpe quality, it likewise heateth, cleanseth, strengthneth, and dryeth. It therefore purgeth downewards the cholericke humours of the belly, and avoideth them also by urine, especially those that are in the veines: but helpeth no flegme that is contained therein, or in the chests or lungs: for the astringent quality therein, is stronger than the bitter: but by reason of the sharpnesse it partaketh more of heate than of cold, so that the temperature thereof, is hot in the first degree, and dry in the third, yet the juyce is farre better than the hearbe it selfe: and speaking of Sea Wormewood called *Seriphium*, he saith it is like unto Wormewood both in kind and in taste: which qualities *Dioscorides* giveth to *Santonicum*; for of *Seriphium* he saith it is more agreeing to Sothernwood, than to Wormewood: whereby it is thought by divers, that the place in *Dioscorides*, or in *Galen*, is perverted by some Writers faults, for they cannot be so farre differing in judgement one from another: It is often used, and by most, either inwardly given, or outwardly applyed for the wormes, in children or elder persons: *Pliny* saith, it healeth old sores or ulcers in the head, and cureth the itch also: the decoction thereof with Cumminseeds taken warme, easeth the paines of the belly and chollicke by winde: the seed thereof helpeth the bloody flixe, and all other fluxes; it is said, that if a few leaves of Wormewood be eaten, it defendeth one from surfeiting and drunkennesse. The vineger wherein Wormewood is boyled, is especiall good for a stinking breath, that commeth either from the gums or teeth, or from corruption in the stomacke. It is likewise much commended in tertian and other lingting agues, by opening obstructions and purging by urine, and by strengthning the liver and stomacke: The conserve thereof much used, preserveth them from the dropsie that are fallen into it, or are in danger to fall thereinto, so as there be a fit course held before, by purging the offensive humours, and such other helpes as the learned Physitian may appoint. The

distilled water is somewhat effectuall, but is much weaker to all the purposes aforesaid: yet the temples being bathed therewith, it helpeth the paines of the head that come of a cold cause, and dropped into the eyes helpeth to cleare the eyesight. The other Wormewoods, although they have some properties, yet by how much they want of the bitternesse and astriction, by so much weaker they are for the diseases aforesaid.

CHAP. XXXVII.

Absinthium Seriphium sive marinum, & Santonicum. Sea Wormewood, and strange Wormewood.

BEcause I would not overburden one Chapter with too many sorts of Wormewoods, I thought it convenient to entreat of the Sea kindes, and other strange sorts, in a Chapter by themselves, which are as followeth.

1. *Absinthium Seriphium sive marinum Anglicum.* English Sea Wormewood.

The English Sea Wormewood riseth up with many hoary round wooddy stalkes, three or foure foote high at the least, having thereon divers hoary white long and narrow leaves, broader and longer than any Sothernwood leaves, or the common Romane Wormewood, but nothing so large as the true Romane Wormewood, of a kind of saltish, but not bitter taste, and of a kinde of unpleasing savour: the flowers are small and yellow standing at the joynts with the leaves, towards the toppes of the branches, as the former common Wormewood doth, and give the like small seed: the roote groweth somewhat deepe and wooddy.

2. *Absinthium Seriphium Narbonense.* French Sea Wormewood.

The French Sea Wormewood groweth not so high as the former, nor so white and hoary, the leaves are small long, and finely cut like them, but thicker, and of an evill coloured greene colour, and strong unpleasant savour, and evill taste: the flowers are yellow, growing as the former doe, and the seed that follow in the small round heads alike.

3. *Absinthium Seriphium Germanicum.* Germane Sea Wormewood.

This Germane Sea wormewood is also very like the last, but with fine hoary white leaves, somewhat finer or smaller, and groweth not so high: in other things there is little or no difference.

4. *Absinthium maritimum Lavendulæ folio.* Lavender leafed Sea Wormewood.

4. *Absinthium maritimum Lavendulæ folio.* Lavender leafed Sea Wormewood.

This Wormewood shooteth forth many slender weake wooddy and brittle stalkes, bending a little downewards, whereon doe grow divers hoary white long leaves, somewhat broader than Lavender leaves, having sometimes some cuts or divisions at the bottomes of them, which is but seldome seene, and in a very few of the lowest next to the ground: those that are set on the stalkes are smaller, and sometimes are cut or divided at the ends, of a reasonable weake scent, betweene Lavender and Sothernwood, but unpleasant taste: the flowers grow after the same manner that the common Wormewood doth, and of a yellow colour, and the seed is not unlike thereunto also.

5. *Absinthium Santonicum Ægyptiacum.* Egyptian Wormewood.

I must here remember also this plant (that is set forth by *Matthiolus* first, and from him *Dodonæus, Lugdunensis, Tabermontanus, Gerard,* and *Bauhinus*, doe all number it among the Wormewoods, as I *Lobel* and *Pena* likewise doe, yet much doubt whether it be a Wormewood or no, for that they say they saw it growing with *Gesner* about a fingers height, and the dryed plant with *Valerandus Donrez*, was in shew like unto Maidenhaire, with white leaves set on both sides, of a middle stalke) rather to incite others to obtaine it, that it may bee better knowne, than that I have any knowledge thereof my selfe, whose description *Matthiolus* who had it from *Cortusus*, setteth forth in this manner: it is (saith he) a small low hearbe, growing in *Egypt*, with small leaves, almost like unto Lavender cotton, and many slender short branches set full of leaves: the seed is small and bitter in taste, but not extreme: some saith he would make it an *Abrotanum mas*, but they might better, as he saith, call it a *famina*: Some also thought that the Wormeseed that commeth from the Levant to us, should be gathered from this plant, but as he saith, he is doubtfull thereof himselfe, yet withall saith, that it hath all the vertues that the Italian Wormewood hath.

6. *Absinthium Santonicum Alexandrinum sive Sementina & Semen Sanctum.* Wormeseed Wormewood, or Levant Wormewood.

This Wormewood likewise is a plant set full of branches, and with very few, and those very fine small leaves on them, at the bottome like unto the finer sorts, of an ash colour, but stored so plentifully with seed upwards, that it seemeth to be there without leaves, and wholly to consist of seed, which as *Rauwolfius* saith, are somewhat bitter in the naturall places, and of a reasonable good and quicke scent with us, especially if they be fresh and not old,

5. *Absinthium Santonicum AEgyptiacum.*
Egyptian Wormewood.

6. *Absinthium Santonicum Alexandrinum, sive Sementina &c.*
Wormeseed Wormewood, or Levant Wormewood.

Absinthij Seriphij sive marini diversa genera.
Divers sorts of Sea Wormewood.

old, but much stronger, as it should seeme by his relation that tasted it, where it grew and moved one to cast very forcibly.

The Place.

The first groweth neare our Sea Coasts in many places of our Land, as also of the Low-countries: the second neare the Sea at *Marselles*, and by *Venice* also: the third in *Misnia* in *Germany*: the fourth about the Coasts of the Venetian Gulph, and in the Iland of *Sio* likewise: the fifth is said to grow in *Egypt*, but *Pena* and *Lobel* doubt thereof: the last groweth in *Syria* and *Arabia*, from whence being brought into divers Christian Countries, it hath there sometimes growne, and there from the figure taken and set forth. *Raumolfius* as it is set downe in the Appendix to *Lugdunensis* saith, hee saw it growing about *Bethlehem*, in the Land of *Jury*.

The Time.

These all flower and seed when the former sorts doe, saving the two last, which comming out of warme Countries are later than the rest with us.

The Names.

The names of Σεριφιον & Σαντόνικον *Seriphium & Santonicum* are confounded by many Authors; for the first is called *Absinthium Seriphium*, or *marinum* by the best Authors, who call it either *Belgicum*, or *Anglicum*, yet *Camerarius in horto* calleth it *Absinthium Santonicum*: the second is called by *Dodonæus* and *Clusius Absinthium Scriphium Narbonense*, but *Lobel* his *Absinthium Xantomicum* in my judgement is the same, although *Bauhinus* make them different, calling the one *Absinthium Seriphium Gallicum*, as hee doth the other *Absinthium Santonicum Gallicum*: the third *Clusius* saith hee saw in the garden of *Aicholtzius* in *Vienna*, being sent him from *Misnia*, and thereupon he calleth it *Absinthium marinum Misnense*, and *Bauhinus Absinthium Seriphium Germanicum*, and saith it is

the *Absinthium Seriphium* of *Gesner in hortis*: the fourth is called by *Lobel*, *Tabermontanus*, and *Gerard*, *Artemisia marina*, by *Clusius Artemisia folio Lavendulæ*, by *Dodonæus Absinthium angustifolium*, but *Camerarius* wondring why he should so doe, calleth it *Absinthium latifolium marinum*, and by others *Absinthium Seriphium & marinum*, *Camerarius* thinketh it is *Matthiolus* his *Absinthium marinum*, but surely his figure doth much differ from it: the fifth is called by *Matthiolus* and *Lugdunensis*, *Absinthium Seriphium Ægyptium*, by *Dodonæus* and others *Absinthium Ægyptium*, by *Lobel Absinthium aliud sive peregrinum Ægyptium*, and by *Bauhinus Absinthium Santonicum Ægyptiacum*: the last is called by *Anguillara Abrotanum mas*, not knowing that Wormeseed was gathered from it, by *Matthiolus Sementina*, (as the Italians call it, and the French *Barbotin*) and so doe *Dodonæus*, and *Tabermontanus*, and *Semen Sanctum* by him, *Lobel*, *Lugdunensis*, and others, *Scheha Arabum* by *Rauwolfius* and *Lugdunensis in Apendice*, *Santonicum* by *Lonicerus*, *Semen Zedoariæ* by *Lobel*, and *Absinthium Seriphium Alexandrinum*, and *Zine semen* by *Cordus* upon *Dioscorides*, and in his History of plants also, by *Bauhinus Absinthium Santonicum Alexandrinum & Indaicum*, for they are both but one plant, although he setteth them downe for two: by divers others *Semen Lumbricorum & ad Lumbricos*, whose seed is generally called Wormeseed, and therefore I have called the plant rather Wormeseed Wormewood, than Holy Wormewood, not thinking any more holinesse in this than in others.

The Vertues.

The Sea Wormewoods are of nothing that goodnesse in quality, as the common and aromaticall bitter sorts are: they are as *Dioscorides* and *Galen* say, adverse and hurtfull to the stomack: yet because it hath not that bitternesse therein as the common sort, it is more accepted and used by many; that rather desire to please their palate, than to be cured of their diseases by bitter medicines, our Physitians and Apothecaries feeding this humour for their owne profit, and to please their patients. The Wormeseed is chiefly, and as I may almost say, onely spent for the wormes in children, and to smaller effect if elder persons take it.

CHAP. XXXVIII.

Chamædrys. Germander.

I Might have joyned both *Chamædrys* and *Teucrium* in one Chapter, because divers Authors both ancient and moderne have not distinguished them, some naming that *Chamædrys* which others call *Teucrium*, and contrarily some call that *Teucrium* that others call *Chamædrys*: yet I thinke it fit to sever them into two Chapters, and speake of them both true and false, as they are now generally received.

1. *Chamædrys vulgaris.*
The common Germander.

Maximus

1. *Chamædrys vulgaris.* The common Germander.

Common Germander shooteth forth sundry stalkes with small and somewhat round leaves, endented about the edges, the flowers stand at the toppes of a deeper purple colour than the next, the roote is composed of divers sprigges, which shoote forth a great way round about, quickly overspreading a ground.

2. *Chamædrys major.* Great Germander.

The great Germander riseth up with bigger and harder square stalkes, halfe a yard high, spreading into divers branches from the very bottome, whereon are set two leaves at a joynt, somewhat larger than in the ordinary, and more dented about the edges, greene above, and somewhat grayish underneath: the flowers doe stand in a longer spiky head, and are larger, but of a paler purple, and gaping like the other: the roote is more bushing with threads, and creepeth lesse than the other. *Prosper Alpinus* saith in his Booke of Egyptian plants, that in *Corcyea*, hee saw a Germander almost two cubits high, with leaves twice or thrice as bigge as any that grew in *Italy*.

3. *Chamædrys Apula unicaulis.* Germander of Naples.

The Germander of *Naples* never riseth up with more than one whitish square stalke, about a foote high, at each joynt whereof grow two long and narrow hairy thicke leaves, dented about the edges, round at the ends, and of a whitish greene colour: the flowers grow at the toppe in a long spike with smaller and rounder leaves set with them, and are hooded as the former are, with whitish beards, and a long yellowish point in the middle, but standing in prickly huskes: the seed is small, long, and round headed, yet greater than the proportion of the plant would seeme to give.

4. *Chamædrys laciniatis foliis.* Tagged Germander, or with fine cut leaves.

This fine Germander riseth up usually but with one weake slender square stalke, divided into other smaller branches, rising not above a foote high, whereon doe grow divers leaves, two alwayes set together at a joynt, on each side of the stalkes, which are very much cut in on both sides, making no shew of the forme of any Germander leafe, unlesse one

one heed it very well : from the middle to the tops of the ſtalkes, at the joynts with the leaves, come forth purpliſh flowers like the former, after which follow ſmall blackiſh ſeed : the roote is ſmall and fibrous, and dyeth every yeare after it hath given ſeed, but will come oftentimes of it owne ſowing and ſhedding.

5. *Chamædrys ſpinoſa Cretica.* Thorney Germander of Candy.

This Thorney Germander is a ſmall low plant, having many ſquare hairy and hoary ſtalkes, not above a cubite high, full of joynts, whereat grow forth divers ſomewhat round and long leaves, dented about the edges, in the lower much more than in the upper, which ſeeme to be without any denting at all : at each joynt with the leaves ſtand forth moſt uſually two thornes, and ſometimes more, which are in ſome ſmall and ſhort, in others bigger and larger, and ſometimes ſhooting forth from thoſe joynts ſmall branches, which end alſo in a thorne : from the middle of the ſtalkes upwards, come forth the flowers at the joynts among the leaves, ſtanding in ſmall hairy and hoary huskes, very like for forme unto the flowers of Germander, but of a yellowiſh red or browniſh colour : after the flowers are paſt the ſeed groweth in thoſe huskes, which is blacke and round.

6. *Chamædrys ſpuria montana Ciſti flore.* Mountaine Germander.

The Mountaine Germander riſeth up with many weake and ſlender browniſh wooddy ſtalkes, about a foote high ; whereon are ſet without any order as in the former, many ſmall leaves dented about the edges, very like the leaves of the common Germander, but ſomewhat ſmaller, greene on the upper ſide, and gray or hoary underneath : at the end of every ſtalke of leaves, there ſhooteth forth a long ſlender and hairy foote-ſtalke, without any leafe thereon : on the toppe whereof ſtandeth one large white flower, conſiſting for the moſt part of ſixe leaves, yet ſometimes it will have eight or ten, according as nature liſteth, and the fertility of the ſoyle is ready to produce, with many ſmall threads in the middle : after the flowers are ſhed, there come up in their places large tufts or buſhes, of long hairy ſeed, like unto thoſe of mountaine *Avens*, but greater : the roote is hard and wooddy, ſhooting long ſtrings and fibres under ground, and divers ſtrings likewiſe above the ground, which take roote as they lye, the ſtalkes that bore ſeed dying downe to the ground every yeare, and the roote renewing then againe in the Spring : it hath little ſcent to be perceived therein, but of an aſtringent or drying taſte.

7. *Chamædrys Alpina ſaxatilis.* Rocke Germander.

From a hard knobbed roote ſhooting forth many blackiſh fibres, ſpring up divers round ſtalkes, about a foote high, not branching forth at all ; whereon grow two thicke leaves together, in order up to the toppe, the lower being larger than thoſe above, ſomewhat dented about the edges, but not ſo much as thoſe of Germander, of a ſhining greene colour on the upperſide, and yet covered as it were with a little hoarineſſe or downe, but very grayiſh, almoſt white underneath : the toppes of the ſtalkes end in a long ſpiky head of flowers, with leaves among them, every one conſiſting of foure or five, and ſometimes of ſixe or ſeven ſmall pointed leaves, of a pale blue colour, with ſome threads in the middle : after which come ſmall round blackiſh ſeed in ſmall huskes : this loſeth not his greene leaves or ſtalkes in Winter, but being of ſmall or no ſcent at all, but of an auſtere and harſh taſte.

8. *Chamædrys ſpuria major fruteſcens.* The greater baſtard Germander.

This Baſtard Germander (for ſo I eſteeme all of them, rather than true Germanders, which have not hooded and gaping flowers, as the true Germander hath, but conſiſting of foure or five, or more leaves as theſe doe, however their leaves bee like to make them beare the names of Germander) hath many ſquare and ſomewhat hairy ſtalkes riſing from the roote, beſet with two large leaves at a joynt, ſomewhat like unto Germander leaves, but larger, and deeper dented in at the edges ; towards the toppes branching forth into ſpiky heads of blue flowers, conſiſting of foure leaves apeece, whereof the uppermoſt is the largeſt, with ſome

4. *Chamædrys laciniatis foliis.*
Iagged Germander, or with fine cut leaves.

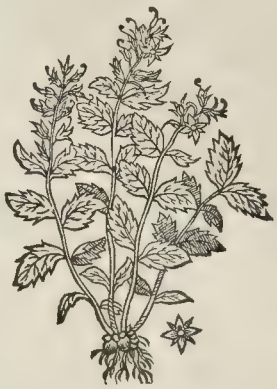
5. *Chamædrys ſpinoſa Cretica.*
Thorny Germander of Candy.

ſtripes

ſtripes or veines therein, and two ſmall threads and a long pointell in the middle: after which ariſe ſmall flat two forked huskes, containing ſmall ſeed: the roote creepeth a little under ground, ſending forth here and there ſome ſtalkes; but the ſtalkes alſo as they lye on the ground, will take roote and ſhoote forth fibres: the taſte of the leaves are bitter.

6. *Chamædrys ſpuria montana Ciſti flore.*
Mountaine Germander.

7. *Chamædrys Alpina ſaxatilis.*
Rocke Germander.



8. *Chamædrys ſpuria major frutescens.*
The greater baſtard Germander.

9. *Chamædrys ſpuria minor latifolia.*
The ſmaler baſtard Germander.

Clusius giveth two other sorts of this kinde, one as tall, but creeping and shooting forth branches abundantly; whose leaves are smaller, and the flowers paler: the other somewhat lower, having narrower and larger leaves, but not differing in any thing else. *Species alia duæ.*

9. *Chamædrys spuria minor latifolia.* The smaller bastard Germander.

This smaller bastard kinde hath many weake purplish, or brownish branches, lying rather on the ground, than standing upright, and not above a foote high, whereon are set two leaves at a joynt as in the rest, very like unto Germander leaves, and dented about the edges also, but somewhat lesser: the toppes of the stalkes are likewise branched forth into spiky heads of flowers, consisting of foure leaves, whereof the uppermost also is the longest, of a more excellent deepe blue than in the other, yet sometimes it is found with flowers of a paler blue, or almost of an ash-colour, and in some pure white: the seed following the flowers is small and reddish, growing in a small huske: the roote is bushy and spreading under ground as well as above, like the other, and abideth like it, shooting forth new stalkes every yeare: the taste hereof is a little bitter like the other, but more astringent.

10. *Chamædrys spuria minima.* The least bastard Germander.

This little bastard Germander (for the manner of the growing, and height of the plant is very like unto the small Gentian of the Spring, set forth in the Chapter of Gentian or Felworts in my other Booke) hath two or three small short stalkes rising from the roote, not above two or three inches high, whereon doe grow two small dented leaves together, as in the former, but much smaller, rounder, and thicker, and standing so close one joynt unto another, that they can hardly be discerned to grow severally, but all together: from the toppes whereof shoote forth naked short foot-stalkes, every one sustaining betweene two small leaves, one large flower in comparison of the plant, made of foure leaves like the other, of a pale blue or ash-colour: after which come flat and larger huskes than in the other, containing such like small seed: the roote is of many fibres shooting forth here and there some other plants.

11. *Chamædrys spuria sylvestris.* Common Wild Germander.

The common wilde Germander that groweth every where in the Medowes, sendeth forth divers square upright stalkes, yet sometimes a little bending, having two leaves set at each joynt, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller up higher, the tops of the stalkes are spiked with divers blue flowers set about them, made of 4. smal round leaves apeece, with a little white eye in the middle, small pointed, and some threads also, after which come small flat pouches, containing small seed: the roote in small and thready.

12. *Chamædrys spuria minor angustifolia.* Narrow leafed wild Germander.

This small Germander hath divers round reddish stalkes, somewhat rough, hard, and hairy, an hand breadth high bending downewards, whose lower leaves are somewhat long and broad, round at the ends, and not dented at all about the edges: but those that grow up higher upon the stalkes, are shorter and narrower pointed also at the ends, and snipt about the edges: the flowers grow spike fashion, being either of a pale blue colour or blush, made of foure leaves like the other, and so are both heads and seeds: the roote is blackish, hard and stringy.

13. *Chamædrys Austriaca laciniata.* Iagged base Germander of *Austria*.

The leaves of this jagged Germander that grow upon the round rough stalkes, are hard and somewhat hairy, divided into many small long pieces, the flowers are blue standing in a long spike, as many other of the former doe, and round biforked heads, after them with very small seed in them.

14. *Chamædrys Hispanica foliis tenuissime divisis.* Wilde Spanish Germander with fine cut leaves.

The round stalke hereof is more slender than the last and hairy, set with many joynts, and shorter and narrower leaves thereat, full of small leaves at the toppe, where it breaketh forth into two small foot-stalkes, whereon stand the small flowers, with each a small long pointell in the middle.

The Place.

The greater Germander is found in many Countries, as well as in the upper *Germany*, as *Clusius* saith, and the lesser in the lower, as *Lobel* saith, they are onely found in gardens with us. The third groweth in the fields of *Naples*. The fourth groweth in *Saxony*, as *Iohannes Thalius* saith, and is onely preserved with those that are curious conservers of rare simples. The fifth we have often had among other seeds out of *Italy* and *Spaine* from *Boelius*, and did grow in Cardinall *Bembus* his garden, as *Bauhinus* saith. The sixth *Clusius* saith he found on the highest toppes of the Alpes in *Austria* and *Styria*, and *Camerarius* saith it is found plentifully on the Hills, both in *Savoy* and *Switzerland*, and in *Daulphine* in *France*, as *Lobel* saith. The seventh *Pona* setteth downe in the description of *Mons Baldus* that he found there. The eighth and the two lesser kindes thereof, *Clusius* saith he found in *Hungary*, *Austria*, *Bohemia*, and other places thereabouts. The ninth *Clusius* also saith hee found in the lower *Austria*, about *Vienna* and *Newstadt*. The tenth *Clusius* also saith he found in the toppe of the snowy Mountaine in *Austria* called *Sneberge*. The eleventh as I said, in every Medow thorowout the Land almost, as also by ditches and hedges sides: The twelft in the Medowes by *Bassill*: The thirteenth in *Austria*, and the last in *Spaine*.

The Time.

These doe all flower in Iune or Iuly at the furthest, except the Thorney Germander, and the Spanish and Candy kindes, which come later.

The Names.

Germander is called in Greeke Χαμαίδρυς, *Chamædrys, quasi humilis aut parva quercus, a foliorum similitudine*, and Χαμαίδρυον *Chamædrops* as *Dioscorides* saith, in Latine *Trixago & Trissago*, and *Quercula minor*, and of some *Teucrium*. The first and second are generally called of most Writers *Chamædrys*, and of some *mas*; and of some as I said *Trixago*, and *Trissago major* or *minor*, *repens* is added according to the kinde, and of some *Serratula minor*, and of some also as *Matthiolus* saith, *herba Febrium*, and *Febrifuga*, from the effects. The third is called by *Columna Trixago Apula unicaulis, & forte Verbena recta Dioscoridis*, and by *Bauhinus unicaulis*. The fourth is called by *Matthiolus Chamædrys altera*, and so doe *Durantes*, *Lugdunensis*, and *Camerarius*, who accounteth it an errour in them that would make it a *Chamæpitys*, as if it smelt like Rosin. *Fuchsius* and others *Chamædrys famina*. *Tragus* calleth it *Chamæcyparissus agrestis*, and first also tooke it to be *Chamæpitys altera Dioscoridis*, whom *Dodonæus* and *Clusius* follow, for he calleth it *Chamæpitys multifidis foliis*, and also *Ajuga*, and *Tabermontanus Ivamoschata*. *Lobel* calleth it *Chamædrys laciniatis foliis*, and by that name it hath continually beene sent to us. *Bauhinus* calleth it *Botrys Chamædryoides*.

dryoides. The fifth *Bauhinus* hath onely set forth and given it the name in the title. The sixth is called by *Clusius Chamædrys montana*, and so doe *Lugdunensis* and *Tabermontanus*, who saith it is also called *Argentina Monspeliaca. Chamædrys Alpina* by *Camerarius*, who saith some called it *Hirtzwortz*, and thereupon *Gesner* called it *Cervaria & herba Cervi quibusdam. Lobel* calleth it *Chamædrys montana frutescens durior. Lugdunensis* saith, some call it *Lencas* of *Dioscorides. Bauhinus* calleth it *Chamædrys Alpina Cisti flore.* The seventh is called by *Pona* in the description of *Mons Baldus Veronica petræa semper virens*: *Bauhinus* saith it is *Clusius* his sixth *Teucrium pumilum*, in his History of plants, and calleth it himselfe *Chamædrys Alpina saxatilis.* The eighth is called by *Clusius Teucrium majus Pannonicum*, in his Pannonick observations, and maketh it the fourth *Teucrium* in his History. *Bauhinus* calleth it *Chamædrys spuria major altera frutescens.* The ninth is *Clusius* his fifth *Teucrium* in his History of plants, or *Teucrium Pannonicum minus.* which *Bauhinus* calleth *Chamædrys spuria minor latifolia.* The tenth *Clusius* calleth *Teucrium minimum*, and *Bauhinus Chamædrys Alpina minima hirsuta.* The eleventh is called *Chamædrys vulgaris fœmina*, by *Fuchsius, Turner, Lonicerus*, and *Lugdunensis, Pseudochamædrys* by *Thalius, Teucrium pratense* by *Lobel*, and by *Clusius*; and commonly with us *Chamædrys sylvestris*: the twelft is called by *Bauhinus Chamædrys spuria minor angustifolia*, who taketh it to be the third sort of the fourth kinde of *Clusius* his *Teucrium.* The thirteenth and the last are remembred onely by *Bauhinus.* There is some controversie among our latter writers, what herbe should be the true *Chamædrys* and *Teucrium* of *Dioscorides, Galen* and other ancient writers: for *Dodonæus* by comparing both the Texts, saith that our common *Chamædrys* doth more properly belong to the descriptions of *Dioscorides* and *Plinies Teucrium*, and so contrarily *Teucrium* unto *Chamædrys*, for *Dioscorides* setteth them downe in this manner, χαμαίδρυς ἐστὶ θάμνιον & πολυκλαδές, *ideſt Chamædrys exiguus est frutex dodrantalis*, that is, Germander is a small shrubbe of a span height, and of the other he saith, τεύκριον πόα ἐστὶ βακδοειδής. *Teucrium herba est virgata, sive virgulas plures ferens. Teucrium* is an hearb bearing many stalkes, and hereby he saith it is evedent, our common Germander is not a shrub, which doth raise it selfe up as *Teucrium* doth; and besides that, *Pliny* in describing *Teucrium* saith, it spreadeth branches like rushes, which doth more fitly agree to our common Germander, thereby transferring the *Chamædrys* to be the taller shrub, and *Teucrium* the lesser and lower: yet as he saith, seeing *Dioscorides* himselfe saith, that in his time they were transferred, for the likenesse of their leaves, one unto another, it is not absurd to call them as they are usually entituled: but as I shall shew you in the next Chapter, the *Teucrium* of *Dioscorides* is better to bee explaned than *Dodonæus* doth. It seemeth also that *Dodonæus* having beene in an errour in his former workes concerning *Hierabotane mas & fœmina*, giving the figures of the *Chamædrys sylvestris* thereunto, reclaimed himselfe in his later History or *Pemptades*, and left them both out, as not allowing of his former opinion. The Arabians call it *Damedrios Chamedrius* and *Kemadrius*: the Italians *Chamedrio* and *Quercivola*, and some *Calamandrina*: the Spaniards *Chamedrios*: the French *Germandree*: the Germanes *Gamanderle* and *Bathengel*: the Dutch *Gamandree*, and we in English Germander.

The Vertues.

Germander is hot and dry in the third degree, and is more sharpe and bitter than *Teucrium*, and as *Dioscorides* saith, is a remedy for coughes taken with honey, for those whose spleene is become hard, for those that can hardly make their water, and helpeth those that are falling into a dropsie, in the beginning of the disease, especially if a decoction be made thereof, when it is greene and drunke. It doth likewise bring downe the termes, helpe to expell the dead child, and taken with vineger doth waste or consume the spleene: it is most effectuall against the poison of all Serpents, both drunke in wine and laid to the place: used with honey it cleanseth old and foule ulcers; and taketh away the dimnesse and moistnes of the eyes, being made into an oyle and annoynted. It is likewise good for the paines in the sides, and for crampes. The decoction thereof taken for some dayes together, driveth away, and cureth both quartane and tertian agues. The Tuscans, as *Matthiolus* saith, doe highly esteeme thereof, and by their experience have found it, as effectuall against the plague or pestilence, as *Scordium* or water Germander. It is also as he saith good against all the diseases of the braine, as the continuall paines of the head, the falling sicknesse, melancholicke sullennesse, the drowsie evill, those that are sottish through the dulnesse of the spirits, and for crampes convulsions, and palsies: a dramme of the seed taken in powder, doth purge choller by urine, and is thereby good for the yellow jaundise: the juyce of the leaves dropped into the eares, killeth the wormes in them: It is also given to kill the wormes in the belly: which a few toppes of them when they are in flower, laid to steepe a day and a night in a draught of white wine, and drunke in the morning will doe also. *Theophrastus* in setting downe the properties of Germander saith, that the one part of the roote purgeth upwards, and the other part downewards; whereof there is more wonder than for *Thapsia* and *Ischias*, that is blistering Fennell, and tuberous or knobbed Spurge to doe so: *Andreas Vesalius, pag.* 49. speaking of the China roote saith, that if a decoction hereof bee made in wine, and taken for 60. dayes continually foure houres before meate, it is a certaine remedy for the gowt. *Durantes* giveth the receipt of a Syrupe very effectuall for the spleene in this manner. Take saith he, Germander *Chamæpitys* or Ground Pine, Ceterach or Milt waste, and Madder, of each one handfull: the barke of the roote of Capers, the rootes of Smallage, Elecampane, Orris, or Flagge Flower-de-luce and Liquorice, of each halfe an ounce. Of the leaves and barke of Tamariske, and of Cyperus, of each three drammes, of the seed of Anise, Fennell and Smallage, of each one dramme, of Raisins stoned one ounce. Let all these be boyled according to art, in a sufficient quantity of Posset, (that is of vineger and water equall parts.) Vnto each pound of this decoction being strained, put sixe ounces of Sugar, and three ounces of Cinamon water, which being made into a cleare Syrupe, take foure ounces every morning fasting. The decoction thereof is good to stay the whites in women, if they sit therein while it is warme, and likewise easeth the passions of the mother: being boyled in vineger and applyed to the stomacke with a little leaven, stayeth vomitings, that rise not from chollericke or hot causes: the leaves hereof and the seed of *Nigella* quilted in a Cap, stayeth the catarrhe or distillation of raw cold and thinne rheumes: being boyled in lye with some Lupines or flat beanes, and the head washed therewith taketh away the dandraffe or scurfe thereof. The mountaine Germander is used by those of the Alpes, where it groweth; to stay all manner or fluxes, whether of the belly, or of the blood, the feminine courses, and the bloody flixe, as also to stay vomitings.

Teucrium

CHAP. XXXIX.

Teucrium. Tree Germander.

IT remaineth that I shew you in this Chapter the rest of the Germanders called *Teucria* Tree Germanders to distinguish them from the former sorts, whether they be true or false.

1. *Teucrium majus vulgare.* The more common Tree Germander.

Tree Germander groweth like a little shrubbe, with hard woodby, but brittle stalkes, a foote or two, and sometimes a yard high, if it be well preserved and defended from the injuries of the Winters, branching forth on all sides from the very bottome, bearing alwayes leaves by couples, smaller, smoother, and thicker than those of Germander, of a darke shining greene colour on the upperside, and grayish underneath, and dented also about the edges like them; the gaping flowers stand about the toppes of the branches spike fashion, one above another, of a pale whitish colour saith *Clusius*, of a purplish saith *Lobel*, of both which I have had plants, somewhat larger than those of Germander, and without any hood above, having a few threads standing forth: the seed is small blackish and round, contained in small round, but pointed huskes: the roote is somewhat wooddy, with many blackish fibres: the whole plant is of a fine weake scent, but somewhat stronger, if it be a little bruised, holding the stalkes and greene leaves continually, if it be not exposed to the sharpnesse of the Winter season.

1. *Teucrium majus vulgare.*
The more common Tree Germander.

2. *Teucrium Creticum.* Tree Germander of Candy.

This shrubby Germander of *Candy*, riseth up with such like wooddy brittle stalkes as the former, but somewhat smaller and whiter, whereon doe grow such like leaves, and in the same manner, but somewhat lesser, lesse greene, and shining above, and more hoary underneath, two alwayes set at a joynt, but on the contrary side: with the leaves towards the toppes come forth five or sixe flowers standing in a huske, like unto the former, but a little lesse, and of a purple colour, after which come small round seed like the other: the whole plant is somewhat sweeter than the former.

3. *Teucrium Bæticum.* Tree Germander of *Spaine.*

This Spanish shrubby Germander groweth in some places of *Spaine*, to the height of a man, but usually much lower with one wooddy grayish stemme or stalke, dividing it selfe into some branches, but fewer than the former, two alwayes set at a joynt: the leaves stand likewise two together, somewhat greater, and waved a little at the edges, of a sad greene colour above, but not shining, and more hoary underneath, the flowers stand at the joynts with the leaves towards the toppes of the stalkes, of a white colour, without any hood above, and with sundry threads in the middle, the lower leaves hanging downewards: the smell hereof is lesse sweet and more bitter than the former, but abideth with stalkes and leaves thereon, greene like the rest, but will require a little more care for the Winters provision in our Country.

4. *Teucrium Alpinum inodorum.* Unsavory Tree Germander of the Alpes.

This small low shrub hath divers hairy and wooddy stalkes, not above an hand breadth high bending downewards, and dividing it selfe into many smaller branches, whereon are set very small hoary leaves, somewhat rugged or wrinckled and dented a little about the edges, like unto the uppermost small leaves of wood Sage, the flowers are very large for the proportion of the plant, being like unto Germander and hooded, of a pupplish blue colour, standing spike fashion at the toppes of the stalkes, the roote is stringy and white: the whole plant hath little or no scent.

The Place.

The first groweth in the rocky places of sundry hills in *Italy*, and other Countries: the second came from *Candy* to *Clusius*, the third *Clusius* saith he found neare the Sea coasts in *Spaine*, not farre from *Hercules* pillars, as also in the Iland of *Cales*: the last as *Bauhinus* saith, was found on the greater hill of Saint *Bernard* in Switzerland.

The Time.

These sorts of Germander doe flower somewhat later than the former.

The Names.

The Greekes call it τευκριον, and the Latines *Teucrium* also, *a Teucro inventore teste Plinio*, some also call it *Quercula major*. In the last Chapter the opinion of *Dodonæus* is set downe concerning *Teucrium* and *Chamædrys*, but he doth not in my opinion declare the whole truth, which from the rest of *Dioscorides* text may bee gathered: for of *Chamædrys* he saith *folia habet effigie & divisura quercus*, it hath leaves like the Oake, both for shape and divisions,

3. *Teucrium Beticum.*
Tree Germander of Spaine

which argueth them to bee greater than of *Teucrium*, whereof hee saith; *Trissaginis est similitudine, tenuifolio, non multum a Cicere alieno*: so that *Teucrium* hath lesser leaves than *Chamædrys*, yet like the lesser ones thereof, and not much differing from those of Ciche pease, and with such leaves is the *Teucrium* furnished. *Pliny* in his 25. Booke, and 5. Chapter, hath fouly erred in the description of *Teucrium*, where he saith it is called *Hemionitis*, or *Hermion* (as *Matthiolus* hath it) having neither flower nor seed, which some would call *Asplenion* or *Splenion*, as he hath it, and then telleth fables how the vertue thereof was knowne to be good against the spleene, in that the Swine that eate thereof were found to have no milt. And againe, that the intrailes of beasts being cast upon the hearbe, the milt or spleene of them onely lying nearest was consumed, *scilicet*, of the dead beast, and then addeth by and by the true description (although somewhat varying from that of *Dioscorides*) of *Teucrium*, so that he confoundeth both *Hemionitis* and *Teucrium* together in one description. *Matthiolus* saith that some did take *Teucrium* to be *Crassula major*, or *Fabainversa*, called by others *Telephium*. The first is simply called *Teucrium* by *Matthiolus*, *Lobel*, and many other Authors, and by *Clusius Teucrium vulgare fruticans*, but by *Dodonæus Chamædrys altera seu assurgens*: the second *Clusius* calleth *Teucrium Creticum*, saying it was sent by the name of *Chamædrys major*, and *Bauhinus Teucrium Creticum incanum*: the third *Clusius* calleth *Teucrium fruticans Bœticum*, and so doe *Lugdunensis*, *Tabermontanus*, and others, that have taken it from him, *Bauhinus* calleth it *Teucrium peregrinum folio sinuoso*, and maketh a *quere*, which *Clusius* had made before; *an Pederota Pausaniæ*: the last *Bauhinus* in his *Pinax* and *Prodromus* calleth *Teucrium Alpinum inodorum magno flore*, and yet is the same with his *Teucrium foliis Scorodoniæ*, as any may well see that will compare them together, for *Camerarius* who had his from *Candy*, by the name of *Scordium verum*, sheweth that it hath the leaves of *Scorodonia*, but lesse.

The Vertues.

Galen maketh *Teucrium* to be hot in the second degree, and dry in the third, and of thinne parts, and cutting also, whereby it is helpefull for the spleene: it is saith *Dioscorides* used either greene or dry, and is good to consume the spleene, being inwardly or outwardly applyed: it is also used against the sting of venemous creatures.

CHAP. XL.

Scordium. Water Germander.

Scordium being a kinde of Germander must be next entreated of, yet for that it smelleth of Garlick, it must be separated from them, and with it the other of his kinde, and some also for the affinity in name or smell are not unfit to be joyned together in this Chapter.

1. *Scordium legitimum.* Water Germander.

Water Germander (from a small roote full of white strings spreading in the ground, and creeping or running about also, shooteth forth divers weake square hairy branches, which take roote in divers places, as they lye and spread, whereby it encreaseth much, whereon doe grow many leaves, two alwayes at a joynt, which are somewhat larger and longer than garden Germander leaves, of a sad or darke greene colour, whereon yet there is a shew of hairinesse and hoarynesse, somewhat soft in handling, full of veines, and dented about the edges, of a scent somewhat strong, resembling Garlicke: the flowers are small, red, and gaping, standing at the joynts, with the leaves towards the toppes of the branches: we have not observed what seed it beareth.

2. *Scorodonia sive Scordium alterum quibusdam, & Salvia agrestis.* Wood Sage.

Wood Sage riseth up with square hoary stalkes, two foote high at the least, having two leaves set at every joynt thereon, which are somewhat like unto Sage leaves, but smaller, softer, whiter and rounder, a little dented about the edges, and smelling somewhat strongly: at the tops of the stalkes and branches stand the flowers on a slender long spike, turning themselves all one way when they blow, and are of a pale or whitish colour smaller than Sage, but hooded, and gaping like unto them: the seed is blackish and round, foure usually set in a huske together: the roote is long and stringy, with divers fibres thereat, and endureth many yeares.

3. *Scordotis Plinij primum.* The first Garlicke Germander of *Pliny*.

Because *Dodonæus*, *Lobel*, *Pena*, and *Dalechampius*, have set forth divers hearbes for the true *Scordotis* of *Pliny*, as some *Scorodonia* or *Salvia agrestis*, some *Stachys*, and others *Gallitricum*, none of them having the smell of *Scordium*, or the vertues that *Pliny* giveth to his *Scordotis*: therefore *Honorius Bellus* a Physitian in Candy, a diligent searcher, and of great knowledge and judgement in hearbes, sent to his friends in divers places, the true *Scordotis* of *Pliny*, with the leafe of Wild Mints, or water Mints; whose description is as followeth: It hath from a long great and fibrous roote, abiding long, and not perishing every yeare, many square hairy white branches, lying round about it on the ground: whereon are set two leaves at a joynt, broader and rounder than the former *Scordium*, and all hoary white, being somewhat like unto the leaves of Horehound, or water Mints: at the toppes of the branches come

1. *Scordium legitimum.* Water Germander.

2. *Scordonia ſive Scordium alterum quibuſdam & Salvia agreſtis* Wood Sage.

3. *Scordotis Plinij primum.* The firſt Garlicke Germander of *Pliny*.

come forth the flowers, ſtanding as it were in a long ſpiky head, with leaves among them, which are of a very pale purpliſh colour, almoſt white like unto Horehound, after which commeth ſmall round blacke ſeed: the whole plant ſmelleth of Garlicke, as much as *Scordium*, and thereby to be knowne as well as by the leaves, to differ from thoſe baſtard kindes that other Authors have ſet forth.

4. *Scordotis alterum Plinij Ponæ.* Another Garlicke Germander of *Pliny*.

The other *Scordotis* riſeth up with his ſtalke more upright, and more branched than the former, bearing the like

4. *Scordotis alterum Plinij Pona.* Another Garlicke Germander of *Pliny*.

5. *Alliaria.* Sawce alone, or Iacke by the hedge.

leaves, but ſomewhat larger, and roundly dented about the edges, two at every joynt, and two branches with them likewiſe, having ſpiked toppes of reddiſh flowers.

5. *Alliaria.* Sawſe alone, or Iacke by the hedge.

The lower leaves of Sawſe alone are rounder than thoſe that grow towards the toppes of the ſtalkes, and are ſet ſingly one at a joynt, being ſomewhat round and broad, and pointed at the ends, dented alſo about the edges, and ſomewhat reſembling Nettle leaves for the forme, but of a freſher greene colour, and not rough or pricking: the flowers are very ſmall and white growing at the toppes of the ſtalkes one above another, like unto Rocket, which being paſt, there follow ſmall and long round pods, wherein are contained ſmall round ſeed ſomewhat blackiſh: the roote is ſtringy and threaddy, periſhing every yeare after it hath given ſeed, and raiſeth it ſelfe againe from its owne ſowing: the plant or any part thereof being bruiſed, ſmelleth of Garlicke, but more pleaſantly, and taſteth ſomewhat hot and ſharpe, like almoſt unto Rocket.

Major. This is ſometimes found with larger and rounder leaves, in nothing elſe differing.

6. *Scordio affinis Elephas Columnæ.* The Germander-like hearbe of Naples.

This Germander-like hearbe hath a ſquare tender hollow ſtalke, ſomewhat hairy, and of a whitiſh greene colour as the leaves are likewiſe, two alwaies ſet at a joynt, the loweſt being ſmaller than the other that grow upward to the middle of the ſtalke, being ſomewhat like unto Mint leaves, but rounder at the points, and roundly dented about the edges like Germander, but more ſparingly: from the joynts with the leaves on all ſides, from the very bottome almoſt of the ſtalke, ſpring forth branches ſet with the like, but ſmaller, longer, and more pointed leaves, towards the toppes whereof come forth gold yellow gaping or hooded flowers, every one upon a ſlender foote-ſtalke, betweene the leaves like the head of an Elephant, with the bowed ſnowt, and two crooked teeth on each ſide thereof, and purpliſh ſpots like eyes under the upper hood, of a very ſweet ſcent, and flowring by degrees one after another, after which come grayiſh ſeed contained in heads, with very thinne skins that they may be diſcerned thorow them: the roote is long and white, with ſome tranſlucid graines like wheate cornes growing at them.

The Place.

The firſt groweth in many wet grounds, and by water ſides in many places of *England*; *Dioſcorides* ſaith, as well on the Hills, as by water ſides, for it will abide well if it be tranſplanted into a garden, and *Camerarius* ſaith that it is found to be ſtronger and ſharper that groweth on high grounds. The ſecond groweth in woods and by wood ſides, as alſo in divers fields and by-lanes in many places with us: the third as is ſaid groweth in *Candy*, whereas *Honorius Bellus* ſaith, the people gather it promiſcuouſly with the former ſort, and ſo uſe it, or ſell it to others: the fourth doth grow alſo in *Candy*, and ſent to *Signor Contarini*, from whom *Pona* ſaith he had the knowledge thereof. The fift groweth under walls, and by hedge ſides, and path-wayes in fields in many places: the laſt on the hill *Campoclari* in *Naples*, as *Columna* ſaith.

The

The Time.

They doe flower in Iune, Iuly, and Auguſt, ſomewhat before which time, the moſt uſuall manner is to gather the water Germander, and dry it to keepe.

The Names.

Water Germander is called in Greeke Σκόρδιον, and in Latine *Scordium*, from σκόροδον which is *Allium* Garlicke, becauſe of the ſmell: the likeneſſe of the Greeke name, did much deceive the former ages before us, for as *Matthiolus* writeth, it begun to be knowne but a while before his time, and that all men both Phyſitians and Apothecaries uſed the wild Garlick called *Ophioſcoridon* in ſtead of the true *Scordium* in their medicines, the occaſion whereof (beſides their owne ignorance and negligence in not diſtinguiſhing of the words) was *Avicen*, as it is moſt likely or his Tranſlator that appointed *Scordium* in one compoſition of Treakle, and wild or crow Garlicke in another: and the Phyſitians of the former ages, thinking that *Avicen* had interpreted himſelfe, expounding one place by another, continued the error by tradition without further ſearch, untill learning & all other ſciences began to be more ſought into, and refined as it were from the groſſe puddle of ignorance and barbariſme, which brought the knowledge of this to light, as it did of many other things; ſo that now our curioſity doth not reſt in *medys & utilibus*, but tranſcendeth *ad imas & minimas etiamſi inutiles*; It is called alſo *Trixago paluſtris*, Water or Marſh Germander, both for the likeneſſe thereof unto Germander called *Trixago*, and for the growing thereof in marſhes, &c. Some alſo call it Σκόροδον from the ſtrong ſcent ſo unpleaſant to the ſences. *Pliny* ſaith that *Crateuas* did aſcribe one of the ſorts hereof unto Mithridates, and called it Mithridation; and it may be from hence as well as from Garlicke, was called poore mens Treakle, and by our Country people Engliſh Treakle. The firſt is called *Scordium*, or *Trixago paluſtris* of all Writers, and although *Tabermontanus* and *Gerard* that ſo loweth him, doth make two ſorts thereof, as *majus* and *minus*, a greater and a leſſer, yet I never could obſerve any other difference then in the place which produced them, being one more or leſſe fruitfull or barren than the other. The ſecond is called by *Lobel* and *Camerarius Scordium alterum*, and *Scordium majus Plinij* by *Geſner*; who calleth it alſo *Salvia montana*, and *Ambroſia quibuſdam*; *Tragus*, *Lonicerus*, and *Tabermontanus*, call it *Salvia ſylveſtris*, and *Salvia Boſci*, and *Boſci Salvia*, and *Lugdunenſis Salvia agreſtis*, as *Dodonæus* alſo doth, who taketh it likewiſe to bee *Sphacelus Theophraſti*, as I have formerly ſhewed. *Cordus*, *Thalius*, and *Gerard* call it *Scordonia*, and *Scorodonia*, although his figure thereunto is not right. *Ceſalpinus* calleth it *Melinum alterum*, *Ætius*, and *Bauhinus Scordium alterum Salvia ſylveſtris*. The third is called *Scordotis legitimum Plinij*, both of *Bellus* and *Pona* in his deſcription of *Mons Baldus*, and it is very probable that *Camerarius* doth meane this ſort, which he calleth *Scordium Creticum lanuginoſum*; for as I ſaid before, *Bellus* ſaith, the people of *Candy* make no difference betweene them, but in gathering put them together. It is probable alſo, that *Anguillara* called this *Scordium alterum*, which hee ſaith was found about the banke of the River *Piſcara*, with leaves as large as Baulme: and that ſuch is found in *Candy* alſo, in *Greece* and other places, nothing differing either in ſcent or quality from the firſt. The fourth is called by *Pona* in his Italian *Baldus Scordotis ſecundum Plinij*. The laſt is called by moſt Authors *Alliaria*, yet *Geſner in hortis* calleth it *Alliaſtrum*, and *Ericius Cordus Rimamarina*, but *Anguillara Rimamaria*, *Dalechampius* upon *Pliny* taketh it to be his *Alectorolophus*, and ſo doth *Lobel* alſo, ſome alſo take it to be *Thlaſpidium Crateuæ*, and *Tragus* calleth it *Thlaſpdium cornutum*. The laſt *Columna* calleth it *Elephas Campoclarenſium*, and *Bauhinus Scordio affinis*, *Flephas*. The Italians call *Scordium Calamandrino paluſtre*, the Spaniards *Camedreos de arroyes*, the French *Scordion* and *Chamaraz*, the Germanes *Waſſer Rothengel*, and *Lachen Knoblauch*, the Dutch *Water Gamandree*, and we in Engliſh Water or Marſh Germander. The Italians call Sawce alone, or Iacke by the hedge *Alliaria*, the French *Alliaire*, and *Herbeaux aulx*, the Germanes *Knoblauchs kraut*, and *Saltzkraut*, the Dutch *Look ſonder look*.

The Vertues.

Dioſcorides and *Galen* doe both agree that water Germander is of an heating and drying, or binding quality, bitter alſo, and a little ſowre and ſharpe, whereby it is effectuall to provoke urine, and womens monethly courſes: the decoction thereof in wine being either greene or dry, is good againſt the bytings of all venemous beaſts or Serpents, and all other deadly poiſons; and alſo againſt the gnawing paines of the Stomake, and paines of the ſide that come either of cold or obſtructions, and for the bloody flixe alſo: made into an Electuary with Creſſes, Roſſin, and Honey, it is availeable againſt an old cough, and to helpe to expectorate rotten flegme out of the cheſt and lungs: as alſo to helpe thoſe that are burſten, and troubled with crampes. *Galen* in *lib. 1. Antidot.* (which *Matthiolus* and others alſo ſet downe) recordeth that it was found written by ſundry faithfull and diſcreet men, that in the warre of the bondmen, where the bodies of the ſlaine had lien upon *Scordium* any long time, before they were buried, they were found to be leſſe putrified than others, that had not fallen thereupon, eſpecially thoſe parts that were next the hearbe; which obſervation bred a perſwaſion of the vertue thereof to bee effectuall, as well againſt the poiſon of venemous creatures, as the venome of poiſonfull hearbes or medicines. It is a ſpeciall ingredient both in Mithridate and Treakle, as a counterpoiſon againſt all poiſons, and infections either of the plague or peſtilentiall or other Epidemicall diſeaſes, as the ſmall pockes, meaſels, faint ſpots, or purples: and the Electuary made thereof, named *Diaſcordium*, is effectuall for all the ſaid purpoſes: and beſides is often given, and with good ſucceſſe before the fits of agues, to divert or hinder the acceſſe, and thereby to drive them away. It is often taken alſo as a Cordiall to comfort and ſtrengthen the heart. It is a moſt certaine and knowne common remedy to kill the wormes, either in the ſtomacke or belly, to take a little of the juyce thereof, or the powder in drinke faſting. The decoction of the dryed hearbe with two or three rootes of Tormentill ſliced, and given to thoſe that are troubled with the bloody flixe, is a ſafe and ſure remedy for them. The juyce of the hearbe alone taken, or a Syrupe made thereof is profitable for many of the forenamed griefes. The dryed hearbe being uſed with a little honey cleanſeth foule ulcers, and bringeth them to cicatrizing, as alſo cloſeth freſh wounds: the dryed hearbe made into a cerate or pultis, and applyed to excreſcences in the fleſh, as Wens and ſuch like, helpeth both to conſtraine the matter from further breeding of them, as alſo to diſcuſſe and diſperſe them being growne. It being uſed alſo with vineger or water, and applyed to the gowt, eaſeth the paines thereof. The greene hearbe bruiſed and laid or bound to any wound, healeth it, be it never ſo great. Wood Sage is hot and dry in the ſecond degree, the decoction thereof is good to bee given to thoſe whoſe urine is ſtayed, for it provoketh it and womens courſes alſo. It is thought to be good againſt the French poxe, becauſe the decoction thereof drunke doth provoke ſweat, digeſteth humours, and diſſolveth

swellings and nodes in the flesh: the decoction of the hearbe rather greene than dry made with wine, and taken, is accounted a safe and sure remedy for those who by falls, bruises, or beatings, doubt some veine to be inwardly broken, to disperse and avoid the congealed blood, and to consolidate the veine, and is also good for such as are inwardly or outwardly bursten, the drinke used inwardly, and the hearbe applyed outwardly: the same also, and in the same manner used, is found to be a sure remedy for the palsie: the juyce of the hearbe or the powder thereof dryed is good for moist ulcers and sores in the legges, or other parts to dry them, and thereby to cause them to heale the more speedily: it is no lesse effectuall also in greene wounds, to be used upon any occasion. Jacke of the hedge is eaten of many Country people as sawce to their salt fish, and helpeth well to digest the crudities, and other corrupt humours are engendred by the eating thereof, it warmeth also the stomacke, and causeth digestion: the juyce thereof boyled with honey, is held to be as good as *Erysimum*, hedge Mustard for the cough, to helpe to cut and expectorate the flegme that is tough and hard to rise: the seed bruised and boyled in wine is a good remedy for the wind collicke, or for the stone, being drunke warme, the same also given to women troubled with the mother, both to drinke, and the seed put into a cloth, and applyed while it is warme, is of singular good use: the leaves also or seed boyled, is good to be used in glisters, to ease the paines of the stone: the greene leaves are held to be good to heale the ulcers in the legges, the roote tasteth sharpe somewhat like unto Raddish, and therefore may be used in the same manner, and to the same purposes that it is.

CHAP. XLI.

Baccharis. Bacchar.

ALthough sundry Writers have set forth divers hearbes, for the true *Baccharis* of *Dioscorides*, and other learned men have refused them: yet these hearbes come neerest thereunto, the one the learned of *Mompelier* account the truest, and with them many others doe agree: the other *Rauwolfius* setteth forth, which are therefore here proposed unto you.

1. *Baccharis Monspelienſium.*
French Baccnar.

1. *Baccharis Monspelienſium.* French Bacchar.

This hearbe hath divers somewhat long and large leaves lying upon the ground full of veines, which make it seeme as if it were crumpled, soft and gentle in handling, and of an overworne greene colour, seeming to be woolly: from among which in the Summer time, riseth up a strong stiffe stalke, three or foure foote high, set with divers such like leaves, but smaller up to the toppe: where it is divided into many branches, at the ends whereof come forth divers flowers, three or foure for the most part, at the end of every severall branch, and every one on a small foote-stalke: which flowers consist wholly of small threads or thrums, standing close and round; and never laid open like other flowers, that consist of leaves, of a dead or purplish yellow colour, out of greenish scaly heads, which thrums turne into a whitish downe: at the bottome whereof is the seed, small and chaffy, which together with the downe is carried away with the winde, and riseth up in sundry places of a garden, where it is once planted, and beareth seed: the roote consists of many strings and fibres, bushing somewhat thick, not running deepe into the ground, but so taking hold of the upper face of the earth, that it may easily be pulled up with ones hand: the smell whereof is somewhat like unto *Avens*, but lesse in gardens, than growing wild, even as *Avens* doth in gardens, and divers other sweet hearbes that are of thin parts and subtile.

2. *Baccharis Dioscoridis Rauwolfio.* Syrian Bacchar.

The Syrian Bacchar, brancheth forth from an hoary stalke, about a foote high, into many smaller sprigges; bearing somewhat long and narrow leaves thereon, as white, hoary, and woolly as Mullein leaves, without any foot-stalke at the bottome, but compassing the stalke about: these being larger below, yet lesse than Mullein, and those above smaller, and smaller to the tops: whereon stand the flowers very thicke set together, somewhat like unto golden Tufts, or Mountaine Cotton weed, called also Cats foote, of a pa'e purplish colour: the roote was not fully observed, but seemed by some parts thereof, to be fibrous like blacke Hellebor, and sweet also.

The Place.

The first groweth plentifully nëare *Mompelier*, and nany other places also. The other in *Syria*.

The Time.

The first flowreth with us about the end of Iuly, or beginning of August. The other time is not expressed.

The

2. *Baccharis Dioscoridis Rauwolfius.*
Syrian Bacchar.

The Names.

It is called in Greeke βακχαρὶς, *Baccharis*, or as some would have it παχχαρὶς, *Paccharis*, as though it should bee named παγχαρὶς *Pancharis*, from the excellent smell it hath. *Pliny* saith that some in his time called it *Nardus rustica*; but saith hee, they were in an errour that did so call it, for *Asarum* is most truely and properly called of the Greekes Νάρδος ἄγρια *Nardus rustica*, and therefore *Gerard* in following the old error reprehended so long agoe, giveth it the English name of Plowmans Spikenard, whereunto it hath no resemblance, neither for forme nor vertues, and his figure also is rather the figure of *Matthiolus Baccharis*, then of this: and although in former times divers did thinke, that *Asarum* and *Baccharis* in *Dioscorides* were all one hearbe, and thereupon came the name of *Asara baccara*; some taking *Asarum* to be *Baccharis*, and so contrarily some taking *Baccharis* to be *Asarum*; for *Cratevas* his *Asarum* is not *Dioscorides* his *Asarum*, but his *Baccharis*, as any may plainely see, that shall read his description, yet now time and diligence have expell those errours. The first of these is called *Baccharis Monspelienſium*, whereunto it doth more fitly agree, than any other hearbe that others have set forth; as *Pena* and *Lobel*, *Clusius*, and others doe agree; although *Dodonæus* calleth it *Conyza major altera*, and saith it hath little or no likenesse unto *Dioscorides* his *Baccharis*. *Matthiolus* his *Conyza major*, is said by the Author of *Lugdunenſis*, to be this *Baccharis Monspelienſium*: and *Lobel* and *Pena* say that the plant which *Matthiolus* set forth for *Baccharis*, cannot agree unto that of *Dioscorides*, but is a kind of sweet Mullein, or a kinde of Moth Mullein: yet *Bauhinus* in his *Pinax*, calling this *Conyza major vulgaris*, shewing thereby that many did call it so, referring it as well to *Matthiolus* his *Conyza major*, as to his *Baccharis*; which *Lugdunenſis* saith, are so contrary one unto the other, as that they cannot be accounted both one plant, as in the Chapter of *Baccharis* he sheweth. They of *Salmanca* in *Spaine*, as *Clusius* saith, called it *Helenium*, and divers both women and Monkes, used both the roote and the hearbe, for scabs and itches, which is one of the properties whereunto the true *Helenium* serveth. The other *Rauwolfius* onely finding in *Syria*, seemeth to referre unto *Dioscorides* his *Baccharis*: which *Clusius* thinketh rather to bee a kinde of that Mountaine Cotton weed, which *Fuchsius* calleth *Pilosella minor*, and therefore *Bauhinus* calleth it *Gnaphalio montano affinis Ægyptiaca*.

The Vertues.

Dioscorides saith, that the rootes of *Baccharis* boyled in water and drunke, helpeth those that are troubled with convulsions and crampes, as also those that have ruptures and are burſten, such as have bruses by falls or otherwise, and those that can hardly draw their breath, or are short-winded, as also for old coughs, and the difficulty in making water: it also procureth the feminine courses, and is very profitable against the bytings of venemous creatures being taken in wine: the greene roote being bound or hanged to, expelleth the birth, and is good for women in travell to sit over the warme fumes of the decoction thereof. For the sweet smell thereof it is put into Wardrobes to perfume: and the smell thereof procureth sleepe: But the greene leaves by reason of their astriction are good to ease the paines of the head, the inflammations of the eyes, and the watering of them in the beginning, the hot swellings of womens breasts after childing, and those hot inflammations called Saint *Anthonies* fire, being applyed to the places affected. *Pliny* saith further, that it helpeth to breake the stone, and to take away paines and prickings in the sides. *Paulus Ægineta* saith moreover that the decoction of the roote openeth obstructions, and that the leaves are helpefull by their astringent quality to stay fluxes: *Virgil* in his seventh Eclogue saith, that is was used in his time as a garland to secure one from witchery and charmes, in these verses.

CHAP. XLII.

Nardus. Spiknard.

ALthough it is not my meaning to shew you the Indian Spiknard in this place, in that it is a plant peculiar to the Easterne parts of the world, and was never brought to grow in these Christian Countries; yet there is a bastard kind thereof found nearer hand, very like unto it, which I must set forth unto you, and some others also, that for the affinity either of scent or property, or both, have beene called *Nardi*.

1. *Nardus Gangitis ſpuria Narbonenſis.* Bastard French Spiknard.

In imitation of the true Indian Spiknard (which *Pena* saith doth grow in divers places of *Syria* and *Egypt*, which relation is his onely; for we never could understand by any of our Merchants that trade into those parts, that it

was

1. *Nardus Gangitis spuria Narbonensis.*
Bastard French Spiknard.

was a commodity so neare at hand, but brought further of; as I shall hereafter further declare) this bastard kinde hath beene observed to grow answerable in a manner to all the parts thereof. For it hath a few small hard fibres, which thrust themselves into the ground: from which spring forth divers hairy round spiky heads or beards, of the bignesse of ones finger, and of an hand breadth high, of a pale browne colour, which are not pointed at the toppes but flat or blunt, through each of these heads, even from the lowest part next the roote, shoote forth divers long rough greene rushes, scarce a foote high, many of these growing close one unto another, so that they make the forme or shew as it were, but of one plant; and after this manner hath hee set forth the figure thereof: but hee further addeth afterwards, (which *Lugdunensis* pretermitteth, although he setteth downe all the former part) that it is altogether without smell, except those hairy spiked heads or beards, which being bigger than the Indian kinde, doth smell somewhat like unto that Mosse that groweth upon Oakes, or that other that groweth upon the ground, and that these heads being halfe way within the ground, doe send forth each of them in the middle of those rigid rushes, a tall slender and smooth stalke, rising about a cubite higher than the rushes: from the middle whereof up to the toppes of them on each side, come forth many small greene cods pointed at the ends standing in cuppes like unto those of Cranes bill. The whole forme hereof doth so neare resemble the true Spiknard, as it hath beene observed by *Pena* and others, who as he saith among a number of bundles, found some that had the parts both of fibres heads, rushes, and leaves distinctly, to be seene as this is here described; that it is not to be doubted that it is a *species* thereof.

2. *Nardus sive Spica Celtica.* Mountaine French Spiknard.

This Mountaine Spiknard creepeth upon the ground under the loose leaves and mosse, &c. with small long and hard slender rootes (for so I call them rather than stalkes, as some others doe, because in these rootes consisteth the whole vertue and efficacy of the plant, and are by the best Apothecaries used onely in Mithridatum, &c. and no part else) covered with many short small dry leaves like scales: sending forth in divers places as it creepeth and spreadeth, here and there small blackish fibres into the ground, whereby it is nourished: at the head whereof stand sundry small buttons or heads, from whence spring many small narrow, and somewhat thicke greene leaves, not divided or dented at all, smallest at the bottome, and broad toward the end, which change yellow in the end of Summer, or beginning of Autumne: among these leaves rise up sometimes more, and sometime but one slender stalke, without any leaves thereon, at the toppe whereof stand many small whitish flowers, like unto the smaller sorts of Valerian, every one on a slender foote stalke: which afterwards bring small seed like unto them also: the whole plant is sweet and aromaticall, more than the Indian Spiknard, hotter also, and sharper in taste, than either of the other.

3. *Nardus Celtica altera.* Mountaine French Spiknard with tufted flowers.

This other French Spiknard differeth in nothing from the last but in the stalke with flowers, which is branched at the toppe, bearing three or foure flowers in a tuft together, on the end of every small branch.

Bauhinus in his *Prodromus* setteth forth another sort hereof like thereto in most things, but that it is wholly without scent.

4. *Saliunca Neapolitana sive Nardus ex Apulia.* Italian Spiknard.

This small plant hath a thicker and yellow roote than the last recited, somewhat rugged, but not scaly like it, and somewhat resembling the garden Valerian, but lesse, having fibres at the bottome, and in divers other places at severall spaces, where it shooteth forth also upwards divers heads or small knobs, and from them many small long leaves, somewhat larger than the other, narrower likewise below, broader upwards and pointed at the ends; what flowers, stalkes, or seed it beareth is not expressed: it hath the sweet scent of garden Valerian, and likewise the sharpe taste thereof, and this is all is declared of it: but that they of *Naples* use it in their medicines, in stead of the *Malabathrum* of *Dioscorides*, for the excellent sweetnesse of the leaves.

5. *Hirculus veterum Clusij.* Vnsavory Spkinard.

This small plant (being found dry amongst many bundles of *Spica Celtica*, or French Spiknard, by *Clusius* in *Antwerpe*) is set forth to have a blackish hairy roote, like unto it, but without any smell at all, and smaller, shorter, and whiter leaves, rather grayish, and of an ash-colour: it was found without any stalke, and so *Dioscorides* and *Pliny* say it was found in their time: but theirs (as they say) had a strong scent, but not sweet, and growing with it was uttered among the true; and by the smell as well as colour and taste was to be knowne from it; for it tooke the name τραγον or *Hirculus*, of the smell thereof like unto that of a goat.

6. *Nardus montana tuberosa.* Knobbed mountaine Spiknard.

This kinde of Valerian or Spiknard, call it which you will, hath his first leaves lying on the ground, without any division in them at all, being smooth and of a darke greene colour, which so abide all the Winter: but those that spring up upwards, when it runneth up to flower, are cut in on the edges, very like unto the jagged leaves of the great garden Valerian, and so the elder they grow, the more cut and jagged they are: the stalke and flowers are very like the stalke with flowers of the garden Valerian, but of a darke or deep red colour, and more store of them thrust together: the seed also is not unlike it: the roote is tuberous or knobbed, both above and below, and round about

3. *Nardus Celtica altera.*
Mountaine French Spiknard with tufted flowers.

4. *Saliunca Neapolitana.*
Italian Spiknard.

5. *Hirculus Clusii.*
Vnsavory Spiknard.

6. *Nardi montanæ tuberosæ summitates.*
The tops of the knobbed mountaine Valerian.

6. *Nardus montana tuberosa primum germinans.*
Knobbed mountaine Valerian, the first leaves.

7. *Nardus Montana longiori radice.*
Long Tuberous Mountaine Spiknard.

about it, with some fibres shooting from them. whereby it is encreased, and smelleth very like the roote of the garden Valerian, or Setwall, or not altogether so strong, being greene, as when it is dry.

7. *Nardus Montana longiori radice.* Long tuberous Mountaine Spiknard.

This other Mountaine Spiknard or Valerian is very like the last, but hath a longer round white roote, shooting forth many long knobs, and small fibres underneath, which may be separated, and grow for increase: it hath many small long and somewhat darke greene leaves like it, but smaller: the stalkes are not above halfe a yard high, in any that I have observed, bearing some finer cut and divided leaves thereon than any below, two alwayes standing together at a joynt; at the toppes stand reddish flowers, thicke thrust together in an umbell like the other, which passing away, leave small seed behind them naked upon the stalkes: the whole plant is of a faint weake scent, but the roote is much stronger, and much more when it is dry, than when it is fresh and greene.

The Place.

The true *Nardus* is said by *Garcias* to grow onely in *India*, whatsoever others have said thereof. The first here was found upon that pleasant high hill in *Narbone*, called of the French, *L'hort de Dieu*, and *Dei Paradisus*, both for the pleasantnesse of it, and for the excellent hearbes that grow thereon, as *Pena* saith, in the mossy moist places thereof, facing the South and Mediterranean Sea, which is not farre from a small village called *Gange*. The second is found upon the Alpes in *Germany* in divers places, as also of *Liguria* in great plenty, and sundry other places. The third is found on the same hills, and on others also. The fourth was found upon the Hills in *Apulia*, which are in the Kingdome of *Naples*. The fift was seene as is aforesaid dry, but never seene growing greene: but that we may well conjecture, that it grew where the French Spiknard was gathered, as *Dioscorides* also and *Pliny* imagined. The sixth was found by *Pena* as he saith, on the hills neare *Mindenum*, and on the hills of *Veganium*: *Clusius* saith hee had it from *Ferrantes Imperatus* of *Naples*, and gathered from the hill *Virgineo*. The last is likely, being a kinde of the other to bee found in the same places with the other.

The Time.

They all flower and florish in the Summer moneths of Iune, Iuly, and August, some earlier or later than others.

The Names.

Nardus is called in Greeke Νάρδος, *a Naardo urbe Cyriaca forte* saith *Lobel*, *Euphrati contermina & ναρδυσαχυς quasi Nardus spica*, and so the Indian kinde is generally called *Spica Nardi*, and of some *Nardus Indica*, for a distinction betweene it and *Celtica*: The first of these *Pena* calleth *Nardus Gangitis spuria Narboæ*, both for the likenesse thereof unto the true *Nardus Gangitis* of *Dioscorides*; and that the next Towne of any note unto that Hill whereon it groweth, being about seven miles of, is called *Gange*; and by that name of *Nardus Narbonensis*, and *Nardus spuria Narbonensis*, it is called by all other Writers. The second is called *Nardus Celtica* of *Dioscorides*, and of all other Writers since, and *Cæsalpinus* following *Pliny Nardum Gallicum*. It is in shops called *Spica Celtica*, and by the most and best, is judged to be the *Saliunca* that *Virgil* in his Bucolicks maketh mention of in these Verses.

Puniceis humilis quantum Saliunca Rosetis,
Iudicio nostro, tantum tibi cedit Amyntas; in English thus:

As the Mountaine Spiknard unto the purple Rose tree,
So (if I judge) *Amyntas* yeelds to thee.

And is thought by them also, that the name ἀλιέγμα is corruptly put for σαλιέγκα in *Dioscorides*: for the Valesians call it in their tongne to this day *Selliga*, as favoring of *Saliunca*, as *Pena* saith also: yet *Matthiolus* findeth fault with *Fuchsius* and *Leonicenus* for taking them to be both one; and the Germanes also, who were reckoned a part of the *Celtes*, call it *Seliunck*: Some would have it called *Nardus ligustica*, because it groweth so plentifully on the Alpes of *Liguria*, and yet *Matthiolus* saith, that the Physitians of *Genua* which is a City in *Liguria*, did not know it before his time, and that he had published his Commentaries upon *Dioscorides* in the Italian tongue, which caused many both Physitians and Apothecaries, to be more inquisitive into the knowledge of hearbes, than they were before. Some also following the Arabians doctrine and words call it *Nardus*, or *Spica Romana*, because they call it in their tongue *Cambul Rumi*. The third is called by *Camerarius* in his Epitome upon *Matthiolus Spica Celtica fastigiato florum ordine*, by *Clusius Nardus Alpina seu Celtica*, but *Bauhinus* maketh this of *Clusius* to be the former, when as *Camerarius* saith it is not the same with *Matthiolus* and others, which is the first here, and *Bauhinus* himselfe calleth it *Nardus Celtica altera*. The other is remembred by *Cordus* upon *Dioscorides*, and *Bauhinus* in his *Prodromus* and *Pinax*, and called by him *Nardo Celtica similis inodora*. The fourth is called by *Lugdunensis Saliunca Neapolitana*, by *Tabermontanus Phu minus Apulum*, and by *Bauhinus Nardus ex Apulia*. The fifth as is before said, was thought by *Clusius* to be the *Hirculus* of *Dioscorides*, although it smel not strong as he saith his doth: *Anguillara* taketh it to be the *Nardus Samphoritæ* of *Dioscorides*, although *Matthiolus* findeth fault with him for that opinion; *Gerard* calleth it Vrinwort in English, whereunto it hath no correspondence: for not having smell or taste, it cannot have the properties of *Nardus*, which hath both. The sixt is generally called *Nardus montana*, and also thought by all Writers, to be *Dioscorides* his *Nardus montana*, notwithstanding hee saith it hath neither stalke nor flower, nor seed, for *Matthiolus* freeth him from that fault, (first both because in the forepart of his owne description

tion he saith, it hath the stalke and leafe of *Eryngium*, and therefore could not be so forgetfull, as within two or three lines to contrary his owne Writing) in laying the errour in the writers of his copy, in the same manner as he set downe in *Dictamnus*, and is declared in the Chapter thereof going before: that is, εἴρει for συμφέρει, *profert* for *confert*, it beareth not, for it profiteth not, the roote onely and no part else being to be used: as also that the leaves hereof doe not agree with the leaves of *Eryngium*, wherein it is most likely an errour is committed also, in miswriting and mistaking one word for another, for all other things agree sufficiently thereunto. *Dioscorides* and *Galen* say also it was called *Thylacitis*, because it was brought out of *Cilicia* in leatherne bagges, which were called θυλάκια and *Nirtis*, as it is in *Dioscorides* copy, but called *Pyritis*, as it is in *Galen*, because it was used as a perfume in their sacrifices. *Bauhinus*, *Camerarius*, and others make two sorts thereof, one that hath but one two or three round small rootes like unto Olives, which thereupon he calleth *Nardus montana radice olivari*, and the other hee calleth *Nardus montana radice oblonga*, and *Camerarius Nardus montana longius radicata*, when as it may be the place onely, where they naturally grow, that causeth the difference of forme in the rootes, as it hapneth in *Anthora*, *Napellus*, and many other things, too long here to recite: for being transplanted and manured, they grow much greater, and somewhat alter that forme it formerly held in the naturall places, yet I have given you the figures of both to see the difference.

The Vertues.

Dioscorides saith that the true Indian Spiknard is of an heating and drying faculty, and that it provoketh urine; It is profitable to stay the loosenesse of the belly, and all fluxes both of men and women, and thin watry humours, being taken in drinke or applyed to the places affected: being drunke with cold water, it is profitable to those that have a loathing of their meate, or having swellings or gnawings at their stomacks, as also for them that are liver-growne, that have the yellow jaundise, or the stone in the reines or kidneys. The decoction used as a bath for women to sit in, or over it, taketh away the inflammations of the mother: It helpeth watering eyes by repressing and staying the humour, and thickning it also. *Galen* saith the same things and addeth withall, that it dryeth up the fluxe of humours, both in the head and breast. It is an especiall ingredient into Antidotes, against poison and venome, as Mithridatum, &c. There had need be caution taken in the using of it, for it often provoketh vomitings, being either put with Rubarbe, as sometimes it is appointed, or in other cordiall medicines: and therefore our *London* Physitians in their *Pharmacopœa*, have appointed it to bee left out of many cordiall medicines. It is also with great caution to be forbidden to women with child, because it procureth them much disquiet, and may force their courses beyond either their time or conveniency. The oyle made thereof according to art. doth both warme those places that are cold, maketh the humours more subtill that were thicke or congealed before, digesteth those that are crude and raw, and also moderately dryeth and bindeth those that were too loose or fluxible: and hereby worketh powerfully in all the cold griefes and windinesse of the head and braine, of the stomacke, liver, spleene, reynes and bladder, and of the mother: being snuffed up into the nostrils, it purgeth the braines of much rheume gathered therein, and causeth both a good colour and a good savour to the whole body: Being steeped in wine for certaine dayes, and after distilled in *Balneo calido*: the water hereof is of singular effect, for all cold indispositions of the members, used either inwardly or outwardly: for it comforteth the braine, helpeth to stay thin distillations, and the cold paines of the head, as also all shaking and paralitick griefes: it helpeth also in all sudden passions of the heart, as faintings, and swounings; and for the collicke, two or three spoonefuls thereof taken upon the occasion: The first of these which is the bastard kinde, being almost without smell or taste, doth declare it to bee of small vertue and efficacy: but the mountaine French Spiknard, is reckoned to be effectuall, for all the purposes that the true Spiknard serveth for, but is weaker in operation; and moreover by reason it is somewhat more heating and lesse drying than it; it is more pleasing to the stomacke, and provoketh urine more effectually: the decoction thereof with Wormewood being drunke, helpeth those that are troubled with the swellings and windinesse of the stomacke, and being taken in wine is good for them, that are stung or bitten by any venemous creature. It helpeth also to dissolve all nodes and hard swellings, and is profitable for the spleene, reines, and bladder. It is also an ingredient of no small effect in *Mithridatum*, and others; and is used outwardly in oyles and oyntments, to warme and comfort cold griefes whersoever they be. The Mountaine Spiknard is weaker than the Celticke or French Spiknard, by the judgement of *Dioscorides*, *Galen*, and others.

CHAP. XLIII.

Valeriana. Valerian.

THere are many sorts of Valerians to be remembred in this Chapter, some naturall, others strangers to our Country; and yet have beene free denizons in our gardens along time, others but of late.

1. *Phu majus sive Valeriana major.* The great Valerian.

The great Valerian hath a thicke short grayish roote, lying for the most part above ground, shooting forth on all sides other such like small peeces or rootes; which have all of them many long and great strings or fibres under them, in the ground, whereby it draweth nourishment: from the heads of these rootes spring up many greene leaves, which at the first are somewhat broad and long, without any division at all in them, or denting on the edges: but those that rise up after, are more and more divided on each side, some to the middle ribbe, being winged, as made of many leaves together on a stalke, and those upon the stalke in like manner, are more divided, but smaller toward the toppe than below: the stalke riseth to be a yard high, or more, sometimes branched at the toppe, with many small whitish flowers, sometimes dasht over at the edges with a pale purplish colour; of a small scent which passing away, there followeth small browniish white seed, that is easily carried away with the winde: the roote smelleth more strong than either leafe or flower, and is likewise of more use in medicine.

There is a Mountaine kinde hereof, as *Camerarius* saith, found in *Savoy*, which is more sweete than this, even of the smell of a Pomecitron, but it is more soft or gentle than it. *Altera odoratior.*

2. *Valerian*

1. *Phu majus sive Valeriana major.* The great Valerian.

2. *Valeriana Cretica tuberosa.* Knobbed Valerian of Candy.

2. *Valeriana Cretica tuberosa.* Knobbed Valerian of Candy.

This Valerian of Candy hath his first leaves, that spring up and lie upon the ground round about the roote greene, thick, and round, like unto the leaves of *Asarabacca*, and sometimes greater; the next that come after them are somewhat longer, and somewhat divided or cut in on the edges, and those that follow more and more divided, so that those that grow upon the stalke, are very like unto the divided leaves of the former Valerian: the stalke is hollow, and riseth to be two foote high at the least, having here and there two smaller leaves set at a joynt: at the toppe whereof, which is divided into some smaller branches, stand many white flowers in an umbell, thick thrust, somewhat larger than those of the former, which turne afterwards into small and flat seed with a little downe at the head of them, like thereunto also: the uppermost roote from whence the leaves and stalke doe spring, is small round short and tuberous, from whence shoot forth round about it, divers other smaller rootes, fastned thereunto by long strings, like as the rootes of *Filipendula* are, the scent whereof is very like unto the former great Valerian.

3. *Valeriana Alpina major sive latifolia.* Broad leafed wild Valerian of the Alpes.

This wild Valerian hath many large and somewhat round pale greene leaves, and in some they will be yellowish, rising from the roote, lying upon the ground round about; every one having a long foote-stalke thereunto, some whereof are very like unto Ivie leaves, but lesser and gentler, and others longer like unto the leaves of *Canterbury* Bells, but lesser also, and not so hard; in some a little dented, in others more dented about the edges, but not divided at all: the stalke is round, and about a foote and a halfe high, in some greene, in others somewhat reddish, having few leaves thereon, which are smaller, longer, and deeper cut in on the edges, than any below, and at the toppe is branched, whereon stand divers small purplish flowers, like unto the other Valerians: after which come small seed like unto the rest: the roote is large, round, and whitish, set with divers knots or joynts, and long fibres under them, of a reasonable good smell, like unto wild Valerians, and of a bitterish binding taste.

4. *Valeriana Alpina minor.* Small wild Valerian of the Alpes.

This small Valerian hath foure or five small long, and somewhat narrow leaves, with one or two dents onely at the edges, lying on the ground next the roote, and are somewhat like unto the leaves of the great wild white Daysie, especially those that grow highest, and are the smallest, but with fewer dents or notches about the edges: the stalke riseth not up above a foote high, having very few leaves thereon, which are smaller, longer, and narrower than those below, with as few dents or notches on the sides as the other: the toppe of the stalke is divided into a few small branches, on every of which grow a few white flowers, like unto the Valerians, but smaller: the roote is small, and creepeth a little under ground, sending forth fibres, but no lesse sweet than the former.

5. *Valeriana annua sive Æstiva Clusy.* Summer Valerian.

This annuall Valerian, hath divers long leaves lying on the ground, all of them deepely cut in or gashed on the edges, somewhat like the leaves of the Starre Thistle, among which rise up round hollow stalkes, two or three foote

3. *Valeriana Alpina major ſive latifolia.*
Broad leafed wild Valerian of the Alpes.

4. *Valeriana Alpina minor.*
Small wild Valerian of the Alpes.

5. *Valeriana annua ſive Æſtiva Cluſij.*
Summer Valerian.

foote high, with ſome leaues growing thereon, two alwayes ſet together at a joynt, as in the other Valerians, but ſmaller and more divided than the lower; branching forth towards the top, on the which ſtand many flowers ſet together in tufts, being ſmall and long, divided at the brimmes into five parts, making a ſhew of flowers, conſiſting of five leaves a piece, ſomewhat like unto the flowers of the Indian Valerian next following, and are of a pale red or fleſh colour, which afterwards bring ſmall ſeed, like unto the red Valerian of *Dodonæus*; the root is ſmall, white, and wooddy, but periſheth every yeare; this hath a ſmall weake ſcent of Valerian.

6. *Valeriana Indica ſive Mexicana.* Indian Valerian.

The Indian Valerian groweth quickly into a ſtalke, from the firſt leaves that ſpring up, which are but few next the ground, ſomewhat long and broad, ſomewhat like unto the firſt leaves of the Mountaine Spiknard, of a pale greene colour; the ſtalke is weake and hollow, not ſtanding upright, but leaning or bending downewards, ſet with joynts, at the which ſtand two long leaves, like unto thoſe below, but a little more cut in or divided at the edges, and at the joynts likewiſe ſhoot forth two branches, ſometimes on each ſide one, and ſometimes but one branch on the one ſide, which are divided, and at the toppes of them doe beare many flowers, ſet thicke together in an umbell or tuft, each whereof is ſomewhat long, and endeth in five diviſions; two of the uppermoſt whereof are broader and ſhorter than the reſt, other two hang downe as labels or lips, and the fift is the greateſt ſtanding in the middle, in ſome plants of a deepe red, or purple being in bud, and of a pale purple colour being open, and in others milke white; each of theſe ſtandeth in a ſmall greene huske, wherein after the flower is fallen, the ſeed groweth, which huske openeth it ſelfe, and ſheddeth the ſeed on the ground, when it is through ripe, if it be not carefully tended and gathered, which is

ſpongy.

6. *Valeriana Indica ſive Mexicana.*
Indian Valerian.

ſpongy, rounder, bigger, and blacker than any of the former Valerians, without any downe at the end of them: the roote is ſmall and ſtringy, periſhing every yeare with the firſt froſts: the whole plant is utterly without any ſmell, in all that I have ſeene, and almoſt without taſte likewiſe.

7. *Valeriana rubra anguſtifolia.* Narrow leafed rēd Valerian.

This ſmall red Valerian is very like unto the greater red Valerian ſet forth in this & my former Book, but differeth chiefly in the ſmalneſſe, being lower, and the leaves long, and very narrow, very like unto the leaves of Line or Flaxe, but not ſo long, harder or rougher in handling than they, and ending in a point: the flowers are of a pale red, like unto them for forme, being long, but ſmaller than they, and having as little ſcent to commend them.

8. *Valeriana Petræa.* Rocky Valerian.

This ſmall Valerian hath divers leaves lying upon the ground, ſome of them little or nothing divided, others as much cut in, and gaſhed on the edges, as any of the other Valerians, but they are nothing ſo great; the ſtalke is branched at the toppe, carrying tufts of purpliſh flowers, but ſmaller: the ſeed that followeth is ſmaller, without any downe at the head, but in ſtead thereof it hath little skins, as it were at the ends, divided in five parts, making them ſeeme like a Starre, much like unto the toppes of the ſeed of Scabions: the roote is ſmall and fibrous, having a ſmall ſcent of Valerian, as the leaves and flowers have alſo.

9. *Valeriana minor annua.* Small Valerian of a yeare.

This ſmall Valerian hath the firſt and lower leaves ſomewhat round and dented, but the other that follow, and grow upon the ſtalke, are divided like unto other Valerians, the flowers are ſmall and purpliſh, which are followed by ſmall ſeed that is blowne away with the winde, the roote is ſmall and threaddy, periſhing every yeare.

10. *Valeriana minima.* Small Valerian.

This little Valerian is very like unto the ſmall wilde Valerian, but much ſmaller, having the leavēs much divided like thereunto: the ſtalkes are not above halfe a foot high, bearing tufts of ſmall purpliſh flowers: the rootes are long and ſmall, with ſmall white threads or fibres, ſmelling like unto the ſmall wild Valerian.

There are ſome other hearbes ſet forth by *Lobel* and others for Valerians, which in my judgement have ſo little reſemblance thereunto, that I have not thought good to ranke them in their Tribe, but referre them to others, the one is called *Phyteuma Monſpelienſium*: the other *Phu minimum alterum*, which *Dodonæus* calleth *Album alus*, and generally is called of moſt, *Lactuca agnina lambes lettice*, or Corne Sallet; which I have mentioned among the kindes of Lettice in this and my other Booke.

11. *Valeriana rubra Dodonæi.* Red Valerian.

This Valerian hath divers hard, but brittle whitiſh greene ſtalkes riſing from the roote, full of tuberous or ſwelling joynts, whereat ſtand two leaves on each ſide one, and now and then ſome ſmall leaves from betweene them, which are ſomewhat long and narrow, broadeſt in the middle, and ſmall at both ends, without either diviſion or dent on the edges, of a pale greene colour: the ſtalkes are three or foure foote high, branched at the toppes, at the ends whereof ſtand many flowers together, ſomewhat like unto the flowers of the ordinary Valerian, but with longer neckes, of a fine red colour, but without any ſcent of Valerian: after the flowers have ſtood blowne a good while, they ſuddenly fall away, and the ſeed which is ſmall and naked, with a little tuft of downe at the toppe thereof, whereby it is eaſily carried away with the wind, ripeneth quickly after: the roote is great, thicke, and white, continuing long, and ſhooting out new branches every yeare.

12. *Valeriana Græca.* Greeke Valerian.

The Greeke Valerian hath many winged leaves lying on the ground, ſomewhat like unto the wilde Valerian that groweth by the ditch ſides, but more tender and ſmall, among which riſe two or three round hollow brittle ſtalkes, two or three foote high, whereon are ſet at the joynts ſuch like leaves as grow below, but ſmaller, the toppes of the ſtalkes are divided into many ſmall branches full of flowers, each conſiſting of five ſmall round pointed leaves, of a faire bleake blue colour in ſome plants, and in others white, with ſome white threads tipt with yellow pendents in the middle: after the flowers are paſt, there come up in their places ſmall hard heads, containing ſmall blackiſh ſeed: the roote is compoſed of a number of ſmall long blackiſh threads, without any ſcent of a Valerian.

13. *Valeriana ſylveſtris.* Wild Valerian.

This wild Valerian hath ſundry winged leaves ſpringing from the roote, whereof the end leafe is the largeſt, of a ſad greene colour, without any dents on the edges, the ſtalke hath two ſuch like leaves at a joynt as grow below, but ſmaller, and at the toppe branched, with ſundry ſmall whitiſh purple flowers, but deeper than the Garden Valerian, the roote is a buſh of blackiſh threads and ſtrings, which ſend forth ſtrings of encreaſe, beſides that the lower branches doe ſhoot forth fibres alſo. Of this kinde there is accounted a greater and a leſſer.

Major.

The

8. *Valeriana petrea,* Rocky Valerian.

11. *Valeriana rubra Dodonæi.* Red Valerian.

12. *Valeriana Græca.* Greeke Valerian.

13. *Valeriana sylvestris.* Wilde Valerian.

The Place.

The firſt is ſaid by *Dioſcorides* to grow in *Pontus*, it is found in the wet grounds of Mountaines, and in other moiſt places, it is generally kept in our gardens. The ſecond grew in *Candy*, and was ſent by *Honorius Bellus* from thence unto *Cluſius*. The third groweth on the Mountaines of *Auſtria* and *Styria*; and ſo doth the fourth alſo, as *Cluſius* ſaith he had from *Plateau*, but recordeth not from whence he had it. The ſixth is ſaid to come from *Mexico* a Province in the Weſt-Indies, it came into theſe parts firſt from *Italy*, and as *Bauhinus* ſaith, that which beareth purple flowers, groweth (as he was given to underſtand) in the Country of *Latium*, or of the Latines in a place there called *Siculus*, and from thence was called of ſome *Valeriana Sicula*, and that with the white flower in the Country of the Sabines. The ſeventh was gathered on *Mons Baldus*. The eighth *Fabius Columna* found on the Mountaines in the Kingdome of *Naples*. The ninth groweth in garden onely with thoſe that are curious, the naturall place being not knowne. The tenth *Lobel* ſaith groweth about *Mompelier* in *France*. The eleventh and twelfth in our gardens chiefly, for we know not the naturall places of them. The laſt two ſorts grow in many Marſhes and wet Medowes by Rivers and water ſides in our owne Country.

The Time.

They doe all flower in the Summer moneths of Iune and Iuly, & the Indian kinds if they be ſet early, will flower betimes, and continue flowring untill the froſts pull it downe, and ſo doth the Summer or annuall kind alſo.

The Names.

It is called in Greeke φῦ *Phu*, and νάρδος ἀγρία, *Nardus agreſtis*, or *ſylveſtris*, becauſe it is in ſmell and faculty like unto *Nardus*, in Latine *Valeriana*, *a multis quibus valet facultatibus*. Some alſo call it *Thericaria*, becauſe it is an eſpeciall ingredient into Treakle, and *herba Benedicta*, of *Paracelſus* it is called *Terdina*. The firſt is generally called, both in ſhops and of all other, *Phu majus*, and *Valeriana major hortenſis*: in Engliſh the great garden Valerian, and of ſome Capons tayle, and Setwall: but Setwall properly is *Zedoaria*, an Out-landiſh roote in the Apothecaries ſhops, which never was knowne to grow in any of theſe Chriſtian Countries. The ſecond is called by *Bellus*, *Nardus Cretica*, becauſe the rootes have the ſmell of *Nardus*, (but the whole face of the hearbe, as hee ſaith himſelfe, is moſt properly like a Valerian) as all the ſweet Valerians are more or leſſe. The third is called by *Cluſius Valeriana ſylveſtris Alpina prima latifolia*, and is the *Valeriana Alpina prima*, and alſo the *Valeriana Alpina Scrophulariæ folio* of *Bauhinus*, deſcribed in his *Prodromus*; both which as hee himſelfe ſaith, are comprehended under this of *Cluſius*: and is alſo the ſame that *Pilleterius* ſent from *Mompelier*, unto *Lobel* in his life time, under the name of *Valeriana montana*, which I doe here publiſh, and it is probable to be the *Valeriana montana* of *Lugdunenſis*, although *Bauhinus* ſeemeth to make it an other peculiar ſort. The fourth is called by *Cluſius Valeriana ſylveſtris Alpina ſecunda ſaxatilis*, which *Bauhinus* calleth *Valeriana Alpina Nardo Celticæ ſimilis*. The fifth is called by *Cluſius Valeriana annua ſive Æſtiva*, and *Bauhinus* calleth it *Valeriana foliis Calcitrapæ*. The ſixth is generally now called *Valeriana Mexicana*, and *Indica*: notwithſtanding as is before ſaid, they have beene both found growing naturally in *Italy*; and as *Bauhinus* ſaith *Paſchalis Gallus* ſent him that with the white flower, from *Padoa* many yeares agoe, under the name of *Valeriana Indica Imperati*; and againe from *Caſabon* under the name of *Nardus Cretica*: *Cortuſus* did judge it to be *Tripolium* of *Dioſcorides*, and was chiefly led thereunto, by the figure of *Tripolium*, which he ſaw in a Manuſcript of *Dioſcorides*, which *Pinellus* kept in his Library. The ſeventh *Bauhinus* onely hath ſet forth the deſcription thereof, under the ſame name is expreſſed in the title. The eighth *Fabius Columna*, calleth *Valerianella altera tenuifolia ſemine ſcabioſæ ſtellato*. *Tabermontanus* calleth it *Phu minus petræum*, and *Bauhinus Valerianella ſemine ſtellato*. The ninth hath no other than is ſet downe in the title. The tenth *Lobel* calleth *Phu minimum*, and *Bauhinus Valeriana ſylveſtris foliis tenuiſſime diviſis*. The eleventh is taken to bé *Polemonij altera ſpecies* by *Geſner in hortis*, and ſaith it is the *Limonium Monſpelienſium*, but *Dodonæus* contrarieth that opinion, *Lobel* calleth it *Ocimaſtrum Valerianthou*: *Dodonæus*, *Camerarius*, and others *Valeriana rubra*, and uſually with us, *Valeriana rubra Dodonæi*, yet *Camerarius* in his Epitome calleth it *Phu peregrinum*. The twelfth is called *Valeriana Græca* by *Dodonæus*, and ſo generally with us and others, *Lobel* and *Camerarius Valeriana peregrina*, and *Bauhinus Valeriana cærulea*. The laſt is uſually with moſt called *Valeriana paluſtris*, and *ſylveſtris*. The Arabians call it *Fu*: the Italians *Valeriana*: the Spaniards *Yerva benedicta*: the Freneh *Valeriane*: the Germanes *Baldrian*, and *Theriacks krant*: the Dutch *Speercrudt*, and we in Engliſh as is before ſaid.

The Vertues.

Dioſcorides ſaith that the garden Valerian hath a warming faculty, and that being dryed and given to drinke, it provoketh urine, and helpeth the ſtrangury, and the decoction thereof taken doth the like alſo, and doth take away paines of the ſides, procureth womens courſes, and is uſed in Antidotes. *Galen* ſaith that the rootes of Phu or Valerian are ſweet, and like unto *Nardus* in quality, but much weaker to all purpoſes almoſt, yet it provoketh urine more plentifully, than either the Indian or Syrian *Nardus*, and is like unto Celtick *Nardus* therein. *Pliny* ſaith that the powder of the roote given in drinke, or the decoction thereof taken, doth helpe all ſtranglings or choakings in any part, whether they be becauſe of paines in the cheſt, or ſides, and taketh them away. The roote of Valerian boyled with Liquorice, Raiſins, ond Aniſeed, is ſingular good for thoſe that are ſhort-winded, and for thoſe that are troubled with the cough, and helpeth to open the paſſages, and to expectorate flegme eaſily. It is given to thoſe that are bitten or ſtung by any venemous creature, being taken in wine: it is of eſpeciall vertue and property againſt the plague, the decoction thereof drunke, and the roote being uſed to ſmell unto: it helpeth alſo to expell the wind in the belly. The greene hearbe with the roote taken freſh, being bruiſed and applyed to the head, taketh away the paines and prickings therein, ſtayeth rheumes and thin diſtillations, and being boyled in white wine, and a drope thereof put into the eye, taketh away the dimneſſe of the ſight, or any pinne, haw, or webbe therein. It is of excellent property to heale any inward ſores or wounds, as alſo for outward hurts or wounds, and draweth any ſplinter or thorne out of the fleſh. The decoction of the roote of the leſſer Valerian, is ſtronger to reſiſt poiſons and infections than the greater, as *Matthiolus* ſaith. It is very profitably applyed to aſſwage the ſwellings of the cods, cauſed of cold or of winde, if the fumes or vapours of the decoction thereof, made with wine, be applyed warme unto them. The water diſtilled from the greater Valerian both hearbe and roote, in the moneth of May, is ſingular good to be taken faſting for all the purpoſes aforeſaid, and is a good and ſafe medicine in the time of the plague: it killeth alſo the wormes in the belly, and is ſingular good to waſh either greene wounds, or old ulcers. It is generally called in the Countries of this Land, the poore mans remedy, to take the decoction of this root and drinke it, when by taking cold

cold after ſweating, or over-heating their bodies, they be troubled with the cholicke or winde, or are otherwaies diſtempered: or to uſe the greene hearbe bruiſed and laid to any cut or wound, or to draw out any thorne or ſplinter, and heale it after.

CHAP. XLIIII.

Conyza. Fleabane.

Dioſcorides ſetteth forth three ſorts of *Conyza* or Fleabane, a greater and a leſſer, and a third which is betweene both. *Theophraſtus* and *Pliny* that followeth him, make but two ſorts, a male and a female: others have added a fourth, the leaſt of all: but there are divers other hearbes referred unto them by *Cluſius* and others, as they have found them in their travels: ſome of theſe ſorts are found wild in our Country in ſome places, but becauſe they are not very frequent to meet with, I thinke it not amiſſe to ranke them with the reſt of their Tribe in this place.

1. *Conyza major verior Dioſcoridis.* The trueſt great Fleabane.

Longifolio

1. *Conyza major verior Dioſcoridis.* The trueſt great Fleabane.

This great *Conyza* which is accounted the trueſt and neareſt unto that of *Dioſcorides*, hath divers hard rough, or hairy round woodly ſtalkes, two or three foote high; whereon are placed without order, many long and ſomewhat narrow pale greene leaves, dented a little about the edges, very clammy as the ſtalke is alſo, but much more in the hotter Countries, than in this, and are ſomewhat like unto the leaves of the Italian Starrewort, but larger, and more pointed at the ends: towards the toppes of the ſtalkes come forth at every joynt with the leaves a yellow flower, ſomewhat large, like unto the flower of Hawkweed or Groundſell; which when it is full ripe, turneth into downe, and flyeth away with the ſeed: the ſmell hereof is ſomewhat ſtrong, but ſomewhat ſweet withall, and not loathſome: and is ſo glutinous and clammy, that what ſmall thing ſoever as Flyes, &c. lighteth upon it, is held thereon.

2. *Conyza major montana Germanica.* Great Mountaine Fleabane of *Germany*.

This kinde of *Conyza* hath divers round greene ſtalkes, about two foote high, nothing ſo clammy as the former, having many long pointed leaves ſet thereon without order, of a ſad or darke greene colour, each whereof is foure or five inches long, and an inch and a halfe broad: the flowers are yellow, ſomewhat larger than the other, every one ſtanding at the toppes of the branches, upon a long ſtalke, in the ſame manner that the former doe, that is with a pale or border of leaves, and many ſmall thrums in the middle, paſſing into downe; and is carryed away with the winde, even as they doe. There is another of this ſort with longer leaves, and leſſer flowers.

3. *Conyza Helenitis mellita incana.* Hoary ſweet Fleabane Mullet.

This Fleabane Mullet riſeth up with divers long and ſomewhat broad leaves, neare unto the forme of Fox-glove leaves, but that theſe are hoary or gray on the upperſide, and of a browniſh greene on the underſide, herein ſomewhat like unto the leaves of *Rha Heleniifolio*, or Baſtard Rubarbe with Elecampane leaves: the ſtalkes are hoary likewiſe, riſing to be two or three foote high, ſet with the like leaves as grow below, but ſmaller and ſmaller up to the toppes, where many flowers ſtand together, like unto the former Fleabanes, and much greater than Groundſell, which turne into downe and flie away with the winde: the roote is compoſed of many blackiſh ſtrings and fibres, whereby it taketh faſt hold of the ground, the whole plant is ſomewhat clammy, yet much leſſe than the firſt, and much ſweeter than it.

Lobel giveth us the figure of another ſort, whoſe chiefe difference conſiſteth in that the leaves are jagged or cut in on the edges.

4. *Conyza Helenitis piloſa.* Hairy Fleabane Mullet.

This Fleabane is both in forme of leaves and flower, and other things ſo like the laſt recited Fleabane Mullet, that there is no other difference to be found; but in that both leaves and ſtalkes are beſides the hoarineſſe, more hairy and rough than it, which cauſeth it to be held as a differing ſort.

5. *Conyza montana piloſa.* Hairy Mountaine Fleabane.

This kind of Fleabane is alſo a differing kind from the laſt, in that the leaves as well as the ſtalkes, which are round, firme, a foote high or more, are hairy and rough, being ſmaller than the former, and not much bigger than the leaves of Hiſope, but as glutinous and clammy (which may be by reaſon of the hot climate wherein it groweth) as the firſt, of a ſtrong virulent ſcent like to the ſmell of a Goat: at the toppes of each of theſe ſtalkes, which are many, ſtandeth one ſmall pale yellow flower, ſomewhat like unto the flower of a Sow-thiſtle, which turneth into

2. *Conyza major montana Germanica.*
Great Mountaine Fleabane of Germany.

3. *Conyza Helenitis mella. a incana.*
Hoary ſweet Fleabane Mullet.

6. *Conyza odorata cærulea.* Sweet purple Fleabane.

downe, and is carried away with the winde as all the reſt are: the roote is blackiſh without, but white within, hard, dry and wooddy, of an harſh taſte, aſtringent or binding; the whole plant elſe is ſomewhat bitter, with a little acrimony alſo to be taſted therein.

6. Conyza odorata cærulea. Sweet purple Fleabane.

From a ſhort whitiſh root with many fibres thereat, ſpringeth up many ſmall ſhort leaves, ſomewhat like unto the leaves of the garden Daiſie, but ſomewhat writhed: among which riſeth up a ſtalke two foot high ſometimes, browniſh at the bottome, ſet here and there up to the toppe with longer and narrower leaves, where it is divided into ſmall and ſhort branches; whereon ſtand many flowers, one above another, in ſmall skaly greene heads or huskes, compoſed of many ſmall and narrow bluiſh purple leaves, ſomewhat white at the ends or tippes, with a ſmall yellow flat thrum in the middle, and in the middle thereof, there riſeth up divers white threads, whereby each flower conſiſting of three colours, white, purple, and yellow, maketh it ſeeme the more delectable to the Spectators: after theſe flowers are paſt, there commeth in thoſe huskes or heads that held them, ſmall long ſeed lying in the downe, each having ſome thereof at the head, which together therewith is blowne abroad with the winde, if it be not gathered and kept: the whole plant is of a ſharpe taſte, but the roote much more, almoſt as much as pepper, and of a ſtrong but not unpleaſant ſcent.

7. Conyza cærulea Alpina major. Great blue Mountaine Fleabane.

The roote of this Fleabane is ſmall, woddy, and reddiſh, from whence riſeth a thicke hairy ſtalke, about a foote high, divided at the halfe way into three ſmall branches, each whereof hath other ſmall ſtalkes, and one flower at the head of them, which is of a purpliſh blue colour, like unto the laſt,

laſt, and likewiſe turning into a downy matter, eaſie to be carryed away with the winde: the leaves on the ſtalkes are thinly ſet thereon, being hairy thicke, long and narrow, about three or foure inches in length, and about an inch in breadth.

8. *Conyza cærulea Alpina minor.* Small blue Mountaine Fleabane.

This ſmall plant is ſcarſe an hand breadth high, and ſometimes lower, having a ſmall round ſlender ſtalke, ſomewhat hairy, whereon groweth onely one bluiſh flower; like unto the greater kinde of Mountaine Fleabane, but three times ſmaller, with many threads in the middle flying away with the wind, when it is ripe as the other: it hath many ſmall leaves at the bottome of the ſtalke, and the toppe of the roote, which are of a pale greene colour, and about three inches long, but ſhorter as they grow higher upon the ſtalke, every one having a ſhort foote-ſtalke at the bottome thereof: the roote is blackiſh and fibrous.

9. *Conyza minor vera Pena.* The trueſt ſmall Fleabane.

9. *Conyza minor vera Pena.*
The trueſt ſmall Fleabane.

The little Fleabane is ſeldome found with more than one ſtalke riſing from the roote, which is a foote and a halfe, or ſometimes two foote high, and ſometimes lower than a foote, ſomewhat hairy and clammy alſo, but greener than the great kinde, as the leaves are alſo, which are long, narrow, and fat or clammy, ſomewhat like unto the leaves of *Linaria* or Toade-flaxe, ſet thereon up to the top, where it ſometimes brancheth forth, or from the middle thereof upwards; with the ſmall leaves come ſmall pale yellow flowers, like unto the great kinde, which turne into downe, and are blowne away with the winde, as the others are, the roote is ſmall and ſlender, with a few fibres thereat, but the whole plant ſmelleth ſweeter than moſt of the former, and dyeth every yeare, and either raiſeth it ſelfe of its owne ſowing, or muſt bee new ſowne every yeare.

10. *Conyza minor Rauwolfij.* Small Syrian Fleabane.

The ſmall Syrian Fleabane hath many ſmall low branches about a foot or more high, whereof few ſtand upright, the moſt of them leaning or lying downe upon the ground, and taking roote againe, in ſeverall places as they lye; the leaves that are ſet thereon are ſmall and long, ſomewhat like unto the leaves of the Olive tree, being fat or clammy, and hairy alſo, of a ſtrong ſcent, yet ſomewhat ſweet withall: the toppes of the ſtalkes are garniſhed with ſmall yellow flowers like unto the laſt, which when they are ripe flye away with the winde as they doe.

There are other ſorts of Fleabanes which becauſe they grow in mooriſh watery, or wet places, ſhall be remembred hereafter among the marſhy or watry plants.

The Place.

The firſt groweth naturally onely in the warmer Countries of *Spaine*, *Italy*, *Narbone* of *France*, and the like, and will hardly endure the cold of theſe Countries, and therefore muſt be carefully kept in the Winter, if any would have it. The ſecond is familiar to *Germany*, and therefore will better abide, having beene found by *Joannes Thalius* and others in *Harcynia ſylva* in *Saxony*, and we in many places of our owne land, as toward *Hampſted*, *&c.* The third and fourth *Lobel* ſaith were found upon the hills in *Artois*. The fifth was found by *Myconius* on high hills in *Spaine*. The ſixth is found in divers places in the Kingdome of *Naples*, in moiſt fields that are in the Mountaines, as *Columna* ſaith, as alſo in the ſand pits or places, neare the River of *Rhoſne* by *Lions* in *France*, and the *Alpes* in *Auſtria*, as *Cluſius* ſaith. The ſeventh was found on Saint *Bernards* Mount in *Switzerland*; and the eight on the Hill of Saint *Gothard*, as *Bauhinus* ſaith in his *Prodromus*. The ninth groweth not farre from *Madrill* in *Spaine*, as *Cluſius* ſaith, as alſo in the woods of *Gramunts* neare *Mompelier*, as both he and *Lobel* ſay. The laſt *Rauwolfius* found growing about *Tripoly* in *Syria*.

The Time.

They doe all flower in the Moneths of Iune, Iuly, and Auguſt, ſome earlier or later than others; the firſt and the ninth for the moſt part flower lateſt.

The Names.

It is called in Greeke κόνυζα, and in Latine alſo *Conyza ſic forte dicta quia κώνωπας, id eſt culices ſuo lentore capiat*, becauſe as is ſaid in the Deſcription, the glutinous clammineſſe both of leaves and ſtalkes, holdeth faſt whatſoever falleth upon them, yet *Dioſcorides* ſaith it is ſo called, becauſe *Suffitu vel Subſtratu culices abigit & culices necat*. *Gaza* tranſlateth it *Pulicaria*, and we in Engliſh Fleabane accordingly, becauſe being burnt or laid in Chambers, it will kill Gnats, Fleas, or Serpents, as *Dioſcorides* ſaith, and not Fleawort, for that is another hearbe as ſhall bee ſhewed in his place. The firſt is the trueſt great *Conyza* of *Dioſcorides*, by the judgement of *Camerarius*, *Dodonæus*, *Lobel*, *Pena*, *Lugdunenſis*, and others. The ſecond *Iohannes Thalius*, as I ſaid, firſt called *Conyza major montana*, who hath alſo another which he calleth *major altera*, both of them being very like one unto another, whereof *Camerarius in hort.* ſetteth out the figure, and *Bauhinus* thereupon calleth it *Conyza montana lutea foliis oblongis*. The 3. of both ſorts and 4. are ſo called, as they are in their titles, by *Lobel* in his Dutch Hearball, becauſe the ſcent of them is not ſtrong like the other *Conyzas*, but ſweet like Honey. The fifth is called by *Lugdunenſis Conyza montana Myconi*, and *Bauhinus Conyza montana foliis glutinoſis piloſis*. The ſixt is called by divers *Conyza odorata*, as *Lugdunenſis* ſaith, and of *Columna Amellus montanus*, becauſe hee ſaith it is ſo like unto the *Amellus Virgilij*. *Geſner* in his booke *De Collectione Stirpium*, and *Cordus* alſo, calleth it *Conyzoides cærulea*, *Tabermontanus Conyza cærulea*; it is called alſo *Dentelaria* of the effect to cure the toothach. *Bauhinus* calleth it *Conyza cærulea acris*, and ſaith it is the ſame that *Dodonæus* in his French Booke calleth *Erigerum tertium*, and in his Latine Booke *Erigerum quartum*: but *Dodonæus* in thoſe places maketh no mention of any blue or purple colour in that *Erigerum*, but onely ſaith it hath a pale yellow flower, ſo quickly fading, that it abideth not a day, but even almoſt the ſame houre that it is blowne, it doth fade,

fade, which I am ſure this *Amellus* doth not, and is not wholly yellow, as that of *Dodonæus* is. The ſeventh and eight *Bauhinus* calleth *Conyza cærulea Alpina major & minor*. The 9. is called *Conyza minor vera*, both by *Pena*, *Cluſius*, *Geſner*, & others, becauſe it differeth from the more common ſort. The laſt *Rauwolfius* referreth to the *Conyza minor* of *Dioſcorides*, which *Cluſius* rather thinketh is a *ſpecies* of his greater kinde, yet *Bauhinus* calleth it *Conyza major altera*, and quoteth both *Rauwolfius* and *Cluſius* to call it *Conyza major Dioſcoridis*. The Italians call it *Conyza*: the Spaniards *Attadegua*: the French *Conyza*: the Germanes *Hundſang* and *Durwurtz*: the Dutch *Donderwortel*.

The Vertues.

The leaves of Fleabane as *Dioſcorides* ſaith, are fitly applyed to the bytings or hurts of all venemous creatures, as alſo for puſhes and ſmall ſwellings, and for wounds: the leaves and flowers boyled in wine and drunke, is good to bring downe womens courſes, and to helpe to expell the dead child: taken alſo in the ſame manner, it is good to procure urine, or when one maketh it by drops: it helpeth alſo thoſe that have the yellow jaundiſe, and the griping paines of the belly: it is alſo good for the falling ſickneſſe, taken in vineger: the decoction is good to helpe many griefes of the mother, if women be bathed therewith, or ſit therein: if the juyce bee put into the Matrix it cauſeth abortement, that is to be delivered before the time: the oyle made of the hearbe, and annoynted, is very effectuall to take away all ſhaking fits of agues, and thoſe tremblings that come of cold. The ſmall kinde helpeth the paines in the head. *Galen* ſaith that both the greater and the leſſer are hot and dry in the third degree, and therefore powerfully warmeth any place whereunto they are applyed, whether uſed of themſelves, or boyled in oyle, and anoynted; the leaves bruiſed and bound to any greene wound or cut, being firſt well waſhed or cleanſed, healeth in a ſhort ſpace: applyed alſo to the ſoles of the feete, it ſtayeth any laske or fluxe, and bound to the forehead is a great helpe to cure one of the frenſie: it openeth the obſtructions of the liver, if the decoction thereof made in wine be drunke: If either Goats or Sheepe eate hereof it will kill them by any extremity of thirſt. The leſſer is effectuall to all the purpoſes aforeſaid, but is more powerfull to helpe any fluxe, or the bloody fluxe. The ſixth as is ſaid before, helpeth the toothach.

CHAP. XLV.

After. Starrewort.

THe likeneſſe in many things that the Starreworts have with the Fleabanes, enforceth me to place them next thereunto, whereof we have ſuch a number, as well of thoſe that were formerly knowne to many, as thoſe which our later times have made knowne to us, and from *Virginia*, *New-England*, &c. have come not the leaſt ſtore unto us. And although *Dioſcorides* hath ſet forth but one kind, which he calleth *After Atticus* of the place no doubt, where it grew moſt plentifully, or was of greater force, which was the Country of *Athens*, yet later Writers having found out divers other hearbes, ſomewhat like unto it, have referred them thereunto; all which I meane in this Chapter to declare unto you.

1. *After Atticus lutea verus.* The true After Attick, or yellow Starwort.

1. *After Atticus luteus verus.* The true After Attick, or yellow Starrewort.

This Starrewort riſeth up with two or three rough hairy ſtalkes, a foote and a halfe high, with long rough or hairy browniſh darke greene leaves on them, divided into two or three branches: at the top of every one whereof ſtandeth a flat ſcaly head, compaſſed underneath with five or ſixe long browne rough greene leaves, ſtanding like a Starre, the flower it ſelfe ſtanding in the middle thereof, is made as a border of narrow long pale yellow leaves, ſet with browniſh yellow thrums, the root dyeth every yeare after ſeed time.

2. *After cernuus Columnæ.* The ſoft Starrewort of *Naples*.

The ſoft Starrewort is very like unto the former yellow Starwort, but that the leaves hereof are ſomewhat broader, larger, and not ſo rough or hairy, the ſtalke is in like manner branched toward the toppe, which is not ſlenderer there than below, but groweth thicker where the flower ſtandeth, and bendeth downeward; on the toppe of every branch ſtandeth one flower, ſomewhat like the other, conſiſting of many yellow leaves, with browniſh threads or thrums in the middle, and compaſſed about with many more greene leaves, which are ſoft and gentle in handling, and not prickly or rough as the other: the ſeed is hitter in taſte, long and norrow, ſomewhat flat withall, yellowiſh, clammy, creſted, and ſweet in ſmell: the root is compoſed of divers bigge yellowiſh ſtrings, of an aromaticall taſte.

3. *After ſupinus.* Low creeping Starwort.

This low Starwort riſeth up with many ſlender weake creſted, and ſomewhat hairy ſtalkes, leaning downewards, and not ſtanding upright, whereon are ſet many long

3. *Aster supinus.* Low creeping Starrewort.

long and narrow leaves, a little round at the toppe, very like unto the former, but ſmaller and greener up to the toppe; every ſtalke beareth one flower which is yellow and large, like unto the flower of a corne Marigold, contained in a very hard huske, made of ſmall greene leaves, which after the flower is paſt, becommeth ſo hard and wooddy that one can ſcarce open or breake it, to take out the ſeed which lyeth cloſe ſticking therein: the roote is long and ſlender, having a few fibres ſet thereat, and abideth divers yeares, if it be a little defended from the extremity of Winter.

4. *Aster luteus major Auſtriacus.* Great yellow Starrewort of *Auſtria.*

This Starwort hath many long and narrow leaves, of a pale greene colour at the ground, ſomewhat like unto the leaves of that kind of *Scabious*, that is called Divels bit, whoſe leaves are not jagged at all, but are ſometimes covered with a little downe, the ſtalke is about two foote high, browniſh and round, whereon are ſet ſparſedly long narrow pointed leaves, a little dented about the edges, at the toppe whereof it is divided into a few ſmall and ſhort branches, every one bearing a large yellow flower, compoſed of many ſmall flowers, conſiſting of five leaves apeece, ſet together in a round head, compaſſed about with many long, ſomewhat broad and flat leaves, of a moſt excellent yellow colour, of a weake ſcent or none at all: after the flower is paſt, the ſeed is contained in the heads, cornered as if it were three ſquare, lying diſperſed in a downy ſubſtance: the roote is ſomewhat thicke and blackiſh, growing aſlope in the ground, ſending forth many ſtrings, & ſhooting forth many heads, wherby it may be encreaſed.

5. *Aster montanus foliis Salicis.* Starwort with Willow leaves.

This Starwort from a long creeping roote, wonderfully ſpreading under ground, and encreaſing: ſhooteth up divers creſted ſtrong greene ſtalkes, two foot high, plentifully ſtored with leaves thereon, being longer, harder, and greener than the laſt, without any downe or woollineſſe on them, and a little dented about the edges, ſomewhat ſharpe and hot in taſte: the toppes of the ſtalkes are divided into two or three ſmall branches, each ſuſtaining divers ſmall greene heads, compoſed of many ſmall leaves ſet together, one about another, which in time open themſelves into flowers, of as large a ſize as the laſt, but with a ſmaller thrum in the middle, and narrower leaves compaſſing them, parted or divided at the end.

6. *Aster luteus lanuginoſus.* Starwort with woolly leaves.

This woolly Starwort hath divers ſmall and ſtrong greene or browne ſtalkes, ſomewhat woolly, riſing from the roote (which is ſpead under ground, and faſtned with many long and ſtrong fibres, ſhooting yearely new ſprouts for encreaſe, but nothing ſo much as the laſt) beſet without order, with many long and narrow greene leaves, bowing to the ground, and covered over with a ſoft woolly downe, compaſſing the ſtalkes at the bottome of them; of a ſharpe hot taſte, and ſomewhat bitter: at the toppe of the ſtalke ſtandeth a large head, made as it were of many ſcaly leaves, which ſuſtaineth a large round flower, conſiſting of many long, narrow, and pale yellow leaves, as a border to the middle, which are a number of ſmall moſſy flowers ſet together, of a deeper yellow than the border; the whole flower doth reſemble that of Elecampane, and without any ſcent to commend it: the ſtalke brancheth forth from the joynts below, into three or foure branches, riſing higher than the middlemoſt, every of them bearing ſuch a flower: which when they are paſt, the ſeed contained in thoſe heads, with the woolly or downy ſubſtance therein, is carryed away with the Winter.

7. *Aster luteus anguſtifolius.* Narrow leafed Starwort.

This narrow leafed Starwort hath as great a creeping running roote as the fourth, and giveth as plentifull encreaſe, from whence ſpring up many ſmall hard greene ſtalkes, not much above a foote high, whereon grow many long and narrow leaves, without any order one above another, not dented at all about the edges, but elſe very like unto the leaves of the wild Pellitory or *Ptarmica*, up toward the toppes, where they are divided ſometimes into two or three ſmall branches, every one bearing a greene ſcaly head, and out thereof a yellow ſtarrelike flower, as the others have, but leſſer than any of the former: theſe branches doe ſeldome over-toppe their middle or maſter branch, as the laſt recited doth; the ſeed that followeth is very like unto the other: and carried away with the wind in the ſame manner.

Pena and *Lobel* in their *Adverſaria* have ſet forth two ſorts of *Aſter*, which they call *Aster montanus*, and *hirſutus*: *Bauhinus* maketh them both of the number of his yellow Aſters, but becauſe that, as *Cluſius* ſeemeth to ſay they are comprehended under the others here ſet downe, I make no further mention of them.

8. *Aster Virgineus latifolius luteus repens.* Yellow creeping Starwort of *Virginia.*

This Starwort riſeth up with a ſtrong round ſtalke, two or three foote high, bearing at the joynts two faire broad leaves like the leaves of a ſmall *Flos Solis*, but more pointed at the ends, and being harder in feeling, full of veines: at the toppe of the ſtalke (which ſeldome brancheth) ſtandeth one large flower (riſing out of a greene huske made of nine or ten greene leaves) compoſed of many long and narrow yellow leaves, with a browniſh thrumme in the middle: which being paſt, there followeth ſeed like unto a ſmall *Flos ſolis* as it is ſaid, for I never ſaw it beare ſeed: the roote is ſtringy, creeping under ground, and ſpreading much: it loſeth both ſtalke and leafe every yeare, and ſpringeth a new from the roote.

9. *Aſter*

6. *Aſter luteus anguſtifolius.* Narrow leafed yellow Starwort.

5. *Aſter luteus lanuginoſus.* Starwort with woolly leaves.

8. *Aſter Virgineus latifolius luteus repens.* Yellow creeping Starwort of Virginia.

9. *Aſter Virgineus luteus membranaceo caule.* Yellow Starwort of *Virginia* with a filmy ſtalke.

This yellow Starwort groweth to be 6. or 7. foot high, with many ſtalkes, whoſe lower part thereof, almoſt to the halfe, is round, hard, and ſtrong, the other part upward having a ſmall filme of skin on foure ſides thereof (as is to be ſeene in many other plants) up to the toppe which brancheth not, but beareth ſundry ſmall flowers, as if they were tufts at the firſt, but being blowne open, each is a yellow ſtarre compoſed of five or ſixe ſmall and long yellow leaves with ſmall thicke yellow pointels in the middle, each having a blackiſh tippe or point reſembling flowers, and afterwards turne to be flat ſeed, broad at the head, which are ſo ſeparately ſet together, that they reſemble the head of ſeed of a *Ranunculus*, but greater: the leaves ſtand ſingly on each ſide of the ſtalke, being very like unto the former, of a dead or ſullen greene colour, but not altogether ſo large and broad, a little longer pointed alſo, and more rough in handling, with a ſmall foot-ſtalke under each: the roote is knobbed and wooddy, with ſundry long ſtrings faſtned unto them, and encreaſeth much at the ſides, but creepeth not, holding ſtrongly in the ground: this flowreth late with us, and that not but in a warme yeare, whereby we ſeldome obſerve the ſeed: divers doe take this to be the *Wiſanck* or *Woſocan* of the Virginians, but if *Gerards* information be right, as it is moſt probable, that which he calleth *Wiſanck*, beareth crooked pods, and ſuch doth the *Periploca* of *Virginia*, as I firſt well obſerved in Maſter *Francquevilles* garden, whoſe roote creepeth farre under ground, and therefore in my judgement this cannot be their *Wiſanck*: this alſo loſeth the ſtalkes as the former, and ſpringeth freſh every yeare.

10. *Aſter Virgineus luteus alter minor.* Another yellow Starwort of *Virginia*.

The other yellow Starwort of *Virginia* groweth up but with one upright ſmall round ſtiffe ſtalke, foure or five foote high, bearing two faire greene long ſhining leaves at every joynt, dented about the edges, but ſmaller than the former, ſtanding on ſmall foote-ſtalkes, and ſomewhat hard in feeling: at every joynt with the leaves on both ſides, from the very bottome come forth branches, halfe a yard long at the leaſt, with the like leaves on them: at the toppe of each ſtalke and branch ſtandeth one flower, whoſe greene ſmall round button under it, hath divers ſmall greene leaves on the head thereof, out of which breaketh the flower, conſiſting of a dozen yellow ſmall and long leaves, compaſſing a middle deepe yellow thrum: this although I and ſome others have had it growing with us, yet flowred and ſeeded with none but Maſter *Tradeſcant* at South *Lambeth*. The ſeed by reaſon it flowreth late, we have not yet well obſerved: the root is compoſed of ſundry white and long hardiſh ſtrings, with ſmall fibres at them, and abideth divers yeares, encreaſing by the ſides, but periſheth to the ground, ſhooting new heads every yeare.

11. *Aſter Conyzoides.* Fleabane like Starwort.

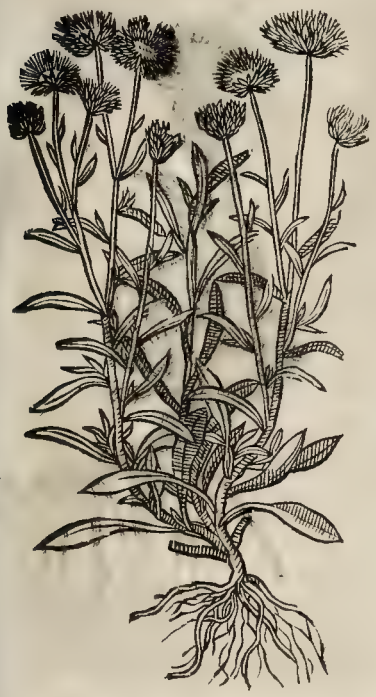
This kind of Starwort hath long and narrow leaves growing on the branched ſtalkes, which are a foote high, ſet ſingly thereon without order: the flowers grow ſingly at the toppe of every ſtalke and branch, compoſed of many duskie yellow leaves, with a browner thrum in the middle turning into downe, which with the ſmall ſeed is caried away with the wind: the roote is threaddy.

Wee have had from *Virginia* another ſort of this kind, very like unto it, but with ſmaller flowers.

12. *Aſter*

11. *After Conyzoides.* Fleabane like Starrewort.

12. *After supinus Conyzoides Africanus.* Fleabane-like Starwort of Africa.



12. *After supinus Conyzoides Africanus.* Fleabane like Starwort of *Africa.*

This hath ſundry weake branches riſing from a ſlender long white roote, with divers ſmall and long hoary leaves ſet thereon without order: both ſtalke and branches beare each but one yellow Star-like flower thrummed in the middle, which after it is ripe turneth into downe, which with the ſmall ſeed encloſed together, flyeth away with the winde.

13. *After Atticus Italorum flore purpureo.* Purple Italian Starwort, or the purple Marigold.

The Italian Starwort hath many wooddy round and brittle ſtalkes riſing from the roote, about two foote high, whereon are ſet without order to the toppes many ſomewhat hard and rough long leaves round pointed, and is divided into ſundry branches, bearing ſingle flowers like Marigold, the outer border of leaves being of a bluiſh purple colour, and the middle thrum of a browniſh yellow, breaking out of a greene ſcaly head, like unto thoſe of Knapweed, but leſſer: theſe flowers abide long in their beauty, and in the end wither and turne into a ſoft downe, wherein lie ſmall blacke and flat ſeeds, ſomewhat like unto Lattice ſeed, which with the downe is carried away with the wind: the roote is compoſed of ſundry white ſtrings which periſh not, but abide many yeares with greene leaves on their heads, and ſpring afreſh every yeare.

14. *After Atticus caruleus alter.* Another blue Starwort, or another purple Marigold.

This other purple Marigold or blue Starwort, is a *ſpecies* or differing ſort of the other *After Atticus Italorum flore purpureo*, ſo like thereto in ſtalke, leafe and flower, that one would thinke there were no difference, and indeed it is not much, but conſiſteth chiefly in theſe particulars: the leaves of this are narrower than the other, and pointed at the ends: the ſtalke riſeth not up ſo high, flowreth ſomewhat earlier before the other, and is of a paler purple colour, and ſometime found white alſo.

Of this Narrow-leafed kinde there is one alſo which groweth lower than this, and is therefore called a dwarfe kinde. *After Humilis*

15. *After Alpinus caruleo magno flore.* The great blue Mountaine Starwort.

From among a number of ſmall long and narrow leaves, hoary as well on the under as upperſide, of the forme of garden Daiſie leaves, being ſmall and narrow at the bottome, and growing broader to the end, which is round pointed lying about the roote of this Mountaine Starwort, upon the ground, riſeth up a ſtalke ſcarſe a foote high, beſet with the like leaves as grow below, but ſmaller up to the toppe, where there ſtandeth a round head, compoſed of many ſmall purpliſh leaves ſet cloſe together, in the midſt whereof breaketh forth a large great flower, conſiſting of many long narrow leaves, of a purpliſh blue colour, ſtanding as a pale or border, about a middle yellow thrum, which upon the fading, turneth into downe, wherein the ſeed lyeth, and both together are diſperſed with the wind: the roote is ſomewhat long, growing aſlope in the ground, with many ſmall white fibres annexed thereunto, and encreaſing by the ſides as the rootes of Daiſies doe.

16. After

13. *After Atticus Italorum flore purpureo.*
Purple Italian Starrewort, or the purple Marigold.

15. *After Alpinus cærulea magno flore.*
The great blue Mountaine Starrewort.

16. *After hirsutus Austriacus caruleus magno flore.* Great blue Starwort of *Austria.*

This Starwort likewise hath many leaves lying upon the ground, about the toppe of the roote, but they are thicker, broader, rougher, yet with a soft hairinesse, somewhat sharpe about the edges, and ending in a more rigid or sharpe point: with such like leaves is the round stalke also beset up to the toppe, where it is divided sometimes into one or two branches, each sustaining as large a flower as the last, but the middle thrum is of a paler yellow colour, and compassed about with a number of small long leaves, of a pale blue colour, which passeth into downe, like unto the other: This although it be somewhat like the last, yet is not the same, but a manifest differing kinde thereof.

17. *After minor angustifolius.* The French purple Starwort.

This purple Starwort riseth up with many slender, but straight upright stalkes, of a foote and a halfe high, set with many leaves up to the toppe, longer and narrower than any of these blue or purple Starworts last recited, somewhat like unto the leaves of *Linaria* or Tode-flaxe: at the toppe of each stalke stand three or foure flowers smaller than the two last Starworts, and somewhat lesser than the first of these blue kindes; consisting of many small leaves standing as a Starre, of a very pale bluish purple colour, and the middle thrum yellow, which passe into downe, and carryed away with the wind as the others doe. I should adjoyne unto these the *Tripolium*, both for the likenesse of the flowers, and the English name of Sea Starwort; and although it be a sweet hearbe, yet because it is a plant that delighteth better to grow in watery places, I will referre it to bee spoken of among the *Paludosa* or watery hearbes.

18. *After Virgineus latifolius precocior purpurante flore parvo.* The earlier and broad leafed purplish Starwort of *Virginia.*

The leaves of this Starwort which stand singly on the sundry hard stiffe browniſh greene stalke, of a yard high, with short foot-stalkes under them, are broad and round at the bottome, growing narrower to the point, and smally dented about the edges, of a fresh greene colour on the upper side, and somewhat yellowish underneath: each great stalke towards the toppe brancheth forth into flowers, which stand in a tuft or spike, with divers small greene leaves below them on the stalke, and the flowers being many, set on severall small branches, have a small greenish scaly huske, and a small pale purplish flower comming out of it, consisting of sundry small leaves laid open like a Starre, with divers pale yellow threads rising up like a thrum, which turne into a downe with small seed therein: the roote is living, holding greene leaves all the Winter when the stalkes are withered and dead, but hard and wooddy at the head, sending forth long whitish strings: this flowreth a moneth or two before the next, that is about the end of August, or later if the yeare prove not warme.

19. *After Virgineus angustifolius serotinus parvo albente flore.* The narrow leafed and later flowred Starwort of *Virginia.*

The many stalkes of this Starwort grow higher than of the other, bearing single leaves at every joynt, being long and narrow, without any dent at the edges, and without any foot-stalke at the bottome: at every joynt from about the

17. *Aster minor angustifolius.*
The French purple Starrewort.

the middle upwards it shooteth very long branches, and they oftentimes branched againe, at each joynt whereof stand single leaves, but much smaller and thicker set than below, the flowers stand singly also at the joynts and toppes of every stalke and branch, which are small and Starre fashion, of a pale white colour, with a single purple thrum in the middle, rising out of a small greene huske which turne into downe like the former: the roote is composed of sundry long white strings, which live long, and encreaseth much, losing all the stalkes in the Winter, and holding a tuft of greene leaves, untill it shoot new stalkes the next yeare: this flowreth much later than the other, sometimes not untill the end of October, or beginning of November, yet a moneth sooner in a warme yeare.

The Place.

The first kind of Starwort groweth in *Province* and *Narbone* in *France*, in *Lombardy* also. The second on the Mountaines in the Kingdome of *Naples*. The third in New *Castile* in *Spaine*. The fourth at the foote of the Alpes of *Austria* and *Stiria*, and on *Leytenberg*, and other hills neare *Vienna*. The fifth in *Moravia*, and on the hills neare *Vienna*. The sixth likewise neare *Vienna*, at the foote of divers hills, and on the woods that were felled there. The seventh likewise in the fields neare *Vienna*, and in a small Wood neare the River *Donaw* or *Danubius*. The eight hath beene many yeares growing in *England*, since it was first brought out of *Virginia*, and so hath the ninth also, but the tenth we have had scarse time enough to observe it thorowly since we got it from *Virginia*, by the meanes of Master *George Gibbes* Chirurgion of *Bathe*, who brought in his returne from thence, a number of seeds and plants hee gathered there himselfe, and flowred fully only with M. *Tradescant*. The eleventh groweth in many places of our owne land, in moist or shadowy places. The twelfth *Guillame Boel* many yeares agoe brought out of *Barbary* with him. The thirteenth in many medowes both in *Italy* and *France*. The fourteenth in many places of *Hungaria*, *Austria*, and *Moravia*. The fifteenth in the grassy fields on the Alpes of *Austria*. The sixteenth groweth about *Crenisum* in *Austria*, and other parts of the Alpes there, as also on the Mountaine *Iura* in *Switzerland* neare *Geneva*. The seventeenth on the dry Rocky hills and Olive yards about *Mompelier* and *Castrum novum*. The eighteenth and last were sent us from *France* growing first in *Canada*. Some of them are hardly nourished up in gardens, especially the eighth and ninth, which are unwilling to change their naturall habitation.

The Time.

They doe all flower in the Summer moneths of Iune and Iuly, some earlier or later than others.

The Names.

It is called in Greeke Ἀστὴρ ἄττικος & ἀκτίνιον: in Latine *Aster Atticus*, *Bubonium & Inguinalis*, both for that the flower is like a Starre, and that as it is likely, it grew plentifully about *Athens*, and of the effect to cure the sores that hapned in *Inguine*, the groyne, *Herba Stellaria* also of some. The first is called by all *Aster Atticus legitimus*, but *Bauhinus* to distinguish it, added *foliolis ad florem rigidis*. The 2. is called by *Fabius Columna Aster Cernuus*, because the flowers bend downe their heads, and by *Bauhinus Aster Atticus foliis circa florem mollibus*. The third is called by *Clusius Aster secundus supinus*, and so doe *Dodonæus*, *Lobel*, and *Lugdunensis*, and *Camerarius*, *Aster Atticus repens*. The fourth is called by *Clusius Aster tertius*, *Austriacus primus*, or *Aster Pannonicus tertius*, of *Bauhinus Aster luteus major foliis Succisæ*. The fifth is *Clusius* his *Aster Austriacus secundus*; of *Tabermontanus*, *Bubonium luteum*: of *Gerard Aster Italorum* but falsely, of *Lugdunensis Bellis lutea*: of *Bauhinus Aster montanus luteus Salicis glabro folio*. The sixt is *Clusius* his *Aster lanuginoso folio sive quintus*: of *Tabarmontanus Aster luteo flore*: of *Gerard Aster hirsutus*: of *Bauhinus Aster lutens hirsutus Salicis folio*. The seventh is *Clusius* his *Austriacus quartus*: of *Bauhinus Aster luteus linariæ*, *rigido glabro folio*. The eighth came first to us by the Virginian name *Aquascomense*; some thinke that the Virginian name of the ninth is *Wisanck*, but falsely: but the tenth and eleventh without names, and therefore we have given them such names as seemed to us most convenient, and as are in their titles, untill some fitter may be given by other. The eleventh *Lobel* in his observations calleth *Aster Conyzoides*, as I and all others doe, but the twelfth was so entituled by *Boelius*, as it is here set downe. The thirteenth is called generally *Aster Atticus Italorum purpureo* or *cæruleo flore*. The fourteenth is a species of the last *Atticus Italorum flore purpureo*, whereof both *Clusius* and *Camerarius* make mention. The fifteenth is *Clusius* his *Aster Austriacus quintus*, which he saith may be called *Amellus Alpinus*, in that it doth resemble the *Amellus* of *Virgil*. *Lugdunensis* calleth it *Aster purpureus montanus*. *Bauhinus Aster montanus cæruleus magno flore foliis oblongis*. The sixteenth *Bauhinus* onely remembreth by the name of *Aster hirsutus Austriacus cæruleus magno flore*. The seventeenth *Lobel* calleth *Aster minor Narbonensium Tripolij flore*, *linariæ folio medio purpureus*. The two last have their names given by us, as we thinke fitteſt for them. There hath beene formerly some controversie among Writers, what plant should bee *Aster Atticus* of *Dioscorides*, divers allowing of that *Aster Atticus flore luteo*, which is set forth in this & my former Booke, whereof the 2. here set forth, as I said, is a kind neareſt thereunto, others refusing it utterly, because it hath no purple colour in the flower, which that of *Dioscorides* hath, both in the description thereof by him, (as many doe translate that part in the description of the flower, to be *purpureum & luteum*, whereas the new Editions have *Purpureum luteumve*) and in the vertues, where he saith that divers say, that the purple of the flower, or in the flower, is good to heale the sores of the groine; and rather allowing of the 13. kinde here set forth, as likewise in my other Booke (whereof those with purple flowers here described are species) to be both the true *Aster Atticus* of *Dioscorides*, and the true *Amellus* of *Virgil*, which he describeth in the fourth Booke of his *Georgicks*, and that most plainely in these Verses.

Est etiam flos in pratis, cui nomen Amello
Fecere agricolæ, faciles quærentibus herbæ:
Namque uno ingentem tollit de cespite sylvam.
Aureus ipse, sed in foliis, quæ plurima circum
Funduntur, violæ sublucet purpura nigræ.
Sæpè deum nexis ornatæ torquibus aræ.
Asper in ore sapor: tonsis in vallibus illum
Pastores, & curvæ legunt propè flumina Melle.

Yet *Guilandinus* misliketh hereof, and although he allow of it, to be *Aster Atticus*, yet not to be *Amellus*, whom as I take it, *Matthiolus* doth convince: he nameth no man, but saith, that some would make that hearbe, which by the judgement of all men, is *Chelidonium minus*, to be the *Amellus* of *Virgil*; which neither the flower, being all yellow, though standing like a Starre, nor having any purple colour therein, which *Virgil* saith *Amellus* hath; for his words *Aureus ipse*, which is the flower, hath *in foliis quæ plurima circumfunduntur*, the purple colour of the violet, but not so faire, and cannot be referred to the leaves of that plant: neither the stature or forme of *Chelidonium*, which is low lying upon the ground, and *Amellus* rising high, and bearing a bush of flowers at the toppe of his stalke, as *Virgil* saith, *uno ingentem tollit de cespite sylvam*: neither the time of the flowring, for *Chelidonium* flowreth in the Spring, and *Amellus* in the end of Summer, when the fields are mowed, as he saith, *Tonsis in vallibus illum, Pastores legunt prope flumina Melle*. *Pena* and *Lobel* in their *Adversaria* also, would make *Tripolium* to be the nearest unto *Amellus* of *Virgil*, because the flower is purple, starre fashion, and yellow in the middle, and that it usually groweth in moist places, neare unto Rivers, as *Virgil* saith of his: which hath the greatest probability next unto this, of any other hearbe, but *Virgil* his words, *asper in ore sapor*, which is harsh or binding, agreeth not unto *Tripolium*: and because I find no other Author agreeing thereunto, and that this is most commonly received of all, I dare not forsake so great reasons, and so many judgements, and adhere to this one of *Pena* and *Lobel*.

The Vertues.

Dioscorides saith, that the purple leaves of the flowers boyled in water, was held to bee good for the paines and sore in the groine, as also the use of the fresh hearbe in oyle to anoynt the place, and likewise the dryed flowers, to be taken into the right hand of the patient, bound to the place that is grieved, it taketh away inflammations in those places, it helpeth children also that have the falling sickenesse: and those that are troubled with the Quinsie. It helpeth an hot stomacke, the inflammations of the eyes, and the fundament when it is fallen downe, if an oyntment be made of the greene hearbe, and old Hogs grease; it helpeth them that are bitten by a mad Dogge, as *Cratevas* saith; it consumeth the swellings of the throat, and driveth away Serpents if it be burned. *Galen* saith it is called *Bubonium*, not onely because, that being anoynted, but also that being hung or tyed to the places, it healeth the sores in the groine: for it hath not onely a digesting, but also no small cooling quality, and repressing, being of a mixt property like the Rose. *Pliny* addeth that being bound to the place, it is profitable for the paine in the hippes.

CHAP. XLVI.

Ruta. Rue, or Hearbe grace.

THere are foure or five speciall sorts of hearbes called by the name of Rue, having little likenesse thereunto, but onely some shew in the leaves, which are these. First *Ruta Canina*, whereof I meane to speake among the *Scrophularias*. The second is *Ruta pratensis*, called also *Thalictrum*, which you shall finde in the next Classis. The third is *Ruta Muraria*, which shall bee spoken of among other Capillare hearbes, and the fourth is *Ruta Capraria sive Galega*, which shall be declared among the *Alexipharinaca* Counterpoisons. Divers other hearbes have beene entituled *Ruta*, by singular Authors, as you shall finde among the names of them, whereof to make mention here were needlesse; I rather referre you to the places specified. But of our ordinary or garden Rue, common enough through all this Realme, there are some other sorts thereof, which are here to be remembred with them, although not usually bred, or to be easily kept in the gardens of our land.

1. *Ruta hortensis major*. The greater ordinary garden Rue or Hearbe of Grace.

This ordinary garden Rue groweth up with hard whitish wooddy stalkes branching forth on all sides, and bearing thereon sundry long leaves divided into many small ones, being somewhat thick and round pointed, and of a darke bluish greene colour: the flowers that stand at the toppes consist of foure small yellow leaves, with a greene button in the midst, compassed about with sundry small yellow threads, which growing ripe, containeth within it small blacke seed: the roote is white and wooddy, spreading farre in the ground, and abiding many yeares.

2. *Ruta Hortensis minor*. The lesser garden Rue.

This Rue is so like the ordinary garden kind, that it will deceive many that doe not heedfully regard it, and I my selfe am halfe perswaded that it is the next sort of Rue, which is the greater sort of wild Rue, transplanted and manured in gardens. It riseth not up so high, neither beareth so great stalkes: the leaves are very like the common garden kind, but that they are smaller, and of a blacker or darker greene colour: it doth more seldome give any flower with us, and the smell thereof is not so strong, nor the taste altogether so bitter as the other; and herein consisteth the difference betweene them.

3. *Ruta sylvestris major*. The greater wild Rue.

This wild Rue, is in all things like unto the garden Rue, but that the leaves are somewhat longer and narrower, and the colour of them are darker, more tending to greene: the stalke is strong and wooddy, in the naturall places, much more than in these colder climates, but riseth not fully so high as our garden kinde, where it scarse attaineth to any wooddinesse: the flowers also are yellow, composed of foure yellow leaves like unto it; and small seed in foure

1 *Ruta hortenſis major.*
The greater ordinary garden Rue of Hearbe or Grace.

3. *Ruta ſylveſtris major.*
The greater wilde Rue.

foure ſquare heads (and ſometimes in three ſquare heads) like the other. This is of a more ſtrong and virulent ſcent and taſte than the garden kind.

4. *Ruta ſylveſtris minor.* Small Wild Rue.

This ſmall Rue, is alſo like unto the former, but that the leaves hereof are much more finely cut than it, both ſhorter and ſmaller, but as ſtrong, or rather more than the other, both in ſcent, taſte, and quality: the ſtalke hereof riſeth not ſo high as the other, but brancheth at the toppe, bearing yellowiſh ſmall flowers, and ſmall ſeed in foure-ſquare heads, like thereunto: the roote is long and wooddy.

5. *Ruta montana.* Mountaine Rue.

This Rue is the ſmalleſt of all the reſt, whoſe leaves are the fineſt cut, and divided of them alſo, ſo that it hath ſcarſe the face or forme of any leafe of Rue; they are alſo much whiter in colour than any of them, and the moſt virulent and pernicious of all the reſt, both in ſcent and taſte: the flowers and ſeed are like unto the other ſorts, but the ſmalleſt of them.

6. *Ruta ſylveſtris Syriaca ſive Harmala.* Wild Aſſirian Rue.

The Aſſirian wild Rue riſeth up with many darke round greene ſtalkes, about a foote high or more, whereon are ſet divers long leaves, divided into many parts, each whereof is longer, thicker, and greener, than the ſmall wilde Rue, but not of ſo ſtrong or virulent a ſavour as it, yet ſomewhat ſtrong, and a little ſharpe and bitter: at the tops of the ſtalkes ſtand many flowers, conſiſting of five white leaves, larger than in any of the other ſorts of Rue; in the middle whereof riſeth up a greene three ſquare head compaſſed about with many yellow threads: in which three ſquare head when it is ripe, is contained ſmall browniſh cornered ſeed: the roote is thicke, and ſomewhat yellowiſh, with divers ſmall fibres annexed to it.

The Place.

The two ſorts of Garden Rue are onely nurſed up in gardens in all places, yet the ſecond is not ſo common as the firſt, but onely kept by a few. The other two wild ſorts grow upon the Mountaines in *Spaine* and *Italy*, and about *Mompelier* in *France*: but how we ſhould beleeve *Gerard*, who ſaith ſome of them grow on the hills in *Lancaſhire* and *Yorkeſhire*, you may eaſily geſſe by their abiding our Winters, in gardens, for being of ſo hot and burning qualities, and growing in hot Countries, not enduring any cold; how ſhould they be naturall to our climate, eſpecially the more Northerly parts: the fifth in *Spaine* alſo, *France*, and other hot Countries. The laſt groweth in *Syria*, from whence it was ſent into theſe Countries: as alſo in the fields, and about the hedges neare unto *Conſtantinople*, as *Bellonius* ſaith, in the fifth Chapter of his third Booke of obſervations.

The Time.

The garden kindes eſpecially the leſſer, doth ſeldome flower in our land, and therefore ſcarſe ever beare good ſeed. And the wild or Mountaines kindes doe the like.

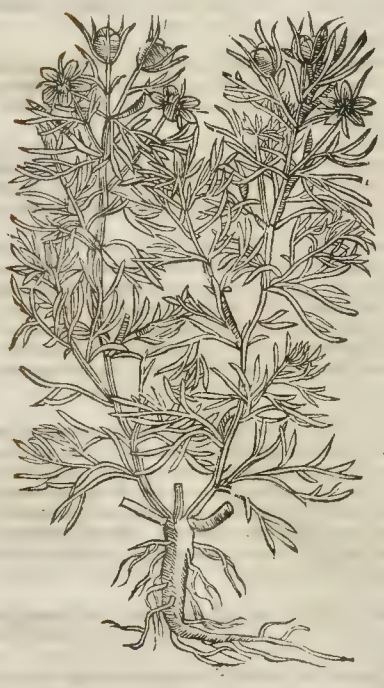
The Names.

It is called in Greeke πήγανον, *Peganum quia caliditate ſemen genitale coagmentat*, the roote of the fifth kinde, as

4. *Ruta ſylveſtris minor.*
Small wild Rue.

5. *Ruta Montana.* Mountaine Rue.

6. *Ruta ſylveſtris Syriaca ſive Harmala.*
Wild Aſſirian Rue.



Dioſcorides ſaith, was called in his time, *Moly montanum*: and the roote of the Aſſirian wild kinde, was alſo as hee ſaith, called *Moly*, for the likeneſſe thereunto, being blacke without, and white within: and *Ruta* in Latine, of *Ruo*, for the violent fierce vapours it ſendeth forth, cauſing itching bliſters, &c. in Engliſh Rue, and Hearbe Grace, or Hearbe of Grace, for the many good properties whereunto it ſerveth: for without doubt it is a moſt wholeſome hearbe, although bitter and ſtrong, and could our dainty ſtomacke brooke the uſe thereof, it would worke ſingular effects, being skilfully and carefully applyed. The firſt is called *Ruta ſativa*, or *domeſtica, hortenſis*, or *latifolia & major* by all Authors. The ſecond is called by *Tragus Ruta hortenſis minor*, and by *Cordus Ruta ſativa minor tenuifolia*, *Dodonæus* calleth it *græve olens*. The third is called *Ruta ſylveſtris* of *Matthiolus*, *Lobel*, *Lugdunenſis*, and others, and is the firſt of the wilde kindes with *Dodonæus* and others, as the fourth is the ſecond wilde with him. The fifth is the ſmalleſt wilde Rue, called of *Lobel Rutula* and *Peganum Narbonenſium*: of *Dodonæus Ruta ſylveſtris minima*: of *Cluſius Ruta montana legitima*: of *Camerarius*, and others *Ruta ſylveſtris tenuifolia*. The laſt is called *Harmala* even in *Dioſcorides* his time, as he ſaith, and *Baſaſan* of others, and ſo it is called ſtill with moſt Writers, or *Harmel*, yet ſome *Ruta ſylveſtris*, and *Syriaca*. The Arabians call it *Sadel*: the Italians *Rutta*: the Spaniards *Arruda*: the French *Rue*: the Germanes *Rauten*: the Dutch *Ruytte*: and we in Engliſh Rue, or Hearbe Grace.

The Vertues.

Both ſorts of Rue (that is) the garden and the wilde, as *Dioſcorides* ſaith, doe heate, burne, and exulcerate the skin. It provoketh urine and womens courſes, being taken in meat or drinke. The ſeed thereof taken in wine is an Antidote or Counterpoiſon againſt all dangerous medicines, or deadly poiſons: the leaves hereof taken either by themſelves, or with

with Figges and Walnuts, is called *Mithridates* his counterpoiſon, or Mithridate againſt the plague, cauſeth all venemous things, as well as of Serpents, to become harmeleſſe; being often taken either in meate or drinke, it abateth venery, and deſtroyeth the ability of getting children: a decoction made thereof with ſome dryed Dill leaves and flowers, eaſeth all paines and torments, inwardly to be drunke, and outwardly to bee applied warme to the place affected. The ſame being drunke, helpeth the paines both of the cheſt and ſides, as alſo coughes, hardneſſe, or difficulty of breathing, the inflammation of the lungs, and the vexing or tormenting paines of the Sciatica, and of the joynts being anoynted, or laid to the places, as alſo the ſhaking of agues, to take a draught before the fit come: being boyled or infuſed in oyle, it is good to helpe the wind collick, or the ſwelling hardneſſe or windineſſe of the mother, and freeth women from the ſtrangling and ſuffocation of the mother, if the ſhare and the parts thereabout bee anoynted therewith: it killeth and driveth forth the wormes of the belly, if it bee drunke after it is boyled in wine to the halfe, with a little honey; it helpeth the gowt, or paines in the joynts of hands, feete, or knees, applyed thereunto; and the ſame with Figges helpeth the dropſie, which is a running of ſharpe water, betweene the fleſh and the skin, being bathed therewith: being bruiſed and put into the noſtrils, it ſtayeth the bleeding thereof. It helpeth the ſwellings of the cods, if it be boyled with Bay leaves, and they bathed therewith. It taketh away wheales and pimples, if being bruiſed with a few Mirtle leaves, it be made up with waxe, and applyed thereon. It cureth the Morphew, and taketh away all ſorts of warts, on the hands, face, noſe, or any other parts, if it be boyled in wine, with ſome Pepper and Niter, and the places rubbed therewith: and with Allome and Hony, helpeth the dry ſcab, or any tetter or ringworme: the juyce thereof warmed in a Pomgranat ſhell or rinde, & dropped into the eares that are full of paine, helpeth them: the juyce of it and fennell, with a little honey, and the gall of a Cocke put thereunto, helpeth the dimneſſe of the eye-ſight: an oyntment made of the juyce thereof, with oyle of Roſes, Ceruſſe, and a little vinegar, and anoynted, cureth Saint *Antonies* fire, and all foule running ſores in the head, and thoſe ſtinking ulcers of the noſe and other parts. The eating of the leaves of Rue taketh away the ſmell both of Garlike and Leekes. The Antidote that *Mithridates* the King of *Pontus* uſed to take every morning faſting, thereby to ſecure himſelfe from any poyſon or infection, was this. Take twenty leaves of Rue, a little ſalt, a couple of Walnuts, and a couple of Figges, beaten together into a Maſſe, which is the quantity appointed for every day. Another Electuary is to be made in this manner. Take of Niter, Pepper, and Cominſeed, of each equall parts, of the leaves of Rue cleane picked, as much in weight as all the other three weighed, beate them well together as is fitting, and put thereto as much honey as will well make it up into an Electuary, (but you muſt firſt prepare your Cominſeed, laying it to ſteepe in vinegar, for 24. houres, and then dry it, or rather toſte it in an hot fire-ſhovell, or as others would have it in an Oven) is a remedy for the paines and griefes of the cheſt or ſtomacke, of the ſpleene, belly, and ſides, by winde or ſtitches, of the liver by obſtructions, hindering digeſtion of the meate, of the reines and bladder, by the ſtopping of the urine, and helpeth alſo to extenuate fat or corpulent bodies. The leaves of Rue firſt boyled, and then laid in pickle, are kept by many to eate, as ſawce to meate, like as Sampire is, for the dimneſſe of ſight, and to warme a cold ſtomacke. The diſtilled water thereof, is effectuall for many purpoſes aforeſaid. Our garden kindes worke all theſe effects, but the wild kindes are not uſed ſo often with us, not onely becauſe we have them not uſually, and that they will not abide our cold Country, but their fierceneſſe is ſcarce tolerable, except for outward griefes and applications, for the falling ſickneſſe, palſies, gowts, joynt-aches, and the like, wherein they worke more forceably than the garden kindes, for taken inwardly by women with child, it deſtroyeth the birth, and mightily expelleth the after-birth. *Antigonus* in his Rhapſody or huddle of memorable things, relateth a ſtory of a Weaſell, that being to fight with a cruell Serpent, eateth Rue, and rubbeth her ſelfe therewith, before hand, to be the better defended from the poiſon; whereby it was found to be powerfull againſt the ſting or byting of venemous creatures. The ſmall Mountaine kind is ſo violent, that it may ſoone kill one, if it be not carefully looked unto, or to great a quantity given at a time.

CHAP. XLVII.

Caryophyllata. Avens.

THere are divers ſorts of Avens more than formerly hath beene knowne, to bee ſet forth together in this Chapter.

1. *Caryophyllata vulgaris.* Ordinary Avens.

Our ordinary Avens hath many long rough darke greene winged leaves, riſing from the roote, every one made of many leaves, ſet on each ſide of the middle ribbe, the largeſt three whereof grow at the ends, and ſnipt or dented round about the edges; the other being ſmall pieces, ſometimes two, and ſometimes foure, ſtanding on each ſide of the middle ribbe underneath them: from among which riſe up divers rough or hairy ſtalkes, about two foote high, branching forth diverſly with leaves at every joynt, not ſo long as thoſe below, but almoſt as much cut in on the edges, ſome of them into three parts, and ſome of them into more: on the toppes of the branches ſtand ſmall pale yellow flowers, conſiſting of five leaves, very like unto the flowers of Cinque-foile, but larger: in the middle whereof ſtandeth a ſmall greene head, which when the flower is fallen, groweth to be rough and round, being made of many long greeniſh purple ſeeds, like graynes, which will ſticke to any bodies cloaths: the roote is made of many browniſh ſtrings or fibres, which ſmell ſomewhat like unto Cloves, in many places, eſpecially in the higher, hotter, and dryer grounds, and freer cleare ayre; but nothing ſo much, or not at all in many other places, eſpecially if they be moiſt, and are of an harſh or drying taſte.

Of this kind *Camerarius* ſaith there is another found in Mountaines, that is larger than it, not much differing elſe in any thing. *Major.*

2. *Caryophyllata montana.* Mountaine Avens.

The Mountaine Avens from a long browniſh round roote, of the bigneſſe of ones finger, creeping under the upper cruſt of the earth, (and not altogether ſo ſtringy as the former) with ſome ſmall fibres ſhooting downewards in ſeverall places, and ſmelling and taſting like the other, ſendeth forth divers winged leaves, made of many ſmall leaves towards the bottome, ſtanding on both ſides of the ribbe, the end leaves being largeſt and whole, not divided,

1. *Caryophyllata vulgaris.* Ordinary Avens. 2. *Caryophyllata montana.* Mountaine Avens.

but ſomewhat deepely cut in on the edges, of a freſher greene colour likewiſe, ſofter alſo and gentler in handling: from among which riſe ſlender ſtalkes, ſeldome branched, having very few leaves thereon, at the toppes whereof ſtand uſually one flower apeece, yet ſometimes more, made for the moſt part like the former, conſiſting of five or ſixe leaves, much larger than they, and of a deeper yellow colour, and ſometimes with a white flower, as *Camerarius* ſaith *in horto*, tending to redneſſe, having many yellow threads in the middle, compaſſing a greene head, which when the flower is paſt, increaſeth to be a round head, beſet with flat ſeeds, not ſo rough, or ready to ſticke to ones garments, but every one of them having a long featherlike haire or thread at the end: the whole plant as well leaves as flowers, and ſeed, are covered with a ſmall ſoft hairy downe, which is not much or eaſily diſcerned, unleſſe one heed it very well.

3. *Caryophyllata Alpina minor.* Small Mountaine Avens.

There is a ſmaller kinde hereof found on *Mont Baldus*, little differing from the former, but in the ſmalneſſe thereof, being covered with a ſoft downe, and of a darker greene colour, the flowers being large for the ſmalneſſe of the plant, and conſiſting of ſixe leaves for the moſt part.

4. *Caryophyllata Alpina minor altera.* The other ſmall Mountaine Avens.

This ſmall Mountaine Avens hath much longer leaves than the laſt, lying upon the ground round about, and much more divided, or cut into divers parts, making each part of the leafe to reſemble that of Smalladge, being a cubite in length, from among which riſe up two or three weake trayling ſtalkes, with foure leaves thereon, much leſſe than the lower, but more finely cut in, on the toppe whereof ſtandeth one large flower, conſiſting of ſixe, and ſometimes of eight leaves, ſtanding in a greene huske, whoſe ends reach to the height of the flower, which is of a paler yellow colour than the former, and turneth into ſuch like heads, of long hairy ſeeds as the former: the roote is ſomewhat long and ſlender, branched forth, and with divers fibres at them.

5. *Caryophyllata montana ſive paluſtris purpurea.* Purple Mountaine or marſh Avens.

This Marſh Avens hath leaves ſomewhat like the ſecond ſort, but with longer foote-ſtalkes, and ſomewhat hairy, the ſtalkes riſe as high as the firſt many times, with fewer leaves ſet here and there on them, and more divided; at the toppes ſtand two or three ſmall flowers apeece, hanging downe their heads, of a purpliſh yellow colour, ſcarce appearing above the huskes that containe them: after which come ſuch heads, but more ſoft and downy: the roote creepeth in the ground, and ſmelleth much leſſe than the former, and ſome little or nothing.

Virginenſis. Wee have had from *New-England* another of this kind, brought by *John Newton* a Chirurgion of *Colliton*, that is taller and greater than this, differing little in any thing elſe, giving flat thin blackiſh ſeed in huskes.

6. *Caryophyllata aquatica altera.* Another Marſh Avens.

This other is like unto the fift, but hath the huske that containeth the flower, ſpreading beyond the brims thereof, which is in ſome more reddiſh, and in ſome more double than in others, not differing in any other notable

5.

7. *Caryophyl-*

3. *Caryophyllata Alpina minor.*
Small Mountaine Avens.

5. *Caryophyllata montana purpurea.*
Purple Mountaine Avens.

7. *Caryophyllata Pentaphllea.*
Cinque-foile Avens.

7. *Caryophyllata Pentaphyllea.* Cinque-foile Avens.

The Cinque-foile Avens hath the leaves thereof divided into five parts, like unto a Cinque-foile leafe, dented about the edges, the ſtalkes are about a foote high, having ſome ſuch like leaves thereon, at the joynts where it brancheth forth; at the toppes whereof ſtand pale yellow flowers, like the firſt ſort, but ſmaller, with many yellower threads, ſomewhat downy in the middle: the roote is compoſed of many browniſh ſtrings, ſmelling ſomewhat like unto the former kindes.

The Place.

The firſt as I ſaid before, is found wilde in many places of this Realme, under hedge ſides, and by the pathes in many fields, and delighteth rather to grow in ſhadowy than Sunny places, yet is uſually brought into gardens to be at hand, to be uſed upon any occaſion. The ſecond is found upon divers Mountaines, as *Coronos* in *Bohemia*, by the Springs of the River *Albis*, as *Matthiolus* ſaith: upon *Mons Baldus*, as *Pena* ſaith, and in ſome other places. The third and fourth upon Mount *Baldus*, as *Pona* relateth, both in his Latine and Italian deſcriptions thereof. The fifth and ſixth grow by water ſides, and in moiſt and wet, or mariſh grounds, on the Mountaines. The laſt was found by *Pena* hard by *Clatena* on the Rhætian Alpes in *Switzerland*, whereas he ſaith, hee tooke it for a kinde of Cinque-foile or Tormentill at the firſt, untill by the ſmell and colour of the roote, he judged it a kinde of Avens.

The Time.

Theſe doe flower in the moneths of May, and Iune, for the moſt part, and their ſeed is ripe in Iuly at the fartheſt.

The Names.

It is generally called in Latine now adayes *Caryophyllata* and *Garyophyllata*, (for it is not found to be knowne to any of the ancient Greeke or Latine Writers, except it bee *Geum* of *Pliny*, as moſt of the later Writers doe confidently, and not without good reaſon ſuppoſe) from the ſcent of the roote, ſo neare reſembling

Cloves,

Cloves, which are called *Caryophylli*, yet ſome have called it *Herba Benedicta*, of the excellent or bleſſed qualities thereof, and others *Sana-munda*, for the like effects. *Tragus* would have it called his *Nardus agreſtis*, not onely for the ſweet ſcent of the rootes, but for the cordiall properties it hath. The firſt is as I ſaid, called of the moſt of the later Writers *Caryophyllata & vulgaris & hortenſis*. *Brunfelſius* as I thinke firſt, and after him *Geſner*, *Tragus*, and *Tabermontanus* call it *herba Benedicta*, and *Benedicta*. *Camerarius* ſaith the French call it *Sana-munda*, and *Turner* as I thinke, or *Geſner* firſt, and after them *Lobel*, call it *Geum Plinij*. The ſecond is called of *Matthiolus* (who firſt ſet it forth) *Caryophyllata montana*, and ſo doe *Dodonæus*, *Lugdunenſis*, *Anguillara*, *Tabermontanus*, and *Gerard*: *Camerarius* calleth it *Caryophyllata Alpina*, *Tragus Benedicta ſylveſtris*: *Lobel Caryophyllata major rotundifolia*; and *Geſner Geum Alpinum quartum*, in his *hortis Germaniæ*; *Bauhinus* calleth it *Caryophyllata Alpina lutea*. The third and fourth being the leſſer ſorts of this kind, were found by *Pona* on Mount *Baldus*, and called by him, *Caryophyllata Alpina omnium minima*, and *minima altera*. The fifth is called by *Lobel Caryophyllata Septentrionalium rotundifolia pappoſo flore*: by *Cluſius Caryophyllata montana prima*: by *Geſner in hortis*, *Geum rivale*: by *Camerarius in horto*, *Caryophyllata paluſtris*, and in his Epitome upon *Matthiolus Caryophyllata aquatica*: by *Iohannes Thalius*, *Caryophyllata major ſeu purpurea*: by *Lugdunenſis Caryophyllata montana Dalechampij*: and by *Bauhinus Caryophyllata aquatica nutante flore*. The ſixth is mentioned by *Bauhinus* in his *Matthiolus* under the title of the former, and calleth it in his *Pinax*, *Caryophyllata aquatica altera*, the flowers whereof are expreſſed by *Cluſius* under the name of *Caryophyllata montana tertia*. The laſt is called by *Pena* and *Lobel* in their *Adverſaria*, *Caryophyllata Alpina Pentaphyllea*. *Caſtor Durantes* giveth the ſame figure, with the name and deſcription of *Matthiolus* his *Caryophyllata montana*. *Tabermontanus* calleth it *Caryophyllata Alpina quinquefolia*, and ſo doth *Bauhinus* in his *Pinax*, who alſo ſetteth it downe as if it were the *Polyrrhizos latifolia in Lugdunenſis*, which there is ſet forth, to have a white flower, growing on ſome hills in *Savoy*, but *Gerard* in tranſlating *Dodonæus* his ſuppoſition, that the *Caryophyllata montana*, ſhould be the *Baccharis* of *Dioſcorides*, excepting the colour of the flowers, and the ſmell of the rootes, which yet he endeavoureth ſomewhat to reconcile, ſheweth onely *Dodonæus* his minde, and not fully his owne, unleſſe you will beleeve that, all that he tranſlateth out of *Dodonæus*, was firſt his owne opinion.

The Vertues.

Being accounted by the lateſt beſt Writers (as I ſaid before) to be the *Geum* of *Pliny*, it is as hee ſaith, not onely good for the diſeaſes of the cheſt or breſt, but good alſo for ſtitches or paines of the ſides, and to expell crude or raw humours, from the ſtomacke and belly, by the ſweet ſavour, and warming quality, for which purpoſes Avens is found by all to be effectuall. It alſo diſſolveth the inward congealed or clotted blood, happening by falls or bruiſes, or the ſpitting of blood, the rootes eſpecially either greene or dryed, being boyled in wine and drunke; as alſo all manner of inward wounds, or outward if they be waſhed, and bathed therewith, or if they be fiſtulous to bee injected. The ſame decoction alſo drunke, comforteth the heart, and ſtrengthneth the ſtomacke, and a cold braine, and therefore is good in the Spring time to open the obſtructions of the liver, helpeth the winde collicke by diſſolving the wind, and ſtitches and paines in the ſides, and being of a binding quality, helpeth alſo thoſe that have fluxes, or are burſten, or have a rupture. If foule ſpots or markes in the face, or other parts of the body be waſhed therewith, it taketh them away, and leaveth the skin well coloured. The powder of the dryed rootes, or the juyce of them when they are freſh, worketh the ſame effects that the decoction doth: and in callous ulcers, with the juyce of the rootes, if a little vardigreaſe be added, it worketh a ſingular good effect. Some uſe in the Spring time to put the roote to ſteepe for a time in wine, which giveth unto it a delicate ſavour and raſte, which they drinke faſting every morning, to comfort the heart, and to preſerve it from noyſome and infectious vapours of the plague, or any poiſon that may annoy it; as alſo to helpe digeſtion, and to warme a cold ſtomacke, troubled with groſſe or foule humours, and to open the obſtruction of the liver and ſpleene. Some doe uſe to lay the rootes dryed among garments, to perfume them with the ſmell thereof, and to keepe away Mothes, &c. from them. The Cinque-foile Avens, becauſe it participateth with the other, both in ſmell and taſte, although weaker, cannot but likewiſe partake with them in the qualities aforeſaid, yet not ſo effectuall, although I know not any Author hath made mention of any experimentall effect thereof. The Mountaine Avens, as *Matthiolus* ſaith, is found to be as good as the ordinary, for all the diſeaſes whereunto it is applyed, and worketh more forceably and ſpeedily in them all.

CHAP. XLVIII.

Calamus Aromaticus. The Aromaticall Reed; and *Acorus legitimus Dioſcoridis, ſive falſo Calamus odoratus officinarum*. The true Acorus of *Dioſcorides*, or ſweet ſmelling Flagge, untruely called *Calamus* in the Apothecaries ſhoppes.

I Have joyned both theſe plants in one Chapter, for the tranſpoſition of the names, and the ſweet ſmelling properties the one doth enjoy, although falſly appropriated to the other, & much differing both in face and manner of growing.

1. *Calamus Aromaticus Matthioli.* *Matthiolus* his Aromaticall Reed.

This Aromaticall Rēed groweth with an upright tall ſtalke, ſet full of joynts, at certaine ſpaces up to the toppe, (not hollow as divers other Canes and Reeds are, but ſtuffed full of a white ſpongious pith, which is of a gummy taſte, ſomewhat bitter, and of the bigneſſe of a mans finger) and at every one of them, a long narrow leafe, of a darke browne greene colour, ſmelling very ſweet, differing therein from all other kindes of Reeds: on the toppes whereof groweth a buſhy or Featherlike panicle, like unto thoſe of the common Reed: the roote is knobby, with divers heads thereat, whereby it encreaſeth and ſhooteth forth new heads of leaves, ſmelling alſo very ſweet, having a little binding taſte, and ſharpe withall. This is the deſcription thereof extant in ſundry Authors ſince *Matthiolus*, which becauſe it ſo neare reſembleth the common Reed, is ſuppoſed by divers to bee but firſt feined by *Matthiolus*, although all others follow him therein, therefore I give you not their figure: but the figure of the dryed ſtalkes that *Camerarius* and *Cluſius* ſet forth, that all may ſee what manner of thing that *Calamus* is, and the whole figure of the plant, as *Alpinus* ſetteth it forth, in *lib. de plantis exoticis*.

2. *Calamus*

1. *Calami Aromatici Syriaci ut fertur veri ſtipites ſiccæ.*
The dry ſtalkes of the true Aromaticall Reed as it is ſuppoſed.

2. *Calamus Aromaticus Syriacus vel Arabicus ſuppoſititius.*
The ſuppoſed true Syrian or Arabian Aromaticall Reed.

2. *Calamus Aromaticus Syriacus vel Arabicus ſuppoſititius.* The ſuppoſed true Syrian, or Arabian Aromaticall Reed.

This plant which is ſuppoſed by many to be the true Indian *Calamus aromaticus*, (but much ſuſpected by others) riſeth up from a thicke unprofitable roote, three or 4. inches long, bigge at the head, and ſmall at the bottome, with one, and ſometimes more ſtalkes, two cubits high (ſaith *Bauhinus*, who deſcribeth it from the ſight of the plant he received from Doctor *Paldius*: but halfe a cubite high, or ſomewhat more, ſaith *Alpinus lib. de plantis exoticis*) being ſtraight, round, ſmooth, and eaſie to breake into ſplinters, full of joynts, and about a fingers thickneſſe, hollow and ſpongy within, of a whitiſh yellow colour (like the pith of an elder, ſaith *Alpinus*, or like other Reeds, as *Bauhinus* ſaith) the ſtalke is divided into other branches, and they againe into other ſmaller ones, two uſually ſet together at a joynt, with two leaves under them likewiſe, very like unto the leaves of *Lyſimachia*, the Willow hearbe, or Looſe-ſtrife, but leſſer, being an inch broad, and an inch and a halfe long, compaſſing the ſtalke at the bottome, with ſundry veines running all the length of them: from the joynts riſe long ſtalkes, bearing ſundry ſmall yellow flowers made of leaves, like alſo unto *Lyſimachia*, with a ſmall pointell in the middle, after which follow ſmall blackiſh long heads, or ſeed veſſels, pointed at the end, containing within them ſmall blackiſh ſeed: the ſtalke hath little or no ſcent, yet not unpleaſant ſaith *Alpinus*, being bitter, with a little acrimony therein: but *Bauhinus* ſaith, it is of an aromaticall taſte, and very bitter. This (ſaith *Alpinus*) the Arabians and Egyptians doe uſe and call it *Caſſabeldariva*, that is *Calamus Aromaticus*, & from them all other Chriſtian nations have to accepted it: but how improbable let any others judge that will beleeve, *Theophraſtus*, *Dioſcorides*, *Galen*, *Pliny*, and others who doe all call it a Reed, when as this you ſee is none, and as *Theophraſtus* & *Pliny* ſay differeth not in forme from other Reeds: for *Pliny* reckoneth up 29 ſorts of Reeds, whereof this is one in their times, and for the ſweetneſſe thereof, onely uſed in ſweet oyntments: for the taſte alſo; *Dioſcorides* ſaith it hath ſome aſtringency, and a little acrimony therein, but mentioneth no bitterneſſe, when as this hath more bitterneſſe in it than any other taſte, which could not be forgotten by *Dioſcorides* if his had any in it. This plant groweth both in ſundry moiſt places in *Egypt*, as alſo by the lake *Gennaſareth* in *Iudea*, and in divers places alſo of *Syria* and *Arabia*: and for ought that wee can perceive, is rather a kinde of yellow *Lyſimachia* than any other plant.

3. *Acorus verus ſive Calamus officinarum.* The ſweet ſmelling Flagge.

This ſweet ſmelling Flagge hath many flaggy long and narrow freſh greene leaves, two foote long apeece, or more, yet oftentimes ſomewhat browniſh at the bottome, the one riſing or growing out of the ſide of the other, in the ſame manner that other Flagges or Flower-deluces grow, which are thin on both ſides, and ridged or thicke in the middeſt, the longeſt for the moſt part ſtanding in the midſt, and ſome of them as it were curled or plaited towards the ends or toppes of them, ſmelling very ſweet, as well when they are greene and freſh, as when they are dryed, and ſo kept a long time; which doe ſo abide in a garden along time, as though it never did, or never would beare flower: the leaves every yeare dying downe to the ground and ſhooting out freſh every Spring, but after two, three, or foure yeare abiding in a place without removing, beſides the leaves it ſhooteth forth (not any ſtalke

3. *Acorus verus sive Calamus officinarum.*
The sweet smelling Flagge.

as other Flower-deluces doe) a narrow long leafe by it selfe, flat like unto the other leaves, especially from the middle thereof upwards; but from the bottome to the middle it is thicker, narrower, or rounder, where it beginneth to grow flat, at which place commeth forth one long round head, very seldome two, in forme & bignes like unto the Catkin or Aglet of the Hasselnut tree, growing upright, and of the length thicknesse of ones finger, or rather bigger, set with severall small lines and divisions, like unto a greene Pine apple, of a purplish greene colour for the most part, out of which bunches, shoote forth small pale whitish flowers, consisting of foure small leaves apeece, without any so good scent as the leaves, falling quickly away, and not giving any seed, that ever I could observe or understand: the roote is thicke and long, lying under the upper face of the ground, shooting forward, and with small rootes as suckers on all sides like unto the garden Valerian, whitish on the outside, or greenish if it lye above the ground; and more pale or whitish on the inside, with many joynts thereabouts, and whereat, it hath or doth shoote forth, long thicke fibres underneath, whereby it taketh strong hold in the ground, of a firme or fast substance, yet not hard or wooddy, but easie to be cut, of a sweet scent, and somewhat bitter taste.

The Place.

The first is thought by *Matthiolus* and others, to grow in *India*, *Syria*, & *Iudæa*. The dry stalkes of the 2. are said to grow at the foot of Mount *Libanus* in *Syria*, not far from *Tripoli*, in the wet grounds there: the other as is said before. The other *Calamus* of the shops, or true *Acorus* groweth in many places of Turky, (in moist grounds, for so with us it joyeth and flourisheth better than in dry) from whence the largest roots, the firmest, whitest, & sweetest are brought unto us: but it groweth also in *Russia*, and those other places thereabouts, in very great plenty: but the rootes being dryed, are more lanke or small, not so firme or white, nor of so singular a good scent.

The Time.

These Reeds are strangers not growing with us, we having no further knowledge of them: the sweet smelling Flagge beareth his catkin in the beginning or middle of Iuly and August.

The Names.

The first and second have their names in their titles, as their Authors have called them, but whether either of them be the true *Calamus Aromaticus* of *Dioscorides*, *Galen*, and others, it were worthy the knowledge; for although it be commonly so taken to be, yet *Clusius* in part improving it, and I shewing more doubts, doe make it the more improbable: and it is very certaine, that we have no true *Calamus Aromaticus* brought unto us in these dayes, for even thorow all *Turkie*, with both Physicians and Druggists, or Merchants, (for they have no Apothecaries such as are in Christendome) it is not seene or knowne, for the Arabian word of *Cassab eldherira*, which is *Calamus Aromaticus*, they understand not what it is, and being demanded for it by that name, (although the Arabian tongue be very frequent among them) they still will give contrary things for it, as *Matthiolus* in his Epistles, and *Bellonius* in his observations doe declare. Now whether it should be called *Calamus Aromaticus*, or *odoratus*, it is worth the scanning also, because very many doe thinke the word *aroma*, from whence commeth *Aromaticus*, is the same with *odor* and *odoratus*; but I finde *Garcias* a very learned Writer, and others also to contrary that opinion; saying, that the Arabian words, *derire* or *dherira*, signifying *aroma*, (as *Cassab* doth *Arundo* or *Calamus*) is properly a drogue or drugge, whether they be spices that smell sweet, or any other thing used in medicine, that hath either a strong or no smell, for so the Hebrew word *deror* signifyeth also, as *Mor deror*, *Myrrha aroma*, or *aromatizans*, the best Myrrhe, in the Scripture *Exod.* the 30. chapter, and 23. verse, was appointed among other spices to make the holy anoynting oyle, and in the 34. verse of the same Chapter, with *Galbanum* which hath no sweet scent, as I thinke every one knoweth, and other gums to make perfume to burne: and Myrrhe although it be reckoned with Aloes and Cassia, as a sweet thing, in many places of the Scripture, yet it is not sweet to us, as wee account sweet things in these dayes, and Myrrhe and Aloes are called *Aromata*, in the 19. chapter of Saint *Johns* Gospell. *Garcias* saith *Calamus aromaticus* he knew well, and was of much use in *India*, both with himselfe, and other Physitians, as also with many persons of high and low degree, but any to be *odoratus* sweet, he knew not, but onely *Iuncus odoratus*, and I thinke *Pliny* first broached that errour in numbring up his sorts of Reeds, calleth one *odoratus*, and therefore judged to be this, and therefore *Hippocrates* calleth it *Myrepsicus*, that is *unguentarius* or *unguentis petitus*. And againe whether that roote that is generally called, *Calamus odoratus* and *Aromaticus* of the Apothecaries and others now adayes, be the true *Calamus Aromaticus* of the ancient Writers. *Brassavolus Ferrariensis*, and *Fuchsius* in their Writings, doe hold that opinion, that the *Calamus odoratus* of the shops, which is a root and not a Reed, or a stalke of a Reed, is the true *Calamus aromaticus* of the Ancients: which, that it cannot bee so, let us first scan the name, which is *Calamus*, or *Arundo* a Reed, which the Ancients alwayes speake of, and name no roote thereof to bee used, but the stalke or reed it selfe, and which *Theophrastus* and *Pliny* say, differeth not, but is like unto other sorts of Reeds; although it groweth in *Arabia* and *Syria*, as well as in *India*, and all men plainely see, that this roote of

Calamus

Calamus ſo called in ſhops, is neither a reed, nor the root of a reed, for being ſeene growing greene, as it is now adayes in many places, and as it is deſcribed before, there is no correſpondency of it with a reed, (and truely to ſee the face of things growing, hath brought many things to knowledge, which elſe would have lien in perpetuall ignorance and darkneſſe: how much therefore the world is indebted to thoſe that are diligent ſearchers out of the genuine plants of the Antients, both by their face or forme, and by their properties and vertues, let the good and honeſt acknowledge, let the vile or baſe neglect or contemne.) Secondly, the Ancients declaring the other notes, whereby it may be knowne ſay in this maner, that which is the yellower and fuller of joynts is the beſt, (the thicker and ſhorter ſaith *Pliny*, ſomewhat pliant) breaking into long ſhivers, (not brittle or breaking ſhort) the fiſtula cane or pipe being *plena aranearum*, or as *Pliny* ſaith, *ineſt fiſtulæ araneum* or *araneus quod florem vocant, præſtantior eſt cum numeroſior* or *numeroſus*, which can be no otherwiſe interpreted, then that the pith in the middle of the cane or pipe, which they call the flower, the more the better, is like unto a Spiders cobweb, (that is full of threads) and clammy in chewing, of an aſtringent taſte, ſomewhat quicke, and biting upon the tongue: now although ſome of theſe notes or markes may be found in that baſtard *Calamus* of the ſhops; yet that is not enough, (for that hath deceived moſt men, to judge a thing to be right, becauſe of one or two notes agreeing, the reſt being not anſwerable,) but all the notes muſt agree, for the falſe *Calamus* breaketh ſhort and not into ſhivers; it is not clammy in chewing, nor hath it any fiſtula or pipe full of that cobweb like pith: by which compariſon all men may plainely ſee, that our *Calamus* is not that of the Ancients, and that we are utterly deſtitute of the true *Calamus aromaticus* of *Dioſcorides*, and the reſt of the ancient Writers: and yet ſo perverſe are many in theſe dayes, that they will ſtill perſiſt in their old errours, becauſe they were bred in them, and will know no other, although they bee told them: but what may be the beſt ſubſtitute thereof in medicines, many have thought diverſly. In that booke of ſubſtitutes that is falſly attributed to *Galen*, *Sphagnum*: that is *Muſcus arboreus*, the moſſe that groweth upon trees) is appointed, which divers have accepted, and *Matthiolus* among the reſt, but as he ſaith examining, and conſidering the matter more ſeriouſly; he is not aſhamed to retract that opinion, and condemne it quite, as erronious, judgeing no correſpondence, but rather a meere contrariety, to be betweene *Calamus Aromaticus*, a ſimple of that worth, rarity, and quality, and the moſſe of trees, which although it be a little ſweet in ſmell, yet of no other quality equall thereunto. Some therefore appoint the ſeed of *Nigella Romana*, both for the ſcent and ſharpe quicke taſte, and other properties incident thereunto. Others would have the *Galanga major* to be the ſubſtitute, for the heating and opening qualities, they thinke it hath; but both the one and the other are hotter in their degrees by much, than the *Calamus* of the Ancients is: *Matthiolus* judgeth they ſhall not doe much amiſſe, that take the rootes of *Angelica* in the ſtead thereof, becauſe it expelleth both urine and womens courſes, and beſides the many other good properties therein, it is found by manifeſt proofes to be ſingular good to expell any poiſon of venemous creatures, or otherwaies, and a ſoveraigne remedy againſt the plague, and peſtilentiall ayres. But the moſt and beſt doe agree, that the *Squinant* or *Iuncus odoratus* commeth neareſt both in degrees and qualities unto it, or elſe that falſe *Calamus* of the ſhops, is the next beſt and neareſt ſubſtitute thereunto, although it doe exceede it in heate, the leſſe being to be taken, agreeing in many qualities therewith, and may alſo ſafely be uſed, untill the true *Calamus* bee better knowne, and brought in uſe. *Acorus* is called in Greeke ἄκορος & ἄκορον, becauſe τῆς κόρης, *id eſt*, *pupillis ſive aciei oculorum caliginoſa medeatur*, it helpeth to cleare a dimme eyeſight. *Monardus*, *Tragus*, *Matthiolus*, *Cordus*, *Geſner*, *Camerarius*, *Lugdunenſis*, *Lobel*, and *Cluſius*, doe all call it *Acorus* or *Acorum*, and *perperam Calamus Aromaticus officinarum*. *Anguillara* calleth it *Calamus noſter Iridis ſpecies*. *Amatus*, *Cæſalpinus*, *Braſavolus* and *Fuchſius Calamus aromaticus vulgo*. There hath beene formerly great ignorance of the true *Acorus* of *Dioſcorides*, for in that it was generally taken and uſed for *Calamus*, it did amuſe them the more, not imagining it to be *Acorus*, untill ſome more induſtrious and diligent, finding it growing in *Turkie*, and comparing it with that they had read thereof, perſwaded themſelves certainely to be the true and right *Acorus*; and *Matthiolus*, firſt after them that ſo found it, as I thinke publiſhed it to the world, and *Lobel* and *Cluſius* after him, have now ſo well perſwaded moſt men, except onely the moſt unlearned, or the moſt wilfull, that few make any doubt or ſcruple thereof; yet ſome ſtill would make the *Galanga major* to be the true *Acorus*, but it is knowne certainely, that the *Galanga major* groweth in *Syria*, and hath neither leaves or rootes like unto a Flower-deluce, as *Dioſcorides* deſcribeth his *Acorus* to have, but rather hath leaves like unto Reeds, nor doe the reſt of the faculties of *Galanga* anſwer theſe of *Acorus*.

The Vertues.

If this *Calamus aromaticus* be the right *Calamus* of *Dioſcorides*, then he ſaith it hath theſe faculties. It provoketh urine, and boyled with graſſe rootes and ſmallage ſeed, it helpeth thoſe that have the dropſie. It helpeth the defects of the reines, is profitable againſt the Strangury, or making water by drops; as alſo for thoſe that are burſten bellied: it provoketh womens termes or courſes, either drunke or applyed to the place: the fumes thereof taken thorow a Reed or Tobacco-pipe, either by it ſelfe, or with ſome dryed Turpentine, cureth them that have a cough: it is put into bathes for women to ſit in, as alſo into Cliſters to eaſe paines. It is uſed in mollifying oyles and plaiſters, that ſerve to ripen hard impoſtums, as alſo for the ſweet ſcent thereof. *Galen* ſaith that becauſe it is temperate, betweene heate and cold, ſomewhat aſtringent, and having a very little acrimony, it is profitably uſed among other things, that helpe the liver and ſtomacke, doth gently procure urine, and is put with other things into fomentations for the mother, when it is troubled with inflammations, and gently to procure the courſes; it is as he ſaith, hot and dry in the ſecond degree, but is more drying than heating, and hath therein a little tenuity of parts, as is in all ſweet ſmelling things. The *Acorus* or ſweet ſmelling Flagge as *Dioſcorides* ſaith, is good to provoke urine, if the decoction thereof be drunke: it helpeth to eaſe the paines of the ſides, liver and breaſt; as alſo to eaſe the griping paines of the pollicke and crampe, and good for thoſe that are burſten: It helpeth likewiſe to waſte the ſpleene, and to bring helpe to them that have the ſtrangury, and freeth thoſe from danger that are bitten by any venemous Serpent. It is very profitably uſed among other things, in bathes for women to ſit it, as the *Iris* or Flower-deluce rootes are; the juyce dropped into the eyes, dryeth rheumes therein, and cleereth the ſight, taking away all filmes or ſuch like that may offend them. The roote is of much uſe in Antidotes againſt all venome or poiſon, or infection: thus ſaith *Dioſcorides*: furthermore, it is a ſpeciall remedy to helpe a ſtinking breath, if the roote be taken faſting every morning for ſome time together. The hot fumes of the decoction made in water, and taken in at the mouth thorow a funnell, are excellent good to helpe them that are troubled with the cough: a dram of the powder of the rootes of

Acorus,

Acorus, with as much Cinamon, taken in a draught of Wormewood wine, is singular good to comfort and strengthen a cold weake stomacke. The decoction thereof drunke is good against convulsions or crampes, and for falls or inward bruises. An oxymell or Syrupe made of *Acorus* in this manner, is wonderfull effectuall for all cold spleenes, and cold livers. Take of the fresh rootes of *Acorus* one pound, bruise them after they are cleane washed and pickt, steepe them for three dayes in vinegar, after which time let them be boyled together, to the consumption of the one halfe of the vinegar, which being strained forth set to the fire againe, putting thereinto as much honey as is sufficient for the vinegar to bring it into a Syrupe: an ounce of this Syrupe taken in the morning with a small draught of the decoction of the same rootes, is sufficient for every dose. The whole rootes preserved either in Sugar or Honey, is effectuall also for the same purposes: but the greene rootes preserved are more desired than the dryed rootes that are steeped, and afterwards preserved. The rootes bruised and boyled in wine, and applyed warme to the testicles that are swollen, dissolveth the tumour, and easeth the paines; it likewise mollifieth hard tumours in any other parts of the body. It is verily beleeved of many, that the leaves or rootes of *Acorus* tyed to a hive of Bees, stayeth them from wandring or flying away, and draweth a greater resort of others thereunto. It is also affirmed, that none shall be troubled with any fluxe of blood, or paines of the crampe, that weareth the hearbe and roote about them. The rootes of *Acorus* or *Calamus*, as it is usually called, are used among other things to make sweet powders, to lay among linnen and garments, and to make sweet waters to wash hand, gloves, or other things to perfume them.

CHAP. XLIX.

Juncus odoratus sive Schœnanthos. The sweet Rush or Camels Hay.

BEcause through all the sorts of Grasses and Rushes, I finde none sweet, fit for this *Classis*, but this which I bring here to your consideration, let me, following the like method of *Dioscorides*, insert this Rush, and the other that shall follow in the next Chapter, in the end of this part of sweet hearbes, as a complement to the same. Of this sort of sweet Rush, I finde two sorts, a finer and a courser, or the true and a bastard kinde, although the ancient Writers have made mention but of one sort, which is the finest and truest.

1. *Iuncus odoratus tenuior.*
The finer sweet smelling Rush.

1. *Juncus odoratus tenuior.* The finer sweet smelling Rush.

This finer Rush hath many tufts or heads of long rushe-like leaves, thick set together, one compassing another at the bottome, and shooting forth upwards, the outermost whereof are bigger or grosser than those that grow within, which are a foote long and better, small, round and stiffe, or hard, and much smaller from a little above the bottome of them, than any Rush with us) of a quicke and spicy taste, somewhat pleasant, and of a fine sweet gentle or soft scent: thus it hath growne with us, but bore neither flower, nor shewed any appearance of stalke, by reason the Winter deawes perished it quickly: but in the naturall places it beareth divers strong, round, hard joynted stalkes, having divers short browniſh or purpliſh huskes on the toppes, containing within them mossie whitish short threads or haires, wherein lyeth a chaffie seed: the roote is stringy or full of long fibres, which are very hard as they are brought to us, from their naturall habitations, which have the smallest scent or taste, of any other part thereof, for so much as ever I could observe, either by the greene or dryed leaves that have beene brought unto us: yet *Matthiolus* saith, he had some plants, that rose with him of seed, whose rootes were sweet, some losing their scent; but the leaves and rushes of his were bigger than ours here described; having as hee saith leaves like Sedge, which is *Carex* or *Sparganium*, or like *Zea*, which is a large, or great kinde of wheat; whereby I guesse it was of the greater or grosser kinde next hereunto following.

2. *Iuncus odoratus crassior.* The grosser sweet smelling Rush.

This greater or grosser Rush, groweth in the same manner, that the former doth, but is greater in every part thereof, and lesse sweet also, as well as lesse sharpe and hot in taste; whereby it seemeth to be a kinde of it selfe, that groweth so great in the naturall, as well as forraigne parts; or that it being the same kinde, by growing in moister places, acquireth thereby the larger habitude.

The Place.

They grow naturally in *Arabia*, *Syria*, *Mesopotamia*, and all that Tract of the Easterne Countries, as also in some places of *Africa*.

The Time.

As I declared in the description it commeth not to flowring in these colder Countries, and therefore *Clusius* and others

others have thought it to be an annuall plant: but assuredly it dyeth not every yeare in those hotter parts, and flowreth in the Summer time.

The Time.

It is called in Greeke χοῖνος ἀρωματικὸς ἢ μυρεψικὸς: χοῖνος *a loris & funibus dicitur*: ἀρωματικὸς *odoratus*, and of some μυρεψικὸς *unguentarius, quia unguentis dicatur*, in Latine *Iuncus, a jungendo*. Some doe call it *Schœnanthos quasi Schœnianthos flos Iunci*, and corruptly in shops *Squinanthum*. Some also call it *Iuncus odoratus rotundus*, to put a difference betweene this, the *Iuncus vulgaris rotundus*, and the sweet *Cyperus*, that is called *Iuncus odoratus angulosus vel triangularis*. It is called also *Palea de Mecha* and *Pastus Chamelorum*: in English the sweet smelling Rush, or Camels Hay, according to the Latine names, or Squinant if you will. There hath beene much diversity among the later Writers, concerning the true Squinant, some thinking it not to be true which we have in shops, some making the great Galanga to be the roote of the sweet Rush of *Dioscorides*, as the Monkes that wrote Comentaries upon *Mesnes*: *Fuchsius* likewise and *Anguillara* alleadge many reasons, why they thinke that those small Rushes that are used now adayes in the Apothecaries shops, are not the true *Iuncus* of *Dioscorides* and others, both for that they are small peeces of rushes and strawes as it were, and not flowers or stalkes, or rootes, which *Dioscorides* saith are to be had in use, and that they have (they say) not any quicke biting taste, nor sweet scent of a Rose, all which *Dioscorides* saith plainely may be found in his *Iuncus*: concerning whose reasons this I say, that the flowers are truely seldome brought over unto us, and when they are brought, they are found of little quickneese in taste, or sweetnes in smell: and *Galen* complaineth that in his time they were very scarsely to be heard: and indeed it seemeth probable, that because these small Rushes, which are now usually in the Druggists and Apothecaries shops to be had, are found to be more quicke and hot in taste, than either the other stalkes, flowers, or rootes that are brought us, these are and have beene received into more use, and the other flowers are left of, or quite neglected to bee used, which hath caused the Merchants likewise, not to aske or seeke for them to bring them.

The Vertues.

Dioscorides saith it provoketh urine and womens courses, discusseth all swellings and wind, but troubleth the head a little: it gently cutteth or breaketh humours, and digesteth them, and loosneth the breathing places of the veines; the decoction of the flowers (saith he) drunke, stayeth the spitting of blood, and is conducible to the griefes and diseases of the stomake, lungs, liver and reynes. It is also put into Antidotes against poison and the venome of Serpents. The roote hereof is held to be of an astringent property, and therefore is more effectuall for those that have a loathing in their stomackes to their meate, a dram thereof taken with the like quantity of pepper every morning fasting for certaine dayes together, is a very good remedy for those that have the dropsie, and for convulsions or crampes: the decoction thereof is profitable for women to sit therein, that are troubled with the mother, for as *Galen* saith it openeth obstructions, digesteth crudities, expelleth corrupt humours, cutteth tough flegme, and consumeth congealed matter in the body, and therefore it is of excellent good use, for the stopping of urine or womens courses, taken either in drinke or by fomentation, it allayeth the inflammations of the liver, stomacke, and body: the rootes doe binde more, and the flowers are more hot, but in all the parts thereof there is astriction; in some more, in others lesse, and therefore it is very profitably mixed with those medicines that serve to stay bleeding. It is used to be boyled in the broth of a chickin (I meane the whole plant) as very helpefull to ease the paines of the wombe, that women feele after their childing, the powder thereof is singular good for the sores of the mouth, and for all creeping ulcers; and taken with wine and vinegar, it is effectuall for those that have an ulcer in their stomacke, if the stomacke or belly be fomented with the decoction thereof, it taketh away all inflammations therein, and easeth the paines.

CHAP. L.

Cyperus. Sweet Cyperus, or English Galinga.

TO finish this first part of sweet hearbes, I have some sorts of sweet Cyperus to describe unto you, others which are not sweet, I shall speake of in their proper place: yet unto these I thinke good to adjoyne the *Trasi dulce*, for the neere resemblance in face and forme unto the others, and for the pleasantnesse in taste, though not in smell.

1. *Cyperus rotundus odoratus vulgatior.* The more common round rooted sweet Cyperus.

This round rooted sweet Cyperus shooteth forth many heads of long and narrow leaves, somewhat ridged in the middle, every leafe seeming thereby to be three square, and somewhat hard and rough in handling, and sweet in scent: among these leaves rise many smooth square stalkes, about three foote high, stuffed with a white pith, and not hollow) without any knot or joynt therein, unto the toppes, where there stand a few short leaves, and many small panicles, or chaffie greene spikes or eares of small leaves above them, which after containe within them the seed: the roote is composed of many long and round blackish browne small rootes, fastned together by long strings, of the bignesse of small Olives, or the greater *Filipendula* rootes: of a sweet scent even while they are greene, but more when they are dry, and of a bitter taste, somewhat like unto Galanga.

We have had a smaller sort hereof brought us from *Spaine* by *Boelius*, not differing from this, but in the lowneese of the stalke, not being a foote high, and in being smaller also in leafe and roote. *Alter Humilus Hispanicus.*

2. *Cyperus rotundus odoratus Syriacus major.* The greater Assirian sweet *Cyperus*.

Of this kinde also there hath beene one brought out of *Syria* and *Egypt*, whose rootes and leaves were somewhat larger than the former, the stalke being somewhat shorter, the scent of the rootes somewhat stronger and quicker, and of a browne colour, on the outside else not differing in any thing.

3. *Cyperus rotundus odoratus Syriacus minor.* The lesser Assirian round rooted sweet Cyperus.

There is also another lesser sort brought both from *Syria* and *Candy*, being more rough, whose rootes and leaves are lesser by the halfe than the last, the stalkes also shorter than the small Spanish, but not differing in any other thing.

2. *Cyperus rotundus odoratus vulgatior.*
The rate common round rooted ſweet Cyperus.

3. *Cyperus rotundus odoratus Syriacus minor.*
The leſſer Aſſirian round rooted ſweet Cyperus.

4. *Cyperus longus odoratus.* The ordinary ſweet Cyperus, or Engliſh Galinga.

This ordinary ſweet Cyperus hath his leaves long, and as it were three ſquare like the former, and as rough or hard in handling alſo: the ſtalkes are ſmooth, ſtuffed with a white matter, like as the others are, and three-ſquare like the other, riſing ſomewhat higher, and having ſome ſhort narrow leaves at the toppes of them, and ſmall long panicles like unto the other in all things, ſo that they are hardly diſcerned aſunder above ground; the onely difference conſiſting in the roote, which in this is long and round, of a blackiſh browne colour on the out-ſide, and whitiſh within, full and firme, creeping under the ſuperficies of the earth round about, whereby it is quickly increaſed, and hath alſo a very good ſweet ſcent, as well greene as dry, yet more being dry than when it is greene and freſh.

5. *Cyperus dulcis rotundus eſculentus, Traſi dulce vocatus.* The moſt delicate ſweet Cyperus, or Ruſh Nut.

The leaves hereof are long and narrow like the other, with a thicke ridge in the middle, and ſharpe pointed, a foote and a halfe in length; among which riſe up the ſtalkes, ſmooth, without joynts, three-ſquare, and a cubite high, or more; at the toppes whereof ſtand five or ſixe ſhort narrow leaves, compaſſing the ſtalke, and ſtanding like a ſtarre, from among which come forth pale yellowiſh ſpiked eares, which are the flowers, wherein lyeth the ſeed, when their colour is thorowly waſted and decayed: the rootes are ſmall, long and round, and many of them ſmaller at the one end, than at the other, hanging or growing at the ends of long ſtrings, ſomewhat like unto the manner of growing of the Virginia Potatoes, of a pale reddiſh colour on the outſide, and white and firme within, of the bigneſſe of beanes; of no ſweet ſcent, nor bitter or aromaticall taſte like the other, but pleaſant to the taſte, eating like Cheſnuts, or rather more delicate.

The Place.

The firſt is found in moiſt and mooriſh grounds, both on Mountaines, and at the foote of them, in ſundry places in *Italy* and *Spaine*, as alſo by *Nilus*, and other places in *Egypt*, as *Alpinus* ſaith, but is not to bee ſeene but in gardens of the curious, either in *France*, *Germany*, the *Low-countries*, or *England*, where they hardly endure the Winters, without great care. The ſecond groweth in *Syria* and *Egypt*. The third in *Syria* and *Candy*. The fourth groweth in many Countries, and as well in *Spaine* and other hot Countries, where the rootes are ſweeter, although ſmaller, as in theſe colder Northerne parts on this ſide the Alpes: it groweth well in our gardens, eſpecially if they bee ſomewhat moiſt and not too dry. The laſt is reported by many Writers to be found naturally growing no where, but neare unto *Verona* in *Italy*, but *Amatus Luſitanus* ſaith, they are brought out of *Æthiopia* and S. *Thomas* Iland. And it is probible by *Drepanum* in *Sicilia*, for *Baptiſta Corteſius* in his *Miſcelania Medicinalia* meaneth this, as I take it: but are planted in *Spaine* and other hot Countries for their delight and uſe. It hardly groweth with us

to

5. *Cyperus dulcis rotundus esculentus Trasi dulce vocatus.*
The most delicate sweet Cyperus, or Rush Nut.

5. *Cyperus esculentus sive Trasi cum flore.*
The Rush Nut flowring.

to any perfection, neither will it abide the extremities of our Winters; for as *Camerarius* saith it will rot, if it bee not taken up before Winter, and new set againe in the Spring, after it hath beene well steeped in water.

The Time.

All these round rooted *Ciperi* doe flower or carry their bushy toppes in August with us, but the ordinary long rooted kinde, giveth his tufted head in the end of July for the most part.

The Names.

The Greeke words κύπειρος *Cypirus*, κύπερος *Cyperus*, and κύπερις *Cyperis*, are taken by divers good Authors, to be one and the same plant, others to be different, especially *Cypirus* from *Cyperus*, because that *Pliny lib.* 21. *cap.* 18. maketh *Cyperus* to be *Gladiolus*, whom *Gaza* in his translation of *Theophrastus* doth in all places follow, and *Pliny* in another place calleth the long rooted sweet kind *Cyperida*: but if I might shew my opinion, I would say that *Cyperus* is the sweet round rooted kinde, then which no other was knowne to *Dioscorides*, and that *Cyperis* is the long sweet kind as *Pliny* doth take it: and that *Cypirus* is the water or marsh *Cyperus*, my opinion herein being confirmed by *Aristophanes in Dialogo de canis*, where he maketh the quire or company to say *Saltavimus per Cyperum & Phleum gaudentes cantibus*: so that hereby *Cypirus* must of necessity be here understood to bee a water or marsh herbe, as *Phleum* is also, among which the Frogges are conversant: κύπερος, is so called from the round forme of the roote, which is like a small boxe or vessell, in Latine also *Cyperus* and *Iuncus triangularis & angulosus*, to distinguish betweene it and the *Iuncus lævis* or *vulgaris*, ordinary Rushes, yet *Cornelius Celsus* calleth it *Iuncus quadratus*, because at it is likely in those places where he observed it, it did peradventuer beare foure-square stalkes, but it is not so in many other places: in English many doe call it Gallinga or Gallingale after the name the Dutch give it, because the round rootes are somewhat like unto the rootes of the small Gallinga, and yet that kinde with round rootes, is not so frequent in our land as the other with long rootes, to be so called for the likenesse thereof betweene them, I thinke the name is transposed from the one to the other. It is called also as commonly Cyperus, and sweet Cyperus, after the Greeke and Latine names. The first is generally by all Writers, called *Cyperus rotundus*, and *odoratus* is added for a distinction betweene this kind that is sweet, and another that hath no scent, which shall be declared in his place. The second *Lobel* and *Camerarius* upon *Matthiolus*, call *Cyperus major rotundus Syriacus*, and *Prosper Alpinus* saith the Egyptians call it *Hodveg*. *Rauwolfius* calleth it *Cyperus Orientalis major vel Babylonicus*. The third is called by *Lobel Cyperus rotundus Syriacus minor*: and *Camerarius* on *Matthiolus* calleth it *Cyperus minor Cretitus*. *Bauhinus* calleth it *Cyperus rotundus orientalis minor*. The fourth as I said before, is called by *Pliny Cyperis*, by *Matthiolus Cyperus*, and by others *Cyperus longus*. *Lobel* and *Lugdunensis Cyperus longus habitior*. *Cordus* upon *Dioscorides* calleth it, *Cyperus Romanus sive longus*. The last is called by *Camerarius* and *Taber-*

montanus Cyperus dulcis; and so it is probable *Theophraſtus* doth in his 6. booke *de cauſis plantarum*, 16. & 17. chap. reckoning *Cyperus*, (which *Gaza* tranſlateth *Gladiolus* in all places following *Pliny* herein, as is above ſaid) among other ſweet rootes to be eaten, *Dalechampius* upon *Pliny*, *Ceſalpinus*, *Cluſius*, and *Fabius Columna*, take it to bee *Malinathalla* of *Theophraſtus*, and *Anthalium* of *Pliny*. The Italians generally call it *Traſi*, and *Traſi dolce*, *Dolzolini*, and *Dolceguine* as *Cluſius* ſaith, from *Bellonius lib. 2. cap. 25.* and thereafter divers Writers doe call it ſo, and *Dulcichinum*, as *Matthiolus*, *Geſner*, *Dodonæus*, and others; it may fitly bee called Ruſh-nuts, from the Spaniſh *Iuncia avellanada*, of the forme of leaves and rootes. *Baptiſta Corteſius* ſaith it (if this bee his) is called *Furoſium* and *Aculinum*, and by the Sicilians *Caſtanalos*, becauſe the rootes taſte like Cheſnuts. *Pona* in the deſcription of Mount *Baldus* ſaith confidently, that he hath found it by experience in ſuffering the rootes to grow unremoved for three or foure yeares, that it beareth neither ſtalke, nor flower, nor ſeed. But *Matthiolus*, *Ceſalpinus*, *Lobel*, *Dodonæus*, and *Columna*, doe all ſay, that it hath both ſtalkes, flowers, and ſeed, and ſo doe give the figure thereof in all their Workes: and *Cluſius* in his annotation upon *Bellonius*, *lib. 2. cap. 40.* giveth a figure without flowers, as if it bore none: but aſſuredly both he (if he thought ſo) and *Pona* might be as much deceived herein, as they that wrote the *Colocaſia* never bore flower, which *Columna* diſproveth. There remaineth one thing more to be ſpoken of, and that is, that many of our Apothecaries, are not onely ſo ignorant, that they doe not know, that onely the round ſweet Cyperus, is that Cyperus and no other, which all the ancient Authors have appointed to be put into the medicines that they appoint; but are without care alſo, or deſire to be furniſhed with thoſe things, that are the genuine drogues of the Ancients; becauſe the falſe is better cheape, and eaſier to be had, and put into their choiſeſt and chiefeſt medicines, as well as others, the common long rooted Cyperus in the ſtead thereof; which although in an extreme neceſſity, may ſupply the want thereof; yet as we all know, no ſubſtitute can bee ſo effectuall to all purpoſes, as the genuine is. The Arabians call it *Saharade*: the Italians *Cypero*: the Spaniards *Juncia de olor*: the French *Souchet*: the Germanes *Wilder galgan*: the Dutch *Wilde Galigaen*: and we in Engliſh as I ſaid before, Gallingall, and ſweet Cyperus.

The Vertues.

It is of a warming quality ſaith *Dioſcorides*, and giveth breathing to the veines: It provoketh urine, and helpeth to breake the ſtone in the bladder, and to conſume the water in the dropſie, if the decoction thereof be drunke: and is a remedy againſt the ſting of the Scorpion: it provoketh womens courſes, and is good for the fretting paines and ſtranglings of the mother, if the parts be bathed with the decoction thereof, or they ſit over the fumes thereof, or in the decoction. The powder thereof is a moſt eſpeciall remedy for all foule ſores and ulcers of the mouth, although they be ſpreading and devouring cankers. It is alſo uſed in ſweet oyntments and ſalves that are warming and comforting. *Galen* ſaith the rootes of Cyperus are of greateſt uſe, being of an heating and drying quality, without ſharpneſſe: whereby it wonderfully helpeth all ulcers, that by their over-much moiſture doe hardly admit any cure, and by the aſtringent quality it hath, it helpeth all manner of ſore mouthes. It hath a cutting quality alſo, whereby it helpeth thoſe that are troubled with the ſtone, and provoketh urine and womens courſes. The rootes of Cyperus and Bayberries, of each a like quantity beaten to powder, and made up with the urine of a Boy under yeares, and laid upon the belly of thoſe that have a dropſie, doth helpe them very much: and both of them boyled in wine, and drunke often while the other is uſed outwardly, doth worke effectually. *Alpinus* ſaith the Egyptians doe much uſe both the powder of the rootes, and the aſhes of them when they are burnt, to cure the ulcers both of the mouth, and ſecret parts, and the decoction of them to be drunke, to comfort and warme the ſtomacke, braine, lungs, ſinewes, arteries, and the wombe; and if it be taken for ſome time together, it warmeth and ſtrengthneth the naturall vigour of the ſpirits, it is alſo an eſpeciall remedy for cold and moiſt braines, and the diſtillations thereof, by warming and comforting the braines and the ſences: it conduceth helpe to the crudities, humidities, and windineſſe of the ſtomacke and belly, and to helpe the ſhortneſſe of breath and coughes: as alſo for all cold and moiſt wombes, and the griefes and diſeaſes comming thereby. It bringeth much comfort to thoſe that by long ſickneſſe are much ſpent in their ſtrength of body, and weakneſſe of their ſtomacks, and faintings of their ſpirits; by warming, quickning, and comforting them, by helping and ſtrengthning the digeſtion, and procuring warmth to the blood, and good colour to the face: it helpeth thoſe that have ſtrong or ſtinking breaths, drinking the decoction thereof made in wine. The long ſweet Cyperus commeth ſomewhat neare to all the faculties formerly expreſſed, yet performeth them not ſo effectually. There is much hereof ſpent in ſweet powder, and ſweet waſhing waters, and to perfume Garments, Gloves, &c. as alſo into Perfuming-pots with vinegar and Roſewater, a few Cloves and Bay-leaves to perfume Chambers. The *Traſi* or Ruſh-nuts, are for the moſt part ſpent, as junkets to be eaten for pleaſure, rather than uſed Phyſically for medicine: yet it is found to bee good, both for the paines of the breaſt and ſides, if a creame bee made thereof and drunke; and therefore very profitable for thoſe that have a cough, to helpe to expectorate the flegme: the ſame alſo drunke mitigateth the heate of urine, and allayeth the ſharpneſſe thereof: it helpeth alſo the ſharpneſſe of humours in any diſentery, or fluxe, and ſtayeth it, if hot ſteele be often quenched in the decoction thereof and drunke. It is alſo thought by many to further venerous actions, by taking the creame thereof, when it is ſteeped, ſtamped, and ſtrained with the broth of fat fleſh: for it is a little windy and nouriſheth well, as by the ſweetneſſe thereof may bee perceived, and the qualities of heat and moiſture conjoyned therewith.

Having thus ſhewed you the chiefeſt of theſe ſweet hearbes and plants that grow with us, it is time to convert my ſtile to another forme, that you may therein heare what will be intreated of.

PLAN-

PLANTÆ CATHARTICÆ SIVE PVRGANTES.

PVRGING PLANTS.

CLASSIS SECVNDA.

The Second Tribe.

CHAP. I.

BEing to shew you here the chiefest sorts of purging plants that may grow with us; I must as well speake of them that worke upwards, as downewards, as also of those that are conducing or helping thereunto, although they be not so forcible in working as the others, I say the chiefest or most, because, that as in the former *Classis* some are omitted that are dispersedly related of in other places of this Worke, so likewise it will fall out in this and some of the other following Classis, and begin with the hearbe Aloes, whose bitter juyce is so frequent in use every where knowne by the name of Aloes and Aloes Succotrina.

1. *Aloe vulgaris Herbe Aloes. sive Sempervivum marinum.* Sea Housleeke.

1. *Aloe vulgaris Herbe Aloes, sive Sempervivum marinum.* Sea Housleeke.

This hearbe hath divers long fleshy pale greene leaves, of the thickenesse of ones finger, with divers hard dents or points on both sides of them, and pointed at the end likewise, the one enclosing the other at the bottome, and standing round, the outward-most bending for the most part backwards, especially in those wee see are brought to us; but in the naturall places standing all of them outright and stiffe, or rather bowing inward than backward, whose leaves are nothing bitter in taste in the places either natural or planted, but rather cold: in the middle of these leaves riseth up a short thick stalke, branching forth into 2. or 3. parts; little more than a foot & a halfe, or 2. foot high, bearing many small bottle-like flowers, of a whitish colour with us, & so *Dioscorides* saith also, but in the hotter Countries yellowish, as we are certainely informed, divided at the ends, into five or sixe parts, every one hanging downe round about the stalkes, from the middle thereof up to the top; it beareth seed in huskes like unto an Asphedill, after the flowers are past: the roote is thicke, and about a foote long or lesse within the ground, shooting out some thicke fibres at the end, and some small ones round about the sides, especially in the naturall places, but are seldome seene to give any with us, as they hang up in our houses, but may better be discerned, if any of them be put into the ground in the Summer time: the stalkes next to the roote will have the markes of the withered leaves when they are past and fallen away, as may plainely bee discerned in many of those that are brought from *Spaine* hither: and shoot forth a number of heads round about it, whereby it may be easily encreased.

2. *Aloe Americana.* Hearbe Aloes of *America.*

The neare resemblance of the leaves hereof unto the former hath caused it to be thus entituled, for it beareth very large long leaves, of a pale greene colour, whereon is to bee seene an eye, of blue or ash colour, being of the length of a man, and of two or three fingers thicknesse in the naturall places, dented about the edges where they are thinnest, with hard sharpe teeth like the other, and ending in a hard round bigge blackish thorne or prick, as bigge as a Faul-

coins

2. *Aloe Americana.* Hearbe Aloes of *America.* *Aloes Americanæ caulis cum floribus & superatine flos & siliqua seminum.*

The ſtalke and the flowers of the *Aloe Amer.* a flower & head of ſeed by themſelves

cons talent, which leaves are found on the under-ſide, and channelled or made hollow like a gurter on the upper-ſide, and at the bottome encompaſſe one another, but growing flat when they are elder after a footes length, unto the end: the innermoſt ſtill abiding channelled and hollow: theſe leaves are full of juyce and full of threads running thorow them, but are no more bitter than the other: in the middle of theſe leaves after a long times abiding, riſeth a ſtrong great ſpungy ſtalke, of the bigneſſe of a mans arme, with a few ſmall dry and browniſh leaves, ſparſedly ſet thereon, and of the length of a Horſemans ſtaffe in ſome places, but riſing higher than two ſpeares length in others; as at *Avignion*, where as it is reported, within the ſpace of 45. dayes, the greene ſtalke grew to the height of 22. hands breadth: that is, about nine or ten foote: and about twelve cubits length, in the Duke of *Florence* his garden, and fifteene cubits at *Rome*, branched almoſt from the middle thereof up to the toppe, into divers branches, and each of them againe into others, the great branch ſtanding out for a good ſpace, and then turning upwards; on each whereof are ſet a number of flowers, even two or three hundred, being no other then long and large greene three-ſquare hard huskes, thruſting out ſixe great yellow hard and crooked threads, tipt at the toppes with yellow pendents; and in the middle amongſt them another yellow round headed pointell, *Lobel* ſaith, of a purpliſh blue colour, which is not true, for they are of a whitiſh or yellowiſh greene colour, and of a ſweet ſcent: theſe huskes that beare the flowers, after they are dry become the ſeed veſſels, which being ripe, are divided into three parts or cells, each containing abundance of white halfe round light biparted ſeed, cloſely compact together: the roote is very great, comparable to the reſt of the plant, two or three cubits long, harder than the former, giving a number of young ſprours yearely, which being ſeparated and planted, will quickly take roote in the ground, and grow up: but muſt be kept from cold in the Winter, and will not deſire to be much watered.

The Place.

The firſt groweth in *Arabia Aſia, Syria*, and all the Eaſt Countries, and in *India*, as well a great way within the land, as neare the Sea ſide, and in the Ilands there, as in *Socotora* as *Garcias* ſaith, where the beſt is made, as alſo in many places of *Italy*, and in *Spaine* about *Andalouſia* neare the Sea ſhore in ſuch plenty, that divers thought to have made good ſtore of Aloes there, but after triall was made, it was not found any way ſo effectuall as the Indian ſort. The other ſort grew firſt in *America*, (which being brought into *Spaine*, was from thence, ſpread into all quarters) and in that abundance about *Mexico*, as Vines doe in *Spaine*, which they there uſe to plant, to ſerve them in ſtead of hedges, as well to ſeparate as to defend the limits of their grounds.

The Time.

They flower in the hotter Countries, in the firſt Summer Moneths, but never in theſe colder, for they are preſerved with great care from the froſts in Winter, which will cauſe them quickly to rotte, if they feele never ſo little almoſt.

The Names.

The firſt is the Ἄλοη of *Dioſcorides*, and all others both ancient and moderne Writers, and as *Pena* ſaith, becauſe it

it moſt commonly groweth neare the Sea, many doe ſuppoſe it tooke the name either from ἅλς ἁλὸς, that is, *a ſale* ſalt, or from ἁλὼ *a Salo*, the Sea it ſelfe, with whoſe breath it is much delighted. The hardned juyce thereof is alſo uſually called Aloe, and becauſe the beſt and pureſt is made, as *Garcias* ſaith, in the Iland *Socotora*, it is called *Aloe Socotorina*, and corruptly in the Apothecaries ſhops *Aloes Succotrina*, or *Succo citrina*. It is alſo called *Aloes hepatica*, becauſe the beſt is browne and red like a liver. It is called alſo ἀμοίβιον, becauſe it not onely groweth in the ground, but will live alſo out of the ground. Some of the moderne Herbariſts doe call it *Sempervivum marinum*, from the thickneſſe of the leaves and likeneſſe unto *Sedum*, called *Sempervivum*. *Columella* in his verſes by naming *Sedum* among the bitter juyces, is thought to meane this, and called it *Sedum amarum*, for there is no *Sedum* that hath a bitter juyce but this onely. Another ſort of Aloe was formerly wont to be brought, (before wee became induſtrious, to chuſe onely the beſt for our uſe) which was called *Caballina*, either becauſe they gave it horſes, being the courſeſt, or becauſe it was not fit for men but horſes, the knowledge as well as importation whereof, is almoſt utterly forgotten and neglected. It is called in Engliſh hearbe Aloes after the Greeke, and Sea Houſleeke after the Latine name, and Aygreene, that is Evergreene. *Pliny* and others have written of an *Aloe metallica*, or *foſſilis* in *Iudea* and other places, but it is found by divers Writers to be an errour in them, and no ſuch thing to be found. The ſecond as *Gomara* in the end of his Mexican Hiſtory ſaith, is called of ſome of the Indians *Metl*: and of ſome others *Maguey*: of ſome Spaniards *Cardon*, becauſe of the prickes about and at the end of the leaves, and of others *Fil y Aguilla*, that is to ſay, thread and needle, becauſe it ſupplieth both their uſes; the ſharpe end thornes ſerving as an aule or needle, and the threads running within the leaves being ſpunne, ſerving as thread. *Cluſius* calleth it *Aloe Americana*, and ſo almoſt all other Authors after him, onely *Lobel* calleth it *Aloe folio mucronato*. *Fragoſus* ſaith that the pricke of the thornes hereof are venemous.

The Vertues.

The firſt hearbe Aloe is uſually hung up in houſes to bee ready at hand upon all occaſions, to apply a little of the juyce of a leafe preſently cut of, or the peece of a leafe it ſelfe, upon any cut or freſh wound, which is found to bee ſingular good to ſoder and heale them: even as *Dioſcorides* ſaith, that that ſort which grew in *Aſia*, *Arabia*, *&c.* is of more uſe to glue or ſoder wounds, than that which commeth out of *India*: the leaves alſo are found to be exceeding cold in the hot Countres, and of very great uſe and effects for all manner of ſcalding with water, or burning with fire, gun-powder, or the like, healing them quickly: the nature of the juyce, or Aloes it ſelfe, is fit to thicken, to dry, to procure ſleepe, and moderately to heate; it openeth the belly, purgeth the ſtomacke, and the yellow jaundiſe, and ſtayeth the ſpitting or vomiting of blood, if a dramme thereof be taken in faire water: it is not onely a good purger of it ſelfe, but is added alſo with other purgers to cauſe the leſſe trouble in the ſtomack: it healeth greene wounds, and bringeth old ſores to cicatrizing, as alſo thoſe of the genitors, it healeth the chappes of the fundament, the piles and breaking forth of blood from them, being uſed outwardly; but aſſuredly it is found not convenient for thoſe that are troubled with the piles, to take thereof inwardly, becauſe it heateth, and maketh the blood of them to be the more ſharpe and fretting. It is alſo found to be more helpefull to flegmaticke, than to hot, dry, and cholericke conſtitutions. It eaſeth the paines of the head to bee taken in pills, or being diſſolved to anoynt the forehead and temples: diſſolved in wine and honey, it helpeth the foreneſſe of the reynes and gums, and all ulcers in the mouth: being torrified in a cleane earthen veſſell, it is an eſpeciall good medicine to be uſed with others for the eyes. *Galen* ſheweth that it is hot in the firſt degree compleat, or ſecond inchoate, and dry in the third, and hath a little aſtringent faculty therein alſo, but exceeding bitter: it openeth the belly and purgeth moderately the ſtomacke chiefly, whereunto it is moſt friendly and comfortable above all other medicines, (for whereas all other purgers doe trouble and weaken the ſtomacke, this onely is found to comfort and ſtrengthen it:) and thoſe humours that are in the lower parts next unto the paſſage, for it is no ſtrong or generall purger of the whole body, to expell groſſe humours, but thoſe onely that be in and about the belly. And for this purpoſe the Aloes ſimply it ſelfe, is fitteſt to be uſed, for if it be waſhed, it loſeth the moſt part of the purging quality, and hath onely a comforting and ſtrengthening property left. And therefore if Aloes that is waſht be given to thoſe that are feveriſh, howſoever it may doe ſmall harme to ſome, yet it is found to doe much to others. Maſticke or Cinamon are accounted, the beſt correctors or helpers to be mixt therewith when it is given: It healeth alſo thoſe ulcers that are hardly cured, and eſpecially thoſe in the fundament and ſecret parts. *Meſnes* ſaith it cleanſeth the head and ſtomacke, and eaſeth thoſe paines are incident unto them: and that the continuall uſe thereof preſerveth any from dangerous and deadly diſeaſes, and with Mirrhe preſerveth the bodies, not onely of the living but of the dead, from all putrefaction and corruption: which effects long before his time were well knowne to the world, for the manner of embalming the bodies of the dead, with Aloes and Myrrhe, which was uſed among the Iewes, as appeareth in the 19. Chapter of Saint *Iohns* Goſpell, the 39. verſe, where it is ſaid that *Nicodemus* brought about 100. pound weight of Mirrhe and Aloes mixed together which was laid with the body of our Saviour *Ieſus* in the Sepulchre: But the Aloes that is mentioned in all other places of the Scriptures, is underſtood to bee the *Lignum aloes*, which the Apothecaries uſe in their ſhops, in many medicines, appointed both by Greeke and Arabian Authors, as well inward as outward, for ſweet oyntments, perfumes, and other compoſitions: and the Aloe tree is onely once or twice named, as in the 24. of *Numb.* and the 6. verſe. The parable of *Balaam* concerning the beauty of *Iacob*, or the children of *Iſrael*, in the faire ſpreading of their habitations, to be like valleies ſtretched forth, like gardens by the River ſide, like the Aloe trees, (which Saint *Ierome* tranſlateth Tabernacles) that God planted, as the Cedars beſide the waters. And in the 45. Pſalme where Saint *Ieromes* tranſlation hath *Myrrha Gutta & Caſia*, it ſhould be *Myrra Aloe & Caſia*, for the Hebrew word *Ahalod*, which the moſt judicious doe tranſlate *Agallochum* into Greeke, and *Lignum aloes* into Latine. It is often given to children for the wormes, either of it ſelfe, or in a few Raiſons of the Sunne opened, and the ſtones taken forth and ſome put therein, or outwardly applyed to the belly, under the navill, made into a plaiſter with a little oyle of Wormewood, or ſome other ſuch thing. Aloes alſo is often uſed in medicines for the eyes, with a little honey to allay the heate in them, to cleanſe the inward roughneſſe of the eye-lids, and cleare the dimneſſe of the ſight, that commeth by moiſt humours diſtilling into them, by drying it up without ſharpneſſe or offence; it healeth alſo the itching in the corners of them. Being mixed with a little vinegar and oyle of Roſes, and the temples and forehead anoynted therewith, about the time of reſt, doth much helpe the headach, and is a meanes to procure ſleepe to thoſe that want: if it be diſſolved in wine, and the head waſhed therewith, it ſtayeth the falling of, or ſhedding of the haire: uſed with honey and wine, it cleanſeth all foule ulcers,

that

that happen in the mouth or throat, as alſo fiſtulaes, that happen in the yard of a man, or in the fundament: and afterwards ingendreth fleſh therein, to fill up the cavity. Briefly, Aloes is of ſo much uſe in the Apothecaries ſhops, or ſhould be, if our delicacy and niceneſſe did not hinder it, as either Honey or Sugar: but the bitterneſſe of the one, is ſo unpleaſant and unwelcome to this delicate age, and the ſweetneſſe of the other ſo much pleaſing and acceptable thereto, that the rotting and corrupting ſweetneſſe of it hath overcome and overgrowne the wholeſome bitterneſſe, that preſerveth from corruption of the other: yet notwithſtanding the effects are the ſame, they formerly have beene, and ſo are uſed, being three or foure times waſhed with the depurate juyce, or ſtrong infuſion of Damaske Roſes, and dryed up againe, it is then called *Aloe Roſata*, Roſed Aloes; which is a ſafe and gentle medicine for tender bodies, familiar and comfortable to the ſtomacke, helping more to ſtrengthen it than other Aloes, and purgeth alſo leſſe than it, yet ſomewhat openeth the belly, and is good againſt ſurfets. The Aloes (that is to ſay, the dryed juyce taken from the hearbe) that is uſed in all theſe Chriſtian Countries, commeth from the East-Indies unto us, where it is made: yet *Fabius Columna* ſaith, he made as good Aloes in *Naples*, from the leaves that grow there, as any that ever came out of the *Indies*, which thing how he brought to paſſe, were I thinke worthy to be knowne, and might be beneficiall to this Realme in time to come; if in any of our remote plantations (as in the Summer-Ilands, or other ſuch like hot Countries) the hearbe were planted in that plenty, that thereof ſome quantity of the dryed juyce might bee brought to us, both to requite their travell, and to ſave ſo much paines and coſt, to bring it from the East-Indies. The manner whereof as he relateth it is thus: It came into his minde to make ſome Aloes, out of the leaves that grew with them in ſufficient plenty at *Naples*; and finding that the juyce of the leaves, bruiſed according to the uſuall manner of all other hearbes, was unprofitable and unſavory alſo, or that the ſcarifying of the roote, did not yeeld any juyce bitter like Aloes, or of any worth, hee tryed that way, to take the juyce out of the leaves of Aloes, which he had formerly tryed and found effectuall, to have the red or bloody juyce, out of the hearbe or thiſtle called *Attractylis*, (as I ſhall ſhew you, when I come to ſpeake thereof in his proper place) which was, that the juyce was to be drawne or taken, not out of the fleſhy ſubſtance of the leaves, but out of the veines, that runne thorow them: he therefore pulling divers leaves from the rootes, while they were freſh, he laid their ends downewards, round about the brims of a broad ſtone pan, that was glaſed or leaded, (ſuch as our milke-pans are) from the mouths or ends of whoſe veines, dropped forth a yellow liquor by drops, which gathering together into one, when they had dropped well of themſelves, hee ſtroaked a little harder with his hand, to draw forth what might be had from them, and tooke that alſo that grew thicke from the ends of the leaves, and this he hid in the open and hot Sunne: having thus taken a reaſonable quantity of this yellow juyce, he let it ſtand in the hot Sunne, for three or foure dayes, but ſet it aſide, and covered it in the night time, and as the juyce dryed on the ſides of the pan, he often every day, ſcraped it downe into the moiſt, untill it became thorow dry and hard, and as eaſie to be diſſolved as any: which from being yellow at the firſt, became more reddiſh in the drying, and laſtly, blacke almoſt like dryed blood, yet cleare or thorow ſhining, light in feeling and not heavie, of a ſweet and aromaticall ſavour, but ſo extreme bitter, that even the ayre was infected therewith, and became ſo bitter, while it was thus in doing, that it was ſcarſe to be endured, by piercing into the mouth and throat. And thus as he ſaith not without much delight and content to himſelfe: he found out the way, not knowne to any before, how to make pure, ſincere, tranſlucent, brittle and hard Aloes, of the colour of a liver; and was content to abide the trouble and paine, thus to impart it to others, that they alſo might take the pleaſure and profit thereof, to know and doe it if they will: but having given directions to ſome that failed in not doing right, they have left it of, as not to be done. The Aloes of *America* is ſaid to be bitter and ſharpe in the hot Countries, where it groweth: but hath no bitterneſſe in theſe European parts of the world, where it is nurſed up of divers. The juyce of the young leaves, and of the root, mixed with the juyce of the Wormewood, that groweth in the ſame Country, is very profitably put into the wounds of thoſe have beene bitten by vipers: the juyce of the leaves boyled a little on the fire, is a ſure remedy, quickly to heale both greene wounds and old ſores: of the yongeſt and tender leaves, they uſe likewiſe to make conſerve; and uſe it for the purpoſes aforeſaid: Some alſo ſay it healeth the French diſeaſe, to be taken in this manner, Take a good peece of the roote hereof cut ſmall, and boyle it in a large ſtone pot, with a good quantity of faire water, for three houres ſpace at the leaſt, ſtopping the pot very cloſe with clay, or ſome other ſuch like matter, that no fumes breake forth, which pot after it hath beene ſo long in boyling, being placed nigh unto the ſicke Patient, ſo as they may receive the hot fumes thereof, when it is opened, will cauſe or procure them to ſweat abundantly: Or elſe if a leafe hereof be roaſted under hot embers or coales, and the hot fumes thereof taken, will provoke ſweat ſo extremely, that it is able almoſt to overcome the ſpirits, not to be endured, although this remedy bee uſed but for three dayes onely together. They of *Mexico*, and other parts of *America*, where it groweth naturally, have as great uſe of this plant, and ſerveth them to as many purpoſes, as the Cocar Nut-tree doth to them of the East-Indies, or more, and that is more by many, than any other plant or tree, growing upon the Earth. For firſt the mighty tall and ſtrong ſtalkes thereof, after it hath given his flower and ſeed, and becommeth dry, as alſo the leaves after they have beene dryed, are gathered and laid up to ſerve them inſtead of wood to burne: the hollow or channelled leaves ſerve them inſtead of tyles to cover their houſes, to defend them from raine, which they can ſo aptly diſpoſe, that no other thing with them there can better performe that office. They uſe to cut it downe before it grow great, to cauſe the roote to grow into the greater ſubſtance, from whence, a hole being made therein, they gather a certaine liquor, which will quickly grow into the forme of a Syrupe, and being boyled a little on the fire, will be as thick as Honey, a little cleared and ſettled will become as Sugar; diſſolved with water it will ſerve as vinegar, and will be made into wine; if *Ocpatli* (which is a roote they uſe to call the medicine of wine) bee put unto it: which wine they much uſe, but nothing wholeſome; for it ſoone intoxicateth the braine, and cauſeth drunkenneſſe: but it moreover cauſeth ſo foule and ſtinking a breath to them that uſe it, that no carrion carkeiſe, or ſtinking ſinke doth ſmell ſo loathſomely. The Prieſts and Painters of thoſe Countries, doe uſe the leaves, both in ſtead of Paper to write upon, and to draw any figure thereon: the Prieſts alſo uſe to pricke and wound themſelves with the ſharpe ends thereof, which are ſo ſharpe and ſtrong; that although they can cauſe them to pierce how farre they pleaſe, yet will they not breake in the fleſh, no nor in other harder ſubſtances, for thoſe prickes ſerve them inſtead of an awle to make any hole, and the long threads in the leaves, ſerve inſtead of thread, to ſow or tye any thing they would therewith, yea it hath beene ſpun into ſo good and ſtrong thread as any hempe can make, and cloth hath beene woven thereof and made into ſhirts, &c. (as *Cluſius* reporteth the Daughter of his Hoaſt at *Civell* in *Spaine* did performe

forme and ſhew to him, while he was reſident there,) and often brought into the markets to bee ſold: and being made into a courſer thread, ſerveth as cords or ropes in Ships, or other ſuch like purpoſes, and with it alſo they uſe being platted together, to worke into Sandals (a kinde of ſhooes in much uſe with the Spaniards, as well as the Indians) into mattes to lay on the ground to goe upon, or to lay any thing thereon to dry: and into ſhort courſe garments, ſuch as Shepheards and Shipmen uſe, to be thereby defended from heat and raine.

CHAP. II.

Iucca ſive Yucca India putata. The ſuppoſed Indian Iucca.

VNto theſe kindes of Aloes may moſt fitly in my judgement bee referred, that plant which is uſually in theſe parts called *Iucca* or *Yucca*, for unto no other plant that I know can it better bee adjoyned, the forme of the leaves eſpecially being ſo like, and although the flowers be differing, as may be perceived by the figure and deſcription, yet that letteth not, for ſo alſo are the flowers of that of *America*, much differing from thoſe of the true Aloes, whoſe deſcription is on this wiſe.

Iucca ſive Yucca India putata. The ſuppoſed Indian Iucca.

Iucca ſive Yucca India putata. The ſuppoſed Indian plant.

This rare Indian plant hath a great thicke tuberous roote ſpreading in time into many tuberous heads from whence ſhoot forth many long hard and narrow guttured or hollow leaves, very ſharpe pointed, compaſſing one another at the bottome, of a grayiſh greene colour abiding continually, or ſeldome falling away, with ſundry hard threads running in them, and being withered, become pliant withall to bind things: from the midſt whereof (ſome

(some yeares for it doth not every yeare with us) springeth forth a strong round stalke, divided into sundry branches, whereon stand divers somewhat large white flowers hanging downewards, consisting of sixe leaves with divers veines, of a weake reddish or blush colour spread on the backe of the three outer leaves, from the middle to the bottome, not reaching to the edge of any leafe, which abide not long, but quickly fall away without bearing any seed in our Country, as farre as could be observed by any hath growne in this land, or in *France*, &c.

The Place and Time.

This groweth in divers places of the West-Indies, and in our English plantations also, of *Virginia*, & *New-England*, as it hath beene confidently affirmed to me. It flowreth not untill the middle or latter end of July, the flowers falling away within a while after they have beene blowne open.

The Names.

That it cannot be the true *Yucca* of *Oviedus*, *Thevet* and others, whereof the bread called *Casavi* is made, both they and *Monardes* shew plainely: for the true *Yucca* beareth leaves divided into seven or nine parts, standing on long foot-stalkes. Yet not knowing what other or fitter name may be given it, let it hold still that name of *Iucca* or *Yucca*, or *Hyjucca* if you will, untill a fitter may be knowne. *Bauhinus* calleth it *Iucca foijs Aloes*.

The Vertues.

There hath not beene knowne any property conducible to any disease as yet found out, or related of it. Some Merchants Factors have affirmed, but how probable I know not, that it groweth in some parts of *Turkie* naturally, and that they make a kinde of course cloth from the threads in the leaves, which are strong and hard: but the Relators were surely deceived herein, for if it doe grow there, it hath beene onely brought to them, as unto us and planted: the natives formerly in *Virginia*, as I heare, did and doe make bread of the rootes hereof, as they of *Hispaniola* doe of the true Iucca, and much after the same manner, and it is said likewise, that the raw juyce is dangerous, if not deadly: *Aldinus* relateth that the wound made by the sharpe point end, of one of these leaves in his owne hand, wrought such intolerable paines, that he was almost beside himselfe, untill by applying some of his owne *Balsamum* thereto, it miraculously eased him of the anguish, and all other trouble thereof.

CHAP. III.

Lapathum sativum & Rha. Garden Dock and Rubarbe.

BEcause both the true and the bastard *Rha* or Rubarbe are sorts of Dockes, as shall be shewed; I have therefore placed them together with the Patience or garden Docke in one Chapter, and unto them for the names sake, rather than for any knowne properties correspondent, I have adjoyned two other plants called also *Rha*, although they have no resemblance unto the Dockes, as the other sorts of *Rha* have.

1. *Lapathum sativum sive Patientia.* Garden Patience, or Monkes Rubarbe.

Garden Patience is a Docke bearing the name of Rubarbe, for some small purging quality therein, and groweth up with large tall stalkes set with somewhat broad and long faire greene leaves, not dented at all, the toppes of the stalkes being divided into small branches, beare reddish or purplish flowers, and three-square seed like unto other Dockes: the roote is long, great and yellow, like unto the wild Dockes, but a little redder, and if it be a little dryed, sheweth lesse store of discoloured veines then the next doth when it is dry.

2. *Hippolapathum rotundifolium vulgare.* Common Great round leafed Docke, or bastard Rubarbe.

This Bastard Rubarbe hath divers large round thinne yellowish greene leaves, rising from the roote, a little waved about the edges, every one standing on a reasonable thicke and long browmish foote-stalke, from among which riseth up a pretty bigge stalke, about two foote high, with some such leaves thereon as grow below, but smaller; at the toppe whereof stand in a long spike many small browmish flowers, which turne into hard theee-square shining browne seed, like unto the garden Docke or Patience: the roote groweth greater than that of Patience, with many branches or great fibres thereat, yellow on the out-side, and somewhat pale yellow within, with some discoloured veines therein, like to the Rubarbe next to be described, but much lesse than it, especially when it is dry, which then hath quite lost that fresh colour, which the other Rubarbe holdeth perspicuously.

3. *Hippolapathum maximum rotundifolium exoticum, sive Rhaponticum Thracium sed verius Rubarbarana verum.* True Rubarbe, or Rubarbe of *Pontus*, or Englishe Rubarbe.

Because in my former Booke, I made onely a short relation of this Rubarbe, and the effects thereof; I thinke good here to give you a more ample declaration thereof, for it deserveth to be worthily accounted of. At the first appearing thereof out of the ground, when the Winter is past, it hath a great round browmish head, rising from the middle or sides of the roote, which openeth it selfe into sundry leaves, one after another, very much crumpled or folded together at the first, and browmish, but afterward spreadeth it selfe, and becommeth smooth; very large, and almost round, every one standing on a browmish stalke, of the thicknesse of any mans thumbe, when they are growne to their fulnesse, and most of them two foot and more in length, especially in any moist or good ground: and the stalke of the leafe also from the bottome thereof, next unto the roote, unto the leafe it selfe; being as long, that is to say, two foote more, the breadth thereof also in the broadest place, from edge to edge being equall, or as much, of a sad or darke greene colour, and thicker in substance than the last, of a fine tart or sowrish taste, much more pleasant than the garden or Wood Sorrell: from among these riseth up some, but not every yeare, a strong thicke stalke, not growing so high as the Patience or garden Docke, with such round leaves as grow below, but smaller at every joynt up to the toppe, and among the flowers, which are white, contrary to the last recited Bastard Rubarb, or any other of the Dockes, spreading forth into many branches, and consisting of five or sixe small white leaves a peece, hardly to be discerned from the white threads that are in the middle, and seeming to bee all threads: after which come browmish three square seed, like unto other Dockes, but larger, whereby it may bee plainely knowne to be a Docke: the roote groweth in time to be very great, with diuers and sundry great spreading branches from it, of a darke browmish or reddish colour on the outside, and with a pale yellow thin skin under it, which covereth the inner substance or roote; which rinde and skin being pared away, the roote appeareth of so fresh and lively a colour,

2. *Lapathum sativum sive Patientia & folium Hippolapatum rotundifolijs vulgaris.* Patience, or Monkes Rubarbe, and a leafe of the Baſtard Rubarbe.

3. *Hippolapathum maximum sive Rhaponticum Thracium vel Rabarbarum verum.* True Rubarbe, or Rhaponticke.

colour, with fleſh coloured veines running thorow it, that the choiſeſt of that Rubarbe, that commeth to us, from the Indies and *China*, cannot excell it: which roote, if it be dryed carefully, and as it ought (which muſt be in our Country by the gentle heate of a fire, in that we want the heate of the Sunne to dry it, as is uſed in the naturall places, and every peece kept from touching one another, (which thing may be obſerved, is alſo done by the Indians, in the dryed rootes that come to us, who put them upon ſtrings to dry them apart:) will hold his colour almoſt as well as when it is freſh, and give a yellow tincture to the ſpittle when it is chewed, but not ſo much, nor hath that bitternes, and aſtriction therein that the Indian root hath, as I have ſaid before. I have divers yeares taken up of theſe rootes, and dryed them carefully as I have ſhewed you, and they have beene ſhewed to the beſt and moſt skilfull, who have approved of them, and divers of our Phyſitians have oftentimes uſed them, and very many others to good purpoſe.

4. *Rhabarbarum & Ponticum genuinum officinarum.* The true Rubarbe and Rhapanticke of *China*, and the Shops.

Matthiolus hath given us a figure of Rubarbe, which he ſetteth forth for the true, but from whom or whence he had it, he declareth not, and it might be a figment out of his owne braine, as ſome others of his are: although hee ſeemeth to ſay that he learned from Perſian Merchants, that it did grow in the Country of *Succuir*, which is ſubject to the Great *Cham* of *Cathay*, in the Mountaines, nigh the chiefe City thereof, called alſo *Succuir*, whoſe figure and deſcription divers other Authors have followed. *Trincavell* in his firſt Booke and 12. Chapter, of the compoſition of Medicines, relateth alſo, that a Merchant who had formerly beene an Apothecarie, and reſident in *Perſia* a long time, did report unto him, that there grew true Rubarbe in great abundance, upon the hilly places in *Perſia*, and that it was carried from thence into *Syria* and *Egypt*, and from thence into divers other Countries of the world: but aſſuredly that Rubarb, which is uſed now adayes in all the world, I am ſure in all the Chriſtian Countries of this part of the world, commeth chiefly from the Country of *China* in the East-Indies, and hath beene brought by Arabian, Turky, and other Merchants, in former times from thence over land by Caravans: (as they call them,) that is a number of Merchants and others, having Camels laden with it, and

4. *Rhabarbarum & Ponticum genuinum officinarum.*
The true Rubarbe and Rhapanticke of China, and the sheps.

5. *Rha Ponticum Enulæ folio latiore,*
The broader Elecampane leafed Rubarbe.

and all other manner of drugges and spices there to be had, wherewith they served all this other part of the world) unto *Cairo* and *Alexandria* in *Egypt*, *Damasco*, and *Tripoli* in *Syria*, and from thence (as from the Store-houses) into other Countries: but now since the passage into the East-Indies by Sea hath beene knowne, and that it hath beene brought unto us that way, there hath little or none beene brought by the Caravans over land, as in the former times. The forme of the roote, as all know that have seene and observed it, is somewhat great, round, and long withall for the most part, yet there are smaller and shorter peeces, as well as the greater that come together: whose colour on the outside is not all alike, no more than the substance within, for still some is better coloured and sounder than other: the best is firme and somewhat heavy, not spungy and light, somewhat browne, but fresh on the outside, without many blackish (which are suspitious places, where oftentimes being broken it is rotten, corrupted and naught, I say many, for the best peeces have sometimes some) spots, which doe not runne farre inward, and if they doe yet notwithstanding, the rest is excellent good, and not to be refused for a little bad, which must bee cut away as not fit, or at least not so fit to be used as the better, which is very much discoloured with flesh-coloured veines running thorow it, bitter in taste, and somewhat aromaticall in smell, especially if it bee fresh, and causing the spittle to be yellow, being a little chewed in the mouth. These properties belonging to the true Rubarbe, being so manifestly to be seene and discerned in the rootes of the former kinde, (excepting onely those things which the nature of the Climate produceth) may so reasonably perswade any of reasonable ingenuity, that the former is the same true Rubarbe with this, and a very Dock proper to the Country of *China*, and peradventure to some other Countries besides also. And if tryall were made thereof in some hotter and dryer Countries, of our forraine Plantations abroad (as I have of late to divers of them put it in practise) I verily beleeve, it would come much nearer to the other qualities of the true China Rubarbe than it doth, and is wanting in ours, according to the heate and climate thereof, wherein it is planted. This I thought good to intimate here, both to shew the correspondence of this Rubarbe of our English groweth, with that of the Indies, which is more probable to be a Docke of that Country, than any such plant as *Matthiolus* setteth it out for, both by figure and description: and besides further to excite some more of our Nation, if there be any ingenuity in them, to make the tryall by planting it in sundry other the hotter Countries, what effects it will procure, and how much it will better our English breeding: The true Rhapontick which hath formerly come to us with Rubarbe (and not that false kind of the great Centory rootes) is onely the lesser and longer peeces of the rootes of the true Rubarbe, whose figure is set forth with the other.

5. *Rhaponticum Enulæ folio latiore.* The broader Elecampane leafed Rubarb.

I have adjoyned this and the next plant, for the names sake onely (as I said before) because *Lobel* hath so named and referred them: but to another place they might be more truely referred in my judgement, and that is unto the Iaceus Knapweeds, or *Centaurium majus* great Centory, both for the likenesse of flower and seede, although the scales of the head be different; yet at this time take the description of them in this place: It hath diverse leaves rising from the roote, somewhat large and long, yet nothing so large as the leaves of Elecampane, greenish on the upper

upperside, and grayish or white and woolly underneath, like therein unto the leaves of Elecampane, every one standing on his owne stalke, broadest at the bottome, and pointed at the end, and dented about the edges; from among which riseth up, a reasonable bigge round stalke, about halfe a yard or 2 foote high, bearing at the toppe thereof one great scalye head, consisting of very broad and loose or open browne scales; at the first shew representing a small Artichoke head, but that the scales doe not stand close together, but are much more open and loose, especially after the flower is past; which standeth in the middle, composed of many blewish red or purple threades or thrumes, very delicate to behold: after which come blackish round and long seede, very like unto the seede of a Iacea or great Centorie, but a little longer and not altogether so thicke: the root is somewhat long and thicke, blackish on the outside, and of a deadish colour on the inside, more loose and spongye than either any Docke or great Centory, which hath in former times beene used among the Apothecaries for *Rha Ponticum*.

6. *Rhaponticum angusti folium.* The narrow Elecampane leafed Rubarbe.

6. *Rha Ponticum alterum angustifolium.* The narrower Elecampane leafed Rubarbe.

There is small difference betweene this and the last described, but onely in the leaves, which are alittle narrower and longer then it, being as hoary white underneth and greene above as the other; and a little unevenly waved on the edges: the head and flowers are a like but a little larger, and so is the roote, so that it is very likely, the naturall place of their growings, causeth the chiefest difference betweene them.

The Place.

The first groweth about *Lausanna* in *Savoy* as *Tragus* saith, but only in gardens with us: the second naturally upon the hils not far from *Caria* in *Germany*, as also neere *Friburg* in *Switserland*, and on the mountaines in *Austria*. The third as it is reported grew in *Thracia*, and from thence brought to *Prosper Alpinus*, at *Padoa*, from whence some Apothecaryes in *Venice* had it: and Master Doctor *Matthew Lister*, one of the Kings Physitions being in *Venice*, obtained 3 or 4 seedes, which he sent me with some other seedes that he procured; and with me (as I thinke the first in this Land) they sprung up grew and seeded within two or three yeares, and from them, both I, and many other my friends, as well in England as beyond Sea have bin furnished. The fourth groweth chiefely as I sayd in *China*, or *Cataya* (for they are held to be but one Countery) as *Matthiolus* his *Persian Merchant* saith, and in the Mountaines of *Persia*, if ye will beleeve *Trincavel* his Apothecary, turned merchant, as is before declared: The fift groweth both on Mount *Baldus*, as I am enformed, neere *Verona* in *Italy*, and also upon the hils in *Switserland*, and in some craggie places in Savoy; though *Lobel* saith the seede thereof, was first brought out of *Turkie*, and that the last was brought out of *Italy*.

The Time.

All these sorts of Rubarbe doe grow with us in our gardens and doe flower, about the beginning or middle of June, and the seede is ripe in July. The rootes that are to be dryed and kept all the yeare following, are not to be taken up, before the stalke and leaves be quite withered or gone, and that is not untill about the middle or end of October; for if they be taken either alittle before the leaves doe spring, or when they are sprung up, the rootes will not have halfe so good a colour in them.

The Names.

The Greekes doe call the Dockes λάπαθον *Lapathum*, from λαπίπειν, or λαπάζειν, *exinanire, quod foliorum decoctum alvum emolliat, lenit & exinaniat*, in Latine *Rumex*, which is rather attributed to those Dockes are sowen, than to those are wilde, and chiefely unto Sorrell, because the leaves are used to be eaten or sucked, to coole the heate and quench the thirst, even as children doe sucke a teate, which was called among the old Romans *Rumem*, *Galen* in 2 *Alimentor.* saith *Lapathum* might be called a wilde Beete, it is so like unto the garden kinde, but because the Beete is more pleasant than the Docke, no man but will more willingly eate the Beete. The first here, is called of most men *Lapathum sativum, Patientia & Rhabarbarum Monachorum*, meaning those that commented upon *Mesues*: The second *Hippolapathum rotundi folium*, to put a difference betweene it, and the former garden Docke, which is also called *Hippolapathum*, it is also called of *Lobel* and others *Pseudo Rha recentiorum*, of *Clusius* and *Camerarius*, *Lapathum rotundifolium*, and of *Cordus in histor. Plantar. lib. 4. fol. 201. Rhabarbaricum*, in *English* great round leafed Dock, or bastard Rubarb. The third *Alpinus* calleth *Rhaponticum Thracicum*, because as is aforesaid, it was brought him out of that Country of *Thracia*, and in his tractate thereupon he will by no meanes bee perswaded that it is true Rubarbe, but so entituleth it, and the rather because he onely saw the rootes while they were young as his figure sheweth, but not so great as the true Rubarbe, such as I have expressed: neither do I think he pared away the outer barke or skin of the rootes to make the inside appeare the fairer, but as agreat many with us also have done, dryed the roots as they tooke them out of the ground, and then they shewed both blacke and small. Master Doctor *Lyster* also sent it me by the name of *Rhaponticum verum*, but because the is so like, both in colour, forme, and quality unto the true Rubarbe, and the small long rootes unto the *Rha Ponticum* or Rubarbe of Pontus, I account it true Rubarbe and *Anguilara* saith these are both one, the difference consisting chiefely in the greater or lesser long peeces, and to the climate, which giveth the true Rubarbe, or Rubarbe

of Pontus, a more ſolid and firme ſubſtance, a more bitter taſte and aromaticall ſmell, and an aſtringent or corroborating quality after the purging, all which are the effects from the climate, as being hotter and dryer, and therefore giving unto the rootes firmeneſſe bitterneſſe and aſtriction, which are all wanting in ſome ſort in the rootes of this Rubarbe growing with us: yet it hath the purging quality, onely in a double proportion and the forme and colour ſo like the true as may be, which cauſeth it to be had in reſpect and good uſe, beſides the beauty of the plant it ſelfe, and may well be called Engliſh Rubarbe, to diſtinguiſh it from that which cometh from China. The fourth is thought by the moſt and beſt writers to be the *Rha* or *Rheum* of *Dioſcorides*, *Galen* and the other ancient writers, which was diverſly named in our former times, as *Rha Barbarum*, *Rha Turcicum*, *Rha Ponticum*, and *Rha Scenicum* or *Sceniticum* many thinking them to be ſeverall things, becauſe of the names impoſed, as comming from ſeverall places, when as the goodneſſe or badneſſe, newneſſe or oldneſſe of the rootes might cauſe this variation. For the Arabians did call it Raved or Raiwand Sceni, or Seni as ſome write, but I finde it ſhould be rather Cini, which corruptly the Portugalls, firſt pronounced Chini, according to their Language, and from them all our parts of the world, doe call that Country China, which was formerly called *Sinarum regio*: Much controverſie there is among writers, concerning the name *Rhabarbarum* or *Barbaricum*: Firſt for the name *Rha barbarum* the *Rha* of Barbaria, what this name of Barbaria ſhould ſignifie, ſome thinking it to be that part of Africa, where old Carthage ſtood, as *Fuſchius* who ſaith *lib. 1. de compoſitione medicamentorum*, that the ſouldiers that went with the Emperour *Charles* to Tunis, brought true Rubarbe of that Country home with them: others thinke that it was brought from Barbarum a City in India, above the River Indus, and that *Rha-Indicum* and *Barbaricum* were all one: and others thought that it came from an Iſland in the red Sea called Barbaria, whereunto ſhippes for Merchandiſe doe much reſort: but *Matthiolus* refuſing all theſe opinions, would faine induce his owne, that Barbaria being often mentioned in *Galen* as *lib. 4. c. 6. de tuenda ſanitate*, that Ginger was brought out of Barbaria, which *Dioſcorides* and *Plinye* ſay groweth among the *Troglodites*, and from them brought to us: and againe he ſaith that *Glans Vnguentaria* or *Nux Ben*, is brought out of the Country of Barbaria, which *Dioſcorides* ſaith groweth in *Æthiopia*, in which Country the Troglodites doe inhabite, and *Plinye lib. 12. c. 21.* ſaith it groweth with the Troglodites. *Plinye* alſo in the ſame booke and 19 chapter ſhewing the cauſes of the ſcarſity of Cinamon in his dayes, ſaith it was becauſe the Barbarians in their furie burnt the woods where it grew: whereby as *Matthiolus* ſaith, it may plainely appeare, that the name Barbaria, can ſignifie no other Country than the Troglodites of Ethiopia: which as *Strabo* in his fifteenth booke of Geography ſaith, is as plentifull in ſpices as the South parts of India: but by the trafficke of our Merchants in theſe times, there is no Rubarbe growing in thoſe parts that they can heare of; and if I might gheſſe as formerly others have done, I would ſay that the name *Barbarum* was joyned with *Rha*, in that both Græcians and Romanes accounted all remote nations from them to be Barbarians. Now for the names, *Scenicum* and *Sceniticum*; *Meſues* ſaith it is all one with *Indicum*, whoſe ſaying *Matthiolus* contradicteth, ſaying it ſhould be rather *Sinicum* which is a Country of India, for the *Scenita* be a people of the deſart of Arabia, and are utterly deſtitute of all manner of Spice and drugges of worth. The name of *Rha Turcicum* and *Ponticum*, is thought alſo to be all one, becauſe ſome Turkiſh Merchants brought it from Pontus: and for the word *Rha*, it tooke the name as ſome ſuppoſe from the River *Rha*, now ſayd to be called *Volga* in *Pontus*, where thoſe rootes did grow: but I rather thinke it came from the Arabians *Reiwand* or *Raiwand*: whether the *Rha Barbarum* and *Rha Ponticum*, be one thing or diverſe, is next to be ſpoken of: *Matthiolus* contendeth againſt *Ruellius* and others, with many words and reaſons to proove them differing: Firſt that *Rha Ponticum* as *Dioſcorides* and *Galen* deſcribe them, are without ſent; then that Rubarbe hath in it a purging quality by nature, which *Rha Ponticum* hath not, being ſayd by *Dioſcorides* and *Galen* to have rather an aſtringent quality therein: and that it is not bitter as Rubarbe, but rather ſomewhat ſharpe & quicke; it is not ſolide and heavie, but ſpongie and light; it is not drye but tough or pliant; it is not yellow as Rubarbe, but blacke: by which reaſons he is perſwaded that they differ, and that *Ruellius* was in a great error to ſay, that they differed onely in the ſent, which hapned by the coldneſſe of the Country, where *Rha Ponticum* grew: *Matthiolus* alſo ſaith that *Manardus Ferrarienſis*, having beene formerly of that opinion, was afterward otherwiſe perſwaded, upon ſight of the true *Rha Ponticum*, that was brought out of *Muſcovia*, agreeing in all things with that of *Dioſcorides*, as the ſayd *Manardus* relateth, in the laſt Epiſtle of the firſt booke written to *Leonicenus*; Surely this we may well ſay, that *Dioſcorides* and *Galen* never ſaw or knew ſuch Rubarbe, as we have brought us now a dayes, and I am halfe in doubt that wee in theſe times cannot well tell what ſort of *Rha Phonticum* that was of *Dioſcorides* and *Galen*; for if we ſcanne the text of *Dioſcorides* a little, we ſhall finde him to ſay, that the *Rha* or *Reum* called by the name *Rha Ponticum*, is a roote like unto the roote of the great Centory, (and if it be but like, it cannot be the ſame) but ſmaller, on the outſide of a blackiſh red colour ſpongie, light and without ſent, and that it grew in the Countries beyond the *Boſphorus*: the beſt as hee ſaith is that which is ſound, without rottenneſſe or worme holes, and doth ſticke in the mouth with a little aſtriction in the taſting, and giveth a yellow colour in the chewing, tending to a Saffron colour: this compariſon of the roote to be blacke like the roote of great Centorie, but leſſe, and of a redder colour, ſpongie and without ſent, cannot agree with any of the qualities of that *Raphonticum*, we have formerly ſeene brought unto us, much leſſe unto the Rubarbe that wee have now, and for the rootes of the great Centory, they are very long and great, almoſt like unto a great Parſneppe roote, but blacke on the outſide and very rugged; which made thoſe in ancient times, and unto our dayes ſtill obſtinately to take the very rootes of great Centory, and uſe them as if they had beene true *Rha Ponticum*: So that to aſſoyle this doubt wee may well ſay that it is probable, that thoſe rootes which were uſually brought in thoſe times, when *Dioſcorides* and *Galen* lived, were the ſmall rootes, or the long branches of the greater rootes of Rubarbe, and not dreſſed or pared, that is the outer skinnes taken away, which are blackiſh being dryed, and not ſuch great thicke rootes as we have now a dayes, and that they were adulterate, as *Galen* mentioneth ſome were in his time, that is, that the rootes were boyled or ſteeped in water for ſome time, to take out the ſtrongeſt juyce, and the rootes dryed up againe, which then it is probable, might be of a blackiſh red colour and ſpongie, light, and without ſent, not having any purging quality, but onely an aſtringent left in them: for I doe verily thinke that *Rha Ponticum* (ſuch as I have ſeene, hath beene brought over to us, being in colour taſte and qualitie, the ſame with Rubarbe, but in ſmaller and longer peeces) is either but a ſmall kinde of Rubarbe, growing not bigger in thoſe

places

places, from whence it is brought, or that it is but the bigger branches of the great rootes of Rubarbe, the colour and properties as I sayd being so like. The fift and last, *Lobel* and *Pena* have onely set forth, under the titles before expressed, whom all other writers that have mentioned them have followed: and it is probable that the Turkes, with whom as it should seeme it is called *Rhaponticum*, used it in steede of the true *Rhaponticum* of *Dioscorides*, and to note the difference betweene them, *Lobel* addeth *Helenii folio*. But some of latter times have called it *Centaurium helenii folio*, for by that name, I received the seedes thereof from beyond Sea: but that quality yellow, in the true *Rhaponticum* of *Dioscorides*, and not to be found, either in this or the great Centory, doth easily convince their obstinacy, that will still persist in an opinion so contrary to truth.

The Vertues.

The leaves of these kindes of Dockes, boyled in broth, doe a little (some more, some lesse) mollifie or loosen the belly; but the rootes have a more opening or purging quality in them, and some more or lesse also according to their quality. The first round leafed one, somewhat more than the garden Patience or Monkes Rubarbe, although weaker than the next thereunto by much: The Bastard Rubarbe hath almost worne out the use of the Patience or Monks Rubarbe, it is grown so common & plentiful; so that unlesse some that are wilful & will not use it, but Patience, or that are too gripple, not to be at any cost to have the best, or have little care what they use, but take what commeth next to hand, there is (or should be) none, but will use it in their diet Beere, or Ale, or in decoctions to purge the Liver, and clense the blood, before the other; yet that I may relate the properties that are found therein (that thereby you may be assured this Bastard Rubarbe, will doe the same more effectually) are these. *Tragus* saith, a dramme of the dryed rootes of the first sort called of some Monkes Rubarbe, with a scruple of Ginger, made into pouder, and taken fasting, in a draught or messe of warme broth, purgeth choler and flegme downeward very gently, and safely without danger; the seede thereof contrarily doth binde the belly, and thereby helpeth to stay any sort of laske, or bloody flixe: the distilled water thereof is very profitably used to heale scabbes, as also foule ulcerous sores, and to allay the inflammations of them. The juyce of the leaves or rootes or the decoction of them in Vinegar, is of very many used as a most effectuall remedie to heale all scabbes and running sores. The round leafed Docke or Bastard Rubarbe, hath as I sayd all the properties of Monkes Rubarbe, but more effectuall, both for inward and outward diseases, and moreover healeth the sting of Scorpions; and as *Dioscorides* saith, he that shall take the roote thereof, shall feele no paine after the stinging: the decoction thereof with Vinegar, stilled or dropped into the eares taketh away the paines, gargled in the mouth, taketh away tooth-ach, and being drunke healeth the Iaundise: the seed thereof taken, easeth the gnawing and griping paines of the stomacke, and taketh away the loathing thereof unto meate, which commeth by vitious sharpe humors gathered to the mouth of the stomacke: the roote thereof, helpeth the ruggednesse of the nayles, and being boyled in wine, it helpeth the swellings of the throate, called the Kings Evill, as also when the kernells of the eares be swolne: and helpeth them that are troubled with the stone; provoketh Vrine, and helpeth the dimnesse of the sight. The rootes of this Bastard Rubarbe, is used in opening and purging Diet drinkes, or in Diet Beere or Ale, with other things, to open the Liver, and clense the blood, and to allay the heate thereof. The properties of the other round leafed Docke, which we have entituled English Rubarbe, are the same with the former, but much more effectuall, and hath all the properties of the true Indian Rubarbe, excepting the force in purging, which is but of halfe the strength thereof, and therefore needeth, as I sayd, to be taken in double quantitie, and likewise hath not that bitternesse or astriction, in other things it worketh almost in an equall quality: The true Indian Rubarbe is an excellent and safe medecine, to purge the body of choler and flegme, being either taken of it selfe, made into powder, and drunke in a draught of white wine, or steeped therein all night, and taken fasting, or put among other purgers as shall be thought convenient, clensing the stomacke and Liver, and thereby the blood, opening obstructions, and helping those griefes that come thereof, as the Iaundise, the Dropsie, the swelling of the spleene, tertian and day agues, and the pricking paine of the sides, as also stayeth the spitting of blood, comming as well from the Lunges, as any other part: the powder taken with Cassia dissolved, and a little washt Venice Turpentine, clenseth the Reines, and helpeth to strengthen them afterwards, and is very effectuall to stay the *Gonorrhœa* or running of the reines. It is also given for the paines and swellings in the head, for those that are troubled with melancholy, and helpeth the Sciatica and Goute, and the paines of the Crampe: for which purpose one dramme or two, of the extract thereof, made in this manner, and given in broth doth work effectually. Let a sufficient quantitie of Rubarbe be steeped in Cinamon water, which being strongly pressed forth, let it be stilled in a glasse Limbeck *in balneo*, untill the water be drawne forth, and the substance remaining, be of the thicknesse of honey, which keepe in a close covered pot or glasse, for the use aforesaid. The powder of Rubarbe, taken with a little Mumia and Madder rootes, in some red wine, dissolveth congealed or clotted blood in the body, happening by any fall, or bruise, and healeth burstings, and broken parts, as well inward as outward; the oyle likewise wherein it hath beene boyled, being anointed worketh the same effect: It helpeth the yexing, or hickocke, and all fluxes of the belly, if it be toasted or dryed a little by the fire, but much more if it be more roasted to be halfe burnt, and taken in wine after this manner: Take a pint of good Claret wine, and burne it with some Sugar, and a toppe or two of Rosemary, into which put a dramme and a halfe of Rubarbe torrified, or roasted by the fire as is aforesaid, and one dramme of *Chebul Myrobalanes*, a little broken or bruised, let these stand in the burnt wine all night by the fire, and straine it forth in the morning, giving this at two times fasting, which will in three or foure dayes stay any scowring or laxe, strengthning the stomack and inward parts afterwards. It is used to heale those Vlcers that happen in the eyes, and eye lids, being steeped and strayned, as also to asswage the tumors and allay the inflammations, and applyed with honey or cute, that is to say boyled wine, it taketh away all blacke and blew spots, or markes that happen therein. This Rubarbe is so gentle a medicine, that it may be given to all sorts of gentle constitutions, (but in robustious or strong bodies it purgeth little or nothing) whether they be children, or women with childe, and that safely at all times of the yeare: the whey of milke, but especially of Goates milke, is the best and most accommodate liquor, wherein it is to be steeped & taken, or else in white wine, and it worketh thereby the more effectually in opening obstructions, and in purging the stomacke and Liver, from choler and flegme; and most doe use a little Indian Spiknard as the best corrector thereof: The other two last sorts of Rubarbe are not much or often used, and their qualities are more astringent then opening, little experience having beene made with us, to shew you more of them.

CHAP. III.

1. *Colocynthis Vulgaris. Coloquintida* or the bitter Gourde.

THis bitter Gourd runneth with his branches upon the ground, as a Gourd or Cowcumber doth, having diverse rough hairy leaves thereon, every one by it selfe, which are lesser and somewhat longer, than those of the Cowcumber, and more divided or cut in at the edges, most usualy into five or seaven parts, each partition also dented in, or notched round about, the leaves of the forme doe very much resemble those of the Citrull Cowcumber; at the joynts with the leaves come forth the flowers which are yellow, of the same fashion with them, but somewhat smaller, and also small tendrells or twining stalkes as the Vine hath, wherewith it windeth about any plants, or other things that stand next unto it, thereby strangling or killing them: the fruite that followeth is small and round as a ball, many of them not much bigger than a great Crabbe or Peare-maine, greene at the first on the outside, and afterwards growing to be of a browne yellow, which shell is as hard as any Pompion or Gourde; and is usually pared away while it is greene, the substance under it being white, very light, spongie, or loose, and of an extreame bitter taste, almost indurable, and provoking loathing or casting in many that taste it; having therein sixe orders or rowes of white hard seede, of the bignesse of Cowcumber seede, but fuller harder and rounder; and nothing so bitter or forceable in working, as the white pulpe or substance is: the roote is not very great but stringie, and quickly perishing with the first cold approach of winter.

Colocynthis Pomiformis & Pyriformis.
The round and Peare fashioned bitter Gourde.

2. *Colocynthis major rotunda.* The greater Coloquintida, or bitter Gourde.

This sort of bitter Gourde differeth not from the former, either in leafe or flower or manner of growing, but onely in the fruite, which groweth to be twice as big as the former, and as round; greene at the first, but of a pale yellow when it is ripe, whose pulpe or inner substance is also white and spongie, and in a manner as bitter, with such like seedes as are in the former; and disposed for the most part into eight rowes, or partitions: the roote perisheth as the former.

3. *Colocynthis oblonga.* The long bitter Gourde.

This kind of Colloquintida differeth not from the last great sort, for either manner of growing, forme of the leaves or flowers, but onely in the fruit, which is as great almost as the last, but is not so spherical or round like a ball, but somewhat long with the roundnesse, and being a little flat at the head; the shell or outer rinde thereof, is greene at the first, and afterwards groweth to be whitish, with many spots thereon: this is also bitter but not so extreame as the first.

4. *Colocynthis pyriformis.* Peare-fashioned Coloquintida or bitter Gourd.

This Peare-fashioned kinde, hath many trayling rough branches like the first, and such like long and round pointed leaves, cut in also on the edges but not so deepely, neither so large or great, and of a darker greene colour; at the joynts with the leaves, come forth the flowers, being yellow, but smaller than the first, and likewise small twining claspers as the other, which taketh hold on every thing, that it may comprehend: the fruite is small, not bigger than a large Catherine Peare, and many smaller, yet all fashioned like a Peare, the head whereof is somewhat rounder than a Peare; the shell or outward rinde whereof is greene, but whiter when it is ripe with many long lines or strakes thereon; the inner pulpe or substance, being almost as white, light, and spongie but lesse bitter than any of the rest, at the least in those have growne in my garden, having but foure rowes or rankes of white seede like the rest.

The Place.

The first commeth as a Merchandise to us from *Arabia, Egypt,* and *Syria,* yet is nourished up in the gardens of those that are curious. The other sorts some have beene found in *Spaine* and *Italy,* but we sow their seede every yeare in our gardens, if wee be desirous to see them, for they never come up of their owne sowing.

The Time.

They flower late, and so doe they ripen with their fruit, which unlesse the yeare proove kindly, hardly come to perfection, untill it be very late: but the first worst of all.

The Names.

The first as that which onely was knowen, or at least mentioned by the ancient writers, is called in Greeke κολοκυνθις *Colocynthis*, and of some συκὲ πικρὲ *Sicua picra quasi Cucumis amarus*, the bitter Cowcumber: *Hippocrates* calleth it συκύωνις & σίκυος, of the Latines *Colocynthis*, and *Cucurbita sylvestris*, in the Apothecaries shops *Coloquintida*; and we in English, either *Coloquintida*, or the bitter Gourde, which you will. The rest of them have

have their names in their titles, as moſt writers do cal them, that mention them, and as much as can be ſaid of them, onely *Tragus* calleth the *Pyriformis*, *Colocynthis Germanica*, becauſe it is leſſe dangerous, and more eaſie to grow in theſe colder Countries. *Beſlerus* that ſet out the Biſhop of *Eyſtot* in *Germany* his garden, calleth both the Peare faſhioned *Colloquintida*, and the greater that beareth round fruite like an Apple *Pſeudo colocynthides*. It is the ſame that in the Scripture in the 2 of *Kings* and the 4. chapter, is called a wild Vine, whereof one gathered wilde Gourds: the Arabians call it *Chendell* and *Handal*, and thereof *Trochiſci Alhandal quaſi ex Colocynthide* came.

The Vertues.

The inner white ſoft ſpongie ſubſtance, under the outer ſhell or rinde, is that onely without any ſeede, which is uſed; and being extreame bitter purgeth violently, even to excoriation and blood oftentimes, eſpecially in tender bodies: but the doſe or quantity which was given by the ancients, and is yet continued in the hotter climates of *Europe*, (their dry conſtitutions better enduring it) doth farre exceede the proportion, that our moiſter bodies, are poſſible able to endure without manifeſt danger, unleſſe it be in thoſe that are robuſtious, and uſed to continuall ſtrong labour: for *Dioſcorides* appointeth 4. *oboli*, that is 2. ſcruples or 40. graines, of the inner ſubſtance to be made with honey, Myrrhe and water into pills, when our Phyſitians dare ſcarſe give one *obolus*, that is 10 graines or halfe a ſcruple; yea they thinke halfe this quantity, mixed among other purgers, is a ſtrong purgation, and it is ſo found by dayly experience, and therefore to avoyd the danger that often happeneth, being a great enemy to the ſtomacke and bowels, although *Pliny* ſaith the contrary, it is beſt to correct the violence thereof with oyle of Roſes, *Gum Tragacantha* and *Bdellium*, as it is appointed in the *Trochiſci Alhandall*, which lenifieth the ſharpeneſſe thereof by the gummes, and cauſeth it by the lubricity of the oyle, to paſſe the ſooner away: This is the ſafeſt way to take it inwardly at the mouth, the ſubſtance of the ſeede in powder, or the decoction, is not of halfe that force, as the pulpe it ſelfe, ſo found by *Lobels* experience, and others; if the ſeedes be taken forth out of an apple, and it overcruſted with loame or clay, and ſome Vinegar and Niter put to be heated therein, the liquor doth eaſe the paines of the tooth-ach, and faſteneth looſe teeth, if they bee waſhed therewith: and if in an Apple ſo ordered, ſome old ſweete wine, or new boyled wine, be put to ſteepe for a day and a night (which ſome have falſely interpreted that the Apple, ſhould be ſteeped in the wine) and the wine ſtrayned forth to be brunke warme, purgeth the body more gently. *Dioſcorides* order was to boyle the wine or honied water, in the Apple, and let it ſtand open all night to coole in the ayre: It purgeth ſtrongly flegme and choler, and other tough or clammie groſſe humors, from the further or more remote parts, as the braines, ſinewes, muſcles and joynts, as alſo from the lunges and breaſt, and from the veynes alſo; and is therefore very helpefull (if it be wiſely applyed) to all the diſeaſes that happen to thoſe parts, as all old paines in the head, the meagrime that is invêrate; the falling ſickneſs, the apoplexie, the turning or ſwimming diſſines in the head, the watring of the eyes, the could Gout, the Sciatica or hipgoute, and other paines of the joyntes and ſinewes: it is helpfull alſo for the Iaundiſe, and for putride or rotten fevers, for an old cough, the ſtraightneſſe of the cheſt, ſhortneſſe of the breath, and above all theſe, it helpeth the cholicke, whether it proceede from flegme or from winde, as alſo the dropſie, being taken either in gliſters, or ſuppoſitories: it is not good to be given to the aged or weake, but to the ſtrong, young, and luſty bodies; neither to women with childe, for if it bee applyed to the wombe it deſtroyeth the childe. Being ſteeped in vinegar, it taketh away all diſcolourings of the skinne, as morphew, and leprye, dry ſcurfe and ſcabbes, if the places affected, be often rubbed therewith. Pure oyle being put into an hollowed or clenſed apple of Coloquintida, and ſet upon warme aſhes or embers, to be throughly heated, both maketh the haire blacke, that was not ſo afore, ſtayeth it from falling that is diſpoſed thereunto, and keepeth it long from growing gray: the ſame oyle dropped into the eares, taketh away the paine, and ſinging noyſe of them: and mixed with a little Oxegall and anointed, on the belly warme, killeth the wormes and cauſeth them to avoyde, and oftentimes purgeth the belly, being onely ſo applyed: *Galen* ſaith, that the bitterneſſe thereof, which might be availeable for many griefes, ſuffereth it not to exerciſe them, but is overcome by the vehement purging quality it hath: If when it is taken it ſhould worke overmuch, and bring forth excoriations and blood, to the danger of the patient, a decoction of Rayſins of the Sunne, given with Oyle of ſweete Almonds, or the Oyle of Walnuts, mittigateth the violence thereof. Rats and mice doe much delight to eate ſeedes, and the ſeede hereof alſo: if therefore they be ſet, or layd, in diverſe corners of the houſe, troubled with them, it will kill and deſtroy them all: The decoction of them alſo ſprinkled in Chambers is ſayd to kill fleaes: The other ſorts of *Coloquintida* are ſeldome or never uſed with us, yet *Tragus* commendeth the uſe of *Colocynthis Pyriformis*, as being leſſe bitter and violent in purging, and therefore ſafer to bee taken inwardly.

CHAP. IIII.

Cucumis agreſtis ſive Aſininus. The wilde or ſpirting Cowcumber.

THis wilde Cowcumber (as well as the former wilde or bitter Gourde, differing from all the reſt of their families) is fit to be entreated of apart by it ſelfe, as alſo to be next remembred, being as violent in all the qualities thereof, as the former, or rather more: It creepeth on the ground like unto the former, with many rough trailing branches, whereon are ſet very rugged and rough ill coloured greene leaves; ſomewhat whitiſh underneath; little or nothing divided or parted at the edges; at the joynts betweene the branches and the leaves, come forth ſmall pale yellow flowers, opening into five leaves, at the end of ſmall greene heads for the moſt part, as all other ſorts of Gourds, Cowcumbers, &c. doe: but thoſe that have flowers onely without ſuch heads, fall away quickly without fruite; for that greene head, as in all others, groweth to be the fruite, which is ſmall, rough, round and long, and ſomewhat of a grayiſh greene, when they are ripe; the ſhort rough foote ſtalkes, being crooked, and bending the fruite downewards, which with a little touch, when they are throughly ripe, will quickely open at the end next the ſtalke, and ſprirt out the juyce, and ſome ſeede, into their faces or hands, or other places againſt

Cucumis Sylvestris.
The Wilde Cowcumber.

it that touched it: the seede being ripe, is blackish and somewhat rugged, but otherwise white, lying in a greene moyst substance, very bitter and loathsome to taste: the roote is white, and firme, thicker, and shorter, than in any other sort of Gourde or Cowcumber, with some fibres thereat, very bitter as is all the rest of the plant.

The Place.

It groweth naturally wilde in Italy, as *Matthiolus* saith, in many places by the way sides; and in untilled and mooriſh places, we onely preserve it in gardens, throughout the whole Land, where it is used.

The Time.

The roote hereof doth often abide in the ground, all the winter long, if it stand reasonably defended, or the ground be rich with soyling, shooting then forth leaves betimes: in other colder grounds not defended, they perish every yeare: the fruite is usually ripe in August.

The Names.

It is called in Greeke ὄνυς ἄγριος, in Latine *Cucumer & Cucumis agrestis*, or *asininus*, as many writers doe, or *anguinus*, as *Turner* and *Cordus*, but not properly: *Matthiolus*, *Tragus*, *Dodonæus*, and some others, call it *Cucumis sylvestris*. The dryed or hardned juyce of the fruit, is called, *Elaterium*. *Gaza* translating *Theophrastus* calleth it *Agitatorium*.

The Vertues.

The rootes hereof and the dryed juyce of the fruite, artificially and not rudely prepared, which is called *Elaterium*, are chiefely used in medicines and scarse any other part: Concerning *Elaterium*, there is difference betweene *Theophrastus*, and *Dioscorides*, of the age, and durability, and in extinguishing or encreasing the flame of a lampe or candle. *Theophrastus* in the ninth booke and foureteenth chapter of his history of Plants, saith *Elaterium* is the most durable medicine of all others, and that the best, is the eldest; for as he saith, a Physition of sufficient credit, kept by him some *Elaterium*, that was 200 yeares old, which he received of one as a gift; which notwithstanding the age, was of wonderfull vertue, and untill it was 50 yeares old, it was so abundant in humidity, that put to the flame of a lampe or candle, it would put it out. And *Dioscorides* saith that *Elaterium*, is fit to be used as a purging medicine, from two yeares old, untill it be tenne, and that is the best, which being put to the flame of a lampe or candle, will make it burne the more bright. Vnto *Theophrastus*, *Pliny* subscribeth the same thing, and saith that it is found true by experience, that untill it be 50 yeares old, it will cause a lampe or candle, to spertle hither and thither, before it put it out; whereupon *Matthiolus* giving credit to the testimonies of *Theophrastus* and *Pliny*, is perswaded that the text of *Dioscorides* is corrupted, but I verily beleeve they both say true, the reconciliation of their repugnancy, being onely in the manner of making of *Elaterium*. *Theophrastus* his *Elaterium* being greene, as I suppose, and made of the substance of the inner pulpe of the fruite; yet in the tenth chapter of his fourth booke, he saith it is made of the seede, which I never saw, or heard of any to be so made with us; and that of *Dioscorides* being white, (which as he saith himself is the best, and condemning the greene,) made onely of the more thinne watery, and wheyish part: *Mesues* also saith that the best is white: my selfe having made of both sorts can testifie, that *Elaterium*, made of the substance of the fruite; although very gently pressed through a fine sive, will be greene, and continue moyst many yeares, after it is evaporated and dryed up hard, relenting with the ayre, and will require many yeares to consume the humidity therein, when as the other sort, made of the whitish, wheyish liquour, that droppeth through the sive of it owne accord, in the cutting of the fruite, without any touch of pressing, will be white when it is dryed, and so remaine white, hard and drye, for many yeares, unlesse it be left open to the moyst ayre, or stand in a moyst place to cause it to relent: the greene sort likewise is not of halfe, that force or violence, to purge either upward or downeward, as the white *Elaterium*; whereof one graine weight dissolved in liquor, worketh forceably in any tender body; yea I have oftentimes seene, that halfe a graine weight put into a purging medicine, to quicken the weakenesse thereof, hath troubled the stomacke very much by castings, and much disquiet, and working also downeward with more violence, then it could bee thought the whole graine given of it selfe could doe. This narration although somewhat tedious, I was the more willing to declare, because I thinke none hath shewed it before, and my little experience may set an edge unto others, to polish that which I have here shewed you, but rough hewen. The dose or quantitie thereof taken at a time, *Dioscorides* saith is a whole *obolus*, and the least quantitie halfe an *obolus*, (some take the *obolus* to weigh 12 graines, but the most usuall is but 10 graines,) which sheweth as I sayd before, the great doses, which the ancients were wont to give of purgers in their medicines, which we dare not follow: It purgeth choler and flegme from all parts of the body, and as he saith, is the best medicine to purge those that are pursie and short winded: to procure a vomit, he adviseth to dissolve it in water, and with a fether dipped therein, to touch the lower part of the tongue, as low as you can; but milke or rather creame which is more unctuous, is fitter to give it in, for it will not suffer it to sticke to the tunicles of the stomacke, but will cause it slippe away the more speedily: it helpeth also the falling sickenesse, being put into the nostrels with milke, and mixed with honey and old oyle, it cureth the Kings evill, being annointed therewith: It bringeth downe womens courses that are stayed,

and

and killeth the birth if it be applyed to the secret parts: It purgeth clammie and watery humors from the joynts, and that ſtrongly: the juyce of the roote doth the ſame likewiſe, and therefore uſed in gliſters, or layd as a plaiſter or pultis, upon the place payned with the Sciatica, eaſeth the paines thereof, the ſame juyce of the roote, boyled with wormewood in water and oyle, cureth an inveterate megrime, if the temples be often bathed therewith, and ſome of the leaves and rootes, be beaten together, and layd as a pultis thereunto afterwards; the juyce of the roote with a little milke, caſt up into the noſtrels doth the ſame: for it wonderfully purgeth the braine from excrements, and healeth the evill ſavour of the noſtrills cauſed thereby: It cureth alſo the old paines of the head and the Epilepſie: and being mixed with Goates dung, and layde as a plaiſter upon any great or hard ſwellings, or kernells, it reſolveth them: The juice of the roote, as well as of the fruite (and ſo doth the decoction of them alſo, ſaith *Meſues*) being drunke doth helpe the dropſie, for they mightily draw forth watery humors, and the yellow Iaundiſe, and all obſtructions both of the liver & ſpleene: *Dioſcorides* alſo ſheweth this medecine to cure the dropſie. Take ſaith he halfe a pound of the rootes hereof, and being bruiſed, let it be put into three quarters of a pint of ſtrong wine, giving thereof three ounces, for 3 or 4 dayes together, untill the tumour be diſcerned, to be aboundantly waſted and fallen; which thing it worketh ſaith he, without any troubling of the ſtomacke: A few graines of *Elaterium* mixed with conſerve of Roſes, and ſome thereof taken will doe the like, and herewith *Caſtor Durantes* ſaith he cured many: The powder of the roote mixed with honey, and layd upon any fowle ſcarre in the skinne, doth attenuate it, and taketh away the markes or blew ſpots, that come upon bruiſing or blowes: the roote boyled or layde to ſteepe in ſtrong Vinegar, cureth the morphew and clenſeth the skinne of all foule ſpots, freckles, and other diſcolorings thereof; and the powder of the dryed roote ſaith *Dioſcorides*, clenſeth the face and skinne from all ſcurfe, and taketh away the blacke or ill colour from any ſcarre: the juyce of the leaves dropped into the eares, eaſeth them of the paines and noyſe therein, and helpeth the deafeneſſe: the decoction of the roote gargled in the mouth, taketh away the paines of the teeth; the powder of the roote mixed with honey, and put into old fores and ulcers, clenſeth them throughly, and thereby furthereth their healing wonderfully: Our Apothecaries doe moſt uſually take the roote of this wilde Cowcumber as a ſubſtitute for the roote of Coloquintida or the bitter Gourd, that not being ſo frequent or eaſie to be had as this.

CHAP. V.

Scammonia. Scamonye.

HAving ſhewed you in the two laſt Chapters, ſome purging plants that runne, or ſpread upon the ground, or clime up by thoſe things that are ſet by them: let me conjoyne ſome other the like, part growing naturally in our owne, and part in other Countries, and firſt of *Scamonye*, which is properly a *Convolvulus* or winding Bell flower, which we call Bindeweede: I will comprehend in this Chapter alſo, thoſe onely that in forme and force in working, come neereſt unto the true: the reſt that differ ſhall follow.

1. *Scammonia Syriaca legitima.* The true Scammonie.

3. *Convolvulus major albus.* The great white Bindeweed.

Scam-

1. *Scammonia Syriaca legitima.* The true *Scammonye.*

The thē true Scammony hath a long roote, of a darke aſh-colour on the outſide, and white within, and of the bigneſſe of an arme, (for ſuch hath beene brought us from *Tripoli*) with a pith in the middle thereof, and many fibres thereat, (which being dryed as *Matthiolus* ſaith, the pith taken out, ſeemed ſo like unto the rootes of *Turbith*, which are brought us, from the farre remote Eaſterne parts, none knowing what plant it is, nor whereunto it is like, ſome thinking it to be the roote of *Tripolium* or Sea-Starre-worte, which *Matthiolus* confuteth; others a kind of *Ferula* or *Ferulaceous* plant, altogether improbable, but that they are not ſo tough, but more brittle, that otherwiſe it might be thought, to be the right *Turbith* of the Apothecaryes ſhoppes) from whence ariſe many long, round, greene, branches, winding themſelves like a Bindeweede about ſtakes or trees, or any other herbes or things that ſtand next unto it, unto a good height without any claſping tendrells, like the true or wilde Vine: from the joynts of the branches, come forth the leaves, every one by it ſelfe, (yet I have ſeene dryed plants that have had two leaves one againſt another,) upon ſhort foote ſtalkes, ſomewhat broad at the bottome, with two corners next thereunto, and ſome alſo round that I have ſeene, and then growing long and narrow to the end; being ſmooth, and of a faire greene colour, ſomewhat ſhining: towards the tops of the branches at the joynts with the leaves, come forth large whitiſh Bell flowers; with wide open brimes and narrow bottomes; after which come round heads, wherein are contained 3 or 4 cornered blacke ſeede; for ſuch I have had given me, from whence hath ſprung plants, which periſhed quickely, not abiding a winter with me: if any part of this plant be broken, it yeeldeth forth a milke, not hot or burning, nor bitter, yet ſomewhat unpleaſant, provoking loathing, and almoſt caſting.

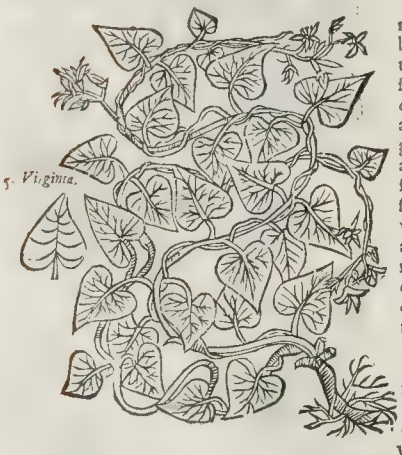
2. *Scammonia Macrorhyza Cretica.* Long rooted Scammonye of *Candye.*

Proſper Alpinus, in *lib. de exoticis*, ſaith, that he in his former times received from Candie, another ſort of Scammonye, differing nothing from the true Scammonye here before deſcribed, but in the faſhion of the roote which is long and ſlender, of about a fingers thickneſſe, but purging as ſtrongly as that of *Syria*, and this in my judgement doth very neere reſemble, our common white greater Bindeweede, that ſhall follow next the Countrey making the difference onely as I thinke.

3. *Convolvulus major albus.* The great white Bindeweede.

Our great Bindeweede commeth as I think ſo neere unto the former Scammonye, that excepting the largeneſſe of the rootes, and the greater force in purging, which may both proceede from the climate; you would ſay this were *altera eadem*, whoſe many ſlender winding ſtalkes, runne up and winde themſelves upon hedges, or whatſoever ſtandeth neere unto it, having diverſe large leaves growing ſeverally thereon, ſomewhat long, and pointed at the further end, and parted into two points at the broad part, next to the ſtalke, making it ſeeme almoſt three ſquare, being ſmooth and of a pale greene colour, yeelding a milke being broken, but not ſo plentifully as the Scamonye: at the joynts with the leaves towards the toppes of the branches, come forth large white Bell flowers, without any diviſion in them, after which riſe round skinnie huskes, or heads, conteining within them diverſe blackiſh, three cornered ſeede, like the former, but leſſer: the roote is whitiſh, and ſmall, of the bigneſſe of Couchgraſſe, or ſomewhat greater, running much under ground, and ſhooting forth in ſundry places: both ſtalkes and leaves periſh every yeare, the roote living in the ground, and ſhooting a freſh every ſpring, which yeeldeth milke, being broken.

4. *Scammonia Monſpeliaca dicta.*
French Baſtard Scammonye.



5. *Virginia.*

4. *Scammonia Monſpeliaca dicta.*
French Baſtard Scammonye.

The neere reſemblance of this plant, unto the former in many particulars, but eſpecially in the ſeede, ſhewing it to be a Bindeweede, hath cauſed me to joyne it likewiſe in the ſame Chapter, which hath ſundry twining branches riſing five or ſixe foote high, twining or claſping the trees or other things that it can reach, whereon are ſet two broad and almoſt round, yet pointed leaves at a joynt, of a bleWiſh greene colour: from betweene the leaves and the branches, as alſo at the toppes of them, come forth many ſmall white flowers, cluſtering together ſtarre faſhion, conſiſting of five narrow pointed leaves with threds in the middle: after which ſucceede ſuch like heads, and black cornered ſeede, as in the former ſorts: the roote hereof is ſmall, of the bigneſſe of ones finger, with many fibres thereat, browniſh on the outſide, and pale within, this yeeldeth more plenty of purging milke than the laſt, comming ſomewhat neerer therein unto the firſt.

5. *Scammonia rotundifolia Virginiana.*

We have had a kind of *Volubilis* from *Virginia*, very neerely reſembling this kinde of French Scammonye, both in growing and forme of leaves (as you may perceive by one ſet by the plant) but the flowers being ſmall and white doe open like a Bindeweede, and not like a ſtarre, into five leaves, like unto the laſt, the ſeede groweth not in pods, but in ſmall heads, being ſmall and blackiſh like other Bindeweeds, and therefore if not to the family of Bindeweeds, I know no better place than to inſert it here. And peradventure this may be the Indians *Hololuichi*, that *Aldinus* mentioneth in his *Farneſian* garden to be ſo dangerous.

The Place.

The firſt groweth in *Syria*, and the farther Eaſterne parts, where no froſts are felt in the winter, for it quickely

quickly periſh with the firſt approach thereof, and therefore to be kept ſafe in theſe cold climates, it requireth ſome vault, or ſtove, or other ſuch convenient place. The ſecond groweth in Candy as *Alpinus* ſaith. The third is frequent in ſundry places of the Land, growing by the hedges ſides and running thereon. The fourth groweth neere the Sea ſide, as well by *Mompelier*, as the kingdome of *Valentia* in Spaine, where *Cluſius* ſaith he found it: and the laſt in *Virginia*.

The Time.

They flouriſh in theſe Countries in Iune, Iuly, and Auguſt, but the firſt, and two laſt, doe ſeldome perfect any ſeede with us.

The Names.

The firſt, is called in Greeke Σκαμμωνία, and in Latine alſo *Scammonia*: the dryed juyce which is moſt in uſe, is called Σκαμμωνιον *Scammonium*, both in the Druggiſts, and Apothecaries ſhoppes, as alſo with moſt writers, yet ſome call the plant ſo too: the ſame being prepared, that is, baked in a quince, under the embers, or in an Oven, or any other way, is called of the ancient writers *Diagridium*, which ſhould onely be uſed in medicines, according to the appointment of all Phyſitians, who are led by the tradition of their elders: but all Apothecaries in generall, doe uſe the Scammonye it ſelfe, as it commeth, without any other preparation, ſo as it be of the pureſt, and beſt, which by their dayly experience, they finde to worke more certainely, and more ſafely, than the *Diagridium*, which is much dulled in the baking or other preparation: and beſides, whereas the ancient writers doe appoint it to be diſſolved, and ſo mixed with their medecines, or to be boyled in the Electuarie, ſo to bee diſſolved, wherein it is appointed to be put: the dayly experience of Apothecaries, who are chiefe maſters in their profeſſions, or ſhould be, if they be worthy of their name, doth teſtifie there againſt; finding that if Scammonie come to never ſo little heate almoſt in the mixing thereof, it will curdle together and lye in knots in the medicine, beate yee it almoſt never ſo long after it is mixed; and therefore they alwayes in their Scamoniate medicines, rubbe it finely into powder of it ſelfe, without other preparation, and ſo put it laſt of all other things into any medicine, that hath beene boyled or heated, and that when it is almoſt cold, for feare of curdling or gathering together in knots, as I ſayd before; and being thus mixed, the medicine ſhall worke more ſafely without perturbations of the ſtomacke, &c. and more ſurely without tedioufneſſe or procraſtination, than if *Diagridium*, were put into it: let not this be imputed as an errour in our profeſſion, or a ſetled wilfulneſſe to contrary ſo great and ancient authority, for we know that true experience hath maſtered reaſon and antiquitie, and we alſo know, that the experience and diligence of our times, hath in many more things, not onely taught us to vary from the Methode and order, appointed by the ancient writers of Phyſicke and hearbes, but to contrary them alſo, when we have found either by reaſon or experience, that there is cauſe ſo to doe, as in the doſe of this Scammonie is plainely to be obſerved. For *Dioſcorides* appointeth a dramme to be given at once, when no Phyſitian with us, dare ſcarſe give halfe a ſcruple, or not above. The ſecond *Alpinus* ſo calleth, as is in the title, and that is as much as can be ſayd of it: the third is called *Volubilis major & Convolvulns major*, by diverſe, as alſo *Smilax levis major* by others, *Helxine Ciſſampelos* by *Cordus* on *Dioſcorides*, and *Malacociſſus Damocratis* by *Anguillara*: the fourth *Geſner* in *hortis* calleth *Scammonia Monſpel*, and *Lobel Scammonium Monſpelienſe*, but *Cluſius* who in his Spaniſh obſervations, firſt calleth it *Scammonea Valentinas* doth in his hiſtory entitle it, *Apocynum 4. latifolium*, yet referreth it to that of *Mompelier* as both one: *Camerarius* and *Lugdunenſis* doe call it *Scammonia maritima Monſpeliaca* as the learned of *Mompelier* doe, and uſe it accordingly: the laſt is remembred onely by my ſelfe, who ſuppoſe it by being like in forme to the laſt, to be neere alſo in quality thereunto.

The Vertues.

Scammonye being the *baſis* as I may ſo call it, of thoſe medecines wherein it is put, there had neede of eſpeciall care to be taken in the choiſe thereof, that onely that which is ſincere and pure, without droſſe or adulteration be uſed in Phyſicke; which may be knowne if it be not heavie, or cloſe compact together, but that it be moderately light, with ſome ſmall holes or hollowneſſe heere and there therein; and that it be ſmooth and plaine in the breaking, and not in grumes or knots, or having ſmall ſtickes or ſtones in it; ſomewhat cleere and blackiſh alſo, but not of a deadiſh darke or evill favored colour, and that will be made quickely into a very fine and white powder: this I mention comparatively, for it will be a very hard matter, for any to know the beſt by relation, but by inſpection; and chiefely by compariſon of the good and bad together, that ſo you may learne to know either of them at the firſt ſight. The doſis hereof as it is appointed by *Dioſcorides* and others, doth ſo farre exceede the proportion of our moderne Phyſitians, that it hath made *Pena* to doubt, that the Scammonye in *Dioſcorides* time, was more corrupt, and encreaſed with other things than ours is; becauſe he gave ſo much, and we doe give ſo little; and *Matthiolus* on the otherſide to doubt, whether wee have any ſincere Scammonye brought unto us at all, or elſe that the text of *Dioſcorides* is corrupt, where he appointeth a dramme or foure *obolos*, that is, two ſcruples to be taken at a time; and he ſetteth downe alſo, that if a purging medicine be required to be effectuall; you ſhould take 3 *oboli*, that is halfe a dram, of *Scammonye*, 2 *oboli*, that is one ſcruple of blacke Hellebor, and one dram of Aloes, all theſe to be taken together at one time: but the greateſt doſis now adayes exceedeth not halfe an *obolus* to a ſtrong body, and leſſe to the weaker, or more tender. *Pena* in his diligent obſervations, and declarations hereof ſet downe in his *Adverſaria*, hath cauſed all whom it may concerne, both to underſtand the choyſe of this Scammonye, as alſo thereby to bethinke them of the ſincerity of other drugges; and that as he gueſſeth the quantity of Scammonye is ſo great, that is ſpent in all countries, which is made onely in one, that unleſſe the quantity were augmented by mixture, there could not be ſufficient ſincere and pure juyce, to ſerve them by much: and although in former ages, and even in our former times, there hath beene much falſe and corrupt Drugges, brought into *Europe*, and all the countries thereof farre and neere: yet the skill and curioſitie of theſe times is ſuch, that our Merchants taking onely the beſt for us of all ſorts, and refuſing the courſe, hath I thinke leſſened, if not worne out, that ſophiſticating art in the maſters thereof, when they ſee that none but true and ſincere is affected and bought: the worſt to lye on their hands untill it grow better: It purgeth both flegme, yellow choler, and watery humors very ſtongly: but if it bee indiſcreetly or careleſſely given without due reſpect, it will not onely trouble the ſtomacke more than any other medecine, but will alſo ſcowre, fret and raſe the gutts in working too forceably, oftentimes unto blood, and oftentimes cauſing faintings and ſwounings: Our Phyſitians therefore doe ſeldome give, to any tender and gentle body any Scammoniate Electuary,

and

and but in pills seldome any at all, to avoyd the dangerous symptomes that often happen thereupon; for *Plinye*, *Paulus Æginata*, and others shew the dangers thereof, and *Mesues* also declareth three severall hurts or harmes that come to the body thereby, and the remedies of them, which is not from the purpose to bee here set downe. The first is saith he, that it engendreth certaine gnawing windes in the stomacke, so much offending it that it procureth a disposition to vomite. To be baked therefore in a quince, and some parsley, fennell, or wilde carrot seed, or *Galanga* mixed with it, is the remedy hereof: The next is that it enflameth the spirits, by the overmuch sharpnesse or fiercenesse therein, whereby it readily induceth feavers, especially in those that are subject to obstructions & repleate with putrid humors; which inconveniences are taken away, by putting those things into your decoctions, that doe coole and quench the heate thereof, and such are the muccilage of the seedes of *Psyllium*, or Fleawort, Prunes boyled or rather the pulpe of them, the juyce, or the Iulep, or the water of Roses or Violets; or if before the boyling thereof, (that is the *Scammonye*) you steepe it in the oyle of Roses or Violets, or in the juyce of a sowre sweete quince, and mingle with it a little *Sumach* or *Spodium*. A third is that having a strong opening and drawing faculty, it causeth immoderate fluxes of the belly, by opening the mouth of the veines more than is fit. This harme also is taken away, by mixing astringent and restraining things with it, such as Masticke is, and especially yellow Myrobolanes and quinces, or the juyce of them. Againe, it raseth or shaveth the intrales and guttes, by reason of that sharpe juyce wherewith it doth abound, and by which it procureth torments and paines therein, the disease called *Dysenteria* which wee call the bloody flixe, and *Tenasmos*, which is a disease, when one desireth to goe often to the stoole, and can doe nothing; but this danger is remedyed, if moyst, fat and slippery medecines be used, as *gum Tragacantha*, *bdellium*, and oyle of Almonds and Roses, as also the pulpe of prunes, made up with Sugar, the muccillage of *Psyllium* or Fleaworte seedes, Masticke and quinces taken afterwards, and warme water last of all; all which cause it to passe the quicklier from the stomacke and bowels, and thereby stay it from doing harme; whereby those that are wise, are taught to give the broth of barly, sweetned with Sugar, to drinke to those that have taken thereof: This fault also is helped, if cold medicines as well as hot, being mixed together be given, thereby to yeeld helpe to the heart, liver, and stomacke: thus farre *Mesues*. The juyce saith *Dioscorides* applyed to the wombe, destroyeth the birth; being mixed with honey and Oxe gall, and rubbed on wheales pimples and pushes taketh them all away: and boyled in Vinegar and annointed, taketh away the Lepry or outward markes in the skinne: being dissolved in Rosewater and vinegar, and the head moystned therewith, easeth the continuall paines therein. A dramme or two of the rootes of Scammonye purge in the same manner that the juyce doth, if some of the things appointed therewith be given with it: the rootes boyled in water, and made into a pultis, with barly meale, easeth the Sciatica, being layd thereon: it taketh away scarfes and scabbes, if they be washed with the Vinegar, wherein the rootes have beene boyled, and also healeth apostumes. Our English Bindweede hath beene experienced to be purging, the rootes especially being boyled, and the decoction thereof taken in a reasonable proportion. That of Candy is mentioned in the description. They of *Mompelier* have often used the dryed juyce of the fourth, in stead of the true Scammonye when it was wanting, but in a double quantity, which yet did not worke so effectually.

CHAP. VI.

Scammonia supposititia. Supposed or Bastard Scammonyes.

THere be some other plants to be joyned next unto the true *Scammonye* for the strong purging quality in them, but not either deadly or dangerous, as the *Apocynam* is, which else for the outward likenesse might be referred unto them.

1. *Scammonia Monspeliaca affinis.* Spanish Bastard Scammonye.

This Spanish kinde of Climer is very like unto the great Bindeweede, in the branches, leaves, and rootes, but the leaves being somewhat longer, are of a grayish greene colour, giving milke more abundantly than any, and the rootes being small white and brittell, more aboundantly creepe under ground, and quickely overspread any place where it groweth, alittle peece being left in the ground, will spring up quickely into a plant ready to clime; so that many being weary thereof, doe strive rather to destroy it quite out of their gardens than keepe it any longer: the flowers are white and starre fashioned, but there come long poddes after them, like unto *Periploca* or *Asclepius*, this looseth both leaves and branches, and springeth a new every yeare.

2. *Secamone Ægyptiacum.* Bastard Scammonye of Ægypt.

This likewise seemeth to be of the same kindred with the former, as by *Alpinus* his relation may be gathered; for as he saith, the Egyptians with whom he saw it, reckoned it a kind of Scammonye, yet made no great use in Physicke thereof. It climeth he saith with many winding branches, having long and hard greene leaves on them, greater than the leaves of *Seseli Æthiopicum frutex*: the flowers are white but larger than the former sort, and bring hard crooked coddes afterwards, two alwayes growing together, like unto the coddes of the *Oleander* or Rose Bay tree: from the leaves or branches of this plant, floweth a pale yellowish milke or juyce, no lesse heating and burning the throate than a spurge, this looseth his leaves, but not his branches every yeare, fresh springing a new in the spring.

The Place.

The first, grew about *Pincia* in *Spaine* as *Clusius* saith. The other in *Ægypt*.

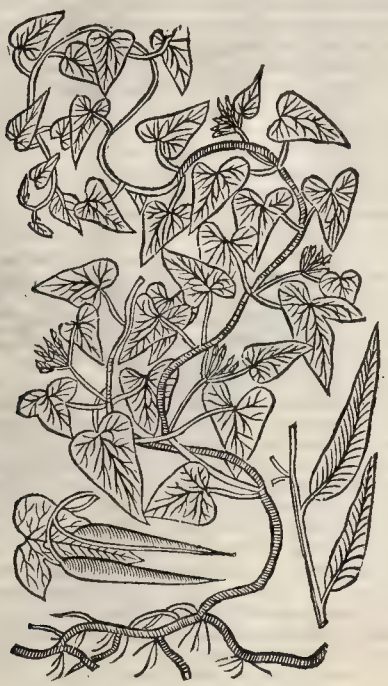
The Time.

They doe both flower in the latter end of Summer, and bring ripe fruite in the end of September.

The Names.

The first *Clusius* saith he received the seedes thereof out of Spaine, and calleth it *Apocynum tertium latifolium*, *Lobel* calleth it *Scammonei Monspeliaci varietas*, *Dodonæus* putteth it for his former *Periploca*, and *Tabermontanus* calleth

1. *Scammonea Monſpeliacæ affinis, &*
2. *Secamone Ægyptiaca.*
Baſtard Scammonye of Spaine and Ægypt.



calleth it *Volubilis marina*. *Bauhinus* in his *Pinax* calleth it *Scammoniæ Monſpel affinis foliis acutioribus*. The other *Alpinus* ſaith the Egyptians call *Sechamone*, taking it as I ſayd before for a kinde of *Scammonye*, as by their name may appeare: *Bauhinus* ſeemeth to referre this to the other ſort of the ſecond kind of *Apocynum* of *Cluſius*, but in my judgement he is miſtaken, the leaves of this being much longer, than in that, and the flowers differing, which in this is white, in the other reddiſh and greene, like to the narrow leafed Dogs bane for he ſaith they are alike, and indeede maketh it his third *Apocynum*.

The Vertues.

Theſe doe purge a little, but to little purpoſe, none of them comming any thing neere the vertue or force of the true Scammonye; yet they of Egypt doe ſometimes uſe the juyce of their owne kinde, in the ſtead of the true Scammonye, and to that purpoſe doe gather and harden the juyce thereof, and keepe it to uſe when they want better, allowing double quantity for a doſe.

CHAP. VII.

Soldanella ſive Volubilis marina. Soldanella or Sea Bindweede.

ALthough this plant groweth by the ſea ſide, and plentifully enough on our owne coaſts, in many places, and might therefore be remembred among other Sea plants, when we come to them, yet becauſe it hath a ſtrong purging quality therein, I thinke it not unfit to joyne it unto the other of his nature: I will alſo adjoyne hereunto that kind that groweth upon hills, called *Soldanella Alpina* or *Montana*, becauſe the leaves are round, ſomewhat like unto theſe.

This Sea Bindeweede hath many weake, ſlender, browniſh greene branches, trayling or lying upon the ground, rather than raiſing it ſelfe up, or climing upon other things, whereon are ſet divers leaves, not alwayes two together at a joynt, nor yet alwayes ſingle, one at a joynt, which are almoſt round like unto the leaves of *Aſarabacca*, but a little unevenly dented about the edges, and thicker, every on ſtanding on a long foote ſtalke, and of a grayiſh greene colour; among which come forth the flowers towards the ends, every one by it ſelfe, comming forth at the joynts, in faſhion like unto the ſmall low common Bindeweede, that groweth upon the ground by the way ſides, every where almoſt, but a little larger and of a reddiſh purple colour: after which come round heads, wherein is encloſed two or three round blacke ſeedes: the roote is ſmall and long, ſpreading a little in the ground, and ſhooting up diverſe heads in ſeverall places: if any part thereof be broken, there iſſueth forth a whitiſh water, which as well as the leaves are bitter, ſalt and unpleaſant.

2. *Soldanella maritima major.* The greater Sea Bindweede.

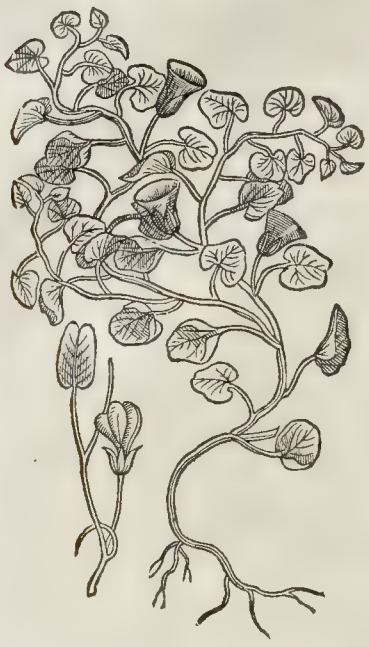
This other kinde hath likewiſe divers long ſlender branches: whereon are ſet larger leaves, many of them having a diviſion, on both ſides the leafe, next the bottome, and many of them but on one ſide, and many alſo that are ſmaller having none at all; yet all of them for the moſt part a little ſinuated on the edges, toward the ends, which are round or with a dent in the middle, making the point ſeeme double forked, with many veines running therein: the flowers are of a reddiſh purple colour, and are not bell or cup faſhion, like the former, but conſiſts of five ſomewhat large and long leaves: the heades and ſeedes are like the other, and the roote creeping a little in the ground.

3. *Soldanella Alpina major.* The greater Mountaine Soldanella.

From the likeneſſe of the leaves, this Mountaine Soldanella tooke the name, which hath many hard round leaves, ſet upon long foote ſtalkes, a little unevenly cut about the edges, greene on the upper ſide, and of a grayiſh greene underneath, and ſomewhat reddiſh like the leaves of Sowbread, reſembling the Sea Soldanella: the ſtalkes are ſlender, ſmall, round, and reddiſh, about a ſpanne high, bearing foure or five flowers at the toppes, every one hanging downe their heads, like unto a bell flower; conſiſting but of one leafe plaited into five folds

each

2. *Soldanella vulg. & major maritima.*
The greater Sea Bindweede.



3. *Soldanella Alpina major.*
The greater Mountaine Soldanella.

ēach of thēm ēnding in a long point, which maketh the flower ſeeme to have five leavēs, having a round greene head in the middle, with a pricke or point at the end thereof: the flower is of a faire blew colour, in ſome deeper or paler, or white as nature liſteth, without any ſmell at all: the middle head after the flower is fallen riſeth to be a long round pod, bearing that pointell it had at the end thereof, wherein is contained ſmall greeniſh ſeede: the roote hath many fibres, ſhooting from a long round head or roote. There is a leſſer ſort hereof as *Cluſius* ſaith, little differing in ſunder one from the other, but in the greatneſſe or ſmalneſſe.

The Place.

The firſt groweth on our owne Sea coaſts, in many places plentifully, as well as in other Countryes. The other groweth as well wilde in deſert places, as in gardens in *Syria*, as *Rauwolfius* ſaith, as alſo on the coaſts of the kingdome of *Naples*, as *Imperatus* ſaith: the laſt groweth on the ſnowye hills in *Hungary* as *Cluſius* ſaith.

The Time.

The two former flower toward the end of Summer, and their ſeede is ripe in *Auguſt*: the laſt in the naturall places flowreth not untill *Iuly* or *Auguſt*, as the ſnow melteth ſooner or later, but in *Aprill* in Gardens.

The Names.

The firſt is taken of all writers for the moſt part, to be the Κεράμη θαλασσία *Braſſica marina* of *Dioſcorides*, all the markes and notes thereof agreeing with this: yet it hath no reſemblance unto any kinde of Colewort, as the name ſhould import, yet many authors doe call it *Braſſica marina*, as *Matthiolus*, *Cordus*, *Geſner*, *Camerarius*, *Dodonæus*, and others, and ſome of them alſo call it *Soldana* and *Soldanella*, as well as *Lobel*, *Cæſalpinus*, *Tabermontanus*, and others. *Bauhinus* calleth it, *Soldanella maritina minor*: we in Engliſh doe call it by diverſe names, as ſome call it *Sea cole*, according to the Latine name, others more properly in my judgement *Convolvulus marinus*, *Sea Withwind*, or *Sea Bindweede*, becauſe the branches winde themſelves, and the flowers, are ſo like the ſmall kinde of *Bindweede*, and that it groweth naturally neere the Sea coaſts, as alſo Sea Bells for the likeneſſe of the flowers, and ſome alſo call it *Tuſſilago marina*, Sea Fole-foote, for the reſemblance of the leaves. The other *Rauwolfius* calleth *Braſſicæ marinæ genus*, as it is extant in the Appendix of the great Herball of *Lugdunenſis*; and *Imperatus* calleth it, *Convolvulus marinus noſter*; *Bauhinus* calleth it, *Soldanella vel Braſſica maritima major*, and hath ſet forth the figure thereof in his *Matthiolus*: the laſt is called by moſt, *Soldanella Alpina*, and by ſome *Lunaria minor cærulea*, in *Engliſh Mountaine Soldanella*, (but not *Mountaine Bindeweede*, as *Gerard* doth, becauſe it is no *Bindeweede*) or elſe *Blew Lunary* or *Moone wort*.

The Vertues.

The herbe and every part thereof as *Dioſcorides* ſaith, is an enemy to the ſtomackē, being ſharpe in taſte, and openeth the belly very powerfully, and violently, and therefore not fit to be given, but unto ſtrong and robuſtuous bodies, and that boyled alſo in the broth of fat meate, to hinder the violence of its working: the decoction thereof with ſome Rubarbe, is commended by ſome to helpe the Dropſie and Timpanie, and the powder of the leaves with Rubarbē, and a few *Cubebes* drunke in wine, is of the like operation: the juyce alſo not preſſed, but

but issuing forth of it owne accord when it is broken, gathered, and dryed, and afterwards relented, and layde as a plaister to the bottome of the belly, worketh upon that disease (the Dropsie I meane) mightily, drawing forth those watery humors: diverse also doe use to eate the greene herbe fasting, to purge them, even as others doe Scurvie grasse: the powder of the dryed hearbe is of very good use, to bring or raise up flesh in deepe and hollow Vlcers, helping also to heale them. The Mountaine Soldanella, is of a drying or binding property, good to consolidate wounds and helpe the Sciatica and Goute.

CHAP. IX.

Convolvuli sive Volubiles majores. The great Bindeweedes or Bellflowers.

THere are diverse sorts of Bindeweedes or Bellflowers, some greater, others lesser, of the greater in this Chapter, whereof some of them have beene made mention by former authors, but others not spoken of by any before.

1. *Convolvulus Azureus sive caeruleus major.* The greater blew Bindeweede or Bell flower.

This greater Bindeweede riseth up with many winding branches, climing and spreading on whatsoever it can take hold on, that standeth neere it, winding it selfe alwayes contrary to the course of the Sunne, on these branches grow many faire, great, round leaves, pointed at the end; of a sad greene colour, at each joynt, where the leaves are set come forth flowers on pretty long foote stalkes, two or three set together, which at the first are long and pointed, almost like a finger, but being blowen open are like great bells with broad open mouthes or brimmes, made of one whole leafe, ending in five corners and foulded or plaited so also, and small at the bottome, standing in small greene huskes: these flowers are of a pale blue colour being in budde: but being open are of a very deepe azure colour, or blue, tending to a purple, the foulds or plaites being deeper or redder, which open for the most part in the evening, abiding so all night and the next morning, untill the Sunnes heate closeth them, never opening againe: after these flowers are past, the stalkes of them bend downewards, and beare within the huske three or foure blacke seedes: the rootes are stringy, and perish every yeare.

2. *Convolvulus major purpureus sive trifolius.* The greater purple Bell flower with cornered leaves.

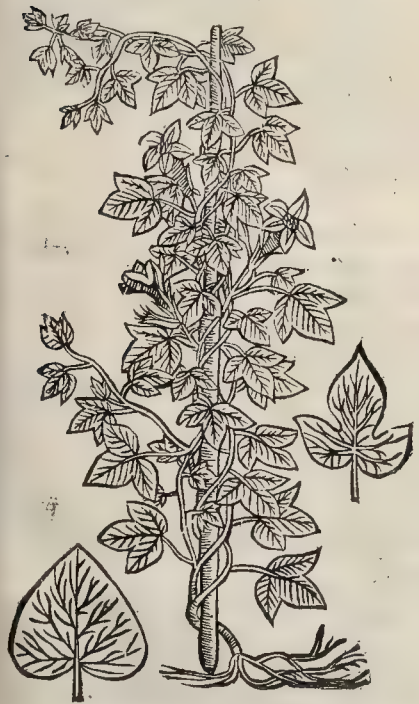
The growing of this Bellflower is all one with the former, the chiefest difference consisting in the leafe which is three cornered, and in the flower which is deeper, tending to a deepe purple violet colour, and more reddish in the plaites and bottome.

3. *Convolvulus trifolius Virgineus.* Blew Bell flower of Virginia.

This Bell flower or Bindeweede climeth and spreadeth on pales, &c. like unto the former, having leaves very

1. 2. 3. *Convolvulus caruleus major folio rotundo sive Nil Avicennae, trifolio vulgaris & Virginus.*
The great blew Bindweede, with a round and triparted leafe vulgar, and that of Virginia.

5 *Convolvulus pennatus Americanus.*
The red Bell flower of America.



like unto the laſt, but ſmaller, and cut rounder in the diviſion of the leafe on each ſide, and one ſide alſo a little longer, bending downewards: the flowers alſo arē much ſmaller, of a watchet or pale blew colour, changing upon the fading thereof to be of a reddiſh purple: the ſeede is like the former but ſmaller, and the roote periſheth like the reſt.

4. *Convolvulus Arabicus ſive Ægyptius.* The Arabian or Egyptian Bindeweede.

The *Arabian* or *Ægyptian* likewiſe climeth and ſpreadeth like the other, with a leafe at every joynt, ſtanding on a long foote ſtalke, parted ſometimes into five ſmall long leaves, ſometimes into more, each one ending in a ſmall pricke, and the one or the other lower peece of the leafe, divided into two parts; at the joynts with the leaves, come forth ſuch like Bellflowers, as are in the former, of a purpliſh blew colour.

5. *Convolvulus tenuifolius ſive pennatus Americanus.* The red Bell flower of America.

This Indian kinde riſeth up at the firſt with two double forked leaves, abiding a long time without fading, betweene which ſpringeth up a ſtalke, three foote high in ſome places, branching forth diverſe wayes, being of a browniſh colour, and ſpreading it ſelfe as the others doe: the leaves that are ſet at each joynt, are winged; that is, ſundry ſmall, narrow, and long, darke greene leaves, but freſher being young, ſet on both ſides of the middle ribbe, and one at the end, from the joynts likewiſe riſe long ſtalkes, with two or three or more ſmall long hollow flowers at the ends of them, of the faſhion of Tobacco, or the white Iaſmin flowers with five points, and not ſo much layd open as the other Bell flowers, being of a bright red colour, and plaited like the Bell flowers, with five chives or threads in the middle, tipt with ſo many pendents which turne into long pointed pods, conteining long and blacke ſeede, taſting hot like Pepper, the roote is ſmall and ſtringie periſhing every yeare: the leaves taſte a little ſweete and nitrous, and yeeldeth a thinne pale milke, when it is broken.

The Place and Time.

All theſe are ſtrangers, the two firſt are thought to come out of the Eaſt Indies or the Eaſt Countrey towards it, the reſt are ſpecified in their titles from whence they came: They all flower late, and therefore we can very ſeldome get ripe ſeede from any of them.

The Names.

The firſt is taken by moſt, to be the *Nil* of *Avicen* and *Serapio*, which they call *granum Nil*, and *Habal Nil*, for there is another *Nil* or rather *Nir*, becauſe of the blue colour, which is the *Anill* or *Indico* of *Dioſcorides* and our times, which ſhall be ſpoken of in his place, it is called by ſome *Flos Noctis*, becauſe his chiefeſt beauty is in the evening, night, and morning; others call it *Convolvulus Azureus & cæruleus*, as they call the ſecond *trifolius & purpurocæruleus*: the third and fourth have their names in their titles, as much as can be ſayd of them; the laſt is called *Quamochlit* by the Indians, and *Iaſminum folio Millefolii* by *Caſalpinus*, who was the firſt as I take it that wrote of it, *Camerarius* next unto him in *Horto Medico* ſaith, it may not unfitly be called *Convolvulus tenuifolius*: and *Fabius Columna* ſaith, it cannot be more fitly referred to any tribe, or family of plants, than unto the *Convolvuli*, and therefore calleth it himſelfe *Convolvulus pennatus exoticus rarior*; he that ſet forth *Cluſius* his *Curas Poſteriores*, referreth it to the *Iaſmines*, calleth it *Iaſminum Americanum*, and ſo doth *Bauhinus* alſo: but in the flowers onely is the likeneſſe of the *Iaſmine*, and in no other part of the plant, or manner of growing, all the *Iaſmines* being wooddy and *perennes plantæ*, and this as the other *Convolvuli* herbaccous & annuall; ſome have taken it to be the *Liguſtrum nigrum*, that *Columella* ſpeaketh of, but with little judgement in mine opinion: the Italians call the firſt and ſecond, *Campana Lazura*, that is, *Campana cærulea*, the Arabians in *Syria* and *Egypt Haſmiſen*.

The Vertues.

The ſeede of the firſt and the ſecond alſo (for they are *congeneres*) doe purge very ſtrongly, but ſlowly and oftentimes with great trouble to the ſtomacke, cauſing vomitings, yet it avoydeth raw indigeſted flegme, and melancholy humors, from thoſe that can endure it, and killeth the long flat wormes of the belly.

CHAP. X.

Convolvuli ſive Volubiles minores. The ſmaller Bindweedes.

THe leſſer ſorts of Bindeweedes remaine to be intreated of in this Chapter, whereof there arē many and ſundry varieties, all of them having a purging quality, more or leſſe, as you ſhall preſently heare in this Chapter.

1. *Convolvulus Althææ folio*: Mallow leafed Bindeweede.

This ſmall Bindeweede groweth not high, nor climeth much upon any thing, but for the moſt part, lyeth with his ſmall ſlender hayrie branches upon the ground, having diverſe leaves very thinnely or ſparſedly ſet on them; ſomewhat broade and long, like unto the leaves of Marſh Mallowes, but ſmaller, crumpled and cut in on both ſides at the lower ends, dented about the edges, and of an hoarie or duſty grayiſh greene colour, clammye or ſticking like gumme to the teeth, ſharpe and ſomewhat bitter in taſte, when they are chewed in the mouth: the flowers come forth one by one, at the joynts with the leaves, all along the ſtalke up to the top, every one upon a long ſtalk, which are very like the ſmall wild Bindweede, that groweth upon the ground: conſiſting of one whole leafe yet plaited, as it were before the opening into five plaites, and being open have five corners, as if it had five leaves, broad like a cup or Bell at the brims, and ſmall at the bottome, of a fine delayed purple colour ſometimes, and ſometimes deeper: the roote is ſmall and browniſh, creeping under ground, and ſhooting up heads in other places.

2. *Convolvulus minor albus Vulgaris.* The common ſmall Bindweede.

The common ſmal Bindweed that groweth every where in fields, by the wayes and hedg ſides, ſometimes riſeth up and windeth it ſelfe, but uſually ſpreadeth on the ground, with long trailing and winding branches, one within another, and leaves ſet thereon ſomewhat like unto the greater white Bindeweede, but much leſſer, the flower is for forme like the other white Bell flower either wholly white or the plaites purpliſh but leſſe, made of one leafe plaited as it were into five foulds, and opening wide at the brims, after which come ſmall blackiſh ſeede, in ſmall long and round heades: the roote is ſmall and ſlender, running both very deepe downe into the ground,

and

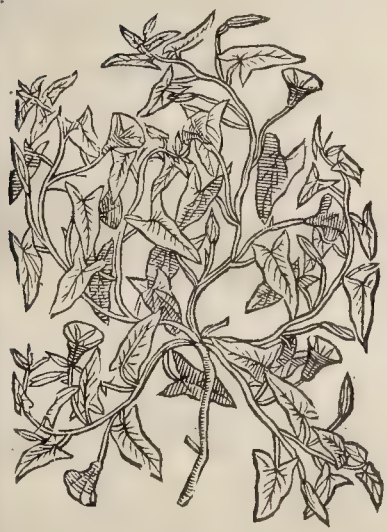
and ſpreading farre abroad likewiſe, eſpecially if it get into garden mellow grounds.

3. *Convolvulus ſpicæ folius.* Lavender leafed Bindeweede.

This ſmall bindeweede is as great a plague to the fields, where it naturally groweth as thē laſt: the leaves are long and narrow, reſembling Lavender, and the flowers of a deepe purple colour, wherein it differeth from others, for elſe it is like the laſt.

1. *Convolvuls Altheæ foliis.* Mallow leafed Bindweede.

2. *Convolvulus minor albus vulgaris.* Common ſmall Bindweede.



4. *Convolvulus minor purpureus.* Small purplē Bindeweede.

This Bindweede is in all things like the ſecond, ſaving that the flowers are either of a pale purpliſh, or bluiſh colour, the foulds being white or of a deeper purple, without and white within, and the bottome ſo likewiſe, which is of much beauty.

5. *Convolvulus minor Africanus.* The ſmall African Bindeweede.

There is ſmall difference in this from the former for the manner of growing, the leaves onely make the variety, which are not divided at the bottome, but whole, and the flowers purple, but bell faſhion like the reſt.

6. *Convolvulus Africanus minimus.* Thē leaſt African Bindeweede.

This ſort creepeth not as the former, but ſtandeth a little upright, or leaneth ſomewhat downe upon the ground, like the next Spaniſh kinde, the ſmalneſſe both of leaves and flowers from the laſt maketh it noted to bee a ſeverall ſpecies.

7. *Convolvulus minor Hiſpanicus cæruleus.* The blue Spaniſh Bindeweede.

This *Spaniſh* kinde ſhooteth forth ſundry ſmall branches three foote long or more, from the ſmall threddie roote which dyeth every yeare, having ſundry leaves ſet ſingly thereon, ſmall and long at the bottome, and broader, and almoſt round at the end, ſomewhat hayrie as it were all over: at every leafe for the moſt part, from the middle of the ſtalkes upwards, commeth forth a flower like unto the common ſort, folded into five plaites, which open into ſo many corners, of a moſt excellent faire skie coloured blue (ſo pleaſant to behold, that it amazeth the ſpectators) with white bottomes pointed upwards and yellow in the middle, which turne into ſmall round white heads, containing within them ſmall blackiſh cornered ſeede to be new ſowen every yeare.

8. *Convolvulus minor Atriplicis folio.* Blacke Bindeweede.

If this ſmall Bindeweede meeteth not with hearbes or other things whereon to clime, it riſeth up but a little, and leaneth downe againe unto the ground, otherwiſe meeting with fit things, it will winde with his long ſlender reddiſh threddie branches about them, to the height of three or foure foote or more, bearing his leaves ſingly at the joynts, as the others doe, either ſomewhat like unto the leafe of an Arrache, or round like unto the wilde blackBrionye, for of both ſorts there are, but much ſmaller: the flowers are very ſmall and many ſtanding together along a ſmall long ſtalke, that commeth from the joynt, where the leafe ſtandeth, and are of a reddiſh greene colour, but ſo ſmall that they are oftentimes not heeded, and ſo quickely faded that they are ſcarce regarded: after which come ſmall blackiſh three cornered ſeede: the roote is ſmall and ſlender, periſhing every yeare, and

3. *Convolvulus ſpicæ folius.* Lavender leafed Bindweede.

riſing of the fallen ſeede every ſpring, unleſſe it be continually weeded out of the garden.

9. *Halxine Ciſſampelos ramoſa Cretica.* Branched blacke Bindeweede of Candy.

The ſtalke hereof is much branched, and the branches alſo much divided, having two ſmall leaves at every joynt hoarie, and hairy very like unto Mouſeare, the upper leaves being ſmaller, and the flowers large, of a pale bluſh colour, ſpread open like the ſmall Bindeweede: the ſeede that followeth is blackiſh browne, one in a ſmall round head, the roote is very threddie and buſhing, yet periſheth yearely.

4. 6. 7. *Convolvulus minor purpureus. Cæruleus Hiſpanicus & Africanus minimus.* Purple and Spaniſh blew Bindweede and the leaſt *African.*

8. *Convolvulus minor Atriplicis folio.* Blacke Bindweede.
5. *Africanus minor.* The ſmall African Bindweed.
4. *Major Arabicus ſive Ægyptius.* The Arabian or Egyptian Bindeweede. *folio* 170.

10. *Ciſſampelos altera Anglica minima.* Small blacke Bindeweede.

This onely in the ſmallneſſe, riſing not above a hand breadth high, differeth from the common blacke Bindeweede.

The Place.

The firſt *Cluſius* ſaith he found in many places of Spaine: the ſecond, third, and fourth, grow in ſundry Countries of

of this Land: the fift and sixt were found by Doctor *Boelius*, (often remembred both in my former and this worke) in *Barbary* and brought to us: the seventh was also found by him in *Spaine* and *Portugall*: the eight in many Countries of this Land, both in fields and else where, and will bee also found as a weede in gardens, to be pulled out: the ninth in *Candy*, and the last groweth about *Drayton* neere *Portsmouth*.

The Time.

They flower in Summer, yet some later than others of their kinde.

The Names.

They are called *Convolvuli & Volubiles, quia crebra revolutione vicinos frutices & herbas implicet.* *Clusius* calleth the first *Convolvulus Althææ folio*, not knowing to what plant of the ancients it might be referred, unlesse it might be the *Iasione* of *Plinye*, whereof he maketh mention in the 22. chap. of his 22. booke. *Gerard* much mistooke this plant, calling it *Papaver corniculatum minus*, but his corrector hath amended it: The second is called *Convolvulus & Volubilis minor* by most writers, yet some *Smilax lævis minor* as *Dodonæus*; and *Helxine Cissampelos* as *Matthiolus* & some others, and taken to be the *Scammonea tenuis* of *Pliny*: the third is thought by *Castor Durantes* to be *Cantabrica Plinii*, and *Clusius* saith the same likewise: of *Cortusus* called *Scammonea Pannonica*, of *Guilandinus Helxine stans*, of *Tabermontanus Scammonium minus*, and of *Lobel* as it is in the title: the fourth, fift, sixt, and seaventh, have their titles in their foreheades, as much as is necessary to be sayd of them: the eight is thought of many to be the *Helxine* of *Dioscorides*, which was called also *Cissampelos*, in Greeke ἕλξινη κισσάμπελος, *ab* ἕλκειν *trahere vel herere*: & κισσάμπελος *quasi vitealis sive Hedera Viticea*, because this *Helxine* should be knowne to differ from *Parietaria*, called *Helxine* also, this most commonly growing in Vineyards, creeping up upon the Vines, with a leafe like Ivie: *Democritus* in *Geoponicis* calleth it *Malacocissos, quasi mollis hedera*: *Lobel* calleth it *Cissampelos' altera atriplicis effigie*: *Dodonæus* calleth it *Helxine Cissampelos & Convolvulus niger*: *Tragus* taketh it to be *Orobanche* of *Theophrastus*, which *Gaza* translateth *Ervangia*: of *Thalius in Harcynia sylva*, *Volubilis media sive nigra*, *Cordus* on *Dioscorides* taketh it to be *Elatine*, *Angullara* to bee *Centunculus Plinii*, and *Fabius Columna* calleth it *Polygonum Hederaceum*: the ninth is so called by *Pona* in his *Italian Baldus*, as it is in the title: the last is not spoken of by any before.

The Vertues.

They are all of the nature of the other small Bindeweedes no doubt, which is to move the belly: yet *Clusius* saith the first is used in Portugall, as an herbe of singular effect to heale all sores or wounds; *Cissampelos*, is said likewise to purge the body strongly, if either the juyce, or the leaves and herbe in powder, be drunke in wine or other drinke. The leaves being bruised and layd on hard tumors or knots in the flesh, dissolveth and consumeth them.

CHAP. XI.

Smilax aspera. Pricklye Bindweede.

THere are two sorts of this Bindweede, differing very notably both in leafe and fruite, as you shall heare by and by: but there is another plant referred unto them, which is the *Sarsaparilla*, that is brought from the West Indies, which I must adjoyne, and speake of it also here.

1. *Smilax aspera fructu rubro.* Prickly Bindweede with red berries.

This Bindweede groweth up with many branches, wherewith it windeth about trees, and other things, set with many crooked prickes or thornes like a bramble, all the whole length, bending this way and that, in a seemely proportion; for at every joynt it bendeth or boweth it selfe, first one way and then another, having somewhat a broad and long leafe thereat, standing upon a long foote stalke, and is broad at the bottome, with two forked round ends, and then groweth narrower unto the point: the middle ribbe on the backeside of most of them, having many small thornes or prickes, and also about the edges; the lowest being the largest and growing smaller up to the toppe, smooth and of a faire greene colour, and sometime spotted with white spots; at the joynts with the leaves also, come forth clasping tendrels, like as the Vine hath, whereby it windes it selfe; the flowers stand at the toppes of the branches, at three or foure joynts, many breaking forth together in a clustre, which are white, composed of sixe leaves a peece, starre fashion and sweete in sent, after which come the fruits, which are red berryes when they are ripe, of the bigneſse of *Asparagus* berryes or small Grapes, and in some lesser; wherein are conteined sometime two or three hard blacke stones, like also unto those of *Asparagus*; the roote is slender white and long, in hard dry grounds, not spreading farre, but in the looser and moyster places, running downe into the ground a pretty way, with diverse knots and joynts thereat, and sundry long rootes running from thence.

2. *Smilax aspera fructu nigro.* Prickly Bindweede with blacke berryes.

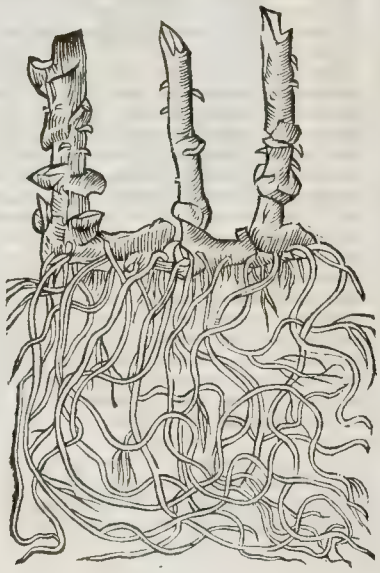
This other prickly Bindeweede, is like the former for the manner of growing in all points, his branches being joynted in like manner, with thornes on them, but nothing so many, climing as the former: the leaves are somewhat like it, but not having those forked ends at the bottome of every leafe like it, but almost wholly round and broad at the bottome, of a darker greene colour also, and without any, or very seldome with any thornes or prickes, either on the backe or edges of the leaves, with tendrells like a Vine also: the flowers come forth in the same manner and are starre fashion, consisting of sixe leaves a peece like the other, but they are not white as they are, but of an incarnate or blush colour, with a round red umbone in the middle of every one, which is the beginning of the berry, that when it is ripe, will be blacke and not red, being more sappie or fleshie than the other, with stones or kernells within them like unto it: the rootes hereof are bigger and fuller than the former for the most part, and spreading further under the ground.

3. *Smilax aspera Peruana.* Sarsaparilla of America.

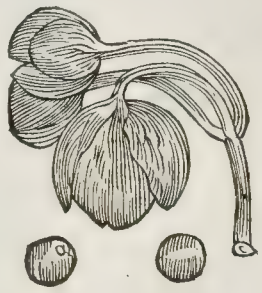
The Sarsaparilla that cometh from *America* into *Spaine*, and from thence into other Countries, hath beene seene fresh, even the whole plant as it hath beene brought from *Spaine* to the Duke of *Florence*, *Lucas Ghinni* his Physitian, being by as a witnesse, that in all things it did resemble the prickely Bindweede, and differed in

1. 2. *Smilax aſpera ſpinoſo & non ſpinoſo folio.*
Prickely Bindweede, with red and with blacke berries.

3. *Smilax aſpera Peruana ſive Sarſaparilla.*
Weſt India Sarſaparilla.



Buenas noches Hiſpanis. The heades with ſeedes of the true Sarſaparilla as it is ſuppoſed.



nothing from it. *Matthiolus* ſetteth downe this relation in his Commentaries, in the 111. chapter of his firſt booke of *Dioſcorides*, ſpeaking of *Sarſaparilla*, what plant it ſhould be, and agreeeth with *Ghinus*, that the *Smilax aſpera* (with red berries, for in not ſpeaking of the other he declareth that he knew it not) was the true *Sarſa*, which both *Ghinus* and others likewiſe had proved by many trialls, to be as effectuall to cure the French diſeaſe, as the *Sarſa* of the Indies. *Proſper Alpinus* likewiſe in his booke of *Egyptian* plants, declareth that he found in the Iſland *Zacynthus*, the rootes of *Smilax aſpera*, whoſe leaves he ſetteth forth to bee without prickles, growing by a running river ſide, to be greater larger and fuller of ſubſtance, than ever he had ſeene them, in any other place in *Italy* before; and being ſo like the true *Sarſa* of the Indies, that he was fully perſwaded the *Sarſaparilla* that commeth from *Peru*, was the rootes of *Smilax aſpera*; the difference betweene them, in greatneſſe or goodneſſe, if any be, to be onely in the climate and ſoyle; and ſaith that an Apothecary in that Iſle, had gotten much money thereby, both by his owne practiſe, and the ſale of them to others for *Sarſa*: and ſaith moreover that he ſaw himſelfe, in ſome bundles of the Indian *Sarſa*, ſome of the rootes, that had the knots at them, as the *Smilax aſpera* hath, and ſome leaves therein alſo like it, which my ſelfe have ſometimes ſeene in them likewiſe. *Gabriel Fallopius* likewiſe in the booke that he wrote of the cure of the French diſeaſe, in the chapter of *Sarſaparilla* ſaith thus; I was perſwaded ſaith he, and ſtood in that opinion along time, that the *Sarſaparilla*, was the roote of *Ebulus* or Wall worte, untill a Spaniard that brought the whole plant unto the Duke of *Florence*, made my errour knowne unto my ſelfe, for I ſaw it to be the roote of that *Smilax aſpera*, that *Dioſcorides* and other the ancients make mention of in their writings; and was better confirmed in my opinion, by the experience I had thereof, in curing diverſe about *Piſa* as perfectly of the French diſeaſe, by the rootes of this *Smilax aſpera*, which I cauſed to bee digged up for my uſe, growing on the hill of S. *Iulian*, as with the rootes of *Sarſaparilla* for two yeares while I ſtayed there to practiſe Phyſicke; which opinion alſo *Amatus Luſitanus*, a Phyſitian of good note, although a Iew, confirmeth in the fift booke of his Centuries. *Alpinus* alſo ſheweth another note of difference, in the rootes of *Smilax aſpera*, whereat many in his time ſtumbled: for they ſaw the rootes of *Smilax aſpera* growing in *Italy*, to be ſhort and full of knots, with ſmall fibres at the end; and the rootes of the other to be long and ſmooth without any knots: to enforme you therefore throughly herein, and take away this doubt; he ſheweth that the firſt rootes of *Smilax aſpera*, are downe right, ſhort, and full of joynts

joynts or knots, from which joynts or knots, ſhoote other rootes or ſtrings, which in dry grounds, are but ſmall and ſhort fibres, and in the more moyſt and mellow, are greater and longer, without any joynt at all in them, (as is to be ſeene in the rootes of many other plants, whoſe rootes have many ſtrings) and that theſe rootes are they, which are like the *Sarſaparilla*, and not the firſt, which are ſhort and full of joynts: and that the ſmalneſſe of the rootes of *Smilax aſpera*, growing in *Italy*, or other dryer Countries, muſt be rather imputed to the climate and ſoyle, rather than any thing elſe: by this narration you may perceive the judgement of the elder times, and likewiſe their practiſe to uſe *Smilax aſpera* inſtead of *Sarſaparilla*, for the diſeaſes whereunto *Sarſaparilla* is proper: but I verily beleeve that the plant of *Sarſaparilla*, that groweth in *Peru*, and the Weſt Indies, is a peculiar kind of it ſelfe, differing from the *Smilax aſpera*, as notably as the *Mechoacan* from our *Brionye* and may very well be that plant that *Simon de Tovar*, chiefe Phyſitian of *Sevill* in *Spaine*, ſowed the ſeedes of, and had it growing with him: and of the ſeed that he ſent to *Cluſius* under the name of *Convolvulus peregrinus*, did one plant likewiſe ſpring for a yeare with *Honeſtus Lopes*, in the low Countries, to whom *Cluſius* had imparted ſome of *Tovars* ſeede, but periſhed at the firſt approach of winter: the deſcriptions of both *Tovar* and *Cluſius*, in their manner of growing, are ſet forth by *Cluſius*, in the ſecond booke and 18 chapter of his *Exotickes* or ſtrang things, which I thinke not amiſſe here to relate unto you, yet contracted into one, leaſt it ſhould bee too tedious to ſet them downe both particularly: Having put the ſeede into the ground, the firſt two leaves that ſprung (ſay *Tovar* and *Cluſius*) were very like the firſt two leaves of *Campanula Indica*, the blue Bindweede (and ſuch likewiſe doth the ſeede of *Mechoacan* yeeld, at the firſt ſpringing ſaith *Tovar*) the roote afterward ſaith *Tovar* ſent forth many branches, which woond themſelves, very much about the poales that were ſet for them to clime on, like unto *Smilax aſpera*, having ſuch like leaves alſo, but greater and ſofter: the branches had crooked thornes or prickes, growing on them likewiſe as the *Smilax aſpera* hath, but fewer and nothing ſo ſharpe: that of *Honeſtus Lopez* ſaith *Cluſius*, ſprang up with many branches, winding it ſelfe alſo about the poales, that were ſtucke into the ground by them; having ſome tender prickes like thornes growing on them, eſpecially at the joynts, which were (ſaith he) nothing but the firſt ſprouting of rootes, which no doubt would have taken hold of the ground, if earth had beene put unto them; it had very greene leaves ſaith *Cluſius*, like unto Bindweede, but longer, and cornered like ivie leaves, ending in a long point, like to the leaves of *Smilax aſpera*; the flowers ſaith *Tovar* were great and white, every one as bigge as a middle ſiſed diſh, which opening in the morning did fade at night; from whence the Spaniards called the plant *Buenas noches*, that is, good night: the plant of *Honeſtus Lopez* ſaith *Cluſius*, brought forth buddes for flowers, but could not bring them to perfection, the earely froſts deſtroying the whole plant: *Cluſius* ſaith that he had a ſmall branch with three heades of ſeed thereon, (whoſe figure I here give you) the largeſt that ever he ſaw in that kinde, for it had five leaves a peece, every one almoſt an inch broad and long, which ſeemed to be the cup of the flower and fruite, every head which was three ſquare and skinnie, had within it three round ſeede, as big as great peaſe, of a ſmoakie or browniſh colour. The report of Maſter White a Painter, unto Maſter *Gerrard*, as he ſetteth it downe in the chapter of *Sarſaparilla*, is ſomewhat to this purpoſe; that it is the roote of a ſhrube or hedge tree, like unto Hawthorne trees with leaves like Ivye, the compariſon unto Hawthorne is rude, according to his skill, but it ſeemeth the branches abide and periſh not, there ſpreading very much: the leaves are better reſembled: but flowers or fruite he remembred not. Theſe deſcriptions doe ſeeme unto me, (although no mention of roote be expreſſed in the relation) very probably to ſet forth the growing of *Sarſaparilla*, whereof no doubt *Simon de Tovar*, if he had lived longer, had given *Cluſius* better information: *Bauhinus* in his *Pinax*, maketh it a third ſpecies of *Smilax aſpera*, calling it *tertia Smilax aſpera India Occidentalis*: time no doubt will declare the truth hereof more plainely, yet it might be haſtened, if there were in any eminent perſon, any ſuch ingenuity of ſpirit, as to cauſe ſuch things, that are rare to be ſought out, and brought home (and many ſuch there are in *Italy*, as at *Florence*, *Rome*, *Venice*, *Padoa*, and many other places, that have their gardens ſtored with all the rareſt plants they can heare of, and brought thither) and then if care, diligence and experience had the ordering of them, after they were brought, they might make them famous that procured them, and be the meanes of a great deale of knowledge to others, for the true declaration of ſuch things, as are either doubtfull or hidden in the courſe of Phyſicke.

The Place.

The two firſt grow in *Italy*, *Spaine*, and other the warmer Countries, whether the continent or Iſles, throughout *Europe* and *Aſia*: but the third is found onely in the Weſt *Indies*; the beſt commeth (as it is ſayd) from the *Honduras*, others not ſo good from other places there, as the fertility or the barrenneſſe of the ground, and the temperature of the climate, affordeth meanes thereof.

The Time.

In the hotter Countries theſe flower, and bring forth their berries timely enough in the yeare, but in theſe colder Countries, without conveniencie to keepe them in the winter, the froſts will ſoone conſume them.

The Names.

The word *Smilax* is diverſly taken and with diverſe ſignifications among writers; it is taken for two ſorts of trees, it is likewiſe taken for three ſorts of herbes. *Theophraſtus* maketh mention of one of the trees, in the 3. booke and 16 chapter of his hiſtory, calling it *Smilax Arcadum* a ſoft Oake, which is like unto an *Ilex* or Holly Oake. The other which the Grecians call *Smilax* ſimply, is called in Latine *Taxus*, the Yew tree: the herbes, are firſt, this here expreſſed, as well as the other more gentle ſort, which is the common Bindeweede, this the Grecians call σμίλαξ τραχεῖα *Smilax aſpera*, as they call the other σμίλαξλεῖα *Smilax lævis ſive lenis*, and the other the Grecians call σμίλαξ κηπαία *Smilax hortenſis*, which is *Dolichus* or *Phaſeolus*, the French or Kidney Beane, as ſhall be ſhewed in their ſeverall places. This *Smilax aſpera* is called alſo of *Galen* in his ſeventh booke of ſimples *Milax aſpera*. *Theodorus Gaza* the tranſlater of *Theophraſtus*, interpreteth it *Hedera Cilicia*, following *Plinye*, who ſaith in *lib. 26. c. 35.* that the herbe called *Smilax* which is like unto Ivye, and came firſt out of *Cilicia*, but is more frequent in Greece, hath thornie branches, &c. *Plinye* alſo calleth it *Nicophoros lib. 24. chap. 10.* It is called generally of all *Smilax aſpera*, onely *Lonicerus* calleth it *Volubilis aſpera*, and *Cluſius* as I thinke firſt of all diſtinguiſhed it by the berries, calling the one *rutilo fructu*, and the other *nigro*, when as they might as well be diſtinguiſhed by their leaves, the red berryed as I take it having thornie leaves, and the other

ſmooth

ſmooth and without thornes or prickles, yet *Gerards* figures have both of them prickles on the leaves, calling the one *Luſitanica* and the other *Germanica*, whereas it is but one and the ſame plant, growing in ſeverall Countries: *Tragus* ſeemeth to bee doubtfull of *Dioſcorides* his *Smilax aſpera*, thinking *Lupulus* the Hoppe to be it; *Lobel* calleth that with blacke berryes *Smilax aſpera altera facie Sarſaparilla aut ei congener*. And it is very likely to be that kinde that *Alpinus* ſaith, he found with ſo large and great rootes, as is before expreſſed, and others ſo much commend to be uſed inſtead of *Sarſaparilla*. The *Zarſaparilla* or *Sarſaparilla* it ſelfe, is a Spaniſh word, which the Spaniards impoſed upon this, when they firſt ſaw it in the Weſt Indies, becauſe they judged them to be both one thing, that is *Smilax aſpera*: for ſo they call it in their language *Zarſa*, or as ſome write it *ſarça*, ſignifying *Rubus* a Bramble, and *Parilla viticula*, the *diminitive* of *Vitis*, a Vine, as if one ſhould ſay a ſmall Vine-like Bramble, and yet *Garcias Lopes Luſitanus* ſaith, the name the Indians call it by, doth ſignifie as much. Some call it *Salſaparilla*, and ſome *Smilax Peruana*. *Matthiolus* giveth us a figure of *Sarſaparilla*, neither branches nor leaves, having any ſhew of thorne or prickles at all upon them, which as he ſaith he received from *Cyprus*; and hath no knot or head, from whence the long ſmooth roots ſhould ſpring, ſuch as is in the true *Sarſaparilla*; which as I ſayd before I have often ſeene my ſelfe in diverſe bundles thereof: but aſſuredly there are diverſe ſorts of *Sarſaparilla*, the beſt being very large & full, with a white pith in the middle, which will rend or ſlive in the middle very eaſily, and this moſt commonly is brought without head or knot, but with a number of fibres on all ſides thereof, which muſt be taken away before it can be uſed, another ſort is not ſo full and great, yet rendeth or cleaveth reaſonably well, and is the moſt ſpent, becauſe the moſt ſtore thereof is brought: the third is a hungry ſort, and is of leaſt reſpect and uſe, this being uſually brought with the heads or knots, to be ſeene from whence the rootes ſprung, I ſay uſually, for ſometimes you may finde a head or two among the middle ſort.

The Vertues.

This prickly Bindweede ſaith *Galen* if the leaves be taſted they have ſome ſharpeneſſe in them, and being uſed any way they heate. *Dioſcorides* ſaith that both leaves and berryes being drunke, before or after any deadly poyſon is taken, are a remedy there againſt, ſerving to expell it. It is ſayd alſo ſaith he, that if to a new borne childe, ſome of the juyce of the berryes hereof be given, it ſhall not be hurt by poyſon ever after: It is given as an Antidote againſt all ſorts of poyſonous or venemous things. If a dozen or ſixteene of the berryes being beaten to powder, bee given in wine, it procureth Vrine when it is ſtopped. The diſtilled water of the flowers being drunke, worketh the ſame effect, and cleanſeth the raines, and aſwageth inward inflammations. If the eyes be waſhed therewith, it taketh away all heate and redneſſe in them, and if the ſores of the legges be waſhed therewith, it healeth them throughly. The rootes as you have heard before, are uſed by diverſe learned and judicious men in ſtead of *Sarſaparilla* with as good ſucceſſe, as if they had uſed the true: for *Sarſaparilla* doth not purge the body of humours manifeſtly as other purgers doe, being generally held not to heate, but rather to dry the humors, yet it is wel perceived that it ſpendeth the humors, by a ſecret and hidden property therein, whether by purging, or waſting & conſuming them. much wherof is performed by ſweating which it provoketh notably: It is much uſed now adays in many kinds of diſeaſes, namely in all cold fluxes from the head & braine, rhumes and catarrhes, as alſo all cold griefs of the ſtomack, and expelleth winde very plentifully, both from the ſtomacke and mother: It helpeth not onely the french diſeaſe, but all manner of aches in the ſinewes and joynts, all running ſores in the legs, all flegmaticke ſwellings, tetters, or ringwormes, and all manner of ſpots and fouleneſſe of the skin: it is not convenient to be given to thoſe whoſe livers are over hot, nor to ſuch as have agues. The manner of uſing it, is diverſe according to mens ſeverall opinions, for in former times it was uſed beaten to powder and ſo drunke: others againe boyled it ſo long untill it became tender, which being beaten or broken, was afterward ſtrayned into the decoction, making a kind of thicke drinke like a creame. Some againe and that moſt uſually boyled it in water, to the halfe, or to the conſumption of the third part, as they would have it ſtronger or weaker, and that either by it ſelfe, or with other things meete for the diſeaſe attempted: and others alſo put it among other things into drinke, either beere or ale new tunned up, to drinke after it hath ſtood three or foure dayes for Phyſicke drinke, for the remedy of thoſe griefes, it is conducible as aforeſayd.

CHAP. XII.

Lupulus ſive Lupus ſalictarius. Hoppes.

THe Hoppe is found to be of two ſorts, one manured for the uſe and profit of the toppe heads, the other wilde growing in hedges, and other ſuch like places of it owne accord, and was no doubt by ordering and manuring brought to be larger in every reſpect, and more fruitfull for uſe, ſuch as the manured is: I thinke it not amiſſe to ſpeake of them both in this place, being ſo neere in forme and quality the one unto the other, and not ſeparate them, or trouble two places with them.

1. *Lupulus ſativus.* The manured Hoppe.

The manured Hoppe riſeth up at the firſt, with diverſe great browne heades, like unto *Aſparagus* but larger, which afterwards ſpreading into rough branches, clime upon great high poles, that are ſet for them to ruune on, having many hard and rough darke greene leaves on them, cut into three or five diviſions, ſomewhat like unto Bramble leaves, and dented alſo about the edges: at the toppes of the branches, which hang downe againe, for the moſt part come forth many ſcaly heads, being as it were a number of ſmall yellowiſh greene leaves, growing thicke together; from among which come forth the flowers, of a whitiſh yellow colour, which being paſt, and the heads changing their colour, to be ſomewhat whitiſh yellow, they are fit then to be gathered to keepe: and then there is a ſmall round ſeede found therein: the roote is great at the head, ſhooting forth many blackiſh ſtrings, taking faſt hold of the ground.

2. *Lupulus ſylveſtris.* The wilde Hoppe.

The wilde Hoppe groweth up in the ſame manner, ramping upon trees or hedges, as ſtandeth next unto them, with rough branches and leaves like the former: this giveth both ſmaller heades, and in farre leſſe plenty, than the manured doth, yea many times, there is ſcarſe a head or two ſeene in a yeare upon diverſe, and herein conſiſteth the chiefe difference.

The

Lupulus salictarius. Hoppes.

The Place.

Theſe plants are more frequent in theſe colder, than in the hotter countries, which ſheweth the goodneſſe of God unto us, to provide for every Country, ſuch things as are fit for the ſuſtentation of life; for where Vines grow not, and the water too cold and raw, to drinke ſimply of it ſelfe, there are theſe Hoppes chiefely bred to make drinke to ſerve inſtead of wine or water: They delight chiefly, or rather onely to grow well, in low moiſt grounds, where they may have moyſture enough, and yet not too much; for therefore where they are planted on hillockes, as it were, there are trenches made to receive any great quantity of water, and bee conveyed away, that the plants ſtand not drowned therein.

The Time.

Theſe ſpring not up untill *Aprill*, and flower not untill the latter end of *Iune*, the heads are not gathered, untill the middle or end of *September*.

The Names.

It is obſerved and much marveiled at, by our ordinary writers, that this plant ſhould not be remembred by *Dioſcorides*, *Galen*, or any other of the ancient Greeke or Latine writers except *Pliny*, who doth but onely name it and, number it among thoſe herbes that grow of themſelves, and that are uſed for meate with diverſe nations, calling it *Lupulus ſalictarius*. The *Arabians* have not onely remembred it, but commended the uſe of it highly for many diſeaſes, as you ſhall heare by and by. *Meſues* maketh it his third kind of *Volubilis* with rough leaves, among his purging plants: the Greekes at this day call it βρύον & βρυωνία, *Bryon* and *Bryonia* it is likely for the forme of the leaves and running of the branches. It is called *Lupulus & Lupus ſalictarius, & reptitius* (*quia ſalit & reptat per arbores, vel quia ſcandit ſalices*) of all our moderne writers, onely *Lobel* calleth it *Vitis ſeptentrionalium*, the Vine of the Northerne regions, and *Tragus* as I ſayd before thinking it to be *Smilax aſpera*: the *Italians* call it *Lupolo*; the *Spaniards Hombrazillos*, the *French Houblon*, the *Germaines Hopffen*, the *Dutch Hoppe*, and we in *Engliſh Hoppes*.

The Vertues.

The firſt buds of the Hoppes, being layd a while in ſand, maketh them the tenderer, and being boyled are uſed to be eaten, after the ſame manner that the buds of *Aſparagus* are, and with as great delight for the taſte, yet they have little nouriſhment in them: their Phyſicall operation therefore is to open, the obſtructions of the Liver and ſpleene, to clenſe the blood, to looſen the belly, and to clenſe the Raines from gravell, and to cauſe them to make water in whom it is ſtayed: the decoction of the toppes of the Hoppes, of the tame as well as of the wilde, and ſo alſo the rootes doe worke the ſame effects, but that they are ſomewhat hotter than the young buds, which have more moyſture in them: in clenſing the blood, they helpe to cure the French diſeaſe, and all manner of ſcabbes, itch, and other breakings out in the body, as alſo all tetters, ringwormes and ſpreading ſores, the morphew likewiſe and all diſcolourings of the skin, and are uſed in Agues: the decoction of the flowers and tops, are uſed to be drunk, to helpe and expell poyſon that any one hath drunk: half a dram of the ſeede in powder taken in drink, killeth the worms in the body, it likewiſe bringeth down womens courſes, & expelleth Vrine. The flowers and heads, being put into bathes for women to ſit in, take away the ſwellings and hardneſſe of the Mother, and is good for the ſtrangurie, or thoſe that very hardly make their water; the juyce of the leaves dropped into the eares, clenſeth the corrupt ſores, and ſtench ariſing from the corruption in them; *Meſues* ſaith they purge choler, but worke more effectually, being ſteeped in whey of goates milke: A Syrupe made of the juyce and ſugar, cureth thoſe that have the yellow jaundiſe, eaſeth the headach that cometh of heate, and tempereth the heate both of the liver and ſtomack, and is very profitably given in long & hot agues, that riſe of choler and blood: Thoſe bakers that will uſe the decoction of Hoppes, to mould up their bread, ſhal make thereby their bread to riſe better, and be baked the ſooner: *Cluſius* reciteth the manner of a medecine uſed in *Spaine*, by women leeches, to cure the falling of the haire, cauſed by the french diſeaſe, in this ſort. A pound of the roots of Hopps, wel waſhed & boyled in 8 pints of faire water, to the conſumption of the third part, or a halfe if they ſee cauſe; whereof they give half a pint to drink in a morning, cauſing them to ſweate well after: into the decoction they put ſometimes, two or three roots of parſly, and as many of couch graſſe, with a few Rayſins of the ſunne. The Ale which our forefathers were accuſtomed onely to drinke, being a kinde of thicker drinke than beere (cauſed a ſtranger to ſay of it, *Nil ſpiſſius dum bibitur, nil clarius dum mingitur, unde conſtat multas faces in ventre relinquit*, that is, there is no drinke thicker that is drunke, there is no Vrine cleerer that is made from it, it muſt needes be therefore that it leaveth much behinde it in the belly) is now almoſt quite left off to be made, the uſe of Hoppes to be put therein, altering the quality thereof, to be much more healthfull, or rather phyſicall, to preſerve the body from the repletion of groſſe humors, which the Ale engendred. The Wilde Hoppes are generally uſed Phyſically more than the manured, either becauſe the Wilde is thought to be the more opening, and effectuall, or more eaſily to come by, or that the owners of the manured, will not ſpare, or loſe ſo much profit, as that which would be taken away might yeeld; yet aſſuredly they are both of one property, take which you will, or can get.

CHAP.

CHAP. XIII.

Bryonia ſive Vitis ſylveſtris. Bryonie or Wilde Vine.

VNder this title of Bryonye I muſt comprehend diverſe and ſundry plants, ſome whereof are of our Land, and found plentifully therein: others are ſtrangers comming from other parts: Among which I muſt remember the *Mechoacan* of *America*, a plant neereſt reſembling the white Bryonie, as you ſhall heare when we come to it, and ſome others alſo that are ſtrangers of thoſe parts.

1. *Bryonia vulgaris ſive Vitis alba.* The common white Bryonie or wild Vine.

The white Bryonie or wild Vine that groweth commonly abroad, ramping up on the hedges, ſendeth forth many long rough, very tender branches at the beginning, growing with many very rough broad leaves thereon, cut into five partitions for the moſt part, in forme very like a Vine leafe, but ſmaller, rougher, and of a whitiſh or hoarie greene colour, ſpreading very farre upon trees or buſhes, or whatſoever ſtandeth next it, and twining with his ſmall claſpers, that come forth at the joynts with the leaves: at the ſeverall joynts alſo with the leaves and claſpers come forth, (eſpecially towards the toppes of the branches) a long ſtalke, bearing thereon many whitiſh flowers, together in a long tufte, conſiſting of five ſmall leaves apeece, layd open like a ſtarre; after which come the berries, ſtanding more ſeperate one from another then a cluſter of grapes, greene at the firſt, and very red when they are through ripe, of the bigneſſe of Nightſhade berries, of no good ſent, but of a moſt loathſome taſte, provoking vomit: the roote groweth to be exceeding greate, with many long twines or branches growing from it, of a pale whitiſh colour on the outſide, and more white within, and of a ſharpe bitter loathſome taſte.

2. *Bryonia alba vulgaris fructu nigro.* Common white Bryonie with blacke berries.

This Bryonie differeth from the former white kinde, neither in the running rough branches or in the leaves, or in any other thing from it, but in theſe two particulars: the berries hereof are blacke and not red, when they are through ripe, and the roote is of a pale yellow colour on the inſide, and ſomewhat browniſh on the outſide.

3. *Bryonia Cretica dicoccos.* Candie white Bryonie with double berries.

The white Bryonie of Candy, ſhooteth forth many long rough trayling branches, in the ſame manner like the former in all reſpects, with claſping tendrells winding it ſelfe upon any thing as the other doth; bearing broad leaves with ſuch diviſions therein, as it hath, but that they are ſomewhat ſmaller, greener, and ſtriped with white lines thorough the middle, as likewiſe in the veynes that goe to the corners: the flowers likewiſe are ſomewhat greater than the former, of a pale whitiſh colour, ſtanding every one, upon a little longer foote ſtalke, which give berryes in their places, greene at the firſt, but red when they are ripe, and formed in a differing manner from the others; for ſtanding ſemicircular upon the ſtalkes, they are joyned at the bottome, as if it were but

1. *Bryonia alba vulgaris*: White Bryonie.

6. *Bryonia Sylveſtris nigra.* Common blacke Bryonie.

one

one berrie, but are parted at the toppes into two parts, wherein are conteined two ſeedes, from whence roſe the name: the roote is very long, but never growing to be bigger than a mans arme, of a browner colour on the outſide, and not ſo white within as the common.

4. *Bryonia nigra Dioſcoridis.* Blacke Bryonie with blacke fruite in cluſters.

This blacke Bryonie ſendeth forth many long greene branches, whereon are ſet diverſe broad leaves, ſomewhat long pointed and not divided on the edges at all, of a ſad or darke greene colour, having at the joynts with the leaves claſping tendrells, whereby it windeth it ſelfe about whatſoever it meeteth with, towards the toppes come forth likewiſe long bunches of whitiſh moſſie flowers, which afterward turne into berryes, greene at the firſt, and blacke when they be ripe: the roote is ſomewhat great and blackiſh on the outſide, but of a yellowiſh colour on the inſide, full of a clammie moyſt humour or juyce, that will cleave to your fingers.

5. *Bryonia nigra baccifera.* Blacke Bryonie with ſingle red berries.

This kinde of Bryonie hath many long and ſquare branches, more hard or wooddy than the laſt, winding themſelves about every thing that ſtandeth next unto them, but hath no claſpers at all, the leaves are ſomewhat like unto the great white Bindeweede, of a ſhining colour, a little unevenly dented about the edges, and ſtanding upon long foote ſtalkes: towards the toppes of the ſtalkes, at the joynts with the leaves, come forth white flowers, every one ſtanding on a ſhort ſtalke, which afterwards give ſingle berries, greene at the firſt; and red when they are ripe, little leſſe than Cherryes, wherein are contained foure or five ſomewhat large round and blacke ſeede: the roote is great thicke and long, ſomewhat like the laſt, and having ſuch like clammie juyce within it as it hath.

6. *Bryonia nigra ſylveſtris, ſive Sigillum Sanctæ Mariæ.* Common blacke Bryonie or our Ladies ſignet.

This kinde of Bryonie hath alſo long trayling branches, without any claſping tendrills, (in all places that I have ſeene) whereby it might faſten and winde it ſelfe; the leaves are ſomewhat broade and like unto the leaves of the rough or prickely Bindeweede, ending in a ſharpe point: the flowers come forth at the joynts upon long ſtalkes, many cluſtering together, in long thinne or ſparſed cluſters, every one conſiſting of five ſmall white leaves, and after they are fallen, there come in their places, ſmall berries, red when they are ripe for the moſt part, or changing ſomewhat blackiſh, in ſome places by ſtanding long: the roote is browniſh on the outſide, and white within, ſomewhat great if it grow in moyſt grounds, but much ſmaller or whiter, in hard drye or ſtonie places, as *Dalechampius* ſaith; of a little hot and ſharpe taſte.

7. *Bryonia alba Peruana ſive Mechoacan.* The Mechoacan of Pēru.

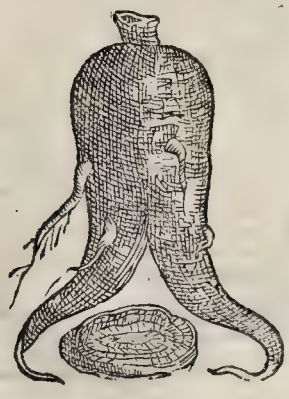
Thē *Mechoacan* of *Peru* that hath growen in theſe parts, ſendeth forth divers darke grayiſh long branches, winding themſelves about Poales that are ſet for them, or any other things that are next unto them, whereon doe grow faire broad leaves, pointed at the ends, very like in forme, unto the leaves of the laſt recited Ladies ſeale, but of a darke greene colour, thinner and harder in handling, ſeeming ſo dry as though they had no juyce in them: the flowers are many, ſtanding in long cluſters, yēt every one bigger than any of the former, (of a ſullen yellow colour in the Indies as *Monardus* ſaith, and as large as an Orenge flower, with an umbone in the middle, which afterwards becommeth the fruite, and being ripe is as big as an haſell nut, divided by a thin skinne in the middle, in each ſide whereof lye two blacke ſeedes of the bigneſſe of peaſe) of a darke whitiſh colour in the warmer Countries of *Europe*, but not with us, yeelding berries and ſeede but not ſo large: the roote groweth to be as great as any Bryonie roote, being not bitter or loathſome to taſte, as it is, but rather altogether without either taſte or ſmell, having many circles in it, as may be diſcerned in the dry rootes, that come over to us, and may eaſily be brought into powder.

7. Bryonia alba Peruana ſive Mechoacan.
The Mechacan of Peru.

8. *Mechoacan ſylveſtris.* Wild Mechoacan.

This wild kind of Mechoacan is altogether like thē othēr,

Mechoacani radix.
The roote of Mechoacan.



both

both in manner of growing, with branches, leaves, flowers and rootes, but leſſer in every particular, and the roote (wherein is the chiefeſt difference) being ſharpe and loathſome, procuring vomiting and troubling the ſtomacke, when it is taken, as mch as any ordinary Bryonie can doe.

9. *Mechoacan nigricans ſive Ialapium.* Blacke Mechoacan or Ialap.

Although we have not ſeene this Ialap grow with us, or have heard it to grow in any theſe parts of *Europe*, neither are aſſured that the plant thereof is of this family, more than by conjecture, and ſight of the dryed rootes, (brought unto us as a Merchandiſe and a purging roote) being ſomewhat like in vertue and in forme unto the ſmaller peeces of the former Mechoacan: yet I thought good to make mention of it in this place, among the reſt of this kinde, both to let it be knowne to the world, and to excite ſome one or other to get the ſeede, or the greene roote, that by ſight thereof growing freſh, we may know to what tribe or family it doth belong: It commeth to us in ſmall thinne peeces, ſome greater ſome ſmaller, yet nothing ſo large as the greater, but rather as the ſmaller peeces of *Mechoacan*, of a browniſh blacke colour, ſomewhat more ſolid, hard, compact, and gummie withall, for out of it will riſe a black gum, being layd on a quick or burning coale, but not (flame in any that I have ſeene or tryed) and of no unpleaſant taſte; but ſticking a little, in the teeth when it is chewed.

The Place.

The firſt groweth on bankes or under hedges, throughout this whole Kingdome. The ſecond groweth in ſome Countries of *Germany*, *Bohemia*, *&c.* where the former white doth not. The third groweth plentifully in *Candy*, from whence *Honorius Bellus* ſent the ſeed thereof to *Cluſius* and others. The fourth *Gerard* ſaith groweth in buſhes and hedges, almoſt every where, but herein I am ſure he is much miſtaken, thinking that our ordinary blacke Bryonie is this of *Dioſcorides* for I have neither found it my ſelfe in any place, nor underſtood of a certainty from others, that they have found any with blacke berries and a blacke roote; and I finde ſome good authours doe doubt, whether the right be to be found or no. The fift *Bauhinus* ſaith was found in the woods by *Huningen* a village in *Germany*. The ſixt is found wild in many places of our owne Countrie as well as in *Italy*: as *Matthiolus* ſaith, or in *France* and *Germanie* as *Lobel* ſaith. The ſeaventh as *Monardus* ſaith, groweth in the Province of *Mechoacan* 40 miles beyond *Mexico*, from whence it was firſt brought into *Spaine*: but afterwards, both more plentifully, better conditioned and of more effect, was brought from the firme or maine land of *Nicaragua* and *Quito*. The eight *Monardus* ſaith was brought from the promontory of S. *Helen*, which is on the ſame continent with *Nicaragua*. The laſt is likewiſe brought from a place in the *Indies*, called *Chelapa* or *Calapa*, from whence alſo it tooke the name.

The Time.

They doe all flower in the monthes of *July* and *Auguſt*, ſome earlyer or later than others, as their originall is from colder or warmer countries, and their ſeede if they give any ripe with us, is perfect ſoone after.

The Names.

It is called in Greeke ἀμπελος λευκὴ *Vitis alba & Vitalba ſic dicta non quod ſit vitis ſed quod ei ſimilis*, as alſo βρυωνία ἀφεῖσα *forte quod eſt pullulo, extollo, exalto, quod in vicinos frutices ſcandens ſe extollat atq; late pullulet*: it is likewiſe called ψιλοθρον, *pſilotrum quod ex ejus acinis coria depilari ac confici poſſunt*, in Latine of ſome *Vitirella*, of others *Roraſtrum*, of *Apuleius Apiaſtellum & Vva Taminia*, but of moſt *Vitis alba*, *Bryonia*, and *Bryonia alba*. The ſecond is called *Bryonia nigra*, *Vitis nigra*, *& Vitis alba baccis nigris*, and onely diſtinguiſhed from the firſt, by the colour of the fruite and roote, for that it is but one kind, differing by the nature of the climate where it groweth. The third is called *Bryonia Dicoccos* of *Honorius Bellus*, who as I ſayd before, firſt ſent it from *Candy*. *Bauhinus* calleth it *Bryonia Cretica maculata*. The fourth is called in Greeke ἀμπελος μελαινα, in Latine *Vitis nigra*, (*ita dicta ab acinis radiceque nigris, & quod vitis ſimilitudinem habet*) *Bryonia nigra & Vitis Chironia*, the true kinde of *Dioſcorides*, whoſe branches having tendrels, whoſe leaves being Ivye like, the berries and roote blacke, is knowne to very few. The fift is called by *Bauhinus* in his *Prodromus Bryonia ſyl. baccifera*, in his *Pinax*, *Bryonia lævis ſive nigra baccifera*. The ſixt is taken of moſt writers to be *Vitis nigra*, or *Bryonia nigra* of *Dioſcorides*, as *Matthiolus*, *Anguillara*, *Lacuna*, *Geſner*, *Caſtor Durantes*, *Lugdunenſis*, *Tabermontanus*, and *Lobel*. *Dodonæus* calleth it *Tamus & Vitis ſylveſtris*, but ſaith it differeth from that *Vitis ſylveſtris* that is called *Labruſca*, which differeth little from the true manured Vine; but that it groweth wild and beareth few or no grapes: Some as *Dodonæus* call it *Vitis Taminia*, and the berries *Vva Taminia*, yet ſome would appropriate that name to the *Bryonia alba*: it is in moſt of the Apothecaries ſhoppes in *Italy*, *France*, and *Germanye* called *Sigillum Sanctæ Mariæ* or *Beatæ Mariæ*: Some likewiſe would have it to be the *Cyclaminus Ciſſanthemos* of *Dioſcorides*, which it cannot be, for he ſaith the roote is unprofitable, which this is not, and others to be *Pliny* his *Salicaſtrum*; both which are more truely referred to the *Dulcamara* or *Solanum lignoſum*. *Gerard* is much deceived in thinking *Cyclaminus altera Dioſcoridis*, to be a kinde of *Cyclamen*. The ſeaventh is called of moſt men *Mechoacan*, from the place where it grew, yet *Monardus* ſaith the *Spaniards* that uſed it, called it *Rhabarbarum* from the effects, and to diſtinguiſh it, called it *Mechoacanum Indicum*, *& album Rhabarbarum*, and *Rhabarbarum Mechoacanum*: *Bauhinus* ſaith it doth neereſt reſemble the *Bryonia ſylveſtris*, and therefore calleth it *Bryonia Mechoacana dicta*, *Dodonæus* rather taketh it to be a kinde of *Scammonye* calling it *Scammonium Americanum* but not rightly. The eight is called *Mechoacana ſylveſtris*, as a wild and worſe kind of the former, and as *Monardus* ſaith, they that do once uſe it, will never uſe it againe, in regard of the violent paines and ſymptomes it doth procure, and therefore *Monardus* thought it to be rather a *Scammonye*, and is called of *Bauhinus Bryonia Mechoacana ſylveſtris*. The laſt is called *Ialapium*, *Ialap*, and *Gelapo*, in different places. *Bauhinus* calleth it *Bryonia Mechoacana nigricans*. The *Arabians* call the white Engliſh *Alfeſera*, the *Italians Vite bianco & Zucca ſalvatica*, the *Spaniardes Nueza Blanca Bryonia* and *Norca blanca*, the *French* Coleurees and *Feuardent*, the *Germanes Stickwurtz Hunds raben & Teufels Kirſche*, the *Dutch Witte Bryonie*, and we in *Engliſh Bryonie*, *White Bryonie*, *White wild Vine*, and *Tetter berries*.

The Vertues.

The roote of the white *Bryonie* purgeth the belly, with great violence, troubling the ſtomacke and hurting the liver, wherefore it is not raſhly to be taken, but as *Meſues* adviſeth, ſome ſpice is to bee added to it, or ſome Maſticke, Quinces or other ſuch like aſtringent and ſtrengthening thing. The firſt and tender ſhootes, as *Dioſcorides* and *Galen* ſay, were uſed in their times to be eaten in the ſpring, both to purge the belly and to provoke urine, and is ſayd to be alſo uſed in our times in other parts, but not in our countrie, who delight not in ſo bitter,

but

but in more pleasant sallets: By the strong purging quality of the roote, it may bee profitable for the diseases of the head, as the falling sickneſſe, the dissineſſe and swimmings in the head and braine, by drawing away much flegme and rheumatick humors, oppressing those parts, as also the joynts and sinews, and is therefore good for palsies, convulsions, crampes, and stitches in the sides: in purging the belly of wateriſh humors it is good also, as same say, against the dropsie, and in provoking Vrine: it also clenseth the raines and kidneyes from gravell and the stone, by opening the obstructions of the spleene, and wasteth and consumeth the swellings & hardnes thereof. It clenseth the mother wonderfully, in helping those that are troubled, with the rising and suffocation thereof, by drinking once a weeke, of the wine wherein the roote was boyled, going to bed, and expelleth the dead childe, and afterbirth in those those that are delivered, but is not to be used by women with childe, for feare of abortion: it bringeth downe also their courses when they are stopped, by taking a dram of the roote in powder in wine, or sitting in the decoction of the rootes; it clenseth the cheſt of rotten flegme mightily, and therefore an Electuary made of the rootes and honey, doth wonderfully helpe them that have an old and strong cough, or that are ready to be strangled with flegme oppressing them, and that are troubled with shortneſſe of breath: the same also is very good for them that are bruised inwardly, to helpe to expell the clotted or congealed blood, *Dioscorides* also saith that the roote being taken, helpeth those that are bitten with a viper or an adder; the *Fœcula* or White hardned juyce, is often used to be taken to the weight of two or three graines at the most, in wine or broth, to all the purposes of purging aforesayd. For outward applications, *Dioscorides* saith, that the leaves, fruite, and roote, by the sharpe quality that is in them, doe clense old and filthy sores, are good against all fretting and running cankers, gangrænes and tetters, and therefore the berries usually called of the Country people, Tetter berries, are with good succeſſe, and often experience applyed to them: the roote also clenseth the skinne wonderfully, from all blacke and blew spots, freckles, morphew, leprie, foule scarres, or any other deformity of the skinne whatsoever, as also all running scabbes and mangineſſe, either the powder of the dryed roote, or the juyce thereof rudely taken, but especially the *fœcula*, or fine depurate and hardened white juyce, to be used at all times of the yeare. The distilled water of the rootes worketh the same effect, but more weakely; yet the water is often used to cleere the skinne from spottes, &c, the roote being bruised and applyed of it selfe to any place, where the bones are broken, helpeth to draw them forth, as also splinters or thornes in the flesh: and being applyed with a little wine mixed therewith, it breaketh byles and helpeth whitlowes on the joynts: it is sayd that *Augustus Cæsar*, was wont to weare it with bayes, made into a roule or garland, thereby to be secured from lightning. The rootes of the blacke Bryonie are of the same effect with the white, but much weaker in purging choler and flegme and other humors, and provoking Vrine, in helping the falling sickeneſſe, the palsie, the passions of the mother, and the other diseases before mentioned: it doth in some sort clense the skinne of spots and markes, but the white is both more used, and more effectuall; the juyce hereof or the roote it selfe, boyled with wine, and honey, and drunke, and the roote also bruised and applyed with honey, to the Kings Evill, is very effectuall to heale it, and all other kernels, knots, or hard swellings, either in or about the necke and throate especially, or in other parts: being applyed also in the same manner, to any place out of joynt, is good both to ease the paines, and to consolidate and strengthen the sinewes, that they be not easily againe put out of their place: it is often used also with good succeſſe, being fresh, bruised and applyed to the shoulders or armes, that are full of paine and ach, as also to such hippes or bucklebones, as have the Sciatica, or paines therein: the leaves bruised with wine and layde upon the sore neckes of Oxen, that are wrung with the yoake helpeth them. *Matthiolus* saith, it was reported unto him, that the roote of our sixt Bryonie (which I say is called beyond Sea, *Sigillum Beatæ Mariæ*, our Ladies seale or signet, and which he thinketh to be the blacke Bryonie of *Dioscorides*) being roasted in the embers and eaten, is a powerfull medecine, to helpe forward the acts of Venerie, and addeth withall, that it excelleth all other medecines, taken for that purpose; which yet he saith he can hardly beleeve; yet *Lobel* doth yerke him for that report. The *Mechoacan* is a familiar medecine used of many, especially when we first had it, as all new things are, but now is much neglected, although it be the same, and worketh the same effects: it is given to all ages young and old, and to young children, yea women with childe without any harme or danger, as also at all times of the yeare, for being without any evill taste or smell, it may be the better taken of the most delicate, and tender stomacke, that doth loath all other medecines: it is most usually being made into powder taken in wine, or if any refuse that manner, the roote may be boyled either in a little broth, (as it was to Queene *Elizabeth* in her last sickeneſſe, without her consent or sence in the taste) or wine, and so taken: the dose whereof in powder, is from halfe a dramme to a whole dramme, or a dramme and a halfe or two drammes, as there is cause, respect being had to the age and strength of the patient: It purgeth cholericke and flegmaticke, yea grosse viscous and putride humors, whatsoever in the body, as also the yellow wateriſh humors of the dropsie, with much ease and facility: it clenseth also the liver and spleene, and like the true Rubarbe strengtheneth the stomacke, corroborating the inward parts, after purging and opening the obstructions of them, it helpeth also all diseases that come from them, as the dropsie: the Iaundise, &c. for it rectifieth the evill constitution of the Liver, by opening and dissolving the hardneſſe thereof, as also of the spleene and stomacke, dissolveth also the windineſſe and expelleth it; it taketh away also all old, or inveterate paines of the head, by clensing the braine and the nerves, and purging those rheumaticke distillations, and humors that are in them; it helpeth also all paines whatsoever in the joynts, in particular or generall, as the joynt aches or gout, and those of the bladder and raines, in procuring one to make water, and the collicke also, by expelling the wind wonderfully; it helpeth the paines of the mother, by tempering the cold humour, and expelling the windineſſe which are the causes thereof: it helpeth the shortneſſe of breath, and the old cough: It is also availeable in the French disease, by taking it often as there is cause, and purging the old peccant humors, especially if the disease be not of any long continuance. It taketh away also the cause of old and long lingring agues, whether they be *tertian* or *quotidian* or other *intermittive* agues, caused by obstructions. The Ialap is in working and purging somewhat like unto the *Mechoacan*, but exceedeth it, in working more strongly, and a little more churliſhly upon both flegmaticke and watery humors, yet strengthening both the liver and stomacke: the manner to take it is, being made into powder, to drinke it in white wine fasting, yet some take it in the distilled water of Cichorie or Borrage, or else in broth made with cold herbes.

CHAP. XIIII.

Ricinus sive Palma Christi. Palma Christi, or great Spurge.

BEcause there be many sorts of Spurges, and that this kinde of great Spurge doth much differ from all the other sorts, hereafter set forth, I thinke it fittest to ranke it in a chapter by it selfe before the other, as a captaine to all the rest; for although the properties be conformable to the Spurges, yet so are not, either forme of leaves, flowers, or seede, of any of the foure or five sorts, I shall here shew you: Take this therefore as the first kinde.

1. *Ricinus sive Cataputia major vulgatior.* The more ordinary Palma Christi, or great Spurge.

This great Spurge, (which doth grow in the warme and hot countries, of *Europe* and *Asia* to be as great in the body as a man, and as tall as a reasonable great tree, and is used to be lopped every yeare, whose seede cannot be gathered without a ladder set thereto, and whose leafe falleth not away in the winter as *Bellonius* saith in the first booke of his observations, the 18 chapter) springeth up in our countrie, to be eight or neere sometimes tenne foote high, whose stemme will be hollowed as bigge almost as our ordinary canes, of a browniſh colour, with an eye of blew hoarinesse upon it: the leaves that stand both upon the stemme, and upon the branches it sendeth forth, every one severally, on all sides upon long foote stalkes, are very broad, and divided into five or seaven or into more divisions (representing the hand of a man, with the fingers spread abroad) of a darke or deepe greene colour on the upperside, and whitish greene underneath; the flowers are many round buttons, shooting forth together, and stand all along upon a long stalke, at the toppes of the stem and branches, consisting of many pale yellow threads, which fall away without bearing any seede: but lower upon the stemme or maine stalke; and sometimes also upon the branches, breake forth other heades, which are the seede upon long foote stalkes, being three square or three seedes joyned together, rough and ashcoloured on the outside, or outer shell, which opening it selfe, or being opened, there lyeth within it the seede, whose outward huske is discoloured, or as it were spotted and shaped like unto a ticke, which conteineth within it, apretty large, shining round somewhat long and flat seede, of a browne colour, having a white pulpe or kernell within it; of a fiery hot taste, burning the mouth and throate, of whomsoever shall taste it, but very unctuous or oylie; whereof an oyle is pressed, which is onely used for outward remedies, for as *Dioscorides* saith it is *cibis fœdum*; but serveth to burne in lampes, in those hot countries, where it is naturall and plentifull, the roote consisteth of many long and great strings, and small fibres, which perisheth with us quickely, after it hath felt the first frosts, and must be new set every yeare by them will have it, but abideth in the warme countries, as I sayd in the beginning of the description many yeares.

1. *Ricinus sive Cataputia major vulgatior.*
The more ordinary Palma Christi or great Spurge.

4. *Ricinus Americanus & folium novellum,*
Palma Christi of America, and one of the first leaves.

2. *Ricinus*

2. *Ricinus major Africanus Syriacus vel Ægyptius.* Palma Christi of Syria, &c.

Camerarius in his *hortus medicus*, maketh mention of another sort whose seede was twice so bigge as the former, the colour whereof was not so pale or spotted, and came as he saith out of *Syria*. This is very probale to be that hot violent sort, that *Aldinus* in his *Farnesian* garden remembreth, being brought from *Ægypt*, the halfe part of whose seede being taken by a strong young man of twenty yeares, mightily troubled with the headach, purged him very forcibly and eased his paines, but in that he chewed the seede in his mouth (and did not swallow it whole without chewing as it should have beene) it inflamed his throate and mouth of his stomacke so violently, that after he had endured an ague, intolerable thirst, and fainting of the spirits, nine dayes after the taking thereof he dyed, notwithstanding the care of three Physitions with all the remedies they could use. Of the seede being, set sprung up a plant greater than the former, whose leaves were larger more crumpled and redder in other things little differing.

4. *Fructus Ricini Americani.*
Palma Christi of America seede.

3. *Minor.*

There is another kinde also but lesser in every part thereof, although it grow in the same ground, whose seede being ripe is evidently observed to be much lesser: This is not remembred by any Authour that hath written thereof, before *Clusius* in the second booke of his *Exotickes* and 21 chapter, and *Besterus* that set forth the Bishop of *Eystot* his garden, in a great large volume, whose seede that we first saw came from the *Bermudas*, where they made oyle thereof, and grew with us in that manner before expressed.

4. *Ricinus Americanus*, Palma Christi of America.

The *Palma Christi* of *America* differeth from the first, and second sort, not onely in the greatnesse, for as *Monardus* & *Aldinus* say it groweth to be a much greater tree, than any growing in *Spaine*, whose first leaves were almost round, & bigger than the first, but those that follow are broad and torne on the edges, into sundry corners, in the seede there is some difference also, which although they be three alwayes joyned together, yet the outer huske is not rough or prickely, but smooth and of an ashcolour, the innermost seede it selfe, being somewhat like the other, but more blacke and not spotted at al, and is as oyle as the first, for thereof as I here, there is made good store of oyle which serveth in the steede of oyle for any outward uses. *Clusius* remembreth a very small sort of this *Indian* kind, whose seede is the smallest of all other, even smaller than the former small kinde, which was brought from *America*.

The Place.

The first groweth in *Spaine* as *Clusius* saith, to a great largenesse as is before sayd, and in *Candy* as *Bellonius* saith, the greater kind, whereof *Camerarius* maketh mention, groweth in *Syria*, & *Africa*, and as *Aldinus* saith in *Ægypt*. The first lesser sort in *America*, and *Guinea* as *Clusius* saith, in the place before remembred. The great kind of *America*, *Monardus* saith groweth in *Gelisco* a province of new *Spaine*, from whence an oyle made of the seede thereof is brought, of much use as you shall heare by and by: and the last and least of all other, was brought from *Brasill* as *Clusius* saith in the 25 chapter of his 2 booke of *Exoticks* the ninth fruit.

The Time.

Those that grow with us flower not untill the beginning of *August*, and their seede doth seldome come to perfect ripenesse in this Country.

The Names.

It is called by *Dioscorides* in Greeke κίκι ἢ κρότων. *Cici & Croton, a Crotonis sive ricini animalis similitudine, quod refert semen. Arias Montanus* in his Commentaries upon *Ionas*, saith that the hebrew word *Kikajon* (which is neere the Greeke *Kiki*) doth signifie this plant, although S. *Ierome* did translate the word to be *Hedera*, and our *English* bibles have it, a Gourd that was raysed up by God to shelter *Ionas* from the heate of the Sun. *Ionah* c. 4. of some *Pentadactylus*, by *Mesues Granum Regium*; *Caesalpinus* from the *Italian* name *Girasole* tooke it to be *Heliotropium Dioscoridis*, but most commonly it is called *Ricinus & Palma Christi*; and in the Apothecaries shops *Cataputia major*, the oyle whereof is known to the most of them, by the name of *Oleum de Cherva*, yet it is also called *Oleum Cicinum*, as well as that oyle made of the *Indian* seed, brought from thence: In *Spaine* they call the seede of the ordinary as well as the *Indian* sort, *Figuo del inferno*, and thereafter some call it *Ficus infernalis*. The lesser kinde *Clusius* saith in the same place before mentioned is called *Eraway* by the *Indians*. The great *Indian* kinde, *Clusius* saith is called *Curcas* in *America*, and we to distinguish it from the former kind, do call it *Ricinus Americus*, or *Americanus*, *Palma Christi* of *America*. The *Arabians* call it *Cherva*, the *Italians Mirasole*, *Girasole*, & *Cataputia maggiore*, the *French Palma Christi*, the *Germanes Winderbaum*, the *Dutch Molenkruit* and *Wonderboome*, and we in *English Palma Christi*, or great Spurge.

The Vertues.

The seede of *Palma Christi* is almost wholly used, and the leaves but seldome, yet 30 seedes clensed from the huskes, being bruised, and taken in drinke saith *Dioscorides* (but *Costæus* in his Commentaries upon *Mesues* judgeth this to be a fault in the writers of the coppy of *Dioscorides*, setting 30 for 3. and yet that is the utmost, according to the dose of those times as I have sayd diverse times before) doth purge choler and flegme, and draw water abundantly from the belly, provoking Vrine also; which manner of purgings as *Dioscorides* himselfe confesseth, doth trouble the stomacke and overturne it mightily: yet with good advise it may be given to strong and able bodyes, with Aniseed or Fennellseede, who are troubled with the dropsie, joynt aches, the gout and sciatica, because it draweth water and flegme very strongly, from the more remote parts. *Durantes* adviseth some of the

ſeede to be boyled in the broth of an old cocke, for the ſame purpoſes: the oyle he ſaith of the ſeede is profitably put into gliſters, to open obſtructions, to eaſe the paines of the collicke and windineſſe of the mother; *Cluſius* ſaith he knew diverſe Empericks give of the ſmall ſeed, that came out of *America* in a ſmall quantity as a purge in diverſe diſeaſes, becauſe by purging the body well, they found good ſucceſſe, they held it as a ſecret of worth, which they kept to themſelves. *Monardus* ſaith that the oyle of the *Indian* ſeede, (and other authors ſay the ſame, of the oyle of the former kinde) is found by dayly experience, to bee helpefull to many diſeaſes, as well in the *Indies* as in Spaine; for as he ſaith it helpeth all diſeaſes proceeding of cold cauſes, it diſſolveth tumours and ſwellings, diſperſeth winde eſpecially of the collicke and mother, if the places grieved be anointed therewith, and ſome few drops thereof alſo taken in a little chicken broth that is fat: it wonderfully helpeth the crampe, and convulſion of the ſinewes, being gently rubbed on the places grieved, and thereby cauſeth the ſinewes to be ſtretched forth, that were ſhrunke: by anointing the ſtomacke the belly or the left ſide, where the ſpleene lyeth, it eaſeth them of the obſtructions in them: it killeth the wormes in children, if either you give a droppe or two thereof, inwardly in milke, or fat broath, or anoynt the lower part of the belly therewith, it taketh away alſo the hardneſſe of the belly in children, that are apt thereto, or have wormes: the oyle alſo helpeth all ſcabs, or running ſores of the head: dropped into the eares, cureth the deafeneſſe, and taketh away the paines and noyſe therein: it mightily cleanſeth the skinne from all manner of ſpots, markes or blemiſhes therein, as alſo the deformities of ſcarres and of the pox: the greene leaves bruiſed and applyed of themſelves, or elſe with barly meale, aſſwageth the inflammations as well as the ſwelling of the eyes, and the ſwellings alſo of womens breſts, after childing: being applyed likewiſe to womens breſts, they doe helpe to encreaſe milke in them: It hath beene formerly ſet downe by good authors, that *Palma Chriſti* planted in a garden, was a ſure remedy againſt moales, to keepe them from working in the ground: but *Camerarius* diſproveth that aſſeveration ſaying, that they will work in the ſame manner, although they be planted therein, yea or although the branches be thruſt into their furrowes or trenches.

CHAP. XV.

Tithymalus ſive Lactaria. Spurge or Milkewortē.

THere are many other ſorts of Spurge, that arē remembred by diverſe authors, with whom there is much variation about the true names of diverſe of them: ſome of them are of the Sea, as particularly to be found there abouts: others in the woods and mountaines properly belonging to them; ſome againe onely growing in gardens in theſe parts, and for the moſt part not well knowne elſewhere to be found, others alſo of the fields: they have alſo obtained ſundry names, according to their formes or natures, yet all of them Spurges or Milkeworts: for ſome ſort is particularly called *Tithymalus*, ſome others *Lathyris* or *Cataputia*, others againe *Eſula* or *Pityuſa*, and others *Peplus*, *Peplis* and *Chamæſyce*: and becauſe they are all of them *congeneres*, that is of one family or kindred, and of one quality or property, which is to purge, I thinke it fitteſt to remember them all together, yet in ſeverall chapters.

1. *Tithymalus paralius.* Sea Spurge.

1. *Tithymalus Paralius ſive maritimus.* Sea Spurge.

The Sea Spurge riſeth up with diverſe reddiſh wooddy ſtalkes a foote or halfe a yard high, ſet thicke with leaves, from the bottome to the toppe, which are ſmall long and narrow, yet broadeſt in the middle, ſomewhat like unto the leaves of Line or Flax, but thick and whitiſh, full of a white milke if any part be broken, which is ſo hot, that being taſted, it burneth the mouth and throate intollerably; at the toppes of the ſtalkes ſtand many pale yellowiſh flowers, with two leaves under them compaſſing the ſtalke, as it is uſuall to all the other ſorts of Spurges, and containing them, after which come three ſquare ſmall heades, wherein is conteined round diſcoloured ſeede: the roote is long and wooddy, abiding long, and ſo doe the leaves on the branches not falling away in winter.

2. *Tithymalus maritimus Venetus.* Sea Spurge of Venice.

This Sea Spurge hath longer or taller and thicker ſtalkes, ſomewhat hollow and reddiſh, branching forth into diverſe parts, beſet with ſmall long leaves, but ſomewhat larger, and more ſeparate than the former, two alwayes ſtanding together all along the branches like Licorice: the flowers are ſmall, pendulous, and of a ſad purpliſh co'our, conſiſting of five ſmall leaves a peece, like a ſmall ſtarre, without any round leaves under them as in the former, after which come ſuch like heads and ſeede: the roote is great long and wooddy withall, ſending forth new branches every yeare.

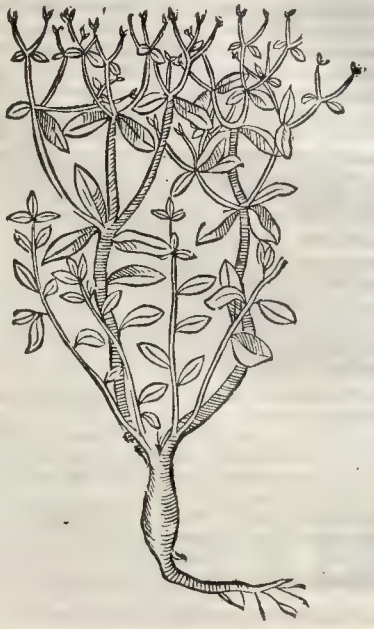
3. *Tithymalus maritimus Creticus ſpinoſus.* Thorny Sea Spurge of *Candy*.

The Thorny Sea Spurge of *Candy*, ſendeth forth diverſe browniſh round ſtalkes, whereon are ſet many whitiſh hoary leaves, being ſmall thick and long, as plentifully yeelding a cauſticke or burning milke as any of the former: upon the branches ſtand diverſe thornes with the leaves, and likewiſe the ends of the ſtalkes and branches end in ſharpe thornes; under which come forth the flowers, in ſome whitiſh, in others purpliſh like unto the laſt *Tithymall* for the forme, and without any cups of leaves under them, which give ſmall round ſeede like the former: the roote is not wooddy as the former but very fleſhie, eſpecially while it is young, and abiding many yeares.

4. *Tithymalus*

2. *Tithymalus maritimus Venetus.*
Sea Spurge of Venice.

3. *Tithymalus maritimus ſpinoſus Creticus.*
Thornie Sea Spurge of Candye.



4. *Tithymalus linifolius Paralio congener.* Baſtard Sea Spurge.

This Spurge, riſeth up with browniſh ſtalkes, having many narrow leaves growing thereon, like unto the firſt Sea Spurge, but ſomewhat larger and a little broader: the flowers ſeede and roote are not much differing from it.

The Place.

The firſt of theſe groweth by the ſea ſide, as well in divers places of our owne Country, as beyond the Sea: The ſecond groweth on the ſhores of the *Adriatike* ſea in many places, and in the Iſland *Lio* that pertaineth to the *Venetians*. The third in *Candy* as *Honorius Bellus* ſaith. The laſt in *Franconia* or *Frankeland*, neere unto the bankes of the river of *Mayne*.

The Time.

They flower in Iuly for the moſt part, and their ſeede is ripe in Auguſt.

The Names.

Τιθυμαλος in Greeke is ſo called as it is thought from τιθὸς *mamma* & μαλὸς *exitioſa*, *quia lactem ab uberibus exitioſum reddit*, in Latine *Tithymalus* alſo and *Lactaria* or *herba Lactaria* of giving milke, which is common to all the reſt of the Spurges. Some call it alſo *Lactuca marina & caprina*, both for giving milke as Lettice doth, and that Goates delight much to eate it. They are all in generall called Spurges in *Engliſh*, from the purging quality, and Milkewort likewiſe from the milke they yeeld, which as I ſayd is common to all the ſorts of them. The firſt of theſe is called almoſt by all writers *Tithymalus Paralius* or *maritimus*, agreeing with that of *Dioſcorides* (which he ſayd was called in his time *Tithymalis* and *Mecona*) in all points. The ſecond *Anguillara* thinketh to be *Alypum* of *Dioſcorides*; and *Pena* and *Lobel* ſay, that at *Venice* it is uſed as a kinde of *Pityuſa* or *Eſula* by the Phyſitions & Apothecaries there, whereupon they called it in their *Adverſaria*, *Eſulara è Lio Venetorum inſula*. The third is remembred onely by *Bellus* in his third Epiſtle to *Cluſius*, ſaying that in *Candye*, (becauſe it is of the kindred of the *Tithymals*, giving aboundance of milke, they call it *Galaſtivida*, as differing from another of that name, which I have ſhewed you before, in the 22 chapter, of the former part, under the name of *Blattaria Cretica ſpinoſa*, which *Cluſius* called *Leucoium ſpinoſum Creticum*, and was judged of others to be a *Verbaſcum ſpinoſum*. The laſt is called by *Camerarius*, *Tithymalus linifolius Paralio cognatus*, and by *Bauhinus* in his *Pinax*, *Tithymalo maritimo affinis linaria folio*; by *Tabermontanus*, *Tithymalus amygdaloides anguſtifolius*.

The Vertues.

The firſt of theſe ſea Spurges is not mentioned by any author either ancient or moderne to be uſed in Phyſicke; for the vehement and ſharpe exulcerating quality thereof is ſuch, and ſo great in purging exceeding other ſpurges, that it is not ſafe to uſe it inwardly, and outwardly applyed it doth burne the skinne, and therefore unleſſe it bee to take away ſcarres, ſcabbes, or warts, or the like it is not uſed at all: onely *Galen* ſaith of it, that the milke thereof mixed with meale and caſt into the water, aſtoniſheth fiſh ſo much, that it maketh them to riſe to the top

of the water. The ſecond is as I ſayd before uſed at *Venice*, by the Phyſitions and Apothecaries inſtead of *Eſula* (I meane the rootes) in *Benedicta Laxativa*, purging pils and other medecines, becauſe it purgeth forceably, and with great Violence, as *Pena* ſetteth it downe. The third is uſed in *Candy*, of the poorer ſort as a ſtrong purger, when they have occaſion: but the laſt is not mentioned by thoſe authors that have written of it, what forcible quality in purging it hath.

CHAP. XVI.

Tithymalus Characias. Wood Spurge.

OF this kind of Spurge there are diverſe ſorts, which I entitle Wood Spurge as a difference to bee knowne from others, although all of them doe not naturally grow in woods.

1. *Tithymalus Characias vulgaris.* Engliſh wood Spurge.

The Engliſh wood Spurge, hath diverſe tough woody browniſh red branches, two foote high or more, bare or naked of leaves, for a ſpace next to the roote, and afterwards ſet up to the toppes, with many narrow and long leaves, yet broader than thoſe of the Sea Spurge, and nothing ſo large as the next, ſomewhat ſmooth in handling, and without any dentes about the edges, turning reddiſh in the ſpring, and more in the ſommer time: at the toppes of ſome of the ſtalkes, (for all of them doe ſeldome flower at once, and are very much branched) ſtand many yellow flowers, whoſe under cups, that is the two almoſt round leaves compaſſing the ſtalke, are yellow likewiſe; after which come ſmall round heads, almoſt three ſquare, ſtanding up a little higher in thoſe cups, than the flowers did upon little ſtalkes, every one by it ſelfe, wherein are conteined ſmall browniſh round ſeede, the roote is long and ſomewhat woody, ſpeading well under ground, but not creeping.

2. *Tithymalus Characias Monſpelienſium.* Great French Wood Spurge.

This kinde of Spurge is ſomewhat like unto the former, but groweth larger and bigger, having but one or two ſtalkes at one time ſtanding upon the roote, which are reddiſh, bare of leaves at the bottomes of them, on the ſtalke that flowreth ſtandeth harder and larger leaves than the former, which is divided at the toppe, into ſundry ſmall branches: whereon grow the flowers, ſtanding in cuppes as the former doth, which are more yellow in ſome places, and more blackiſh in others, the ſeede and rootes are correſpondent unto the other.

3. *Tithymalus Characias folio lanuginoſo.* Hayrie or downie white wood Spurge.

This white wood Spurge, hath ſtalkes and leaves ſomewhat like unto the laſt, but that the ſtalkes doe never

1. 4. 5. *Tithymalus Characias. Serratus Monſp. Characias anguſtifolius.* Wood Spurge. Great French wood Spurge. Narrow leafed Wood Spurge.

8. *Tithymalus Myrſinites incanus.* Hoarie Myrtle Spurge.

turnē

turne red, but alwayes abide whitiſh, and are branched: the leaves alſo being almoſt as large, are whiter and ſofter in handling, with a kind of cotten or hairineſſe on them, which maketh them to be the eaſilier knowne, by that difference: the flowers are of a paler yellow colour, not differing in ſeede or roote.

4. *Tithymalus Characias ſerratus Monſpelienſium.* Dented Wood Spurge.

This wood Spurge riſeth up with many greeniſh ſtalkes, 2 or 3 foote high, whereon are ſet ſmall long thick fat greene leaves, ſomewhat like unto the leaves of the largeſt Mirtle, but more pointed at the ends and a little dented about the edges, the ſtalks are branched very much at the tops, that beare yellow flowers like unto the other, but ſmaller, whoſe ſeede differeth not from them. The roote is white and very long, nothing ſo hard or wooddy as the former, but as *Pena* ſaith having a more fleſhy pith in the middle, and a more ſoft ſubſtance without, whoſe barke doth ſo neere reſemble the *Turbith* of Alexandria, as no roote can doe more.

5. *Tithymalus Characias anguſtifolius.* Narrow leafed Wood Spurge:

This ſmall Wood Spurge hath diverſe weake branches, that ſtand not upright, but ſet thicke with leaves which are white long and narrow, much like unto the firſt wood Spurge, but nothing ſo great; the flowers ſeede and roote differ little from the other.

6. *Tithymalus lunato flore Columnæ.* Small wood Spurge with horned flowers.

This wood Spurge riſeth up to no great height, with hayrie ſtalkes, bare at the bottome, thickē ſet about thē middle, with ſomewhat hairie leaves ſmaller and ſofter than the laſt, of a blewiſh greene colour, and ſmaller upwards: the flowers ſtand in cuppes as the others doe, of a greeniſh yellow colour, conſiſting of foure leaves a peece, bowing outwards like unto an horne or halfe moone, joyning together at the backe of them, with yellow threads in the middle: the ſeede is like the other: the roote is very ſmall in reſpect of the plant, and blacke on the outſide.

7. *Tithymalus Myrſinites.* Mirtle Spurge.

This Spurge hath divers whitiſh branches, leaning downeward, not ſtanding upright, whereon are ſomewhat thicke ſet without order, many ſmooth and whitiſh greene leaves, ſmall at the bottome, and larger in the middle, ending in a point ſomewhat ſmall and ſharpe; ſomewhat like for forme but not for hardneſſe, unto the leaves of Knee holme, or Butchers Broome, the flowers are ſmall and yellowiſh, not ſo many ſtanding together as the other, elſe alike, as the ſeede and rootes are.

8. *Tithymalus Myrſinites incanus.* Hoary Mirtle Spurge.

This white or hoary Spurge hath many upright reddiſh ſtalkes, about a foote or more high, whereon are ſet without order, ſuch like leaves as the laſt recited Mirtle Spurge, but a little larger, and of an hoary white colour and hayrie withall: the flowers are yellow ſtanding at the toppes of the ſtalkes like unto it, and the heads triangled bearing the like ſeede: the roote is ſmall and differeth not much from the former.

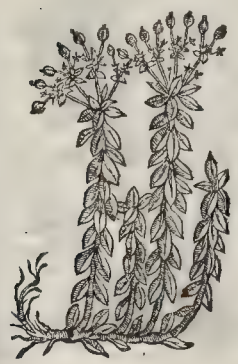
9. *Tithymalus verrucoſus Dalechampii.* Wartlike Mirtle Spurge.

This kinde of Spurge hath ſmall ſlender ſtalkes, halfe a yard high, divided into branches, whereon are ſet without order, ſmall broade whitiſh greene leaves, like unto ſmall Mirtle leaves: the flowers are ſmall and yellowiſh, after which come round heads, ſtanding like ſmall wartes, whereof it tooke the name, wherein are ſmaller ſeede, than any of the former: the roote is ſmall and not long, with diverſe ſprayes running from it.

10. *Tithymalus arboreus.* Tree Spurge.

The ſtemme of this tree ſpurge groweth up right, as bigge as a mans thumbe, from the bottome, and being there bare without leaves for almoſt halfe a foote, then ſhooteth forth diverſe

7. *Tithymalus Myrſinites.* Myrtle Spurge.



10. *Tithymalus arboreus.* Tree Spurge.

branches,

branches, of a fingers thickeneſſe, whereon are ſet narrow long leaves, ſomewhat like unto the Sea Spurge, or rather the marſh Spurge, or great *Eſula*, having larger yellow flowers and ſeedes, but like the other former ſorts: the rootes are not ſo great and long as ſome of the former, yet ſufficiently comprehending in the ground, to ſuſtaine the whole plant, which *Lobel* compareth to a Myrtle tree, for the bigneſſe and faſhion of growing but not to the leaves.

11. *Tithymalus latifolius Hiſpanicus.* Broad leafed Spaniſh Spurge.

This broad leafed Spurge ſpringeth up ſometimes, but with one ſtalke, halfe a yard high or more, and not branched, and ſometimes with more, and ſpreading forth many branches, from the bottome up to the toppe: the leaves that ſtand on them, are large and long, of a freſh greene colour round pointed, ſomewhat thicke or fat in handling: and like to the younger leaves of Woade, the flowers are of a purpliſh yellow colour, like in forme unto the others of this kinde, and ſtanding in cuppes after the ſame manner: the roote is great thicke and white.

12. *Tithymalus paluſtris ſive Eſula major Germanica.* Great Marſh Spurge.

This great Spurge (which is uſually called *Eſula major*, to diſtinguiſh it from other Spurges) riſeth up with many great round reddiſh ſtalkes, whereon are ſomewhat thicke ſet, many long and ſomewhat broad greene leaves, neither ſo broad or long as thoſe of wood Spurge, elſe ſomewhat a like: the tops of the ſtalkes are furniſhed, with fewer and ſmaller yellow flowers, than ſo great a plant, would beare ſhew to have: ſome flowers breake forth alſo below the toppes, at the under joynts, ſtanding upon their ſtalkes, three or foure together at the moſt: afterwards come ſmall round ſeede like unto the others, the roote is of a blackiſh colour on the outſide, and white within, great thicke and ſpreading diverſe wayes, the barke whereof is thicker and more fleſhy than in any of the reſt, and endureth the extremities of the winter, although the branches for the moſt part periſh every autumne, and riſe a new every ſpring.

13. *Tithymalus Helioſcopius.* Sunne turning Spurge or Wartwort.

The Sunne Spurge or Sunne turning Spurge, hath for the moſt part but one reddiſh ſtalke, halfe a yard high, bare of leaves at the bottome almoſt half way upwards, and then ſpreading into two or three ſmall branches, whereon grow ſparſedly, diverſe yellowiſh greene leaves, ſmaller at the bottome, and broader at the ends, ſomewhat like unto Purſlane leaves; the flowers are yellow like unto the reſt, ſtanding in hollow cups of two leaves a peece, the ſtalke running through them, as is to be ſeene in moſt of the others; the whole toppe or head of flowers is ſayd to turne with the ſunne, whereof it tooke the name, the ſeede is ſmall but round and like the reſt: the roote is ſmall and threddy, periſhing every yeere after ſeede time, and riſing againe of it owne ſowing.

14. *Eſula dulcis Tragi.* Sweete Spurge.

This ſweete Spurge riſeth up, but with one browniſh ſtalke for the moſt part, not above a foote high, whereon grow not very many leaves, yet without order, which are ſomewhat long and narrow at the bottome, and broader to the middle, yet not ſharpe but round pointed, and of a pale greene colour, giving milke when they are broken, but not ſharpe or hot, like all the reſt: the toppe of the ſtalke is furniſhed with many flowers, ſomewhat large, in ſome places yellow, and in others reddiſh, which after give yellow ſeede, ſmaller than the laſt: the roote is greater than it, whoſe milke is ſweete like the leaves, and not hot or ſharpe, and abideth not but periſheth after ſeede time.

The Place.

The firſt groweth moſt uſually in woods, as well

11. *Tithymalus latifolius Hiſpanicus.*
Broad leafed Spaniſh Spurge.

12. *Eſula major Germanica.*
Great Marſh Spurge.

13. *Tithymalus Heliofcopius.*
Sunne Spurge.

well in our Land as in *Germany*, *Hungary* and other places. The ſecond at *Mompelier* and other places in *France*, as alſo in the Kingdome of *Valentia* in *Spaine*, as *Cluſius* ſaith. The third groweth likewiſe in *Spaine* and *France*, as alſo in *Germany* and in *Switzerland*. The fourth *Lobel* and *Pena* ſay, groweth no where, but in the Country of *Narbone* or *Languedocke*, yet *Cluſius* ſaith he found it in the kingdome of *Valentia* in *Spaine*. The fift is ſayd by *Lobel* to grow in *Narbone*, and *Provence*, and not to be ſeene any where elſe but in gardens. The ſixt *Columna* ſaith he found on the hils *Aſprenſes* in *Naples*. The ſeventh groweth as *Camerarius* ſaith, on certaine hils in *Italy*, but in theſe parts, chiefely in the gardens of the curious. The eighth was ſent out of *Italy*. The ninth groweth in the dry ſandy grounds, nigh unto *Lyons* by the river *Rhodanus*. The tenth is found onely in the hot Countries of *Spaine*, *Italy*, and *Narbone* in *France*, and is kept with great care and regard from the froſts of our cold winters. The eleventh was found by *Cluſius* in *Spaine*. The twelfth groweth in many places of *Germany*, and as *Lobel* ſaith in his obſervations, in a wood belonging to Mr. *John Coltes*, nigh unto *Bath* very plentifully. The thirteenth groweth wilde with us in many and diverſe places, as well as in other Countries. The laſt groweth as *Tragus* ſaith, in the moyſt grounds upon ſome of the Alpes in *Switzerland*, and *Pena* and *Lobel* ſay in the gardens of the Low Countries, with them that are lovers of plants.

The Time.

All theſe flower in the Summer months of Iune and Iuly, ſome earlyer or later than others, and their ſeede is ripe ſoone after: the firſt Myrtle leafed Spurge is obſerved by *Camerarius* to abide the winter better, than ſome other that come from hot Countries.

The Names.

The firſt is called in Greeke πιθυμαλος χαρακίας & *Tithymalus Characias* alſo in Latine, that is to ſay *Vallaris*, becauſe it uſually groweth in the low moyſt places of the woods, or in trenches that have beene made to drayne the water, and is the firſt *Tithymalus Characias* of *Dodonæus*, and with *Lobel Tithymalus Characias Amigdaloides*; we call it in Engliſh Wood *Tithymall*, or wood Spurge, becauſe it is more uſually found in woods, than any where elſe. The ſecond is called by *Lobel* and *Pena Tithymalus Characias Monſp.* & *Characias* ſimply by *Matthi.* *Lacuna*, *Lonicerus*, *Lugdunenſis*, and *Tabermontanus*, by *Cluſius Tithymalus Characias legitimus*, called alſo *mas* & χαρακίας *ab ampla* & *patula coma* & *Amygdaloides a foliorum forma*, by *Dodoneus Tithymalus Characias alter*. The third *Cluſius* maketh to be another ſort of this ſecond kind, but differing in the ſmothneſſe and woollineſſe of the leaves. The fourth is called by *Lobel Tithymalus ſerratus Monſpelienſium*, which is the fift *Characias* by *Dodonæus*, and by *Cluſius* called *Tithymalus Myrtites Valentinus*, for he ſaith the true *Myrtites* of *Dioſcorides* is neither knowne in *Spaine* nor in *France*. The fift *Lobel* in his obſervations calleth *Myrſinites altera*, yet ſaith it better agreeth with a *Characias* or Wood Spurge, then Mirtle Spurge: it is the fourth *Characias* of *Dodonæus*, who ſaith they doe amiſſe, that call it *Myrſinites*; *Cluſius* calleth it *Tithymalus Characias tertius Auſtriacus*; it is the third *Myrſinites anguſtifolius* of *Tabermontanus*, and by *Bauhinus Tithymalus Characias anguſtifolius*. The ſixt *Fabius Columna* calleth *Tithymalus lunato flore*, from the likeneſſe of the flowers, and *Bauhinus* thereupon calleth it, *Tithymalus ſalvaticus lunato flore*, taking it to be the *Dendroides* of *Cordus* upon *Dioſcorides* and the *Platophyllos* of *Anguillara*, but with no reaſon that I know, for it anſwereth unto neither as you may perceive by the deſcription. The ſeventh is called *femina* by *Dioſcorides*, and *Myrſinites* by *Matthiolus*, *Geſner*, *Camerarius*, *Dodonæus*, *Lobel* and others. The eighth *Bauhinus* calleth *Tithymalus incanus hirſutus*, and thinketh it may be the plant, that *Camerarius* calleth *Pityuſa Anglica*, becauſe Doctor *Pennye* ſent it him; but becauſe it hath leaves ſo like unto the former Spurge with Mirtles leaves, I have joyned it next thereunto. The ninth is called by *Dalechampius Tithymalus verrucoſus*, and by *Bauhinus* in his *Pinax*, *Tithymalus Myrſinites fructu verrucoſo*, and ſaith *Guilandinus* was wont to call it *Alypium*. The tenth is called *Tithymalus Dendroides* by *Matthiolus*, *Geſner*, *Camerarius* and others. *Lobel* calleth it in his *Adverſaria* and Obſervations, *Dendroides ſive arboreus Myrtifolius*, *Myrthei ſpeciei non a foliis ſed a fructice*, which as it ſeemeth made *Dodonæus* to account it a kind of *Characias*, and ſet it for his third of that kinde. The Eleventh is called *Platophyllos* of *Cluſius*, who judgeth it to be the right or true *Platophyllos* of *Dioſcorides*, and ſo all others ſince him, becauſe there is not any of theſe Spurges, found to have ſo great and large leaves as this hath; although *Pena* and *Lobel* tooke the *Characias Monſpelienſium* to be *Platophyllos* which afterwards changing their minds, they acknowledged this of *Cluſius* to be the moſt probable. The twelft is called *Eſula major*, and *Eſula major Germanica*, by *Tragus*, *Dodonæus*, *Lobel*, and *Lugdunenſis*, and by *Bauhinus* in his *Pinax* *Tithymalus paluſtris fruticoſus*. The thirteenth is generally by all writers, taken to be the true *Heliofcopius*, that is *Soliſequus* of *Dioſcorides*, and by *Brunfelſius* and *Tragus* called *Eſula vulgaris*. The laſt is called by *Tragus Eſula dulcis* for the reaſons ſhewed in the deſcription, whom diverſe others ſince have followed: *Tragus* himſelfe ſaith that many would referre it to *Miliaria* of *Plinie*, but this may bee plainely ſeene to be a kinde of *Tithymall*. *Camerarius* in his *hortus medicus*, nameth a kinde *Tithymalus arvenſis annuus*, which hee ſaith is like hereunto,

hereunto, but fuller of branches, and but an annuall or yearely plant, and that it is not without sharpenesse, which *Bauhinus* referreth to the *Cyparissias* with spotted leaves, as is hereafter shewed: in his *Pinax* he referreth hereunto also, the *Pityusa sive Esula minor floribus rubris* of *Lobel*, and calleth it *Tithymalus montanus non acris*, but I cannot so thinke, but take it to be a sort of the small *Esula*, as you shall finde it in the next chapter save one. The rootes of diverse of the Spurges, and of some other plants also, are taken by diverse writers, to be the *Turbith officinarum*, and of the ancients, as the *Myrsinites altera* of *Lobel*, being the fift in this chapter, which he saith is taken of some to bee the true *Turbith*, that commeth from *Alexandria* into these Christian parts of the world: of the *Characias Monspelliensium*, *Lobel* saith in the same place againe, that the rootes be the most like unto the true *Turbith* if any be like it. The *Esula rara Venetorum* set forth in the last Chapter, is also called by some, *Turbith nigrum* of *Actuarius*: but all the best writers say, that the small common *Esula*, is the true *Turpetum nigrum* of *Actuarius*; whom *Mesues*, *Rhasis* and *Avicen* follow, the roote of *Alypum Narbonensium*, or *herba terribilis*, is likewise called *Turpetum album* by the same *Actuarius*, in diverse places of his booke, *de methodo medendi*. *Mesues* againe saith that *Turbith* is the roote of an herbe that giveth milke, whose leaves are like unto *Thapsia* or *Ferula*, Fennell giant, and there upon diverse have taken the rootes of *Thapsia* to be true *Turbith*. *Serapio* taketh the roote of *Tripolium* or Sea Starwort, to be the true *Turbith*: and lastly the roote of *Scammonye* is taken of some, to come neerest the true *Turbith*, as hath beene shewed in the chapter of *Scammonye* here before. *Matthiolus* saith that all the sorts of *Tithymall*, were indifferently taken and used for *Esula* by Physitions and Apothecaries in his time: but assuredly the *Turbith officinarum*, which is most likely to be the same of the ancients, is not the roote of any of the *Tithymalls*, or Spurges, because all of them are hot and sharpe, whether fresh or dryed, and the true *Turbith* is almost insipid, and because they being dry break short, without any of those long threds that are in the true *Turbith*: neither can it be *Alypum* or *Esula*: for they are hot likewise: It cannot be the roote of *Thapsia*, which besides the heate and sharpenesse is too white also, and the roote of the true *Turbith* is somewhat blackish on the outside and not so white within as *Thapsia* is. That *Tripolium* cannot be it, *Dioscorides* and *Galen* declare sufficiently, who say it is sharpe in taste, and hot in the third degree, which qualities are not to be found in *Turbith*. Lastly, that *Turbith* should be the roote of *Scammonye*, I cannot thinke, because they doe quickly grow greater than the rootes of *Turbith*, are ever seene to be. The *Arabians* call *Tithymall Xanxer & Ethutia*, *Mesues Scebran & Alscebran*, the *Italians Titimalo & Tortumaglio*, the *Spaniards Leche nersna & Leche tregna*, the *French Herbe au laict*, the *Germanes Wolffs milke*, the *Dutch Wolfs milck*, and we in *English* Milkewort or Spurge in generall, and particularly Sea Spurge, Wood Spurge, &c. as is extant in the titles.

The Vertues.

All these Spurges except the last, are heating and exulcerating the skinne, if they be outwardly applyed, and are vehement and excoriating purgers taken inwardly, without great care and caution: for as *Mesues* saith in his booke of purging Herbes, they are all offensive to the heart, liver, and stomacke, they breake the veines, shave the guts, and heate the whole body so much that thereupon they raise fevers many times: the first ill qualities therefore he saith are taken away if those things be put thereto in the taking, that doe strengthen the heart, liver, and stomacke. The second and third are taken away, by putting thereto such things as have a glutinous quality, and such are *gum Tragacant*, *Bdellium*, and the muccilage or expression of the seedes of Fleawort and Purslaine. The fourth evill quality is taken away, by mixing cold and moyst things with it, and such are the juyces of Sowthistle, Endive, Purslaine, Nightshade, or the seedes of Quinces well beaten with Vinegar. These Tithymals or Spurges doe purge with great violence, both upward by vomits, and downeward by the stoole, flegmaticke humors, both from the stomacke, and from the joynts, as also blacke choller, melancholy, and the dropsie, but they wast and macerate the body, and consume generation: 3 or 4 droppes of the milke taken fresh is often put into a dry figge, which is taken by strong Country people, to purge them; but it requireth some caution in gathering of the milke, that they stand with their backes, and not their faces to the winde, and especially that they touch not their face or eyes with their hands. The milkie juyce of them is the strongest worker; the seedes and leaves are next in quality thereto, and the rootes of most are of the same operation, but not so strong: yet they being boyled in Vinegar helpe the toothach, especially if they be hollow, and the milke put into them, so as it touch not any of the other teeth or gummes, doth worke more effectually and speedily; the same milke layd also upon any hairy place, taketh away the haires; but it is necessary that it lye not long at a time, & that the places be anointed with oyle of roses, and Nightshade quickly after: the same also taketh away callous knots, and all other callous or hard kernels, or cornes of the feete, or other parts of the body, if they be first pared to the quick, and some thereof dropped on or layde to: the same also boyled in some oyle of bitter Almonds, clenseth the skinne of the markes or scarres that come of sores, as also other deformities and discolouring of the skinne, and the scabbes and scurfes of the head: The Myrtle leafed Spurge is effectuall in all these diseases, excepting vomiting wherein it is weaker. The rest are all of a like quality, but the *Helioscopius* is the weakest; yet the leaves of the greater sorts in generall, although some attribute it to the broad leafed Spurge onely, cast into the water, causeth the fish therein, to rise up to the toppe thereof, which lying thereon as halfe dead for a while, may be easely taken with ones hand or otherwise. A lye made of the ashes of them, and the ashes themselves also, are answerable to the same effects before set downe in many things. The sweete Spurge as *Tragus* saith doth strongly provoke vomitings, if the roote thereof be taken inwardly. The outer barke of the roote, being steeped a day and a night in Vinegar, and then taken forth dryed and powdered, halfe a dramme of that powder taken in wine or honyed water, doth purge all waterish humors downewards, as also choller, and is very profitably given to those that have the dropsie, the roote also wonderfully sodereth and healeth all manner of greene wounds. *Tragus* also sheweth the manner of making certaine pills, that are very effectuall for the dropsie, and those that are short-winded, which may be taken as he saith without either paine or danger. Take of the rootes of *Esula* prepared as aforesayd halfe an ounce, of aloes one ounce, of Masticke one dramme, these being beaten into powder each by it selfe, are to be made up with Fennell water into great or small pills.

CHAP.

CHAP. XVII.

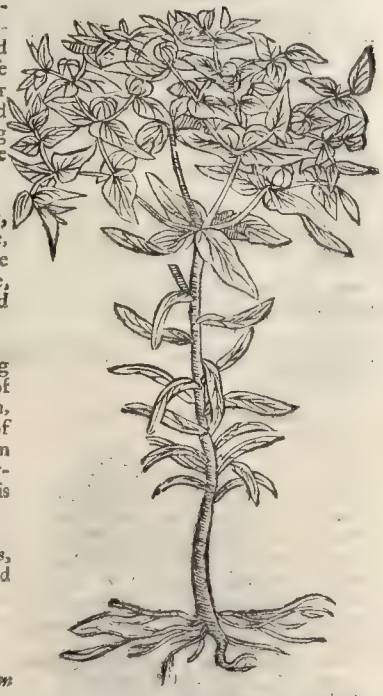
Lathyris sive Cataputia minor. Garden Spurge.

VNto these greater Spurges I must adjoyne this other kinde of Spurge, which by all authors both before and since *Galens* time, was accounted to be neerest unto them, and yet differing from them, and therefore fittest to be expressed in a Chapter by it selfe: yet hereof there are two or three sorts observed, one greater than another, as shall be presently shewed.

1. *Lathyris major hortensis.* The greater garden Spurge.

The greater of these garden Spurges riseth up, but with one hollow straight whitish stalke, as big as a finger, shaddowed as it were over with browne, on which grow up to the toppe, for the first yeare, many thicke fat long and somewhat narrow leaves, of a blewish greene colour on the upperside, and more whitish underneath, somewhat like unto Willow leaves for the forme, yeelding milke as plentifull as any of the rest: the next yeare after, it divideth it selfe, into many small branches, with smaller leaves at every partition, every part thereof yeelding milke, as the others doe: the flowers are of a pale yellow colour, and stand in cups like the former sorts, but are smaller than many of them, yeelding sweete, and nothing so hot and burning seede, in three square heads, somewhat like unto those of *Palma Christi*, but round and bigger, than any of the former Tithymalls or Spurges, which in the hot Sunne will cracke and leape out of the huskes: the roote is long and wooddy, perishing as soone as it hath given seede, and springeth againe of it owne seede, that is suffered to fall.

2. *Lathyris major vulgaris sive Cataputia minor.* Ordinary garden Spurge.



2. *Lathyris minor.* The lesser garden Spurge.

The lesser kinde of garden Spurge is so like unto the former, that I shall neede but onely to tell you, that it is the very same, but lesser in every part thereof; for whosoever hath seene the greater sort, will presently say when they see this, it is the same, but a lesser kinde, and so much I hope will satisfie to declare and distinguish these two sorts.

3. *Lathyris minima.* The least garden Spurge.

This small garden Spurge hath many slender branches, lying upon the ground, set full of small leaves, no bigger than those of Knotgrasse; among which riseth up a stalke, about a foote high, with such like leaves on it as grew below: at the toppe whereof stand many small yellow flowers, clustering thicke together on their small foote stalkes, but not spread abroad like unto the former sorts: this yeeldeth milke as the others doe: the roote is small, spreading many small strings, with fibres at them.

The Place.

They all grow in some places wilde, about the borders of fields, but most usually in gardens, where, when they are once planted they will hardly be rid out againe.

The Time.

They flower in July, and the seede is ripe in August.

The Names.

They are called in Greeke λάθυρις *Lathyris, quia congenerem Tithymalo quidem, sed efficaciorem & magis virosam signaret*: in Latine *Cataputia minor*, for as is before sayd, the *Ricinus* or *Palma Christi* seede, is called *Cataputia major*, and it is likly it was so called *quia semen fert sen pilulas sive catapotia*, & in English garden Spurge, that they may differ from all others. The first and second are generally by all writers called, either *Lathyris* or *Cataputia minor*. The last is called by *Lugdunensis Lathyris minor Dalechampii*, and *Bauhinus* thereupon *Lathyris minor conglomerato flore*, and it is likely also to be the same that *Cesalpinus* calleth *Cataputia pusilla*; The *Arabians* call it *Mandana* and *Mahene dane*, the *Italians Catapuzza*, *Lathini* and *Cataputia minore*, the *Spaniards Tartago*; the *French Espurge*, the *Germanes Springkraut*, *Springkorner* and *Treibkorner*: the *Dutch Sprinkeruidt & Spurgie*; and we in *English*, *Spurge* and garden *Spurge*.

The Vertues.

The seede of this Spurge, is for the most part onely in use with us, whereof 5 or 7 or 9 or 10 graines, at the most are taken at a time, to purge both by stoole and vomit, tough flegme, choller, melancholy, and water, as *Dioscorides* saith: the usuall manner is to swallow the seedes whole, without breaking either huske or kernell and then they worke the more gently and weakely, but if the huskes be broken, and the kernels swallowed whole or chewed, or bruised and mixed with drinke or broth, they will then worke more violently; and therefore to be taken with the more caution: the milke is more violent, even as the former Tithymals or Spurges are to be taken inwardly, but outwardly applyed and carefully, it helpeth to take away haires on the eye-browes, forehead or temples, for it must not touch any other part of the face or skinne; the same also cautelously applyed, taketh away the proud and dead flesh in wounds, hard callous knobs, cornes or warts in the flesh, (if they bee first pared to the quicke and then applyed) running scabs and sores, and the blemishes scarres and spots of the skinne: it is put also into hollow teeth to take away the paine, but you must beware that it touch no other of the teeth or gummes, or other part of the mouth: the milke made up into *Troochisces*, or little balls, with the meale of beanes or pease, and kept dry, doth serve all the yeare to use, as occasion is offered, for the purposes aforesayd, the distilled water of the whole plant, is of especiall use, to clense the skinne from freckles, morphew, or any other discolourings, either of it selfe, or mixed with the water of beane flowers, and bastard Dictanie, and being gently

gently bathed on the places troubled with the itch, taketh it away in a very short space: the same simple water also cleanseth foule vlcers and sores. The leaves being boyled in fat broath, worketh to some purposes more safely, though more weakely. It is held by many good authors, to be effectuall for all the purposes, the greater Spurge or *Palma Christi* is applyed unto.

CHAP. XVIII.

Tithymali sive Esulæ minores. The smaller Spurges.

HAving shewed you all the sorts of the greater Spurges, there remaine diverse other small kinds, which I will comprehend in this chapter, that so I may accomplish, and set forth the whole family of them together.

1. *Pityusa, Tithymalus Pinea sive Esula minor.* Pine Spurge or small Esula.

This small Spurge hath diverse weake and slender stalkes, halfe a yard long, whereon grow many small long and narrow pointed leaves, without order round about them, very like unto the leaves of Todeflaxe: at the toppes of the stalkes grow yellow flowers, sometimes dasht over with purple, like the former Spurges but lesser, and standing in the like cuppes, which falling away, the seede groweth in small three square huskes, wherein is conteined small round seede: the roote is small and long, of the bignesse of ones finger, somewhat blackish on the outside, but white within, and abiding many yeares, yet the extremities of the winter, doe sometimes rot it and cause it to perish: both milke, roote and seede, are somewhat like in heate and sharpenesse unto the garden Spurges, but not altogether so violent: the roote of this *Esula* is accounted of the most skillfull, to be the truest *Esula minor*; and the extract out of the roote hereof, rightly prepared and called *Extractum Esulæ*.

2. *Pityusa sive Esula minor floribus rubris.* Small Spurge with red flowers.

There is another of this kinde growing a foote high with such like leaves thereon, whose flowers are reddish standing in the like cuppes, that the other Spurges doe.

3. *Tithymalus Cyparissias vulgaris.* Common Cypresse Spurge or Wellcome to our house.

The Cypresse Spurge is so like unto the first described, that it deceiveth many, that doe not marke them precisely; for this hath also diverse slender browne stalkes, whereon grow small narrow leaves, yet somewhat shorter and thicker than the former, and thicker set upon the stalkes also: the flowers and seede are like the other, and so is the roote also, whereupon diverse have mistaken it, and take it for the true *Esula minor*, and so have used it instead thereof.

1. *Thymalus Pinea.* Pine Spurge.

2. *Esula minor altera purpureis floribus.* Small Spurge with red flowers.

4. *Tithymal*

3. *Tithymalus Cyparisias vulgaris.*
Cypresse Spurge or welcome to our house.

5. *Tithymalus Leptophyllos.*
Small annuall Spurge.

4. *Tithymalus Cyparissias maculatis foliis.* Cypresse Spurge with spotted leaves.

This other Cypresse Spurge, differeth not much from the former having smooth round reddish stalkes, two foote high at the least, the tops whereof doe a little bend downewards; the leaves are fat and long like unto the former, but standing more together at spaces, which are greene on the upperside, and more yellowish underneath, thicke set with deepe yellow spots almost red, which are eminent at their first springing: the flowers likewise are of a little deeper colour, tending to a red or purple: the roote is smaller than those of the former, and more parted into sprayes or branches, with many fibres at them, of a brownish red colour on the outside, and pale within, not abiding as the other doth after seeding time.

There is another of this kinde lesser in all parts thereof, else not differing from it. *Mincy*

5. *Tithymalus Leptophyllos.* Small annuall Spurge.

This annuall small Spurge hath many slender weake stalkes, bushing forth into many branches, and spreading farre upon the ground, whereon grow very small long and narrow leaves, standing upright, the uppermost whereof are somewhat broade at the bottome, and compasse the stalkes, ending in a long sharpe point or end: the flowers are yellow, like unto the other and very small, after which come three square heads, but very small, wherein is conteined very small round grayish seede, not much bigger than poppy seede: the roote is small long hard and woody, perishing every yeare as soone as it hath given seede.

6. *Esula rotunda sive Peplus.* Round headed Spurge, or Vineyard Spurge.

This Spurge shooteth forth round about the roote many small weake reddish upright branches with small leaves set by couples for the most part, somewhat like the leaves of Sun-turning Spurge, but rounder pointed and smaller, of a grayish greene colour on the upperside, and a little reddish or purplish underneath, oftentimes which will change to be wholly purple, in the Sommer time: the flowers are very small and yellow standing more round, or close together, as it were in an umbell, otherwise like unto the rest: and so is the seede also very small, conteined in three square heads: the roote is small and long, with many small strings and fibres at it, perishing also every yeare, and rising againe of it owne sowing.

7. *Peplis.* Small purple Sea Spurge.

This small purple Sea Spurge, spreadeth his small purplish branches upon the ground more plentifull than the other, and somewhat lesser; whereon doe grow many small leaves like the other, but not so round at the ends; and purplish likewise both underneath and above oftentimes, especially in the beginning of the heate of the yeare: the flowers are small and yellow like the other, and so is the seede, but somewhat bigger and standing two together for the most part, not onely upon the toppes, but here and there upon the branches also: the roote is small and slender and of no use.

8. *Chamæsyce.* Petty Spurge or time Spurge.

The pettie Spurge is one of the smalleſt Spurges that is, having very small slender branches, lying upon the ground, divided oftentimes into other smaller, with smal pale green leaves set thereon, smaller than those of Tyme,

6. *Esula rotunda sive Peplus.* Round headed Spurge.

7. *Peplis.* Small purple Sea Spurge.

or as *Penà* compareth them unto Rupture wort: the flowers are the ſmalleſt and ſo is the ſeede of all the reſt; ſet in heads by couples like the laſt: the roote is ſmall and long, conſiſting of nothing but threds, and is of no uſe.

9. *Esula exigua foliis obtusis.* Petty Spurge with broad pointed leaves.

This Petty Spurge likewiſe groweth cloſe upon the ground, the ſmall round branches not exceeding an hand breadth in length, with ſmall long and narrow leaves, broad at the points or ends, as if they had beene cut off, ſet without order on them, yeelding milke as the others doe: the flowers and ſeede is like the laſt, and ſo is the roote alſo.

10. *Tithymalus exiguus saxatilis.* Rocky pettie Spurge.

This is the ſmalleſt Spurge of all the reſt, the ſmall branches not extending two or three inches in length, with the ſmalleſt and narroweſt leaves of any ſet thereon: the flowers are ſmall and ſomewhat reddiſh: the ſeede is agreeable to the plant, and the roote as ſmall as threds.

11. *Apios sive Tithymalus tuberosus.* Tuberous or knobbed Spurge.

Tuberous or Knobbed Spurge, hath diverſe ſmall reddiſh branches, lying upon the ground, with many ſmall leaves, ſomewhat like unto thoſe of Saint *Johns* wort ſet thereon without order, every one having the middle ribbe white therein: ſome of thoſe beare a few ſmall flowers at the toppes of them like unto the other Spurges, and ſeede likewiſe in three ſquare heads; the roote is tuberous in his naturall place, blackiſh without white within, and formed ſomewhat like a peare or figge, from whence the name thereof roſe: but a little differing in our climate, not keeping ſo proportionable a figure as it hath come over to us, even as the blacke Raddiſh hath done likewiſe; and therefore we may thereby plainely perceive the nature of the ſoyle doth alter much the forme of rootes, and leaves alſo in many things.

12. *Apios sive Tithymalus tuberosus, oblonga radice.* Long rooted Tuberous Spurge.

This other Tuberous Spurge, the figure whereof *Cluſius* had ſent him from *Plateau*, is ſo like the former, that I verily beleeve (as I ſayd before of the former) the ſoyle and climate was the cauſe of the alteration therein, yet briefely to ſhew you what he ſaith thereof, is this, it hath five or ſixe branches riſing from the roote lying upon the ground, ſomewhat reddiſh towards the bottome of them, divided into other ſmaller branches: the greene leaves, that are ſet thereon by couples on both ſides are ſmall like the other, but a little rounder: the flowers that grow at the toppes are of a yellowiſh red colour, after which come three ſquare heads ſomewhat rugged or ſet with knobbes, wherein is conteined ſmall round ſeede, like unto the other, the roote is long and round, having many other ſmall and long thicke rootes, iſſuing from the lower end thereof, with many ſmall fibres thereat, blackiſh on the outſide and white within, like the former.

13. *Tithymalus tuberosus Germanicus.* Knobbed Spurge of Germany.

The knobbed ſpurge of Germany, differeth from the former two ſorts of *Apios*, firſt in the rootes which conſiſt of many reddiſh knobs, ſet together with diverſe long fibres among them, like unto the rootes of *Scrophularia*, or great Figgewort: the branches are ſmall and tender, whereon grow the leaves which are ſmall and nar-

row,

8. *Chamæſyce.*
Petty Spurge or Tyme Spurge.

10. *Apios ſeu Tithymalus tuberoſus.*
Knobbed Spurge.

11. *Iſchas ſive Apios oblonga radice.*
Long rooted tuberous Spurge.

row, ſomẽwhat like unto the leaves of *Meſereon* but ſmaller: the flowers are yellow, and the ſeede ſmall and round, growing in three ſquare heads, like unto the other ſorts of Spurges.

The Place.

The firſt and third ſorts, grow in ſomẽ placẽs of *Germanie* and *France*, both by the Rivers ſide and borders of fields, but no where naturall in *England* that I can heare, but in the gardens of thoſe that are lovers of plants; the third is oftentimes found in the Country gardens of poore folkes in many places with us. Thẽ ſecond is found in ſomẽ Herbariſts gardens in the low Countries; *Ioannes Thalius* remembreth the two ſorts of the fourth kinde, which hee found in cragged ſtonie places, lying open to the ſunne, and in the borders of ſome fields, that were dry in Saxonie neere *Turin* in *Germanie*. The fift alſo is found in the fields in the ſame places of *Germany*, that the laſt are, but neerer the villages. The ſixt groweth in the Vinẽyards of *France* in diverſe places, as alſo in ditches and borders of fields there. The ſeventh groweth neere the Sea ſide in *Narbone* and about *Marſeilles*. The eighth groweth about *Mompelier*, in the dry ſandy Vineyards and Olive grounds, neere the Sea alſo. The Ninth and Tenth, grow about *Mompelier* and *Marſeilles*; as alſo *Padoa* as *Bauhinus* ſaith. The eleventh groweth on Mount *Athos* as *Bellonius* reporteth, in *Apulia* and the Kingdome of *Naples*, as *Ferrantes Imperatus* affirmeth, who ſent ſome of the rootes thereof unto *Cluſius*, in *Candy* alſo and diverſe other the warmer Countries, but they are all nurſed up onely with us in the gardens of thoſe that are curious. The twelfth is not expreſſed where it is naturall. The laſt is remembred by *Camerarius*, who ſaith it was found in certaine woods about *Lypſik* in *Germanie*.

The Time.

They doe all flower in the Sommer Months of *Iune*, *Iuly*, and *Auguſt*, ſome earlyer and ſome later than others; but the third kinde is often found in flower in *May*.

The Names.

Pityuſa is called in Greeke Πιτυωσα, in Latine and in ſhoppes *Eſula*, or *Eſula minor*, becauſe there is a greater as hath beene ſhewed before; it ſeemeth to have taken the name from *Pityuſa*, being derived thereof, and made *adiminitive*, as if it were *Pityuſula*, and ſhort *Yuſula* or *Eſula*, as a ſmall *Pityuſa* or Pine Spurge. The firſt is taken to be the *Pityuſa* of *Dioſcorides*, and called *Eſula minor* generally in moſt Countries, although the ſeede anſwere not to the deſcription of *Dioſcorides*; yet is often confounded with the third, which is called *Cypariſſias* by moſt authors, and therefore *Tabermontanus* maketh the firſt to be his ſecond *Tithymalus Cupreſſinus*: that the roote hereof is taken by *Actuarius* and others for *Turbith*, I have ſhewed before. *Nicolaus Myrepſicus* in ſome medecines and purging pils, doth appoint to be put thereinto *Eſula*, by the name of *Chamæpitys*: whereupon *Fuchſius* thinketh, that *Nicolaus* his *Chamapitys*, is the ordinary ground Pine and not any kind of *Tithymall*, being deceived by the *Etimologie* and double ſenſe of the word: for *Chamæpitys* ſignifieth a low Pine, which *Pityuſa* doth alſo: but *Chamæpitys* doth reſemble a Pine, as wel in the reſinous ſmel, as in the forme of the leaves, which *Pityuſa* doth not, and alſo that *Pityuſa* is a ſtrong purger, fit for ſuch medecines, and pills, as *Nicolaus* appointeth it an ingredient, and therefore by *Chamæpitys* there he only meaneth that *Eſula* with Pine tree leaves. The ſecond is by *Lobel* in his obſervations ſet forth under the ſame title, is here expreſſed, and I have adjoyned unto the firſt as moſt likely to be a ſpecies thereof, rather than of the *Eſula dulcis Tragi*, as I have ſhewed you in the next chapter ſave one before this, as *Bauhinus* would make it. The fourth *Bauhinus* referreth as I ſayd before to *Camerarius* his *Tithymalus arvenſis*, and to that which *Ioannes Thalius* in his *Harcynia Saxanothuringica* calleth Πιτύρυλλον. *Bauhinus* in his *Pinax* calleth it *Tithymalus Cypariſſias foliis punctis creceis notatis*. The fifth is *Matthiolus* his *Leptophyllos*, whom *Camerarius* and *Thalius* doe follow. It is *Tragus* his *Eſula exigua*, and *Peplis minor* of *Dalechampius*. The ſixt is

called πεπλος συκη, *Peplus & Syce*, and μηκων ἀγριωδης *Mecon aphrodes* as *Dioscorides* saith, in Latine *Esula rotunda*, from the forme as well of the branches, growing up round about the rootes, and the umbell of flowers which are round, which names hold withall writers. The seventh is called πεπλις & πεπλιον, *Peplis & Peplion*, of the red colour of the leaves, and ἀνδραχνη ἀγρια, *i. Portulaca sylvestris*, of the face and forme of the whole plant: it hath no other Latine name than *Peplis*, yet *Bauhinus* calleth it *Peplis maritima folio obtuso*, and *Cæsalpinus Peplium*, and is *Dalechampius* his *Peplion*. The eight is called *Chamæsyce, quasi humilis vel terrestris ficus* generally of all writers. The ninth and tenth *Bauhinus* onely remembreth, and giveth the names as they are in the titles. The eleventh is called Ἄπιος *Apios* of *Dioscorides*, and Ἰσχας *Ischas* of *Theophrastus*, from the forme of the roote, which is like unto a peare or figge; in Latine *Tithymalus tuberosus*, by which names either the one or the other, all writers call them; but there is an errour in *Fuchsius* and *Tragus*, in mistaking a small wilde kind of Vetch, with small tuberous or clogge rootes, growing in woods and fields to be *Apios*, which *Matthiolus* thereupon calleth *Pseudoapios*, and is the plant that *Gerard* doth call in *English* Pease Earth Nut, *in* Latine *terræ glandes*, and of *Tabermontanus* and others *Chamæbalanus*: *Turner* also is in another errour supposing the *Bulbocastanum* or *Nucula terrestris* to be *Dioscorides* his *Apios*. The twelfth *Clusius* saith he had the figure onely sent him from *Plateau*, and thereupon calleth it *Ischas altera*. *Bauhinus* translating the name to *Tithymalus oblonga radice*, and I to *Apios sive Tithymalus tuberosus oblonga radice*, but I verily thinke it to be, but a luxurious kind of the former *Apios*. The last *Camerarius* onely hath made mention of in his *Hortus Medicus*, and calleth it *Tithymalus tuberosus alter*, and *Bauhinus Tithymalus tuberosus Germanicus*, as it is in the titles.

The Vertues.

All these spurges are of the nature of the former, yet some more, some lesse violent in purging, and conducing better to some speciall diseases, as you shall heare in particular. The first *Pityusa* which is accounted the truest *Esula minor*, (although the *Cyparissias* be taken of many for the same, and so used but with lesse successe, yet neerest thereunto) is accounted of force to heale the bitings or stingings of venemous serpents: it purgeth strongly downewards both choller and flegme, and taketh away the hardnesse and paines of the belly, and swellings of the breasts: the seede and roote prepared helpeth the dropsie, being carefully and with good advise taken: the leaves (steeped a while in vinegar, and afterwards dryed and made into powder, which is the preparation of them) may be given to the weight of three drammes saith *Dioscorides*, (which I hold proportionable, to the rest of the great quantities of purgers, given by the ancients whereof I have spoken before, which is over large to be given to any in our time, or at least nation) the roote (prepared in the manner aforesaid) is given likewise to the weight of two drammes saith *Dioscorides*, in meade or honeyed water: but one dramme is so strong, that it is not fit to be taken but with caution, and by a strong body) the seede saith *Dioscorides* may be taken to the weight of a dramme: but seeing 9 or 10 seedes, of the garden Spurge is a sufficient strong medicine, I thinke so many of those seedes are too many by much: and of the juyce or milke a spoonefull *Dioscorides* appointeth, being made into pills with flower, which is the strongest of them all: an extract made artificially out of the rootes is much commended by many in the dropsie, and other diseases before named, but it had neede of an artist, as well in the preparing as giving. The Pills of *Esula* set downe in the 16 chapter before, doe properly belong unto this place, being to be made more properly, of this *Esula* than of that. The small annuall spurge is in purging like the other sorts, but is not so strong for the diseases aforesaid as the former are. The seede of *Peplus* or the round *Esula*, being beaten and drunke in hydromel or honyed water, purgeth flegme and choller. The leaves are used to bee pickled up, and kept to be used in meates, and the powder of them saith *Dioscorides*, strewed upon meate troubleth the belly: The small purple Sea Spurge hath the same properties, and is used to be pickled and eaten, with the like effect that the former is. The Petty or Tyme Spurge, is used for paines of the mother, if the young branches and leaves be bruised with a little wine, and put up as a pessary: The same boyled and taken doe purge the belly even as the milke or juyce doth also, and is good against the stinging or biting of serpents, and taketh away all manner of warts and excrescences of the like nature. It is very effectuall for the dimnesse or mistinesse of the eyes, to cleere the sight, and also for watering or running eyes, and to take away filmes or scarres that grow upon them, used with a little honey. The tuberous or knobbed Spurge saith *Dioscorides*, purgeth downewards, if the lower parts be taken, and upwards if the upper parts be taken: but the juyce to the quantity of halfe a dramme, purgeth both wayes, and so doth the plant being taken wholly together. The manner of drawing out the juyce thereof (is somewhat rude in regard of the exquisite manner of preparing extracts chymically in our dayes) as *Dioscorides* setteth it downe is thus. Beate the rootes and put them into a vessell full of water, stirre them well therein, and with a fether gather the upermost upon the water, which being dryed and kept, serveth for the uses aforesaid, and for those that have the dropsie. All these cleanse the skinne from discolouring, even as the former doe, and with as good successe. There is none of them but are strong and violent, and therefore great caution and advise is to be had, in taking of them inwardly, and therefore some appoint to put diverse cold hearbes to them in the taking: but for outward applications there is the lesse feare of danger, because if the skinne be any thing exulcerated, and the parts inflamed, helpe may sooner be had and applyed thereto, than within the body.

CHAP. XIX.

Hippophaes, Hippophæſtum & Hippomanes. Thornie Milkewort or Fullers thorne.

BEcauſe *Dioſcorides* ſpeaketh of *Hippophaes* and *Hippophæſtum*, making them both Thornie plants, yeelding milke and purging, before *Ricinus* and the *Tithymales*, and *Theophraſtus* in his ninth booke, and fifteenth chap. ſaith that *Hippomanes* is made of *Tithymalus*, or *Lactaria* Milkewort, the beſt as hee ſaith, was knowne to be made in *Tegea* and was held to be of great worth; yet my *Theophraſtus* in Latine, which is very ancient without name of the *Printer* or yeare of the Printing, hath in that place *Hippophaes* although I confeſſe I have ſeene Greeke copies which have had *Hippomanes*; but ſurely *Hippomanes* being declared by other authors, to bee a kinde of poyſon made of the nature or thinne ſperme of *Mares*, as you ſhall heare by and by, could not in my minde be ſo unknowne to *Theophraſtus*, that he ſhould ſay, it was made of the *Tithymalls* or Milkeworts, but rather that *Hippophaes* was a Milkewort, or made thereof; for in his 6. booke and 4. chapter, at the latter end he numbreth *Hippophyon* which *Gaza* tranſlateth *Iappago*, among thoſe plants that beare thornes at the leaves, and in the ſame booke and 5. chapter he nameth *Hippopheos* which *Gaza* tranſlateth *Iappago* likewiſe, to have gentle ſmooth leaves, not like unto the Capers, which have ſharpe leaves as well as ſtalkes, and in his 9 booke and 15 chapter, maketh no mention either of forme, having declared it before, or of purging or poyſonfull quality therein; but numbreth it among other things, the beſt whereof grow in *Arcadia*, and nameth it next after the *Elaterium*, made of the Wilde Cowcumbers, ſo that it is probable his *Hippophyon*, *Hippopheos*, *Hippophaes*, or *Hippomanes*, whether you will, for diverſe doe thinke diverſly, was an herbe or roote, that bore thornes as is before declared, whoſe condenſate milke or juyce, was of much worth being made in *Tegea*: I thinke it not a miſſe ſomewhat to declare both what I thinke *Dioſcorides* his *Hippophaes* and *Hippophæſtum* are, and the derivation of the name: and what *Anguillara* and others ſay of it alſo, that ſay they have found it, to incite ſome induſtrious to attaine it alſo, if that which I ſhall ſhew you in my opinion be not it, and likewiſe to ſhew what diverſe authors doe report of *Hippomanes*, that thereby the diverſity of things might cleere *Theophraſtus* from imputation of want of knowledge, what *Hippomanes* was, or variety from others, and that his *Hippopheos* and *Dioſcorides Hippophaes*, was one and the ſame thing: This therefore is the text of *Dioſcorides* concerning *Hippophaes*. *Hippophaes* wherewith fullers doe refreſh garments, groweth in gravelly grounds and neere the ſea. It is abuſhing plant thicke of leaves, or well ſpreade, having long leaves like unto the Olive tree, but ſmaller and longer, and betweene them many whtiſh hard thornes diſtant one from another. The flowers ſtand in cluſters like unto thoſe of Ivye, but ſmaller and more gentle, ſomewhat reddiſh or bluſh out of a white: the roote is thicke and tender full of juyce, like milke and bitter in taſte, from whence as from *Thapſia*, a juyce is taken, which being dryed up either by it ſelfe ſimply, or with the flower of *Orobus* (or the bitter vetch) is kept for their uſe that neede it: *Hippophæſtum* (ſaith *Dioſcorides*) which ſome call *Hippophaes*, groweth in the ſame places, and is a kinde of Fullers thorne alſo. It is a low herbe having thornie ſmall leaves, without either ſtalke or flower, with empty heads, it hath thicke and tender rootes: a juyce is drawne out of the rootes, leaves, and heads, and dryed up to be uſed: Thus farre *Dioſcorides*: In comparing therefore *Dioſcorides* and *Theophraſtus*, I doe not finde them to vary more than in a letter or two of the word. For as you heare *Dioſcorides* ſaith *Hippophaes* hath many branches full of leaves, and ſome thornes alſo, and *Theophraſtus* doth intimate the ſame, ſaying that *Hippopheos* hath ſmooth leaves, and thornes by the leaves, or is a thornie plant as *Phleos* (of which you ſhall heare in that part that ſpeaketh of thornie plants) *Capers*, *Caltrops*, and *Reſtharrow* are: *Dioſcorides* ſaith the roote of *Hippophaes* is thicke and full of a milkie juyce, and *Theophraſtus* ſaith *Hippophaes* (as I ſayd my booke hath it, and *Columna* in his chapter of *Hippophaes* hath ſo alſo, or as others have *Hippomanes*, which as I ſayd before cannot be) is made of a *Tithymall* or Milkewort, the beſt being made in *Tegea*, and is of great worth, *Pliny* maketh mention of *Hippophaes* in one place, and of *Hippophues* in another, as of one and the ſame plant, as likewiſe of *Hippophæſtum* in ſeverall places, which as yet in one place he calleth *Hippape*, but in that he doth but relate what he hath out of *Dioſcorides*, yet ſomewhat different: it is probable he never ſaw the plant, but did deliver what he ſayd onely upon the credit of the author, we ſhall not neede to inſiſt more upon him. The Greek name ἱππόφαες commeth either of ἱππος & φάος or φύω which is interpreted *equarum ſalus aut lux, aut ab equis genita*, for ſo *Plinye* in his 22. book, and 12. chap. ſaith, *Debent accommodatæ eſſe & equorum naturæ, neq; ex alia cauſa nomen accepiſſe*: and ἱππομανὲς ex ἱππος & μανία *quia equorum maniam ſive furoremſ anabat*: but becauſe *Dioſcorides* ſaith it was called *Spina fullonia*, and that garments were cleanſed thereby, it ſeemeth the *Etymon* of the word was rather derived from ἱππος taken *pro adverbio accreſcentis, & ſic pro valde* or *multum*, & φάος *pro lumine* or *nitore*, of the cleanſing quality: for ſo *Plinye* ſaith of *Hippophæſtum* in his 27 booke and 10 chapter *Hippophæſtum naſcitur in ſpinis ex quibus fiunt pilæ fullonicæ*: for with the plant or roote made into bals, thoſe times of his uſed to ſcoure garments, like as if it were done with ſope. *Anguillara* ſaith he found *Hippophaes* in the Iſland *Peloponeſus*, in the ſandy grounds by the ſeaſide, which had a roote of the length of ones hand or better, yelding a thinne juyce, being either broken or wounded, like in colour to milke, of a very bitter taſte (but ſaith he ſaw then neither flower nor fruite) and ſtrong ſmell, which the inhabitants call *Acantha Nacatharile*, *Spina purgatrix*, the purging Thorne, which *Bauhinus* ſetteth downe in his *Pinax* for a kinde of *Rhamnus Catharticus folio oleæ*, and thinketh the *Hippophæſtum quorundam* of *Lugdunenſis* to be the ſame; *Fabius Columna* refuſing the opinion of others that tooke the *Rhamnus primus* of *Dioſcorides*, as *Lobel* ſuppoſeth that purging thornie plant to be, growing by the ſea ſides of *Italy*, *France*, and *Holland*, ſuppoſeth that that kinde of *Rhamnus* which groweth in *Campania* and *Apulia*, by the ſea ſhores, called by the *Italians* in thoſe places *Spina ſanta*, and which is the ſecond ſort of the firſt kinde of *Rhamnus*, ſet forth by *Cluſius*, doth more neerely reſemble the *Hippophaes* of *Dioſcorides*: but in my minde neither of both theſe ſhrubbes, wanting milke at the roote can be the *Hippophaes* of *Dioſcorides* called alſo *Spina fullonia*. *Ruellius* likewiſe ſaith that *Hippophæſtum*, was brought from *Narboue* in *France*, which had ſmall whitiſh leaves among the thornes; by *Lugdunenſis* it is ſaid that *Hippophæſtum* was ſent to *Daleschampius* from *Melita* or *Malta*, and was a plant, ſpread full of thornie branches or rather the branches being wholly but thornes themſelves, with ſmall white flowers, ſtanding cloſe to-

gether at the joynts and partitions of the branches; but whether it were purging was not signified: this declaration, being onely taken from the dryed plant was sent: but if I may be bold to give my censure, what *Hippophaes* is, and whether it be to be found or no, I would surely conjecture, that the plant called *Galastivida Cretica*, which I have set forth in the 15 chapter of this part, under the title of *Tithymalus maritimus Creticus spinosus*, and as I say there, is sayd by *Honorius Bellus* to be a kinde of *Tithymall*, or Spurge having thornes, and giving milke, whose roote is thicke and fleshy, might as neere resemble *Hippophaes*, both for forme, for giving milke and purging quality, as any other plant whatsoever, and even the relation of the leaves and flowers set downe in that place, is not greatly differing, let others judge hereof as they see cause. Now concerning *Hippomanes* let me shew you also, what diverse authors have written thereof. First it is imputed to *Theophrastus* to say, as some corrupt (as I thinke) greeke copies have it as I sayd before, and *Camerarius* as I thinke was the first that did so cause it to bee read, that *Hippomanes* is made of *Tithymall*, but is mistaken for *Hippophaes* as I sayd before. *Theocritus* saith in *Pharmaceutria*, that *Hippopmanes* is a plant whereby horses are made furious madde. *Collumella* saith that *Hippomanes* is a poyson, which kindleth lust in horses like to that of men, but what it is, or whereof it is made or taken, he doth not expresse. *Plinye* also in his 28 booke and 11 chapter affirmeth, that *Hippomanes* was of so strong power or force in witchery or sorcery, that being but layd to the brasen figure of the mare at *Olympus*, it would drive the horses in extreame fury to cover it: which *Pausanias* before *Plinye* his time, doth set downe more at large in his fift booke: but *Aristotle* in his 6 booke and 18 chap. of the nature of beasts, saith that the mares doe let passe from them a certaine thinne humour, like unto their sperme, when they are inflamed with lust to be covered, which is called *Hippomanes* by some, and in the 22. chap. of the same booke he saith, that there sticketh to the forehead of the foale, new fallen, a certaine round, and somewhat broad blacke peece of flesh or skinne, of the bignesse of a small dryed Figge, which the mare licketh up with the secondine, as soone as shee hath foaled, which if any shall take away before she hath devoured, and afterwards offer it her to smell thereunto, she not knowing the sent thereof, will be stirred in to great fury or madnesse, but will not suffer her foale to sucke her that hath it taken therefrom; which thing *Iunius Solinus Polyhister* confirmeth in the 48 chapter of his booke, onely he varyeth from *Aristotle*, in saying it is of a browniish yellow colour, which hee said was blacke. And *Plinye* writeth also the same thing in his 8 booke and 42 chapter, although he said also, it was an other thing as you have heard before. *Virgill* in his third booke of *Georgickes* hath these verses, to shew what it is, and whereto used, taken as it should seeme from *Aristotle*.

Hinc demum Hippomanes, *vero quod nomine dicunt*
Pastores, lentum distillat ab inguine virus
Hippomanes, quod sæpe male legere novercæ.

And *Tibullus* the Poet in his 2. booke and 4. *Elegie*, hath the same also in effect in these verses:

Et quod, ubi indomitis gregibus Venus afflat amores
Hippomanes, cupidæ stillat ab inguine equæ.

Anguillara is of opinion that the *Hippomanes* of *Theocritus* is the lesser *Stramonium*, or thorne apple, and that *Cratevas*, whom *Theocritus* his interpreter doth cite saith, that it is a plant whose fruite is like the wilde Cowcumber fruits, but full of thornes: Now if the ancients have left these doubts, whether *Hippomanes* be an herbe or made of an hearbe, and shew not certainely what the hearbe is, or doe not all agree that it is the sperme of mares, how shall we in these times compound the controversie.

The Vertues.

Dioscorides saith that the pure juyce of *Hippophaes* it selfe being dryed, and the weight of halfe a scruple thereof taken, or the weight of two scruples, if it be made up with the meale of the bitter Vetche, taken in meade or honyed water, purgeth downewards flegme, choller, and water: the whole plant rootes and all being bruised and put into meade, and about a quarter of a pint thereof taken, worketh in the same manner: the juyce taken from both the plant and the roote, as it is used to be done with *Thapsia*, a dramme thereof taken at a time, is a purgation of it selfe for the same purposes. The juyce pressed out of the rootes, leaves, and heads, of *Hippophæstum*, is to be dryed and halfe a dramme thereof given to whom you will, in meade or honyed water, draweth forth flegme and water: principally and chiefely this purgation is fit or convenient, for those that are troubled with the falling sickenesse, shortnesse of breath, and aches in the joynts and sinewes.

CHAP. XX.

Alypum Monspelienſium ſive Herba terribilis Narbonenſium. Herbe Terrible.

BEcause this herbe is of a most violent purging quality, sharpe and exulcerating withall, very like unto the former *Tithymalls*. I thinke it fitteſt to joyne it next unto them and another with it, which by *Pena* his judgement is very like thereunto, both for face and quality.

1. *Alypum Monspelienſium.* Herbe Terrible.

This terrible herbe hath many wooddy stalks, rising two or three foote high, dividing it selfe into smaller branches, covered with a thinne barke, the elder branches being, of a darke purplish colour, and the younger more red, thicke set with small hard and dry leaves without order, from the bottome to the toppe, which are somewhat long and small at the setting on, broader in the middle, and sharpe pointed, somewhat like unto small Mirtle leaves, of a greenish colour on the upperside, and whitish underneath: at the top of every branch standeth a round flower in a scaly head, consisting of many purplish thrummes or threds, paler in the middle than round about, somewhat like unto the head of a *Scabious* or rather *Knapweede*: the roote is of a fingers thicknesse, long, wooddy and of a browniish colour, somewhat salt, if it grow neere the sea shore, where it may drinke any of the Sea water, or else not salt at all, but bitter if it grow further off; the leaves also tasting after the same manner.

2. *Tarton*

1. *Alypum Monſpelienſium ſive Herba Terribilis.* Herbe Terrible.

2. *Tarton raire Maſſilienſium.* Gutworte or Trouble belly.

Hippogloſſum Valentinum Cluſii.

2. *Tarton raire Maſſilienſium.* Gutwort or Trouble belly.

The herbe Gutworte or Trouble belly, hath very many hoary, or ſilver white ſlender and very tough branches, two foote high, divided into many other ſmaller, whereon grow many ſmall white hoary leaves round about them, ſmaller than thoſe of *Alypum*: the flowers are white and ſmall, ſet cloſe together, in a long tuft, but ſo covered with the white woollineſſe that they can ſcarſe bee perceived: after which come ſmall blacke ſeede, bitter and unpleaſant, and ſo fiery hot, that if any ſhall either chew of them or the leaves, a little in their mouth, they will ſo heate the mouth, lippes, and jawes, that no waſhing will for a long time take it away: the roote is ſmall long and wooddy, with many fibres at it, yellowiſh on the outſide and white within, nothing ſo hot, bitter or unpleaſant as the leaves or ſeede, yet leaving a ſmall hot taſte at the end, without any ſent, and not giving any milke: it is ſaith *Pena*, very like unto the *Turbith* of *Alexandria*, or of the ſhoppes, in the forme thereof.

The Place.

The firſt groweth on the mountaine or hill, called *Ceſtius* or *Cap de ceſte*, and in other rockes and ſtony places, hard by *Marſeilles* in *France*, as alſo in diverſe places in *Spaine* as *Cluſius* ſaith. The ſecond doth likewiſe grow neere *Marſeilles* by the Seaſide, on a ſmall hill neere thereunto, called *Mondrond*, as *Pena* ſaith, and all a long the coaſt of *Liguria*, and the Iſles of *Corſica*, and *Sardinia*, as *Lugdunenſis* ſaith.

The Time.

They flower not untill it be late with us; but *Cluſius* found the firſt in flower, in the moneths of *February*, and *March*, as he ſaith in *Spaine*.

The Names.

Ἄλυπον in Greeke, *quaſi indolens inoffenſumque remedium* καὶ' ἀντίφρασιν, *per contrarium enim ſe habet, quem admodum in aliis*; *Græcè ſcilicet fella* γλυκέα *ſive dulcia* ὄλβιον, *Holoſtium tota oſſea, cum herba ſit tenera appellans*: except it might rather be ſaid to come from ἅλικον, *id eſt, ſalſum vel maritimum*, becauſe it groweth neere the ſea: in Latine it is called alſo *Alypum & herba terribilis*, according as the common people of *Provence* doe call it, from the effects it worketh. It is called alſo *Alypias* by *Actuarius*, yet ſome thinke that his *Alypias*, which as he ſaith purgeth flegme, doth differ from his *Alypum*, which purgeth blacke choller: but *Paulus* reconcileth this doubt in his ſeaventh booke; and fourth chapter, where hee ſaith, that the ſeede of *Alypum*, purgeth downewards blacke choller, taken with a little ſalt and Vinegar, in the ſame quantity that *Epithymum* doth: but if we credit *Dioſcorides*, ſaith he, it doth lightly exulcerate the guts: but is the ſame in my judgement ſaith *Paulus*, which is now called *Alypias*: the roote hereof, as I ſayd in the chapter of *Tithymalls*, is called by *Actuarius Turpetum album*, as that of *Eſula minor*, *Turpetum nigrum*: There is ſome doubt with many, whether we have the true *Alypum* of *Dioſcorides* or no, for that ſome copies differ from others in the deſcription of the forme of the plant, ſome having the word μελαντερος that is like fennell, and ὑπέρυθρος ſomewhat red ſay others, whereupon

whereupon *Lobel* and *Pena* are bold to affirme in their *Adversaria*, that our age knoweth no herb, that may so wel or more truely, both in the forme and purging vertues, resemble *Dioscorides* his *Alypum*, (except the *Ferulas*) then this herbe here set forth, altering that word onely, which as he saith may be a fault (such as is common in many other places of his worke) in the transcribers: and hereupon as it is probable *Mesues* grounded his opinion, that Turbith was the roote of a ferulous plant. *Clusius* saith that diverse professors in the Vniversitie at *Valentia*, did call an herbe which he therefound *Hippoglossum*, supposing it to be the true *Hippoglossum* of *Dioscorides*; whereunto it can as he saith be nothing like, the properties being so differing, except in a little appearance of likenesse in the leaves: *Clusius* also doth not acknowledge it to be *Alypum* but misliketh of their judgement, that doe referre it thereunto, because the leaves are so dry, that they seeme to be without any juyce in them; whereupon the *Spaniards* call it *siempre enxuta*, and from the round head of flowers, which is paler in the middle than round about, doe call it *Coronilla de frayles*, *Coronula fratrum* the Friers Crowne, and of some as he saith *Segulhada*, but others of good judgement doe hold them, to be both but one plant, the diversity, if any be, to consist in the climate. *Dalechampius* as *Lugdunensis* setteth it forth, was of opinion, that it might be *Empetron* of *Dioscorides*, which others as he saith called *Phacoides*, onely led thereunto, by the purging quality and growing neere the Sea, as *Empetron* doth; and because that the *Crithmum* or *Faniculum marinum*, is disprooved by most not to be *Empetron*, which many heretofore thought to be so, (and among the rest *Pandulphus Collinutius*, in his defense of *Plinye* against *Leonicerus*, for it is certainely seene, that *Plinye* hath confounded that *Empetrum*, which is a *Saxifrage*, with the other which is a purger) because it hath no purging quality in it at all: but seeing we hold this *Alypum*, to be the right or neerest it of *Dioscorides*, I cannot see what reason can move any, to thinke it to be *Empetrum* also, seeing *Dioscorides* maketh them two distinct herbes in severall chapters, and placed the one the very next unto the other: some also as *Lugdunensis* saith, take it for *Ptarmica*, or for the third sort of *Conyza*. *Bauhinus* in his *Pinax*, calleth it *Thymelæa foliis acutis, capitulo Succisæ, sive Alypum Monspeliensium*. The other is called *Tartouraire* by *Lugdunensis*, and *Lobel*, and is so called as hee saith, in the Isles of *Corsica* and *Sardinia*, and all along the Sea coasts of *Liguria* and *Marseilles*. *Dalechampius* saith that many doe referre this to the *Sesamoides magnum* of *Dioscorides*, which he hath mentioned in his fourth booke, and 147 chapter, with leaves of Groundsell or Rue: and therefore *Dalechampius* in the description hereof saith, the leaves are like Rue, which in my judgement doth very hardly agree thereunto, but much lesse unto Groundsell, whereunto they are also compared. Furthermore he saith also, that peradventure this may be that *Helleborus* of *Theophrastus*, whose seede is like *Sesamum*, and wherewith in *Anticyra* as he saith they used to make purgations: but the extreame purging quality herein, shewing it as *Pena* saith, to be a new plant of our ages finding, and not well knowne to be mentioned by any of the ancient writers, Greekes, *Arabians* or *Latines*, hath caused diverse to referre it, as I say, some to *Sesamoides*, and others to *Theophrastus* his *Helleborus*, with the fruite of *Sesamum*, and yet whosoever will advisedly consider, the seede of all the sorts of *Hellebores*, both the white and the backe, shall not finde them much unlike the seedes of *Sesamum* it selfe. *Alphonsus Pontius* of *Ferrara* tooke it to be *Cneorum* of *Theophrastus*: the roote hereof as *Pena* saith, is like unto the Turbith of *Alexandria*, and hath not so much heate or bitternesse therein, nor other evill taste as others have. *Bauhinus* calleth it *Thymælea foliis candicantibus sericis instar mollibus*.

The Vertues.

The seede of *Alypum* (saith *Dioscorides*) or herbe terrible, purgeth downeward blacke choller or melancholy, if it be taken in the like quantity with *Epithymum* and a little salt and Vinegar put to it in the taking, but he saith it doth a little exulcerate the bowells: the common people in *Narbone*, but especially the Quacksalvers and women leeches, as *Pena* saith, notwithstanding they find the effect to purge with such violence, yet doe often give it, making a decoction with the leaves flowers or seede, or otherwise make them into powder, and give it them with wine or broth; the smallest quantity thereof, to be taken in chicken broth, saith *Plinye* is two drammes, a meane quantitie is foure drammes, and the greatest portion to be given at once is sixe drammes: *Clusius* saith that the Landlopers in *Spaine*, doe usually give the decoction hereof unto those, that are troubled with the *French* disease, and that with good successe as it is reported: the other Gutworte or Trouble belly is as violent in working as the former, or rather much more, for the violence thereof is so unlimited, that it oftentimes causeth immoderate fluxes, even to blood and excoriations; especially if the dryed leaves be given unadvisedly in powder, and mixed with some potable liquor, and driveth forth cholericke, flegmaticke, and watery humors in abundance; the roote likewise worketh powerfully for the same diseases, which if it were *Theophrastus* his *Helleborus*, or *Dioscorides Sesamum*, were unprofitable or of no use; the seede onely with them and not the roote, having the propertie and power of purging. Advice therefore before taken, and preparation both of the physicke and body, the quantity also, the disease and strength of the patient considered, it may be admitted to be given where better and safer things cannot on the suddaine be had.

CHAP. XXI.

Thymelæa. Spurge Olive.

THere remaine yet some other violent workers, which shall be declared in this and the next Chapters following, and first of the *Thymelæas*, and then all the sorts of *Chamælea* and *Sanamunda* of *Clusius*, because they are so like both in forme and nature: and let me also adjoyne the small *Sesamoides* of *Dalechampius*, for the neere affinitie with them.

1. *Thymelæa.* Spurge Olive.

This Spurge Olive hath diverse tough stalkes, rising to the height of two or three foote, sometimes in the naturall places, and much lower in some other, of the thicknesse also of ones thumbe, covered with an ash coloured barke, and spread into many branches; whereon grow many small, clammie, flat, pointed leaves, somewhat like unto Mirtle leaves, or rather unto the narrow leaves of the Olive tree, for they are larger and broader than the leaves of Flaxe, whereunto many doe compare them, and doe continually abide on the branches without falling

falling off, as the *Chamelæa* doth; at the toppes of the branches, grow many ſmall ſtarlike flowers, conſiſting of foure white leaves a peece; after which come ſmall berries greene at the firſt, and of a very red colour, like unto Corall when they are ripe, being a little more long than round, of the bigneſſe of a Mirtle berrie, with a pulpe or ſubſtance like unto a Cherry, wherein is one kernell covered with a blacke ſoft and brittle ſhell: the roote is ſoft and tender while it is young; very like unto a Raddiſh roote as *Cluſius* ſaith, but wooddy when it is growne elder, coverd with a tough thicke barke.

2. *Thymelæa minor ſive Cneorum Matthioli.* Small Rocke Roſes.

This plant hath diverſe long weake and ſlender but tough branches lying upon the ground divided uſually into other ſmaller ones whereon grow many ſmall long and ſomewhat thicke leaves neere unto thoſe of *Meſereon*, ſet without order to the tops where it ſhooteth forth a tuft of many flowers together, conſiſting of foure leaves a peece, of a bright red or carnation colour, and in ſome plants white, very ſweete, which turne into ſmall round whitiſh berries, conteining ſmall round ſeede, of a grayiſh colour: the roote is long and yellowiſh, ſpreading divers wayes under ground, and abideth many yeares ſhooting forth new branches.

3. *Chamelæa Germanica ſive Meſereon vulgo.* Dwarfe Bay or flowring Spurge.

There are two ſorts hereof, the one having a pale, and the other a deeper red coloured flower, they both riſe up with a thicke wooddy ſtemme, five or ſixe foote high or more, and of the thickneſſe (if they be very old) of a mans wreſt at the ground, ſpreading into many flexible long branches, covered with a rough grayiſh barke, beſet with many ſmall long leaves ſomewhat like unto Privet leaves but ſmaller and paler and in a manner round pointed, falling away every yeare: the flowers are ſmall conſiſting of foure leaves, many growing ſometimes together at a place, and uſually before the leaves appeare, after which come ſmall berries, greene at the firſt and very red afterwards, but blackiſh red being ſuffered to abide long on the buſh, the roote ſpreadeth into many long and tough branches covered with a yellow barke.

4. *Chamelæa Alpina incana.* Mountaine ſpurge Olive.

This mountaine Laurell hath a ſmall wooddy ſtemme three or foure foote high or more, branching forth towards the upper parts, into many ſlender and tough branches, covered with a rough hoary greene barke, beſet at the ends thereof with flatter fuller and ſmaller round pointed leaves than the former, of a grayiſh greene colour on the upperſide and hoary underneath, which fall away before winter as the laſt doth: the flowers are many, ſet together at the ends of the branches, greater than the laſt, conſiſting likewiſe of foure leaves a peece of a light bluſh colour, ſtanding in ſmall grayiſh huskes, of as little ſent as the other: the berries are ſmall long graines of an excellent red colour, which afterwards turne blacke: the roote is long and ſpreadeth about under the upper part of the earth.

5. *Chamelæa tricoccos.* Widdow waile.

This triple berryed Spurge Olive hath no great ſtemme at all, but ſpreadeth from the ground into many flexible tough greene branches, whereon are ſet diverſe narrow, long, darke-greene leaves all along them, which

1. *Thymelæa.* Spurge Olive.

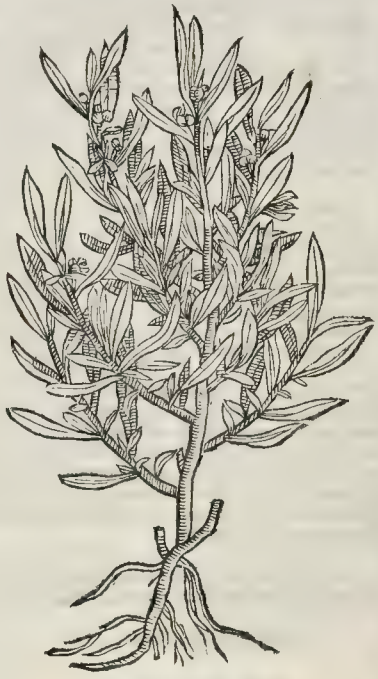
2. *Thymelæa minor ſive Cneorum Matthioli.* Small Rocke Roſes or Spurge Olive.

abide

3. *Chamelæa Germanica, sive Mesereon.* Dwarfe Bay.

4. *Chamelæa Alpina incana.* Mountaine Spurge Olive.

5. *Chamelæa tricoccos.* Widow Waile.



7. *Sandmunda tertia Clusii.* The third Spanish Spurge Olive of *Clusius.*

10. *Sandmunda Africana.* Spurge Olive of Africa.

abide greene all the winter; the flowers are very ſmall, ſcarce to be ſeene, and come forth betweene the leaves and the ſtalke, of a pale yellow colour, conſiſting of three ſmall leaves, after which come ſmall blackiſh berries three uſually ſet together: the roote ſpreadeth not much in the ground but is hard and wooddy, dying oftentimes if it be not well defended in the extremitie of winter.

6. *Sanamunda prima Cluſii.* The firſt Spaniſh Spurge Olive of *Cluſius*.

This kind of Spurge Olive hath diverſe flexible pliant branched ſtalkes, riſing up to a foote and a halfe high, covered with a blackiſh barke, and under it with a gentle ſmooth one, which may be eaſily ſeparated into long threads: having many ſmall and ſomewhat long hairie leaves thicke ſet on them, ſmaller ſharper and thicker than thoſe of *Chamælæa* or Dwarfe Bay, and commeth ſomewhat neere in likeneſſe to the Sea *Tithymall*, or Sea Spurge, but ſomewhat hayrie, of a bitter ſharpe and burning taſte, ſomewhat clammie or gummie in chewing: the flowers grow with and among the leaves on the branches, conſiſting of foure ſmall yellow leaves a peece: after which come ſmall blackiſh berries ſomewhat like unto the laſt: the roote is thicke long and wooddy. *Cluſius* mentioneth another hereof with ſhorter leaves, and whiter or downie, and ſmall yellow flowers in tufts.

7. *Sanamunda 3 Cluſii.* The third Spaniſh Spurge Olive of *Cluſius*.

The third Spaniſh kind of Spurge Olive, hath whiter and more pliant ſtalkes, covered with a thicker barke, very hard to breake, the ſmaller toppe branches being almoſt wholly white with doune, which bend againe towards the ground, whereon are thicke ſet a number of whitiſh leaves, and thicke, covered as it were with cotten or doune, ſmaller than the laſt, and very like to thoſe of Stonecroppe of a ſharpe hot burning taſte: the flowers are ſmall and greeniſh or pale (ſaith *Cluſius* like unto the others, the roote is thicke and wooddy like the former.

8. *Seſamoides minus Dalechampii.* A different Spaniſh Spurge Olive.

There is another ſort of this plant as I thinke, that *Dalechampius* as *Lugdunenſis* ſaith, uſed to call *Seſamoides minus*, that is in compariſon of the greater kind, was ſet forth by him a little before, not underſtanding the *minus* of *Dioſcorides*, which is a farre differing plant: but this *Seſamoides minus Dalechampii*, hath ſmall pale greene leaves, ſet about the woolly ſtalkes: the flowers come forth at the joynts with the leaves, which are ſmall and white, and not yellow, very ſweete in ſent, farre differing from all the reſt in ſweeteneſſe.

9. *Sanamunda Monſpeliaca glabra.* Smooth French Spurge Olive.

This greene or ſmooth ſpurge Olive, hath a thicke white wooddy roote, covered with a pale coloured gentle pliant thicke barke, from whence ſhoote out many ſmall ſlender branches, full of joynts, and of an hand breadth high: on each ſide whereof are placed diverſe ſmall ſhort and narrow greene leaves, ſeldome round pointed, ſomewhat like unto the leaves of *Polygala* Milkewort or Gangflower: the flowers are ſmall and yellow ſtanding with the leaves and amongſt them: the ſeede hath not beene obſerved.

10. *Sanamunda Africana.* Spurge Olive of Africa.

This *African* plant hath diverſe pliant ſtalks riſing from the roote full of joynts, and two ſmall and almoſt round leaves at them, which ſometimes lye ſo cloſe to the ſtalke, that they ſeeme to be onely thicker joynts than the other: the flowers are yellowiſh growing at the toppes of the ſtalkes: the roote is long and tough, with a rugged barke.

The Place.

The firſt groweth in many places in *Spaine*, as alſo in *Italy* in *Hetruria* and about *Trent* as *Matthiolus* ſaith, and likewiſe in *Narbone* of *France*. The ſecond in *Germanie*, *Bohemia*, and *Auſtria*: The third in many places of *Germanie* alſo: The fourth in the mountaines of *Savoye*: The fift in *Provence* and *Spaine*: the ſixt in the Countries of *Granado* and *Valentia* in *Spaine* as *Cluſius* ſaith. The ſeaventh both upon the hils, and neere the ſea in ſome places of *Spaine*. The eight by the Sea ſide in the Iſland of *Corſica*, and is ſeldome ſeene, either in *Spaine*, *Italy*, or *France*. The ninth was found upon the hill neere *Mompelier* called *Hortus Dei*. The laſt by *Boetius* often remembred in this and my former worke in *Barbery*. All of them are very tender, loving onely the wormer Countries, and will not without extraordinary care be kept in ours.

The Time.

The firſt flowreth not in Spaine untill Iuly and Auguſt, but the reſt ſome in Ianuary or February, and ſome in March and Aprill, in their naturall places, and many with us not untill Iune or Iuly, if they be preſerved in the Winter.

The Names.

Θυμέλαια in Greeke is called *Thymelæa* in Latine alſo with all writers, *quaſi Tithymelæa, ex Tithymalo & Olea deducta*. The *Arabians* call this *Meſereon* promiſcuouſly with *Chamælæa Germanica*, and *Tricoccos*, the Greekes call the berries hereof, properly κόκκος κνίδιος *Coccum Cnidium* or *gnidium*, as ſome have it, but as *Dioſcorides* ſaith, are not thoſe of *Chamelæa*, yet aſſuredly the properties are not ſo farre differing, but that the berries of *Chamelæa* may very well be uſed in the want of the other: *Dioſcorides* ſaith that the leaves were called *Cneorum* in his time, whereupon *Guilandinus* tooke this to be *Cneorum nigrum* of *Theophraſtus*, as he doth the *Chamelæa* to be *Cneorum album* (which *Gaza* tranſlateth *Caſia*) for hereof they made two kinds, the one white the other black. *Cordus* in his hiſtory of plants calleth the *Cneorum Matthioli Thymelæa minor* whom *Bauhinus* followeth (and ſo doe I) calling it *Thymelæa affinis facie externa*. But if I ſhould in this place, upon this occaſion, to ſave the often repetitions in other places, ſhew you all the opinions of other writers concerning *Cneorum*, whereunto they doe referre them, and their contraries, I thinke I ſhould not doe amiſſe: *Anguillara* maketh *Lavendula* to be *Cneorum album*, and *Roſmarium* to be *nigrum*, whom *Matthiolus* refuteth thus, that *Theophraſtus* ſaith both ſorts of *Cneorum*, ſend downe long rootes into the ground, and the branches are pliant and gentle, fit to binde things withall, neither of which properties can be found in Lavander or Roſmary, *Matthiolus* in his laſt Latine edition, ſetteth forth 2 figures of *Cneorum*, the one in the chapter of *Cinamon*, which he ſaith hath the true notes of *Cneorum album Theophraſti*, and the other in the chapter of *Thymelæa*, which he thinketh to be *nigrum*: and in his third booke of Epiſtles, in that unto *Ioannes Crato*, and in his fourth booke of Epiſtles, in that to *Bartholomæus Maranta*, as well as in his Commentaries upon *Dioſcorides*, in the Chapter of Cinamon he is perſwaded that *Theophraſtus* his white or ſweete *Cneorum* is the *Caſia* whereof *Virgill* in his *Bucolicks* and *Georgickes* maketh ſo often mention, and which *Plinye* alſo from the teſtimonies of *Higinus*, calleth *Caſſia* the ſweete herbe and not the

the Aromaticall tree, which is like to Cinamon: *Lugdunenſis* by correcting the greeke text of *Theophraſtus* in divers places where he thinketh it is faulty, ſheweth the figure of a Plant, accounted of divers, as he ſaith, to be the *Cneorum album* of *Theophraſtus*, which *Bauhinus* judgeth to be the *Dorychnium Imperati & Plateau*, mentioned in *Cluſius* his Hiſtory of Plants. But *Bauhinus*, both in his annotations upon *Matthiolus* as he hath publiſhed them, and in his *Pinax* referreth both theſe Plants of his, the firſt unto *Ocymoides repens Polygoni folio* of *Lobel*, and the other unto the *Ocymoides repens* of *Camerarius*, *Myconus*, as *Lugdunenſis* ſaith, referreth his *Cneorum album*, unto *Avicenne* his other *Oleander*, which he calleth wild *Oleander*, for as he ſaith it is like common *Oleander*, both in leafe, flower, and ſent. The third is called *Chamælea & Meſereon* uſually now adayes, and ſo likewiſe by *Tragus*: *Dodonæus* and *Camerarius* call it *Chamælea Germanica*: by *Fuchſius* and others, *Daphnoides*, *Geſner in hortis Daphnoides noſtrum vulgare*: *Lugdunenſis*, *Laureola fœmina*, *Anguillara Pipermontanum*, and *Lobell*, *Lauras puſilla*, and *Meſereon Germanicum*: ſome alſo take it to be (*Chamædaphne Dioſcoridis*. The fourth is called *Chamælea Alpina incana* by *Lobell* & *Chamælea altera* by *Cluſius*, and *Italica* by many with us, becauſe *Cluſius* ſaid it came to them only from *Italy*. The fifth is the true *Chamælea* & *Meſereon* of the *Arabians*, & generally called now adayes *Chamælea tricoccos*. The ſixt is called *Sanamunda*, by the *Spaniſh Mores* in *Granado*, as *Cluſius* ſaith, and of the profeſſors of Herbariſme, or Herbariſts there alſo, though the countrie people call them, as he ſaith, *Mierda cruz*, of the propertie of the ſtrong purging. *Bauhinus* calleth it *Thymelæa foliis Chamelææ minoribus ſubhirſutis*, and is the *Thymeleæ ſpecies Myconi* of *Lugdunenſis*, & the ſecond *Sinamunda of Cluſius*, which *Bauhinus* calleth *Thymelæa foliis Kali lanuginoſis ſalſis*. The ſeventh is the *Erica Alexandrina* of *Lobell*; and the 3. *Sanamunda* of *Cluſius*. The eight is called *Seſamoides minus Dalechampij* by *Lugdunenſis*, who in my mind much confoundeth both himſelfe and his readers herein, for he referreth this both to *Cluſius* his ſecond *Sanamunda*, which he ſaith is hot, ſharpe, and ſomewhat ſalt, even as he ſaith his *Seſamoides* is: and alſo to the *Cneorum nigrum Myconi*, which he ſheweth after the deſcription thereof, that the taſte of the leaves is ſomewhat binding, with a clammineſſe or gleuiſhneſſe therein alſo, which is quite differing in propertie, and yet he maketh them to be all one Plant: and *Bauhinus* following him herein, ſo ſetteth it downe in his *Pinax*: but both this deſcription, as I have before given it you, differeth from *Cluſius* his ſecond *Sanamunda*, which as *Cluſius* ſaith, hath his flowers in cluſters at the tops, and from the other which hath them at the joynts, *Cluſius* again giveth unto his yellowiſh flowers, like unto thoſe of the Olive tree, and *Dalechampius* ſaith, it beareth ſmall white flowers, very ſweete: ſo that it may ſeeme to be a ſpecies thereof, and not the very ſame, but it cannot be alſo his *Cneorum nigrum Myconi*, if the taſtes be ſo different: let others judge hereof after they have conſidered them both well. The ninth *Bauhinus* ſetteth downe in his *Pinax*, with the title *Thymelæa foliis polygalæ glabris*, in his *Prodromus* with the title *Sanamunda viridis*, *vel glabra*, and referreth it to the *Thymelæa ſpecies Myconi* of *Lugdunenſis*, who ſaith it doth beſt agree with *Cluſius* his firſt *Sanamunda*. The laſt is not remembred by any before.

The Vertues.

The firſt Sparge Olive worketh very churliſhly with whomſoever, and in whatſoever manner you give it, *viz.* the leaves prepared beaten to powder, and taken in wine or broth, or the berries ſwallowed whole or bruiſed and taken by themſelves; for as *Dioſcorides* ſaith, if twenty foure of the berries be taken in drinke (this proportion is anſwerable to the reſt of the phiſicke in thoſe times as I have often ſaid) or the inner pulpe of them onely, it purgeth downewards very ſtrongly, both Choller, Flegme and water, but as he ſaith, they will burne the jawes and throate, and therefore they had neede be rowled, or otherwiſe given with flower or barley meale, or ſwallowed in meale, or in raiſins, the ſtones taken out, or taken with purified honey, being beaten with niter and vinegar, it is applied to them that are given to over much ſweating. He that will give the pouder of the leaves, had neede firſt to take away the ſtrings that runne in the leaves; which may be done while it is groſſely beaten, before it be beaten finer, which prepared in this manner may be made into *Trochiſces* or balls, to keepe all the yeare, the leaves being gathered in Autumne: It is a remedy alſo for them that have eaten and drunken Hemlocke, the poyſonfull herbe. All the *Sanamunda's* likewiſe are violent purgers, for halfe a dramme of the juyce of the berries taken in wine, or in broth, which is the better, and the ſafer way, purgeth watery humours aboundantly; and therefore if it be taken with good adviſe warily, it may doe good in Dropſies, Gouts, Joynt-aches, the *Sciatica*, and the like: in *Spaine* they uſually give a dramme in the decoction of red Cicers, which purgeth flegmaticke and melanchancholy humors wonderfully, and conſequently is availeable to all ſuch diſeaſes, as riſe from ſuch humours, *Lugdunenſis* recordeth a cure of one in the Hoſpitall at *Lions*, who was grievouſly tormented with the Crampe, performed by *Dalechampius*, by giving him a dramme of the leaves of the fourth kinde here ſet downe in pouder, in a little barley water, which wrought as forceably as if he had taken Colocynthis, and thereby was reſtored to his health. The country people, as *Matthiolus* ſheweth, doe often take of thoſe berries to purge themſelves, thinking to be their owne Phyſitions herein, and deceive them of their fee due for their counſell, but as he there ſaith, they often deceive themſelves, by their unskilfull foolehardineſſe, and make more worke for the Phiſitions to cure them of the paines and torments, and other dangerous diſeaſes that follow the taking of theſe violent purgers, if they free them not of further trouble by their owne deaths: *Pliny* is juſtly to be taxed for writing in his 27. booke and 9. Chapter that the *Coccognidium* (which as I ſaid before, is called by the *Grecians* the fruite of *Thymelæa*) doth ſtay or bind the belly (*Siſtit alvum*, is the word in the generall Copie, which yet ſome would impute to be the errour of the Writer out thereof, when it ſhould be *Ciet alvum*) when *Galen* and all other Authors acknowledge it to be a ſtrong purger. *Meſues* adviſeth that *Meſereon* (which I ſaid before the *Arabians* doe confound, and is to be underſtood this *Thymelæa*, as well as that *Chamælea*, &c.) is not to be given without the correctors appointed for it, and yet not, but unto ſtrong able bodies: All theſe therefore are not ſafe to be given to weake bodies or ſtomackes, to women with child, or to children that are not ſtrong, except they be ſtrongly infected.

CHAP. XXII.

Laureola. Laurell or Spurge Laurell.

THis Laurell or Spurge Laurell (that it may be knowne from the Bay tree, which is of divers, called the Laurell tree) riſeth up uſually but with one ſtemme, yet ſometimes with more, very tough and pliant, covered with a whitiſh thicke tough barke, branching forth into divers parts toward the toppes, whereon are ſet many long, ſmooth, thicke, ſomewhat broad and ſhining darke greene leaves, ſomewhat like unto Bayleaves, but longer, ſmoother, ſofter, and not with hard veines therein as Bayleaves have; the flowers come forth towards the toppes of the ſtalkes and branches, and at the joynts with the leaves many ſet together, which are ſomewhat long and hollow, ending or ſpreading into foure ſmall leaves, of a whitiſh, yellow, greene colour: after which come ſmall round, and ſomewhat long blacke berries when they are ripe, wherein lieth a white kernell; the roote groweth downe deepe into the ground, and ſpreadeth likewiſe tough long white ſtrings, ſomewhat woodie: both leafe and flower, both barke and roote are very hot and ſharpe in taſte, heating and burning the mouth and throate of any that ſhall taſte them: it keepeth the greene leaves all the Winter, and doth not ſhed them.

2. *Chamædaphnoides ſive Laureola Cretica.* Candie Laurell.

From a crooked ſmall white roote, riſe up three or foure crooked and bending blackiſh ſtalkes, thicke ſet with leaves without order, covering them allmoſt wholly, which are long and ſmall towards the bottomes, and grow broader to the ends, being thicke and hard, greene above, and grayiſh below, taſting very hot, and burning both mouth and throate very notably; what flowers or fruit it beareth, hath not beene ſeene, but referred unto this Laurell for the forme and propertie, and groweth very low.

The Place.

The firſt groweth wild in many places of this realme, as well as beyond the ſeas, and being brought into gardens will there abide, and flouriſh ſufficiently well, the other was ſent out of *Candie* to *Proſper Alpinus*, who hath given this remembrance of it.

The Time.

The firſt flowreth very early in the yeare, even in Ianuary or February, and ſometimes before, if the Winter be milde, the berries are ripe about June; the other hath not floured, as is before ſaid.

The Names.

It is called in Greeke Δαφνοειδὲς *a Lauri foliorum ſimilitudine*, and the Latines accordingly, *Laureola quaſi puſilla Laurus*. Some doe appoint two kinds of *Laureola*, *mas & fœmina*, ſome accounting this to be *mas*, and *Chamælea Germanica* to be *fœmina*, others this to be *fœmina* and *Chamælea* to be *mas*; ſo variable are divers in their opinions: *Matthiolus* taketh this to be *Chamædaphne* of *Dioſcorides*, and the *Chamælea* to be *Daphnoides*, but in both

1. *Laureola Florens.*
Lawrell in flower.

2. *Laureola cum baccis.*
Laurell with berries.

he is much miſtaken: *Lobel* and *Lugdunenſis* doe take this *Laureola* which he calleth *Mas*, to be *Daphnoides*, and the *Chamælea Germanica* to be *Chamædaphne* or *Laureola fœmina*. *Tragus* alſo is much deceived in miſtaking this plant, for *Dioſcorides* his *Thymelæa*. Moſt of other writers doe call it *Daphnoides*, or *Laureola*, *Dodonæus* as I ſaid before, would make it to be *Cneorum nigrum* of *Theophraſtus*, and the *Chamælea* his *Cneorum album*. In my former booke I was partly perſwaded, that *Chamædaphne* of *Dioſcorides*, was the *Chamælea Germanica*, or came ſomewhat neere thereunto; but upon better thoughts, I thinke that *Chambdaphne* may be more truely referred, to the *Laurus Alexandrina* of *Matthiolus*, whoſe leaves are ſmall like unto Bay leaves, and the berries red when they be ripe, ſtanding upon the leaves: and if you would aske me then, which is the *Laurus Alexandrina* of *Dioſcorides*, I would anſwere you, that it is that *Laurus Alexandrina legitima*, that *Lobel* hath ſet forth in his Appendix, to his *Adverſaria*, whoſe branch I communicated to him, to ſet forth, as I had it from *Piſa*, whoſe leaves come neerer unto *Dioſcorides* his deſcription, than either that of *Matthiolus*, or of any other as you ſhall further underſtand in his proper place; the other is called *Chamædaphnoides*, *id eſt*, *Laureola Cretica* by *Proſper Alpinus*, *lib. de plantis exoticis*.

The Vertues.

The leaves and berries hereof are as violent a purger, and do heate and inflame the throat, bringing the ſtomack, of whomſoever ſhall take thereof, and drive them into as many dangerous diſeaſes, as any of the former; yet taken adviſedly it purgeth flegme from the ſtomack and oftentimes by vomit alſo, it procureth womens courſes, and being chewed in the mouth, it draweth down from the head and braine much corrupt matter that would offend it. Many Emperickes do give the berries ſometimes, but the leaves more often, to evacuate the watery humors in the dropſie, and think they finde good ſucceſſe thereupon, as alſo to eaſe the paines of the collick, doe give the powder of the leaves in a little broth: the berries and leaves hereof when they are freſh boyled in oyle, and afterwards ſtrayned forth: this oyle being annointed on the belly looſeneth the belly, and helpeth the collicke, and being annointed on the backe and raines provoketh urine and helpeth the piles.

CHAP. XXIII.

Laurus Tinus ſive ſylveſtris. The Wilde Bay tree.

I Shall in this chapter ſhew you the wilde Bay trees, and joyne it next unto the *Laureola*, both for the name and nature thereof.

1. *Laurus Tinus Luſitanicus.* The firſt wild Baye of *Cluſius* or of *Portingall*.

The wilde Bay tree riſeth up to the height of an hedge buſh, or the Dog-berrie tree; having diverſe long ſquare ſtalkes, full of branches, and faire large broad leaves, ſomewhat like unto Bay leaves, ſet in or-

The firſt wilde Bay of *Cluſius* or of Portingall.

2. *Laurus Tinus alter vel 2. Cluſii.*
The ſecond Wilde Bay of *Cluſius*.

der

der thereupon, two alwayes set together at a joynt, one against another, but of a darke greene shining colour, of no sent at all in them, and of a bitter sharpe unpleasant taste, troubling the stomacke, causing loathing, and casting withall: at the toppes of the branches and twigs, stand many small sweete smelling flowers in clusters, consisting of five white leaves a peece: after which succeede small berries, being somewhat long flat and cornered, of an excellent pale bright blew colour, inflaming and burnig the mouth and throate, of whosoever shall taste it, that it is almost insupportable, and not but in a long time, and by drinking milke, and holding it in the mouth, to be taken away or eased; this abideth greene all the winter.

2. *Laurus Tinus alter vel* 2. *Clusii.* The second wilde Bay tree of *Clusius.*

This other wilde Bay tree, riseth to be a bush, much about the same bigneſſe with the former, having stronger stalkes, and more plentifully branching forth, which are reddish being young, and more greene with the rednesse when they are older: whereon grow the leaves in the same order, but somewhat longer, narrower, and more full of veines than it: the flowers stand at the toppes of the twigs and branches, in the same manner that the other doe, but are more purple and lesse sweete than they; which afterwards give smaller, fuller, and blacker berries, than the former: this also holdeth his greene leafe all the winter without shedding.

3. *Laurus Tinus sylvestris alter sive tertius.* The third wilde Bay tree.

This wilde Bay groweth seldome to be a tree of any height but abideth low shooting forth many slender branches, covered with a darke greene barke, with sad greene smooth leaves, set by couples thereon, somewhat resembling Bay leaves without any smell: the flowers grow in tuftes or clusters at the ends of the branches, somewhat reddish while they are in bud, but whiter being open with reddish edges, consisting of five leaves a peece, smelling sweete: there seldome followeth any fruite but are blacke round berries when it beareth, yet not perfect to spring againe in any that I have seene.

4. *Laurus Tinus Cretica fruticosa.* The shrubby wilde Bay of Candye.

This Bay tree groweth low and shrubby, bearing many slender round short branches covered with a black bark with knotty joynts, wheron are set 5 or 6 or more leaves like the former, but smaller upon short foot stalks which are wholly without sent, but heating the mouth and tongue with a little astriction: the fruite or seede is as small as a pepper corne, with a thin rind opening into three parts like a Spurge seed, containing within each part a small long whitish kernell like to a graine of wheate, smelling strong and tasting somewhat bitter and heating or burning the mouth and tongue.

The Place.

The first groweth in *Portugall* and *Spaine* in diverse places, as *Clusius* saith, in *Italy* also on the hils of *Florence* and *Romania*; and in the wood *Valena* in *Narbone*, and among the dwarfe scarlet Oakes, in many places of Mount *Cetus* or *Sestius* neere *Mompelier* in *France*. The second as *Clusius* saith he found in the *Monestery* of *Pera longa* in *Portugall*, and neere the Seaside also, in other parts of *Spaine*: the third he saith he onely saw in *Boysot* his garden, rayſed from *Italian* seede, which afterwards communicating the suckers thereof, became familiar in many other Herbarists Gardens there, as it doth also with us in our Country: and the last in *Candye*.

The Time.

The first flowred in July and August, and the fruite was ripe in October in some places of *Portugall*; when as in other places, *Clusius* saith he found it in flower in November, with the fruite on it then also: the second floureth also and beareth ripe fruite much about the same time: the third flowreth with us onely in December and continueth flowring Ianuary and February, if the winter be not too early or too extreame.

The Names.

It is called by *Theophrastus* in Greeke Δάφνη ἀγρία *Laurus sylvestris*, in his first booke and 15 chapter, among those trees that are ever greene, which *Gaza* translateth onely *Laurus*, not naming *sylvestris* at all, for it is not remembred by *Dioscorides* or *Galen*, or other of the Greeke writers. *Plinye* maketh mention thereof, in his 15 booke and 30 chapter, and in other places, calling it *Tinus*, which some understand to be this *Laurus sylvestris*, wilde Bay. M. *Cato* also remembreth it in *l. de re rustica*, by the name of *Laurus sylvestris* and no other ancient Latine writer besides: all the later writers doe call them *Tinus*, *Laurus Tinus*, and *Laurus sylvestris* as *Clusius* doth. The *Italians* call it *Lauro salvatico*, and as *Lobel* saith *Lauro regio* if he be not mistaken; the *Spaniards* and *Portingalls* *Vna de perro*, *Follado* and *Durillo*; the *French Laurier sauvage*; the *Germanes* wilde *Lorbeerbaum*; the *Dutch* wild *Laurus Boom*; and we in *English*, the Wilde Bay tree.

The Vertues.

There is nothing recorded of them by any Author, to be used either inwardly or outwardly; but our late experience hath found the berries, as I sayd before, to inflame and burne the mouth and throate, in as violent manner, or rather worse than *Laurell* or *Chamelæa*, and worketh downewards likewise with trouble and perturbation of the whole body.

CHAP. XXIIII.

Sambucus. Elder.

AMong the number of these strong purgers, the Elders must not be omitted to be spoken of, whereof there are many kindes, and the *Ebulus* Wallwort or Danewort, is to be reckoned with them, for the likenesse both of forme and qualitie, as all Authors doe.

1. *Sambucus vulgaris.* Common Elder.

The common Elder tree groweth up sometime, if it stand alone and in good ground, to a reasonable great height, otherwise standing thicke together, as for the most it is found to be, it is a shrubbe of meane height, spreading his branches farre and wide, covered with a grayish barke for the outside, but underneath it hath another that is greene, having a pith in the middle even of the Elder branches, but the young ones much more: at the joynts of the branches come forth on both sides winged leaves, consisting of 7 or 9 upon a stalke, a little nicked or dented adout the edges, of a faire sad greene colour, but smelling somewhat rancke and strong: the flowers stand at the toppes of the severall branches and twigs, many growing together in broad tufts or umbells, of a white colour, smelling more strong than the leaves, which being past, there rise up in their places

1. & 3. *Sambucus vulgaris & Laciniatis foliis.*
The common and the jagged Elder.

4. *Sambucus racemosa rubra.*
Red Berried Elder.

small round berries greene at the first, and blackish when they are ripe, full of a purplish juyce within them, wherein lie some small flat seedes or graines: the roote is great and thicke spreading farre about. There is a kinde of *Fungus* or excrescence growing at the foote of the body, and on the branches of this tree, called Iewes eares, which I shall further declare among the other sorts of Mushroomes.

2. *Sambucus fructu albo.* White berried Elder.

This Elder is so like the former, both in growth, barke, pith, branches, sent, leaves and flowers, that untill it come to beare fruit, it is very hard to be discerned from the other; the chiefest difference hereof, is that the berries are not blacke, but of a pale whitish yellow colour in most places, yet in some they abide greenish; and hereby onely it is distinguished from the former.

3. *Sambucus laciniatis foliis.* Jagged Elder.

As the former Elders were distinguished onely by their berries, so the onely difference in this from the first, is the forme of the leaves, which are so much jagged, and divided even to the middle ribbe, that unlesse the smell thereof declared his descent, no body by the present face would deeme it an Elder: in all other parts thereof as well flowers as fruite or berries, it differeth not from the common Elder.

4. *Sambucus racemosa rubra.* Red berried Elder.

The Mountaine Elder also differeth little from the first sort, for but that it groweth seldome so great, and that the flowers being somewhat yellowish, grow not in large spread tuftes, but in small long branched clusters, like unto Privet, and that the berries following them are of a scarlet red colour, pleasant to be eaten and not offensive to any: it is like it in the growing, rugged white barke in the body and Elder boughes, and somewhat reddish in the young leaves, as also in the rootes the wood being not so soft nor so pithy.

5. *Sambucus palustris sive Aquatica.* Marsh Elder.

The Marsh or Water Elder, hath his body and branches covered with a whitish barke, but they are smaller and more brittle than any of the former: the leaves also differ much from them, being broad and smooth divided at the edges, into three, or sometimes into five divisions or incisures, and dented round about, being very like unto a Vine leafe, and comming somewhat neere unto the great Maple or Sicomore leafe, as we use to call it: the flowers stand in tuftes or umbells like the first sorts, but they are smaller and whitish, the outermost being larger by much than any of the innermost, or of the former Elders, consisting of five leaves a peece, round pointed, which compasse the middle flowers round about, but have no threds in the middle, of a reasonable sweete sent: after which follow very red berries, somewhat flat and full of a red juyce, bitterish in taste, ready to provoke casting.

6. *Sambucus Rosea.* The Gelder Rose.

Of this kinde is this Elder or Gelder Rose, growing after the same manner with such like leaves, but the flower is composed as it were of many white, or pale blush flowers, set together in a round tuft or ball.

7. *Ebulus sive Sambucus humilis.* Walewort. Danewort, or Dwarfe Elder.

Wallwort is but an herbe every yeare dying downe with his stalkes to the ground, and rising againe a fresh every spring, and is like unto the Elders both in forme and qualitie, that deservedly it hath the name of a dwarfe Elder, which riseth up with a foure square rough hairy stalke foure foote high or more sometimes: the winged leaves,

6. *Sambucus Roſea. 5. Et Aquatica ſive paluſtris.*
The Gelder Roſe and the Marſh Elder.

7. 8. *Ebulus vulgaris & laciniatis foliis.*
Ordinary Walwort and with fine cut leaves.

leaves, are ſomewhat narrower than the Elder, but elſe ſo like that it might ſoone deceiue one not very well exerciſed or cunning: the flowers are white with a daſh of purple, ſtanding in umbels very like thoſe of the Elder, but more ſweete in ſent; after which come ſmall blackiſh berries, full of juyce while they are freſh, wherein there lye ſmall hard kernels or ſeede: the roote doth creepe under the upper cruſt of the ground, ſpringing a freſh in diuerſe places, being of the bigneſſe of ones finger or thumbe ſometimes.

8. *Ebulus foliis laciniatis.* Iagged Wallwort.

This Wallwort is in all other things ſaue the leaues, ſo like unto the ordinary kinde, that there can be knowne no difference: but the forme of the leaues, doth ſo deforme the whole face of the plant, and bring it out of knowledge, like the Iagged Elder, that none almoſt would thinke it ſhould belong unto the former: the flowers and fruite and ſent, onely leading us to judge of the ſpecies, and whereunto to be referred, for the leaues are almoſt as much jagged and diuided as the Iagged Elder, which is the onely difference in this from the former.

The Place.

The firſt or common Elder groweth not wilde but is planted in all places, to ſerue for hedges, and partitions of grounds, vineyards, &c. to hold up the bankes by ditches and water courſes, and to bee planted in places where Conies breed for ſhadow: every ſticke or branch being thruſt into the ground, ſerving as a ſtocke which will eaſely take roote and grow. The ſecond as it ſeemeth *Tragus* firſt found in the woods of *Germany*. The third is found wild on hills in watery woods. The fourth is not knowne certainely from whence his originall came, but is found planted in the gardens of thoſe that are curious, and lovers of rare plants. The fifth is found by water ſides and mooriſh grounds of *Germany*, *France*, *England*, *Italy*, and *Piemont* in *Savoye* as *Pena* hath ſet it downe. The ſixth is nurſed up onely in gardens, but beſt delighteth in moiſt grounds: The ſeventh groweth wilde in many places of *England*, where if it be once gotten into a ground, it will ſo creepe and runne therein, that it will hardly be gotten forth. The laſt is a ſtranger in *England* as yet, and nurſed onely in that curious garden of that *Venetian Magnifico Signior Contarini*.

The Time.

All or moſt of the Elders flower in Iune, the Wallwort ſomewhat late, as his fruite is likewiſe later ripe, even not untill September, when the others are ripe for the moſt part in Auguſt.

The Names.

The Elder is called in Greeke *ἀκτὴ*, *quaſi littoralis dicta videtur*: in Latine generally *Sambucus*, of *Sambix* as it is thought the firſt finder thereof; but *Quintus Serenus* calleth it *Sabucus* in his verſes, and thought to be derived from *Sabucus* or *Sambucus* as *Hermolaus* ſaith, which is an hollow inſtrument of Muſicke, called alſo *Pectis & Magadis*: The excreſcence growing on the *Elders* is uſually called *Fungus Sambucinus* of *Dodonæus Gummi Sambuci*, and of ſome *Auricula Iudæ*, in Engliſh Iewes eares. The firſt is called *Sambucus urbana domeſtica, campeſtris*, and *vulgaris* of all writers, and of *Bauhinus Sambucus fructu in umbella nigro. Tragus* calleth the ſecond

Sambuci aliud genus. Dodonæus Sambuci altera ſpecies. Lobel Sambucus fructu albo. Bauhinus Sambucus fructu in umbella viridi. The third is called *Sambucus Montana* of *Matthiolus*, *Geſner*, *Caſtor Durantes*, & *Camerarius*: of *Tragus* and *Lonicerus* *Sambucus ſylveſtris*, and becauſe he ſaith it hath beene certainely obſerved, that the Hindes and Does doe greately affect the leaves thereof, when they are great with young, *Tabermontanus* calleth it *Sambucus cervina*, and *Gerard* after him *Sambucus racemoſa vel cervina*; of *Lobel Sambucus montana racemoſa*; and *Ioannes Thalius*, in the deſcription of *Harcynia Saxono-thuringica*, *Sambucus montana, ſeu* ῥιθεσσυλον. *Bauhinus* calleth it *Sambucus racemoſa rubra*, putting a doubt whether it be *Sambucus montana* of *Plinye*, which he ſaith groweth on *Mountaines*, and thinking it alſo to be πυγὸς of *Theophraſtus*, whereof he maketh mention in his 3 booke and 4 chapter, among thoſe trees that onely delight to grow on hills, and will not grow in the champions, and which *Gaza* in the Latine tranſlation hath omitted and left out: but the Greeke *Theophraſtus* hath not πυγὸν *pygus* as *Bauhinus* ſetteth it downe, but φηγὸς *Phagus*, as *Gaza* hath it in other places, he and *Plinye* before him, being the cauſe of many mens errours, in miſtaking the Latine *Fagus* a Beech tree, for this φηγὸν *Phagus* of *Theophraſtus*, which is a kinde of Oake as you ſhall underſtand in his proper place, when I ſhall ſpeake of all the ſorts of Oakes. The fourth *Lobel* in his Dutch herball, firſt made knowne to all, having found it planted in the gardens of the low countrie Apothecaries, and others that were lovers of rare and ſtrange plants, and called it *Sambucus laciniatis foliis*, whom all others have followed. The fift is called *Sambucus aquatica* of *Matthiolus*, *Tragus*, *Lobel*, *Caſtor Durantes*, *Lugdunenſis* and others. *Sambucus paluſtris* of *Dodonæus*, *Cæſalpinus* and *Camerarius*; *Cordus in hiſtoria* calleth it *Lycoſta phylos famina*. i. *Vna lupina*; *Ruellius* tooke it to be *Opulus* but that is a kind or name of Maple, as *Lugdunenſis* hath it. *Anguillara* calleth is *Platanus aquatica*: (and ſo do the *Italians* for the moſt part) which is the third kinde of Maple as he ſaith, *Geſner* calleth it *Sambucus paluſtris vel aquatica ſylveſtris*, and ſaith ſome alſo called it *Chamæplatanus*: *Lugdunenſis* firſt and *Bauhinus* after him, doe take it to bee θραυπαλον *Thraupalus* of *Theophraſtus* in his third booke and ſeventh chap. and in his fourth booke and 1 chap. *Bauhinus* calleth it himſelfe *Sambucus aquaticas flore ſimplici*, as hee calleth the *Gelder* Roſe *Sambucus aquatica flore globoſo pleno*. The Wallworte or Daneworte or dwarfe Elder, is called in Greeke χαμαιδαφνη, *id eſt*, *humilis Sambucus*, in Latine *Ebulus*, by which names all other Greeke and Latine writers have called it: and the laſt from the Noble *Contarenus* his garden, receiveth the name of *Ebulus laciniatis foliis* as it is in the title. It is ſuppoſed it tooke the name Danewort, from the ſtrong purging quality it hath, many times bringing them that uſe it unto a fluxe, which then we ſay they are troubled with the Danes. The *Arabians* call it *Infacti*, the *Italians* *Sambuco*, the *Spaniards* *Sabuco*, *Sauco* & *Canivero*, the *French* *Suſean* *Suſier* & *Suin*, the *Germanes* *Holder* & *Holler*, the *Dutche* *Vlier*, and we in Engliſh Elder.

The Vertues.

Both *Dioſcorides* and *Galen* doe attribute to the Wallworte, as well as to the common Elder, (for they account their properties both one) an heating and drying quality, purging watery humors aboundantly, but not without trouble to the ſtomacke: the firſt ſhootes of the common Elder boyled like unto *Aſparagus*, and the young leaves and ſtalkes boyled in fat broth, draweth forth mightily choller and tough flegme; the tender leaves alſo eaten with oyle and ſalt doe the ſame: the middle or inner barke boyled in water, and given to drinke, worketh much more violently; and the berries alſo either greene or dry, expell the ſame humors, and is often given with good ſucceſſe to helpe the dropſie, by evacuating great plenty of wateriſh humors: the barke of the roote alſo boyled in wine, or the juyce thereof drunke, worketh the ſame effects but more effectually, then either leaves or fruite doe; the juyce of the roote taken provoketh vomit mightily, and purgeth the watery humors of the dropſie; the ſame decoction of the roote cureth the biting of the viper or adder, as alſo of a mad dogge, and mollifieth the hardneſſe of the mother, if women ſit therein. and openeth the veines and bringeth downe their courſes: the berries boyled in wine performe the ſame effects; the haire of the head or of other parts waſhed therewith, is made blacke; the juyce of the greene leaves applyed to the hot inflammations of the eyes, aſſwageth them: the leaves boyled until they be tender, then beaten and mixed with barly meale, and applyed to hot inflammations aſſwageth them, and helpeth places that are burnt either by fire or water, cureth fiſtulous ulcers being layde thereupon, and eaſeth the paines of the goute, being beaten and boyled with the tallow of a bull or goate, and layd warme thereon: the juyce of the leaves ſnuffed up into the noſtrills, purgeth the tunicles of the braine; the juyce of the berries boyled with a little honey, and dropped into the eares, eaſeth the paines of them; the decoction of the berries in wine being drunke, provoketh urine: the powder of the ſeedes, firſt prepared in vinegar, and then taken in wine, halfe a dramme at a time, for certaine dayes together, is a meanes to abate and conſume the fat fleſh of a corpulent body, and keepe it leane: the berries ſo prepared, and as much white tartar and a few aniſeede put to them, a dramme of this powder given in wine, cureth the dropſie humour, by purging very gently: the dry flowers are often uſed in the decoctions of glifters to expell winde and eaſe the chollicke, for they loſe their purging quality which they have being greene, and retaine an attenuating and digeſting propertie being dryed: the diſtilled water of the flowers, is of much uſe to cleare the skinne from ſunne burning, freckles, morphew, or the like: and as *Matthiolus* ſaith both the forepart and hinderpart of the head, being bathed therewith, it taketh away all manner of the headach that commeth of a cold cauſe. The Vinegar made of the flowers of Elder by maceration and inſolation, is much more uſed in *France*, than any where elſe, and is gratefull to the ſtomacke, and of great power and effect to quicken the appetite, and helpeth to cut groſſe or tough flegme in the cheſt. A *Syrupus acetoſus* made hereof, would worke much better than the ordinary, for theſe purpoſes. The leaves boyled and layd hot, upon any hot and painefull apoſtumes, eſpecially in the more remote and ſinewie parts, doth both coole the heate and inflammation of them, and eaſe the paines. The diſtilled water of the inner barke of the tree or of the roote, is very powerfull to purge the watery humors of the dropſie or timpanie, taking it faſting, and two houres before ſupper: *Matthiolus* giveth the receipt of a medecine to helpe any burning by fire or water, which is made in this manner; take, ſaith he, one pound of the inner barke of the Elder, bruiſe it or cut it ſmall and put it into two pound of fine ſallet oyle, or oyle Olive, that hath beene firſt waſhed oftentimes with the diſtilled water of Elder flowers, let them boyle gently a good while together, and afterwards ſtraine forth the oyle, preſſing it very hard; ſet this oyle on the fire againe, and put thereto, foure ounces of the juyce of the young branches and leaves of the Elder tree, and as much new wax: let them boyle to the conſumption of the juyce, after which being taken from the fire, put preſently thereunto, two

ounces

ounces of liquid Verniſh, (ſuch as Ioyners uſe to verniſh their bedſteeds, cupboords tables, &c.) and afterwards of *Olibanum* in fine powder foure ounces, and the whites of two egges being firſt well beaten by themſelves, all theſe being well ſtirred and mixed together, put it up into a cleane pot, and keepe it for to uſe when occaſion ſerveth. The young buddes, and leaves of the Elder, and as much of the rootes of Plantaine beaten together, and boyled in old Hogs greaſe, this being laid warme upon the place, pained with the gout doth give preſent eaſe thereto. The leaves alſo burned and the pouder of them put up into the noſtrills, ſtaieth the bleeding being once or twiſe uſed. If you ſhall put ſome of the freſh flowers of Elders into a bagge, letting it hang in a veſſell of wine, when it is new made, and beginneth to boyle (I thinke the like may be tried with a veſſell of ale or beere new tunned up, and ſet to worke together) the bagge being a little preſſed every evening, for a ſeaven night together, giveth to the wine a very good relliſh, and a ſmell like Muſcadine, (and will doe little leſſe to ale or beere.) The leaves of Elders boyled tender and applied warme to the fundament, eaſeth the paines of the piles, if they be once or twice renued growing cold; The foule inflamed or old ulcers and ſores of the legges, being often waſhed with the water, of the leaves or of the flowers diſtilled in the middle of the moneth of May, doth heale them in a ſhort ſpace. The diſtilled water of the flowers, taketh away the heate and inflammation of the eyes, and helpeth them when they are bloud ſhotten. The hands being waſhed morning and evening with the ſame water of the flowers, doth much helpe and eaſe them that have the Palſie in them, and cannot keepe them from ſhaking. The pith in the middle of the Elder ſtalkes, being dried and put into the cavernous holes of Fiſtulous ulcers, that are ready to cloſe, openeth and dilateth the orifices, whereby injections may be uſed, and other remedies applied for the cure of them. It is ſaid that if you gently ſtrike a horſe that cannot ſtale, with a ſticke of this Elder, and binde ſome of the leaves to his belly, it ſhall make him ſtale quickly. The Muſhromes of the Elder called Iewes eares, are of much uſe being dried to be boyled with Ale or Milke with Columbine leaves for ſore throates, and with a little Pepper and Pellitory of *Spaine* in powder, to put up the *uvula* or pallet of the mouth when it is fallen downe. *Matthiolus* ſaith that the dried Iewes eares ſteeped in Roſewater, and applied to the temples and forehead, doe eaſe the paines of the head or headach. The Mountaine or red berried Elder, hath the properties, that the common Elder hath, but weaker to all purpoſes: the berries hereof are taken to be cold, and to procure ſleepe, but the frequent uſe of it is hurtfull: It is ſaid that if a branch of this Elder be put into the trench that a moale hath made, it will either drive them forth, or kill them in their trench. The Marſh Elder is of the like purging qualitie with the common, eſpecially the berries or the juyce of them. Hens and birds doe feede upon them willingly in the Winter. The Wallwort or Danewort, is more forceable or powerfull than the Elder, in all the diſeaſes and for all the purpoſes whereunto it is applied, but more eſpecially wherein the Elder is little or nothing prevalent; the Wallwort ſerveth to theſe uſes. The young and tender branches and leaves thereof taken with wine, helpeth thoſe that are troubled with the ſtone and gravell, and laid upon the teſticles that are ſwollen and hard, helpeth them quickly: the juice of the roote of Wallwort applied to the throate, healeth the Quinſie or Kings evill: the fundament likewiſe is ſtayed from falling downe, if the juyce thereof be put therein: the ſame alſo put up with a little wooll into the mother, bringeth downe womens courſes; the ſame juyce of the roote is a mighty purger of watery humours, and held moſt effectuall for the dropſie of all others herbs whatſoever: the dried berries or the ſeeds beaten to powder, and taken in wine faſting, worketh the like effect, the powder of the ſeeds taken in the decoction of *Chamepitys* or ground Pine, and a little Cinamon, to the quantitie of a dramme at a time, is an approved remedy, both for the gout, joynt aches, and ſciatica, as alſo for the French diſeaſe, for it eaſeth the paines by withdrawing the humors from the places affected, and by drawing forth thoſe humors that are fluent, peccant and offenſive: the pouder of the roote worketh in the like manner, and to the ſame effect. The roote hereof ſteeped in wine all night, and a draught thereof given before the acceſſe and comming of the fit of an Ague, prevaileth ſo effectually there againſt, that it will either put off the fit, or make it more eaſie, and at the ſecond taking ſeldome faileth to rid it quite away. An ointment made of the greene leaves, and May butter made in the moneth of May, is accounted with many a ſoveraigne remedy, for all outward paines, aches and crampes in the jointes, nerves, or ſinewes, for ſtarckneſſe and lameneſſe by cold and other caſualties, and generally to warme comfort and ſtrengthen all the outward parts ill affected: as alſo to mollifie the hardneſſe, and to open the obſtructions of the ſpleene, the grieved parts anointed therewith. The leaves laid to ſteepe in water, and ſprinkled in any chamber of the houſe, as it is ſaid, killeth Fleas, Waſpes and Flies alſo, if you will credit the report. *Tragus* ſaith, that the tender branches boyled in wine, whereunto ſome honey is put, and drunke for ſome dayes together, is profitable for a cold and drie cough, cureth the diſeaſes of the breaſt, by cutting and digeſting the groſſe and tough flegme therein. Briefely whatſoever I have ſhewed you before in relating the properties of Elder, doth Wallwort more ſtrongly effect in opening and purging choller, flegme and water, in helping the gout, the piles, and womens diſeaſes, coloureth the haire blacke, helpeth the inflammations of the eyes and paines in the eares, the ſtinging and biting of Serpents or a mad Dogge, the burnings or ſcaldings by fire and water, the wind-collicke, the collicke and ſtone, the difficultie of urine, the cure of old ſores and fiſtulous ulcers, and other the griefes before ſpecified, which for brevitie I doe not ſet downe here, avoiding tautologie as much as I can.

CHAP. XXV.

Helleborus niger. Blacke Hellebor or Bearefoote.

OF the Hellebors there are two primary ſorts, white and blacke: Of the white ſort we will ſpeake in the next Chapter, and of the blacke in this whereof there are ſundry ſorts as you ſhall heare.

1. *Helleborus niger verus.* The true blacke Hellebor, or Chriſtmas flower.

The true blacke Hellebor (or Bearefoote as ſome would call it, but that name doth more fitly agree unto the other two baſtard kinds) hath ſundry faire greene leaves riſing from the roote, each of them ſtanding on a thicke round ſtiffe greene ſtalke, about an handbreadth high from the ground, divided into ſeven, eight, or nine parts or leaves, and each of them nicked or dented from the middle of the leafe to the pointward on both

ſides,

1. *Helleborus niger verus.*
Blacke Hellebor or Chriſtmas flower.

2. 3. *Helleboraſter minor, & trifolius, pinoſus.*
Baſtard blacke Hellebor or Beares foote, and with trefoile prickly leaves.

ſides, abiding greene all the Winter, at which time the flowers riſe on the like ſhort ſtalkes, as the leaves grow on, without any leafe thereon for the moſt part, yet ſometimes having a ſmall ſhort pale greene leafe, reſembling rather a skin than a leafe, a little under the flower, and grow but little higher than the leaves: each ſtalke alſo beareth uſually but one flower, yet ſometimes two, conſiſting of five large round white leaves a peece like unto a greate ſingle white Roſe, changing ſometimes to be either daſht with a purple about the edges or to be wholly purple without any white in them, as the weather or time of continuance doth effect, with many pale yellow thrums in the middle, ſtanding about a greene head, which after groweth to be the ſeede veſſell, divided into ſeverall cells or podes like unto a Colombine head or *Aconitum hyemale*, but greater and thicker, wherein is contained ſomewhat long and round blackiſh ſeede, like the ſeedes of the baſtard kindes: the rootes are a number of browniſh blacke ſtrings, which runne downe deepe into the ground, and are faſtened to a thicke head, of the bigneſſe of ones finger. Of this kinde there is an other whoſe flower is red from the firſt opening, which *Bellonius* remembreth in his obſervations to have ſeene in the woods of Greece.

Florentbro.

2. *Helleboraſter minor flore viridante.* Baſtard blacke Hellebor or Bearefoote.

The ſmaller baſtard Hellebor or Bearefoote is in moſt things like unto the former true blacke Hellebor, for it beareth alſo many leaves upon ſhort ſtalkes divided into many parts, but each of them are longer and narrower, of a darker greene colour dented on both ſides, and feele ſomewhat hard, periſhing every yeare, but riſe againe the next Spring: the flowers hereof ſtand on higher ſtalkes, with ſome leaves on them alſo, yet very few, and are of a pale greene colour like the former, but ſmaller by the halfe at leaſt, having likewiſe many greeniſh yellow threads or thrummes, in the middle, and ſuch like heads, or ſeede veſſells and blackiſh

3. *Helleboraſter maximus ſive Conſiligo.*
The greateſt baſtard blacke Hellebor or Beares foote called Setterwort.

ſeede

ſeede in them, the rootes are more ſtringie blacke and hard than the former.

3. *Helleboraſter alter trifolius ſpinoſus.* Trefoile Prickly leafed Bearefoote.

This ſort differeth little in the manner of growing, from the laſt deſcribed, having long ſtalkes with leaves thereon, and flowers at the toppes of the ſame faſhion and ſo is the ſeede alſo that followeth, but the leaves are harder, and only divided into three partes, & the dentes about the edges are hard ſharpe and prickly; the flowers being of a paler or whiter greene colour.

4. *Helleboraſter maximus ſive Conſiligo.* The greateſt baſtard blacke Hellebor, or Bearefoote, called alſo Setterwort.

This great Bearefoote hath diverſe ſad greene leaves, riſing from the rootes, each upon a long ſtalke, which are divided into 7 or 9 diviſions or leaves, each whereof is narrower than the leſſer baſtard blacke Hellebor or Bearefoote, nicked or dented about the edges, but not ſo deepely, and abiding above ground greene all the winter, whereas the other periſheth as I ſaid every yeare, and riſeth againe in the ſpring: this ſhooteth up a reaſonable great and tall ſtalke, higher by the halfe than the other, with ſuch like leaves thereon as grow below, ſmaller up to the toppe, where it ſpreadeth into divers branches, bearing many hollow cup-like flowers, divided at the brims into 5 parts, but doe ſeldome ſpread thẽſelves open, of a whitiſh yellow greene colour ſomewhat like the other baſtard kind, & ſometimes purpliſh about the brims or edges, with a greene head in the middle, & a few white threads about it: (wherby it may ſeeme likely to be that fourth kind of *Veratrum nigrum* of *Cluſius*, which he calleth *peregrinum*, and ſaith is like unto the third of *Dodonæus*, whoſe figure as hee ſaith, he ſheweth there, to be knowne which he mea-

5. *Helleborus niger ſerulacius.*
Fennell leafed baſtard blacke Hellebor.

6. *Helleborus niger Sanicule foli o major.*
The greater purging Sanicle like Hellebor.

8. *Epipactis Matthioli. Matthiolus* his baſtard blacke Hellebor.

neth

neth; but it is not the third of *Dodonæus* as he saith, but the second, and this that I here describe unto you, is *Dodonæus* his third *Veratrum nigrum*) which greene head growing to be the vessell, wherein the blacke seede is contained, shooteth forth into foure, five, or sixe hornes; fashioned like the other bastard kind, but smaller, as the seede is also for the most part, the roote is but single with nothing so many stringes growing with it, and oftentimes perisheth after it hath given seede, yet not alwayes, nor in all places: the whole plant, and every part thereof, is of a worse smell than the other: the roote of this with the lower part of the stalke next thereunto, is that Setterwort, that the countrie people doe use to rowell their cattell withall. Of this kinde also *Clusius* maketh mention of an other, differing onely in the darker greene colour of the leaves, and in the flower, that the edges of the three innermost are of a darke purple colour.

Alter Clusij.

5. *Helleborus niger ferulaceus.* Fennell leafed bastard blacke Hellebor.

This kind of bastard Hellebor shooteth forth many greene stalkes, sometimes lying or leaning to the ground, or else standing somewhat upright, beset very thicke with small leaves, finer and shorter than fennell, some of them ending in a tuft of such like fine greene leaves, and some having at the toppes of them one large flower a peece, somewhat reddish or brownish on the outside, while they are in bud and a while after, which being open consist of 12, or 14 long and narrow leaves, of a faire shining yellow colour, set in order round about a greene head with yellow thrummes in the middle, laying themselves open in the Sunne or a faire day, but else remaining close: after the flower is past, the head growing greater sheweth it selfe compact of many round whitish seede, very like unto the head of *Adonis* flower, but much greater: the rootes are many long and blackish strings set together at the head, very like unto those of the lesser blacke Hellebor or Bearefoote, but harder, stiffer, or more brittle, and seeming to be without any moisture in them, but abide and increase every yeare, although the stalkes with greene leaves doe utterly perish every yeare.

6. *Helleborus niger Sanículæ folio major.* The greater purging Sanicle like Hellebor.

This Hellebor hath divers broad darke greene leaves, each of them standing upon a long footestalke, which are cut in on the edges into five divisions for the most part, & dented about besides, somewhat resembling the leaves of the common Sanicle, but more truely the leaves of the field *Ranunculus* or Crowfoote, or *Geranium Batrachoides*, Crowfoot, Cranes bill: from among which rise up divers slender smooth greene stalkes, having some leaves upon them, and at the tops of them, two or three or more flowers together, each of them consisting of many small hard whitish leaves, as a pale or border, compassing many threads in the middle; which being fallen, there rise up many flat whitish and long seede, somewhat like unto seete Fennell sweede, but not altogether so bigge, nor so yellow; *Gerard* following *Dodonæus* description, and not his owne knowledge; saith the seeds are like unto *Carthamus*, and his Corrector mendeth not the fault: the rootes are small blacke stringes, shooting from a toppe head, like unto the roote of the Bearefootes.

7. *Helleborus niger Sanículæ folio minor.* Small purging Sanicle like Hellebor.

This small Hellebor or Sanicle, (which you please to call it) hath divers small and somewhat round leaves, everie one upon a long footestalke, being not much broader than the nayle of a mans thumbe, yet divided even to the middle ribbe into seven parts, every one of them being short, narrow, and dented about the edges: the stalkes are many and small, not above an hand breadth high, with one or two leaves on them, more cut in and divided than the lower are; at the toppes of them stand divers small flowers very thicke, set together in tufts or umbles, like unto the last, but smaller, after which come small flat seede, somewhat like the other, but lesser by much, as it is also in all the other parts thereof.

8. *Epipactis Matthioli. Matthiolus* his bastard blacke Hellebor.

This small herbe riseth up with sundry slender weake smooth stalkes, bearing each of them a broad greene leafe, divided for the most part into five divisions or parts, somewhat like those of the sixt, yet sometimes but into three, especially the first or lowermost, and dented also about the edges: the flowers grow from among the leaves upon the like slender stalkes, being starrelike, and composed of sixe pale coloured leaves, with many short threades in the middle; the roote is a tuft of blackish fibres like the former blacke Hellebors, issuing from a thicke a head.

The Place.

The first groweth in *Germany*, *France*, and *Italy*, and *Greece* in sundry places: the second I have seene in some woods in Northamptonshire, and in other places of this Land; the third grewat *Delft* with *Corvinus*, and then at *Rome*, as *Aldinus* saith in his *Farnesian* garden: the fourth groweth, as *Tragus* saith in the borders of stony fields and grounds, and on rockie hills by the *Mosella* and the *Rhine*, as also in *Harcynia Sylva*; and as *Pena* saith in *Aquitaine*, as also by the river *Lanus* at *Mompelier*: the fifth groweth neere *Vienna* in *Austria*, and both the *Hungaries* as *Clusius* saith: the sixth groweth naturally on the hills of *Germany*, and other untilled and craggy places: the seventh groweth on *Mons fructus* neare the *Alpes*, as also on the *Tyrrenean* hills: the last as *Pena* saith in the low grounds or valleyes of the forrest or wood of *Essens*, not farre from *Jupiters* hill.

The Time.

The first doth flower in December and Ianuary, if the weather be any thing temperate: the second, third, and fourth in February or March, and their seede is ripe in May; the fifth in Aprill; the other in May and June.

The Names.

It is called in Greeke ἐλλέβορος, and sometimes without the asperation ἑλλεβόρος, *sic dictum volunt quod cibum corporis eripiat*, in Latine also *Elleborus & Elleborum*, and also *Helleborus, & Helleborum, & veratrum, quod mentem vertat*: But there is much controversie and contrarietie, both in the ancient and moderne Writers concerning them: for the *Helleborus* of *Theophrastus* and *Dioscorides* doe much differ the one from the other, and divers of our moderne Writers, thinke that ours doe differ from them both. Some likewise appropriate one herbe, some another unto theirs as you shall presently heare. *Theophrastus* saith in the ninth Booke, and eleventh Chapter of his History of Plants, that the rootes of the blacke and white Ellebor, are like the one unto the other, except the colour, that is, the one blacke the other white (which may be reconciled if you will take it spoken onely of their Fibres, the one being blacke, the other white) but that the leafe of the blacke as he saith is like unto a Bay leafe, and that of the white unto those of Leekes, can no way be reconciled, for they are so differing from *Dioscorides* or ours, that we may well say, we neither have nor know any of both *Theophrastus* his Ellebors, vnlesse there be

be some errour in the text as many thinke. *Dioscorides* describeth his blacke Ellebor, to have leaves like *Platanus*, the Plane tree, but lesse, neere unto those of *Spondilium* or cow Parsnippe, but more rough and blacker, cut into many divisions; the stalke is rough, the flowers, saith he, are whitish, inclining to purple, standing in a cluster: the seede is like *Cincus* or bastard Saffron, which is called *Sesamoides* in *Anticyra*, wherewith they make purgations: the rootes are small blacke strings, comming from a certaine head like an Onion, which are in use; thus farre *Dioscorides*: unto this description our true black Hellebor doth not agree in all things: for the leaves of ours, do very sorrily resemble those of the Plane tree (which is a whole broad leafe cut otherwise in the edges into parts or divisions) or of the *Spondilii* cow Parsnip, (which is a broad whole leafe consisting of many much broader divisions in it) neither are the leaves rough, (but cented or toothed at the ends) nor the stalke rough, but smooth, nor do the flowers stand in clusters but one by one each upon their own stalk, or two at the most on a stalk: whereupon *Dodonæus* would mak our fixt sort here expressed, which is somewhat like the *Sanicle* or Selfe heale, to be the *Veratrum nigrum*, or *Elleborus niger Dioscoridis*, because it hath seeds in tuftes, which *Gesner*, *Pena*, and *Lobell*, call *Astrantia nigra* of *Dioscorides*, and *Fuchsius Sanicula femina*: but *Dodonæus* himselfe is much puzled, to make it agree thereunto, finding it to differ in many things, sometimes in making the seed to be like *Cnicus*; whereunto it hath but little resemblance, as I shewed you in the description, and sometimes blaming the text, (where it is said to be called *Sesamoides* in *Anticyra*,) to be corrupt, and that *Dioscorides* borrowed it from *Theophrastus*; who saith that in *Anticyra*, they did give *Elleborus Sesamaceus* the *Sesamoides* like *Elleborus*, that is to say whose fruit is like unto *Sesamum*, to purge withall: And it is most probable, that the seede of the blacke Hellebors, both the true and the bastard kindes, may somewhat agree thereunto, and not very unfitly be compared unto the fruit or seed of *Sesamum*, & the seed of *Cnicus*; but whether the seed of those black Hellebors, have more force in purging than the rootes have, I am not certaine, that any hath made a true experiment, for most of our moderne writers do agree, that both our white and black Hellebors are the true sorts, set forth by *Dioscorides*, (& notwithstanding the variation, as it is before set downe) *Theophrastus* also. The first is called *Helleborus niger* by all that have written of it, some adding thereunto *Flore magno purpureo*, as *Gesner*, or *Flore roseo* as *Bauhinus*, or *legitimus* or *verus*, as others doe. *Dodonæus* onely in his French Herball calleth it *Planta leonis* and *Anguillara Elleborus niger annuus*, but why I know no reason: the second is called *Helleboraster & Helleborus niger vulgaris* by *Gesner*, by *Cordus nostras*, by *Fuchsius adulterinus hortensis*, and *Consiligo* by *Lugdunensis* and *Turner*: the third is remembred by *Aldinus* in his *horto Farnesiano*: the fourth is called by *Dodonæus* in his French Herball *Lycoctonum primum* whom *Lobel* seemeth in his *Adversaria* to follow, saying it commeth neere to the *Aconites*; *Gesner* in *hortis* took it to be *Pulmonaria Vegetii*, *Cordus* calleth it *Sesamoides magnum*, and *Tragus Pedicularia fœtida tertia*, *Dodonæus* and *Clusius Veratrum nigrum tertium*, and *Cæsalpinus Eneaphyllon Plinii*: but generally it is called either *Helleboraster magnum* as *Tabermontanus*, or *Helleboraster maximus*, or *Helleborus niger sylvestris adulterinus*, or else *Consiligo Ruellii*, as *Lobel*, *Lonicerus*, *Lugdunensis* and others: yet all the Hellebors both black and white are also taken by one or other to be *Consiliges*, for in regard there is no description of *Consiligo* extant in any author, but the vertues and properties onely whereunto it is applyed, divers have written thereof diversly. *Tragus*, *Lonicerus*, *Gesnerus* and others, both Physitians and Apothecaries almost through all *Germany*, and the parts adjoyning in former times, tooke this fift sort, called *Buphthalmum majus*, by *Anguillara*, *Clusius*, and others; and *Helleborus niger ferulaceus* by *Lobel*, but *Pseudo Helleborum* by *Matthiolus* to be the true *Helleborus niger* of *Dioscorides*, or at least a kind thereof; and which *Clusius* saith was so used of all in *Vienna* and those parts before he came thither, and shewed them their error and the right kind, which they ever after used: *Dodonæus* also calleth it *Buphthalmum*, joyning it next to *Eranthemum* or *Flos Adonis*, whereunto it is very like in leaves and seede, but not in rootes: others would make it *Sesamoides minus* of *Dioscorides*, whereunto it hath no correspondency: the sixt is called by *Fuchsius Sanicula femina*, and so doth *Gesner*, who also calleth it *Astrantia nigra*, as *Lobel* doth; following as it should seeme *Tragus*, who calleth it *Osteritium montanum*: *Tabermontanus* calleth it *Imperatoria nigra*, *Dodonæus* as I sayd before, taketh it to be *Elleborus niger*, or *Veratrum nigrum* of *Dioscorides*, and *Bauhinus* in his *Pinax* calleth it *Elleborus niger*, *Saniculæ folio major*, and I from him do so likewise, as thinking it a name as proper, if not more then any other is given it: the seventh *Bauhinus* onely hath described in his *Prodromus* by the same title that I have given it: the last is the *Epipactis* of *Matthiolus*, which *Lobel* and *Pena* call *Elleborine Alpina Saniculæ & Hellebori nigrifacie & commentitia*, as counterfeited by him, yet others doe not thinke so: but whether the *Epipactis* of *Dioscorides*, which he saith some called *Elleborine* should bee referred to the white Ellebor, as *Camerarius* and others would have it, or to the blacke, resteth doubtfull, because *Dioscorides* is so briefe in his description thereof, that it cannot certainly be determined, he onely saying it is a small Herbe with small leaves, good for the diseases of the Liver, and against poyson. The *Arabians* call it *Cherbachem* and *Charbach asued*, the *Italians Elleboro negro*, the *Spaniards Verdagambre negro*, the *French Vrare & Veraire noir*, the *Germanes Zwart Nieswurtz*, and *Christwurtz*, the *Dutch Swert Nieskruit*, and we in English as it is in their titles.

The Vertues.

The true blacke Hellebore is used for most of the griefes and diseases, whereunto the white is available, but is nothing so violent or dangerous: the leaves shred small, or the juice of the leaves made up with flower, into small cakes, and baked, hath been used to good purpose to helpe the Dropsie, Iaundies, and other evill dispositions of the Liver and Gall: The leaves sometimes also are used to purge and open the body in some cases, as well as the rootes which are of greatest use, and greatest effect, against all melancholike diseases, long lingring Agues as the quartaine and the like, the Meagrime and the old paines in the head, the blacke as well as the yellow Iaundies, the Leprosie, falling sickenesse, Consumption eyther of the Lungs or whole body, or paines in the belly; Sciatica, Crampes, Convulsions or shrinking of sinewes, and all other griefes, paines and aches of the joynts or sinewes, if the roote be taken in pouder, in infusion or decoction, or in broth, being first prepared in vinegar as is sometimes used to bee done, that is steeped in vinegar for a day and a night, and after dryed up againe, which manner of preparation is according to the antient custome then used: but wee have not found that the roots of this blacke Hellebore growing in our owne Country, to be deadly to cattle if they eate it, or any of the other sorts, or that this hath any such strong or churlish operation in working, as the ancients doe attribute to theirs of the hotter Countries, that thereby such preparations should neede to qualifie the malignitie thereof: for wee have never seene ours, (I thinke the moisture and temperature of our climate, abating and correcting the

the violence thereof) to worke any troubleſome fit or paſſion in any that hath taken it, without any of that preparation aforeſaid,(the remedy if any danger be thereby is to drinke Goates milke) yet *Matthiolus* doth much commend his *Elleboriſmus*(the receipt whereof is in the third booke of his Epiſtles namely in that to *Hanntſchius*) whoſe preparation is to ſteepe the rootes and take out their pith and dry the barke againe, and preferreth the rootes of that true blacke Ellebor that beareth red flowers, before thoſe that beare white, but in want of the one as he ſaith himſelfe, the other may be to as good effect taken; for that kind (if it be a kind of it ſelfe, that will not degenerate, and not the quality of the climate onely cauſing the colour) wee have not ſeene growing in our land, although ſuch an one hath beene ſent me from beyond ſea, but periſhed quickly after: he commendeth it for all the griefes aforeſayd: yet if an extract be made of the rootes, it will ſerve upon all occaſions, being ready at hand to be uſed: the rootes applyed in a peſſarie mightily prevaile to bring downe womens courſes: the powder of the roote ſtrowed upon foule Vlcers, although they be fiſtulous doth quickly heale them; and if there be any callous or hard fleſh growne in the Fiſtula, the roote left in it for two or three dayes will conſume it quite. *Galen* remembreth this in *6. de ſimpl. med. facult.* and *Iulius Alexandrinus* ſaith, he often tryed it to be true: the rootes boyled in vinegar, and any place waſhed therewith troubled with ſcabbes, wheales or puſhes, the lepry or any other ſuch like breaking out, yea although they be gangrenous or eating ſores, by ſtaying their eating or ſpreading, preſerveth the fleſh from putrefaction: the ſame decoction alſo helpeth the Toothach, if the mouth be gargled therewith: as alſo dropped into the eares eaſeth the noyſe and helpeth the deafeneſſe. The Second kind which is the leſſer baſtard Hellebor or Beares foot, for any thing that ever I could finde, by the ſeverall tryalls made thereof, is more forceable and churliſh in working and purging then the former; a dram of the rootes ſteeped in wine all night and drunke in the morning, aſſuredly prevaileth powerfully againſt all the diſeaſes appropriate unto the former kind: therefore I ſhall not neede to repeate the ſame things againe: but beſides the things before remembred, the powder of the dryed leaves thereof doth helpe to kill the wormes in children more effectually: a little thereof given in drinke or broth, or in a Fig or Rayſins, or ſtrowed upon bread ſpread with Hony: it is ſayd alſo to reſiſt any poyſon that is taken to expell it, or cauſe that it ſhall not hurt: the uſe hereof likewiſe in outward cauſes, is the like with the former, as for foule ſores and Fiſtulaes, Scabs, &c. An idle conceit poſſeſſed many in ancient times, that he that would digge up the rootes hereof, had neede to eate Garlicke before hand, leaſt the evill vapours that ſhould ariſe from it in the digging up, did not offend the head and braine: The greater Baſtard Hellebor or Setterworte, was held by *Dodonæus* as I ſayd before to be a venemous Aconite, not to be dealt with, and that it would kill Woolves, Foxes, Dogs, &c. I have knowen little uſe thereof unleſſe in great neceſſity, where the other ſorts are not to be had, and onely among country people, whoſe ſtrong robuſtious bodies are able to abide the working thereof; but is onely or chiefly uſed to rowell cattell withall, as *Plinylib.25.c.5.* ſaith that a peece of the roote of blacke Hellebor being drawne through a hole made in the eare of a beaſt troubled with the cough, or having taken any poiſonous thing cureth it, if it be taken out the next day at the ſame howre. *Abſyrtus* and *Hierocles* declare the ſame thing and *Columella* alſo: this manner of curing is uſed with us: but the place is changed from the eare to the dewlap of Oxen, and to the foreleg or hinderleg of an horſe above the paſterne. It is thought alſo by divers of good judgement that not onely all the Hellebors both white and blacke will doe the like if any cure be performed hereby, but many other ſorts of herbes: yet as the name Lowſewort importeth the herbe made into an oyntment, or the decoction of the leaves killeth Lice, if the places be eyther waſhed or annointed that are chiefly troubled with them. The ſixt here ſet forth, which I call purging Sanicle, hath beene often found by good experience to open and purge the body of melancholy humours, & that ſafely without ſuch perturbation thereto as is ſayd to be in the other ſorts of blacke Hellebor: *Dodonæus* likewiſe ſuppoſing this to be *Dioſcorides* his black Hellebor, appropriateth all the vertues thereto, that *Dioſcorides* ſaith they of *Anticyra* uſed their *Elleborus Seſamaceus*, the other ſorts are not uſed or very ſeldome in Phyſick now adayes.

CHAP. XXVI.

Helleborus Albus. White Hellebor or Neeſewort.

OF the white Hellebores there are two principall varieties, as greater and leſſer, the greater being accounted wilde as manured or of the garden, and the other wilde.

1. *Helleborus albus vulgaris.* Ordinary white Hellebor or Neeſing roote.

The firſt great white Hellebor riſeth at the firſt out of the ground with a great round whitiſh greene head, which growing up openeth it ſelfe into many goodly faire large greene leaves, plaited as it were with eminent ribbes all along the leaves, compaſſing one another at the bottome, from the middle whereof riſeth up a ſtrong round ſtalke with divers ſuch like leaves but ſmaller to the middle thereof, from whence to the top it is divided into many branches, having many ſmall yellowiſh or whitiſh green ſtar like flowers, all along upon them, which after turne into ſmall long threeſquare whitiſh ſeede, ſtanding naked without any huske to containe them, although ſome have written otherwiſe: the roote is reaſonable thicke and great at the head, having a number of great white ſtrings running downe deepe into the ground, whereby it is ſtrongly faſtened. Some doe make a varietie in the flowers hereof to be whiter, and ſo would make a differing ſort thereof for that cauſe onely, but I doe not thinke it worth the name of a differing ſort.

Alter flore albo.

2. *Helleborus albus præcox ſive atro-rubente flore.* The early white Ellebor with darke red flowers.

This other Hellebor is very like the former, but that it ſpringeth up a moneth at the leaſt before it, and that the leaves are longer thinner & no leſſe plaited, foulding themſelves backwards oftentimes, and ſooner periſh falling away from the plant: the ſtalke hereof is higher then the former, with fewer leaves thereon, bearing ſuch ſtarry flowers, but of ſo darke or blackiſh a red colour, that they are ſcarce diſcernable but at a neere diſtance, the ſeede is very like the former: the roote hath no ſuch tuberous head as the other, but as it were a long bulbous ſcaly head, from whence ſhoote as many long white ſtrings as the other: both theſe loſe their leaves wholly and gaine freſh every ſpring.

3. *Elleborine*

1. *Elleborus albus vulgaris.*
Ordinary white Ellebor or Neeſewort.

2. *Helleborus albus vernus atrorubentibus floribus*
The early white Ellebor with darke red flowers.

3. *Elleborine major ſive Calceolus Mariæ.* The great wilde Hellebor, or our Ladyes Slipper.

The greater of theſe ſorts of wilde white Hellebors, riſeth up with one two or more ſtalkes, a foote and halfe high at the moſt, bearing broad greene leaves on each ſide, one by one, ſomewhat like thoſe of the former white Hellebor, but ſmaller and not ſo ribbed, and each compaſſing the ſtalke at the lower end; at the top of the ſtalkes ſtandeth ſometimes but one flower, yet ſometimes two or three at the moſt, one above another upon ſmall ſhort footeſtalkes, with a ſmall leafe at the foote of every one: each of theſe flowers are of a long ovall forme and hollow withall, eſpecially at the upper part, the lower being round and ſwelling like a belly: at the hollow part there are ſmall peeces like eares or flippets, that at the firſt doe cover that hollow place, and after ſtand apart one from another, all which are of a fine pale yellow colour in all that I have ſeene; yet it is reported that ſome are found of a browner colour or tending to purple: there are likewiſe fowre long narrow and darke coloured leaves at the ſetting on of the flower unto the ſtalke, wherein as it were the flower at the firſt was encloſed: the whole flower is of a pretty ſweet ſent: the ſeede is very ſmall, and like unto that of the *Orchides* or *Satyrions*, and contained in like pods; the roote is compoſed of a number of ſtrings enterlacing themſelves one within another, lying within the upper cruſt of the earth, and not ſpreading deepe, of a darke brownish colour. A ſort thereof hath beene brought from the North parts of *America*, differing onely in being greater both in ſtalkes, leaves and flowers, which are not yellow but white, with reddiſh ſtrakes through the bellies of them.

3. *Calceolus Mariæ.* Our Ladyes ſlipper.

Americanus.

4. *Elleborine minor flore albo.* The ſmall wilde Hellebor with a white flower.

This ſmaller Hellebor groweth up in the like manner, and not much lower, bearing the like leaves but ſmaller, and of a white greene colour like thoſe of *Lilly Convally*: the top of the ſtalke hath many more flowers, but leſſer growing together ſpike

faſhion

4. *Elleborine minor flore albo.*
Small wilde white Ellebor.

8. *Ellevorine angustifolia.*
Variable wilde white Ellebor.

fashion with small short leaves at the stalke of every flowēr, which consisteth of fivē small white leaves with a small close hood in the middle without any sent at all: the seede is alike and so are the rootes but smaller.

5. *Elleborine minor flore purpurante.* The small wilde white Hellebor with blushflowers.

The leaves hereof are narrower than the last, the stalke and flowers are alike but smaller and of a pale purplish or blush colour.

6. *Elleborine flore viridante.* Wild white Hellebor with whitish greene flowers.

This differeth not much from the last, but in the colour of the flower which is greenish on the outside and somewhat white within.

7. *Elleborine flore atro-rubente.* Wilde white Hellebor with darke red flowers.

This wilde kinde groweth somewhat bigger and higher, and with larger leaves than any other of these small wild sorts, the flowers likewise are more in number and of a deepe purple colour.

8. *Elleborine angustifolia spicata versicolor.* Variable wilde white Hellebor.

This also riseth somewhat high, having narrower leaves on the stalke, yet ribbed somewhat like unto the rib-wort Plantaine: the stalke endeth in a long spike of fine purple coloured flowers, in fashion like the rest, but the opening hoodes with their labels are white spotted on the inside with purplish spots: the leaves and rootes are alike.

The Place.

Both the first sorts grow in sundry places of *Germany* and *Austria* as *Clusius* saith, as also in somē of the *Iland* about *Russia* where a good ship might be fraighted with the rootes of the ordinary sort as Master *Tradescante* the elder affirmed; the other sorts grow many of them in our owne land as well as beyond sea, namely the third fourth and sixth; especially the third in a wood called the *Helkes* in *Lancashire* neere the border of *Yorke shire*.

The Time.

The first flowreth before thē second, although it spring earlier out of the ground, being not in flower until the end of July, the rest flower about May, some earlyer or later than others.

The Names.

I have shewēd you in the chapter before that it is called *Elleborus* or *Helleborum*, &c. The first is generally called *Helleborus albus*, and by *Dodonæus*, *Cordus* upon *Dioscorides* and others *Veratrum album*, *Guilandinus* took it to be the *Helleborus candidus* of the Grecians, but is assuredly the *Consiligo* of *Vegetius*, *Absyrtus*, *Columella* and *Pliny*

Plinye, Gerard tooke this for the next to call it *præcox. Bauhinus* to distinguish them calleth this *flore subviridi*, and the second *flore atro-rubente* & other writers *ex purpura nigricante*, & *Lobel* addeth *præcox* vnto it: the third is called by *Clusius Elleborine recentiorum*, and of others *Calceolus Mariæ* or *Marianus*, and *Lugdunensis*, *Elleborine ferruginea Dalechampij*; *Gesner* in *hortis Germaniæ* taketh it to be *Alismatis species*, and so doth *Thalius* likewise, and some *Damasonium nothum & Pseudodamasonium*; the fourth is taken by some to be *Epipactis*, by others *Alisma* or *Damasonium*, but generally is now adayes called *Elleborine flore albo*: the rest have their names in their titles, as they are most usually entitled by others: the controversies hereabouts I have touched in the foregoing chapter, and therefore will not here againe recite it: the *Arabians* call it *Charbachem*, the *Italians Elleboro bianco*, the *Spaniards Verdegambre blanco & yerva de balastieros*, the *French Veraire* and *Helleboire blanc*, the *Germanes Weiss Nieswurtz*, the *Dutch witte Nieserwyt*, and we in *English* white Ellebor or Neesewort.

The Vertues.

The roote of white Hellebor or Neesewort is of most use (neither the leaves flowers nor seede being used at any time with us that I know) and worketh very strongly and churlishly with any that shall take, it procuring strong vomitings: yet being taken with convenient preparation of the body aforehand, and dieted by advise as *Dioscorides* warneth it, may doe much good to strong constitutions that can endure the working of it, by causing much tough viscous clammy and corrupt humours that offend the stomacke to be avoyded, to be taken not fasting but for sometime after one hath eaten, for which purposes the *Oxymel Helleboratum* is a medecine prepared to your hand and fit to be used: it provoketh womens courses and will kill the birth if it be taken inwardly: halfe a dramme of the roote prepared with *Oxymel* and given in wine, to those that are so deepely possessed with melancholy that it causeth fits of fury or madnesse, doth much abate the peccant humour giving much ease to the party: being likewise steeped and afterwards boy'ed in broth and given, helpeth those that are troubled with the falling sickenesse, the leprosie, and all other breakings out in the skinne, as scabbes, &c. quartane, agues, the ptisicke or pining consumption, an old cough, the dropsie, ruptures, sciatica, goute, crampes, paines in the joynts and sinewes, and paines and swimming in the head: the best preparation of it is to be infused in the juyce of a Quince, or to be put into a Quince, and either baked in an oven, or roasted under the embers, and halfe a scruple thereof given at a time; and this was as *Matthiolus* saith, the ancient manner of curing these diseases: but being so dangerous a medecine though sometimes taken with caution, that it putteth many in hazard of strangling, and is onely remedied by eating Quinces, or taking the juyce or the Syrope made thereof, hath made the use thereof wholly almost to be given over and left: the roote saith *Dioscorides* is put with other things to helpe the dimnesse of the sight: the juyce of the roote dropped into the eares taketh away the noyse and singing in them: being boyled in lye and the head washed therewith it killeth lice and helpeth the running scabbes and sores thereof, being mingled with flower and a little honye or butter, or else boyled in milke and set where flies gnats, &c. doe much resort, doe kill as many as touch it: if hens, duckes, or geese doe chance to drinke thereof it will kill them likewise: being moulded up with meale and honye, and put into moale holes or the burrowes of field or dormise, or any other such small Vermine will quickly destroy them: the powder or scraping of the roote by it selfe, or with a few leaves of Marjerome put up into the nose, purgeth the head and braines by neesing: being boyled in vinegar and the decoction gargled in the mouth, easeth the paines of the tooth ach: the same decoction likewise helpeth the itch and scabbes in the hands, and clenseth foule sores and ulcers in the legges and other parts. The *Spaniards* and *Navarrois* doe make a certaine poyson of the juyce of the rootes of white Hellebor which after it hath fermented in a horne or earthen leaded vessell (the time when it is readie to be used they know by this tryall: having thred a needle with thred, and wetted it therein, they draw it through a frogge which if it presently dye, then it is good, and ready) they dippe their arrow heads therein, and then what beast shall be wounded therewith shall suddenly dye: which thing *Matthiolus* saith, hee also tryed on dogges and chickens, which dyed presently after they were wounded with a weapon dipped therein, in that the venome had peirced the blood, against which poyson no other antidote can be found more fit and speedy, than the eating of Quinces, for even the smell of them being in a house where that poyson is, taketh away the whole force thereof: but is restored againe (as it is said) if ripe grapes be mixed therewith or some pepper cast into it: this poyson is onely used while it is fresh, for it loseth the strength, if the juyce dry upon the arrow heads, and therefore to keepe them the better they use to keepe them in a case, the iron heads being wrapped in wooll and clothes wet therein: but this is the most wonderfull as it is related, that this poyson being drunke, procureth almost no harme to them that drinke it, unlesse they take too much and as it is sayd the hunters often take it themselves to purge them: it is sayd also that the flesh of those beasts killed by this poyson, is more tender and pleasant in eating than of other not killed therewith, and especially that part about the wound. *Pausanius* in *Phocicis* recordeth a notable stratagem that *Solon* used in besetging the Citty of *Cyrrheus*, *viz.* That having cut off the River *Plistus* from running into the Citty, he caused a great many of those rootes to be put into a quantity thereof, which after they had sufficiently infected the water, he let passe into the Citty againe, whereof when they had greedily drunke they grew so weake and feeble by the superpurgation thereof, that they were forced to leave their wals unmand, whereby the *Amphyctions* their enemies became masters of their Citty: the like stratagems are set downe by diverse other authors performed by the helpe of other hearbes. The lesser wilde sorts are not knowne with us to be used in Physicke: but if either of these *Elleborines* be his *Epipactis*, he saith it is good in the defects of the liver and against poysons and to procure vomiting; *Theophrastus* saith the same.

CHAP. XXVII.

Gratiola. Hedge Hyſſope.

OF the true *Gratiola* or Hedge Hyſſope, I doe know but one kinde as all the beſt authors doe agree, but yet unto it there are added two or three other hearbes, as neereſt thereunto, either in face or qualitie, ſome reckoning the one and ſome the other; and I in this place bringing them all as fit to be ranked under this title.

1. *Gratiola vulgaris.* True hedge Hyſſope.

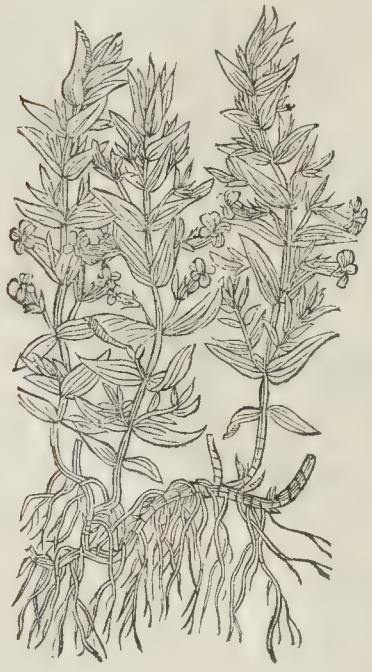
This hearbe is but a ſmall low plant, ſeldome growing with his ſlender bending foure ſquare branches, above a foote high; having diverſe ſmall leaves ſet thereon, very like unto thoſe of the ordinary garden Hyſſope, but a little ſhorter and broader, and of a pale greene colour, of a very bitter unpleaſant taſte: from about the middle of theſe branches, at the joynts of the leaves up to the toppes of them, come forth the flowers, every one at a place, ſtanding upon very ſhort footeſtalkes, which are ſomewhat long and hollow, ending in foure leaves, two of the loweſt ſtanding out as it were lippes, and the other two above, ſhorter by the halfe, of a whitiſh yellow colour, tending to a blacke blew, and ſometimes more blewiſh or purple: after which come ſmall round heads, wherein is conteined ſmall ſeede: the roote ſhooteth forth too and fro under ground very much, with many joynts and ſmall fibres at them, thereby encreaſing and quickly ſpreading largely, eſpecially if it ſtand in any moyſt place, becauſe it will hardly hold long in any dry ground.

Flore luteo. *Camerarius* ſaith he found by a brooke ſide, not farre from *Geneva* one of this kind with a yellow flower, not differing in any thing elſe.

2. *Gratiola minor ſeve Hyſſopoides.* Small hedge Hyſſope.

This ſmall hedge Hyſſope, ſhooteth forth ſometimes many, and ſometimes but one or two round reddiſh ſtalkes halfe a yard high, branched toward the toppes; whereon are ſet one above another, and ſometimes one againſt another, diverſe ſmall and ſomewhat long leaves, ſomewhat ſmaller than the former, and neere reſembling Hyſope leaves, of a pale greene colour, joyning cloſe unto the ſtalkes and branches, and without any foote ſtalke at all: at the joyntes with the leaves come forth flowers, every one by it ſelfe, ſtanding in a long huske, conſiſting of foure leaves of an excellent blew colour: after which ſucceede ſmall browne ſeede, conteined in long round pods: the roote is white and ſhooteth forth many fibres, whereby it comprehendeth well in the ground: the hearbe and every part hereof is utterly without any ſmell, and almoſt without any taſte, yet ſome hold it to have a nitrous or little ſalt, and ſome a little ſweetiſh taſte: Sometimes and in the moyſter grounds, this is found with larger leaves, and growing higher; ſometimes with ſmaller and longer leaves, which ſcarſe riſeth an handbreadth high, and that in the dry grounds.

1. *Gratiola Vulgaris.* The true hedge Hyſſope.



2. 4. *Gratiola anguſtifolia minor: Et latifolia noſtras.* Small hedge Hyſſope. The leſſer broad leafed hedge Hyſſope.

3. *Gratiola*

3. *Gratiola cærulea, sive latifolia major.* The greater broade leafed or blew flowred hedge Hyssope.

This hearbe also is referred unto *Gratiola*, for some resemblance it hath, both for place and manner of growing, and especially for the bitternesse thereof, so like it, which by *Lobel* and *Pena* their judgements was thought at the first likeliest to be a kinde of *Lysimachia*, and so entituled it *galericulata* for distinction sake, but others of good judgement since, have otherwise thought as you shall heare anon: I have placed it, with the *Gratiola*, partly led by the authority of others, and partly by the common vote of these times, who as frequently call it *Gratiola latifolia*, as *Lysimachia galericulata*: take the description thereof, therefore in this manner. It is a smooth low plant not rising above a foote high, with many square stalkes diversly branched from the bottome to the toppe, set with diverse joynts and two small leaves at every one, which stand upon short foote stalkes, being broad at the bottome and smaller to the end, a little dented about the edges, (which is not remembred in *Lobel* and *Pena* their description) and full of veines, of a sadder greene colour than the former, longer also and broader: the flowers are gaping, somewhat like unto those of Dead Nettles, of a faire blewish purple colour, with some white spots the eim, every one standing at the joynts with the leaves up to the toppes: after which come forth small seede vessels, formed somewhat like unto the toppe of the thigh bone of a man or beast, wherein the small nut or hucklebone is set; the upper part whereof doth first open, when the seede is ripe, and falleth away when it is touched, shewing within it small yellow seede: the roote spreadeth much, and with many branches under grouud, quickely thereby possessing a large circuite or compasse.

There is a lesser sort hereof found in the like places as the former, differing onely in the smallnesse of the plant.

4. *Gratiola latifolia sive nostras minor.* The lesser broad leafed hedge Hyssope.

There is also another small hearbe growing in our Land onely, for ought I can either heare or learne which *Gerard* first found and called *Gratiola latifolia*, as referring it thereunto, and so doe I also, yet more for the resemblance of the flower unto the last (which was not knowne to him, or at least not mentioned by him) and bitternesse, than any thing else: Out of the wet boggie ground from among the grasse &c. that groweth about it, springeth up one or more small stalkes, scarse halfe a foote high, round but crested as it were all the length, which spread forth other smaller branches; whereon doe grow many small leaves, set by couples one against another, being somewhat broade, but very short withall, seeming almost round, and ending in a point, a little dented about the edges: at the joynts with the leaves come forth the flowers, every one by it selfe, on a small foote stalke, being in forme somewhat like the last, a gaping flower but shorter, of a pale reddish colour, spotted in the middle of the lower leafe, with many small white spots: after the flowers are fallen come in their places small seede vessels, in shape somewhat like unto the nut of a crossebow; wherein is conteined small yellowish seede; the roote is small long and white, spreading it selfe under ground diverse wayes; which perisheth not in the winter, neither runneth like the last, but spreadeth new branches every yeare: the taste hereof is as extreame bitter as the last.

3: *Gratio'a cærulea sive latifolia major.*
The greater broade leafed or blew flowred hedge Hyssope.

The Place.

They doe all naturally grow in moyst and marrish grounds, wherein they will joy best, if you will have them to live. The first naturally groweth in many places in *Italy* and without Saint *Justines* gate at *Padoa* plentifully, and is onely cherished in gardens with us. The second hath beene found naturally growing in some places of our owne Land; but the third in many and sundry places of this Country, in wet low grounds and by waters sides: and the last upon *Hampstead* heath in the wet boggie places, and in sundry other partes of the heath.

The Time.

They all flower in Iune and Iuly, the first seldome giveth good seede in our land; all the other doe ripen their seede quickely after their flowers are past.

The Names.

None of these hearbes are mentioned by any of the ancient Greeke or Latine writers, nor of *Plinye*. The first is generally now adayes, as it was formerly called *Gratiola* by *Matthiolus*, *Gesner*, *Dodonæus*, *Lobel*, *Lugdunensis*, and others: it is also called by some *Gratia Dei*, after the high *Dutch* name *Gotts gnad*, which signifieth so much; yet some call it *Gratia Dei altera*, because there is another herbe among the *Geránia* so called: *Anguillara* thought it might be the *Papaver spumeum* of *Dioscorides*: the seede hereof is called as hee saith *Gilbenech*. *Cordus* calleth it *Limnesium sive Centauroides*, because diverse for the bitternesse sake thereof, did thinke it a *species* of *Centaurium minus*: he also calleth it *Eupatorium Mesues*, for so it was generally thought to be, in all the upper and lower *Germanie* for a long time, and among some of our Apothecaries also in times past: which opinion I thinke is worne out, time bringing the truth to light. *Gesner* calleth it *Gratiola sive Centaurium aquaticum*, and thinketh it may be the *Polemonium palustre amarum* of *Hippocrates* (the horse-

leech, not the famous Phyſition) and *Fabius Columna* that ſaith it is uſually called *Gratiola*, yet ſaith it is thought of ſome more truly to be taken, for a common Hyſope; *Geſner* uſed to call it *Seſamoides*: *Bauhinus* in his *Pinax* calleth it *Gratiola Centauroides*: we call it in Engliſh Hedge Hyſope for diſtinction ſake, and not for that it groweth by any hedge ſide; for it might more properly bee called Marſhe Hyſope, from the naturall place of the growing. The ſecond is called by *Camerarius Hyſopoides*, (as if you ſhould ſay a ſmall Hyſope) and ſo it is called in Italy. *Geſner* in *Collectione ſtirpium* calleth it *Gratiola minor*, *Cordus* in his woode of obſervations, nameth an herbe to be called with them in *Germany* Graſſe poley, with the leaves of knot graſſe, growing in mooriſh places, which doth fitly anſwer unto this plant; and therefore *Bauhinus* in his *Pinax* doth ſo referre it; but entituleth it there himſelfe *Hyſſopifolia*, becauſe his brother *John Bauhinus*, had ſo called it formerly; when as in his *Matthiolus* he calleth it *Gratiola minor*, it is called alſo as he ſaith by ſome at *Mompelier*, where it groweth in the brookes there *Anagallis aquatica*, and in *Haſſia* as hee ſaith alſo, ſome called it *Halimus aquaticus*. The third is called as I ſayd before by *Lobell* and *Pena Lyſimachia galericulata*, from ſome reſemblance of the leaves, and naturall place of growing, but becauſe none of the reſt of the *Lyſimachias* have hooded flowers, but conſiſting of five leaves laid open, I think it fitter to joyne it with theſe then with thoſe, *Camerarius* calleth it *Lyſimachia flore cæruleo galericulata Lobelii*: *Ioannes Thalius* in his *Harcynia ſylva*, calleth it *Sideritis cærulea*, and ſaith it was called alſo by divers, *Gratiola cærulea*. *Cæſalpinus* calleth it *Gratia Dei*. *Tabermontanus Tertianaria*, and *Dodonæus* in his French Edition *Herba Iudaica altera*. With us it is generally called, as well *Lyſimachia galericulata*, as *Gratiola latifolia*, but more properly as I ſayd in my judgment *Gratiola*, both for that this is extreame bitter as they are, and hath hooded flowers as all the others have, yet I have added thereunto *major* becauſe of the next, in Engliſh the greater broad leafed, or blew flowred Hedge Hyſope. The laſt is called by *Gerard* as I ſayd *Gratiola latifolia*, whereunto I have added *noſtras minor*, becauſe if the laſt or this be to be referred unto the *Gratiola*, this is the leſſer, which may ſtand untill a fitter be found out: The *Arabians* as is before ſayd, call the ſeeds *Gelbenech*, the *Itilians* the herbe *gratia Dei* and *Stancaca vallo*, the *French Grace de Dieu*, the *Germans Gottes gnad*, the *Dutch Godts gratie*, and we in Engliſh, Hedge Hyſope.

The Vertues.

The firſt hedge Hyſop worketh very ſtrongly and churliſhly, both upward and downeward, avoiding much tought and groſſe flegme choller and watery humors, thereby giving eaſe to thoſe, that are troubled with watery humors, paines in the joynts and the hips, the dropſie, the gout and ſciatica; if either the decoction of the greene herbe be given, or a ſmall quantitie of the pouder of the dried herbe: it helpeth alſo both tertian & quartaine agues taken in the ſame manner, but becauſe it is ſo churliſh, it is needefull to put thereto ſome correctors, as Anniſeede Cinamon or the like: Some alſo give the powder in broth the leſſe to offend. *Camerarius* commendeth the extract hereof, made into pilles with the powder of Cinamon, not onely to be availeable againſt the dropſie, but againſt all ſorts of tertian and day agues, if ſome of the juyce of Calamint be added unto it: it is profitably given for the obſtructions of the liver and ſpleene, by opening and purging the peccant humors: it killeth the wormes in the belly, and prevaileth much againſt all putrefactions, either inward or outward, for the pouder, infuſion or decoction, cleanſeth and healeth wonderfully all old and foule ulcers, and conſolidateth freſh wounds. The ſecond is not applied to any diſeaſe by any Author or other, that ever I could learne. The other two likewiſe are not remembred by any, whereunto they might be availeable; yet their bitterneſſe comming ſo neare unto the firſt *Gratiola*, iuduceth me to thinke, that they cannot but be effectuall, if not to purge by the bitterneſſe, yet to conſolidate and heale by the temperate heate is joyned with them: the *Italian* name declareth the true experience they have found in it, that horſes will become lancke and leane that feede thereon.

CHAP. XXVIII.

Staphis agria. Staveſacre or Louſewort.

STaveſacre riſeth up with a ſhort, but ſtrong blackiſh greene ſtalke, branching forth divers wayes, whereon doe grow great large leaves, cut at the edges into five or ſeven diviſions, ſomewhat like unto the leave, of the great yellow Aconite or Wolfesbane, but deeper edged, and of a ſad or darke greene colour, every one ſtanding upon a long foote ſtalke, the flowers grow at the toppes of the branches one aboue another, upon ſhort ſtalkes, being ſomewhat like a Larkes ſpurre flower, for it hath a ſpurre or heele behind it, of a very deepe or darke blew colour, but much larger: after which come in their places three or foure horned ſeede veſſells, like unto the Aconites but greater, wherein are contained triangled rough great ſeede: the roote is long and wooddy, periſhing every yeare, after it hath borne ſeede.

The Place.

It is onely nourſed up in our gardens, and that very hardly, for if it be not well defended, it will not abide a Winter with us; for it never riſeth to flower or ſeede the firſt yeare it is ſowen, but in the hotter countries of *Italy*, as *Naples*, and in *Iſtria* and *Sclavonia*, and other places it groweth in the open champion grounds.

The Time.

It flowreth not with us untill it be late in the yeare, notwithſtanding it hath abidden a Winter, and never giveth perfect ſeede.

The Names.

It is called in Greeke σταφὶς ἀγρία, *Galen* hath it ἀγρὶς ἀγρία, but at this day the naturall Greekes call it ψειῶνικον, but more properly φθειρωνικον that is *granum pedicularium*; in Latine *Staphis agria*, in the Apothecaries ſhoppes beyond ſea *Staphiſaria*, and *Pedicularis*, and *Pedunculatis*, and *Pituitaria ſic dicta a viribus quas habet pediculos enecando, & fervore pituitam educendo*, and thereupon *Cordus* on *Dioſcorides* calleth it *Pthirococtonon*. *Pliny* ſeemeth to call it *Vva Taminia* in his 26. Booke and 13. Chapter, but in his 23. Booke and firſt Chapter, hee ſaith that *Aſtaphis agria* or *Staphis*, is corruptedly called *Vva Taminia*. The ſeede thereof is ſo called alſo, being onely in uſe, and to be had in ſhoppes. The *Arabians* call it *Alberas Habebras*, *Muthuzagi*, *Mabbezegi*, the *Italians Staphiſaria*, the *Spaniards Fabaras Paparraz yerva pionta* is *piopheyra*, the *French Eſtaphiſagria Pœilleuſe* and herbe *aux povileux* or *povileux*, the *Germans Biſſmints*, the *Dutch Luyſcruidt*, and we in Engliſh Staveſacre and Louſewort.

The

The Vertues.

A few of the ſeed bruiſed and ſtrained into poſſet drinke, and drunke, worketh very ſtrongly upon the ſtomacke, bringing forth abundance of ſlimie groſſe flegme, but there had neede of great caution to be uſed, of whoſoever ſhall take it, for in that it heateth extreamely, and bringeth danger of ſtrangling by the violence thereof; it is not uſed but by ignorant or deſperate Surgions, or countrie leeches, without ſuch correction and things as may mittigate the force thereof, that thereby it may do no harme; which being ſo ordered, it is then uſed to be given to thoſe that are troubled with itch, ſcabbes, the leprie, or foule ſcurfe, as well inwardly, as to waſh the places outwardly with the docoction of the ſeede, which helpeth much, as alſo to kill lice and vermine, growing in the heads or bodies of any, or the ſeeds mixed with oyle and *axungia*, and anointed on the places. Some uſe to make an Electuary of them, by boyling them in water, with ſome few correctors, unto which liquor being ſtrained, ſo much Sugar is put, as may be ſufficient to make it up with the powder of Aniſeede and Cinamon into an Electuarie, whereof a dragme is a ſufficient proportion at a time, and is profitable for the diſeaſes aforeſaid, as alſo to procure womens monethly courſes: it is alſo good to waſh foule ulcers in the mouth or throate; but if the decoction be too ſtrong, you may alay it with ſome vinegar, and a little honey mixed therewith and ſo uſe it: the ſeeds bruiſed and boyled in vinegar is good to helpe the toothach, if the teeth and gummes be waſhed therewith, for it draweth downe abundance of rheume, which peradventure was the cauſe thereof, being bruiſed alſo with a little pelletory of *Spaine*, or without it, and put into a fine linnen cloth and chewed where the teeth paine you moſt, doth the like, and often eaſeth and ſometimes taketh away the paine. Some ſay that if the flowers be chewed in the mouth, and ſome of them laid upon the hurt place, of any ſtung or bitten by any ſerpent, they will heale them: the ſeede beaten and mingled with meale, and ofit ſelfe ſo laid, or made up into a paſte with ſome hony, will kill Miſe and Ratts, and ſuch like vermine that doe eate it.

Staphyſagria.
Staveſacre or Louſewort.

CHAP. XXIX.

Euphorbium; The burning thornie plant called *Euforbium & Anteuphorbium.*
The remedy for the *Euforbium*, or the burning thorny plant.

AS the moſt extreme of all violent purging plants, I bring this to your conſideration, not having any to exceede it in the qualitie of heate or violence; and thereunto as many other Authors before me have done, I joyne that other cooling herbe, which is accounted the onely helpe and remedy againſt the fierie heate thereof.

1. *Euphorbium.* The burning thornie plant called *Euforbium.*

This ſtrange thornie plant, from a leafe thruſt into the ground, will ſhoote forth rootes, and grow to have divers thicke and long leaves, round alſo and not flat, halfe a yard in length, ſet with divers great ribbes, which are armed all the length of them, with a double row of ſmall ſharpe thornes or prickes, two for the moſt part ſet together, like unto the middle bone of a fiſh, &c. what fruit or flower it beareth we have not learned of any, that hath ſeene it growing in *Barbery*, from whence it hath beene brought, both into our countrie and into others: the rootes are great thicke and long, ſpreading very much, but impatient to endure any cold, as the leaves are alſo: there iſſueth out of the leaves, as ſome ſay, or out of the rootes as others ſay, a palé yellowiſh gumme, in ſmall droppes or peeces, moſt violent fierce even to ſmell unto, but being taſted doth burne the mouth and throate not to be endured, the duſt alſo and fuming vapours that ariſe from it when it is ſtirred, but much more when it is beaten to powder, doe ſo fiercely penetrate into the head and mouth, but eſpecially the noſtrills, that it procureth frequent and ſtrong neeſing, often times even unto delacrymation; and if any ſhall touch their face, or any other part of the skinne that is tender, with their hands after they have handled it; it will burne and enflame it ſo terribly that oftentimes it will raiſe bliſters and wheales, the furie whereof will not be allaid ſcarſe in halfe a day after, although cold water or any other cold thing be applied to mitigate the ſtrength thereof, and therefore in the ſame naturall places groweth with it as the chiefe and onely remedy thereof, the

2. *Anteuphorbium.* The remedy for *Euforbium.*

The *Anteuphorbium* hath divers fat thicke greene ſtalkes, with many thicke and long leaves thereon ſomewhat like unto the leaves of Purſlane, but much bigger, both ſtalkes and leaves being full of a cold and ſlimie moiſture, moſt fit and apt to temper the heate of the former; we have likewiſe no further underſtanding of either flower or ſeede that it beareth: the rootes are great and thicke, from whence ſhoote forth many long and great ſtrings and ſmall fibres, but as quickly ſubject to the cold as the former, and periſheth upon the firſt cold blaſt that commeth upon it.

The

1. *Euphorbium.*
The burning thorny plant called *Euphorbium.*

Anteuphorbium.
The remedy for *Euphorbium.*

The Place.

Both theſe plants have beene brought out of *Barbery* as I ſaid from many places there, as alſo other Iles there abouts, and here they have thrived well all the heate of the yeare, but as I ſaid will endure no manner of cold, and therefore without extraordinary care and keeping not to be kept in our land.

The Time.

The time of the well thriving is formerly expreſſed, for it never bore flower with us, or with any that hath had it, as farre as we can learne.

The Names.

The Greeke name is εὐφόρβιον, and the Latines have no other name than *Euphorbium* for it, although *Pliny* calleth the plant *Euphorbia*, and the gumme *Euphorbium*. *Iuba* that was father to *Ptolomy*, and firſt ruled both the countries of *Mauritania*, is ſaid by *Pliny* to have firſt found this plant, and gave it the name *Euphorbium*, after the name of his chiefeſt Phiſition, whoſe brother *Muſa* healed *Auguſtus*, who alſo wrote much in commendation of it. I have called it in Engliſh rather a thorne or thorny plant than a thiſtle, for that it hath no reſemblance with any thiſtle or thiſtle like plant, neither is it venemous or poyſoncus, though violent in heate: the *Anteuphorbium* hath no other name in any Author that hath written of it; onely *Dodonæus* who firſt gave us the figures of both theſe plants, thinketh this may be ſome ſpecies of *Telephium* or *Orpine.*

The Vertues.

Although neither *Dioſcorides* nor *Galen*, have made mention of any purging qualitie in the *Euphorbium*, yet *Pliny* for got it not, making mention thereof in his 26. Booke and 8. Chapter, and *Meſues* hath found and declared it, and ſo hath *Aëtius*, *Paulus* and *Actuarius*, who have exactly delivered their knowledge therein; that it doth mightily purge the wateriſh humors of the dropſie, and tough viſcous flegme from the joynts, and the more remote parts of the body, and therefore helpeth the gout and Sciatica, by cleanſing conſuming and eradicating thoſe groſſe humors, that lie deepely hid in the hollowneſſe of the joynts and ſinewes: but becauſe it heateth the body and fretteth the bowels extremely, corroding them and the ſtomacke, and inflaming the liver, it is neceſſary that it be corrected before it be given, and that it be groſſely not finely beaten to pouder; as alſo that ſuch things be mixed with it, as may allay the violent heate and ſharpeneſſe, and ſuch are cold and aromaticall ſeedes, and ſuch things alſo as may make it ſlippery, the more eaſily and ſpeedily to paſſe away, and therefore made into pills with hony, may be effectuall, and that the quantities of theſe correctors be ſo plentifull, that they may cover the ſuperficies thereof. It being ſo dangerous, therefore the adviſe to be taken, is that it be not uſed inwardly, but in cold windie and temperate bodies, and not in hot and dry conſtitutions; but outwardly applied it is of exceeding good uſe; as mixed with the oyle of Wallflowers, or any other digeſting oyle, it wonderfully helpeth all cold diſeaſes of the ſinewes, as palſies and ſhakings, or trembling of the joynts and ſinewes, as alſo crampes and convulſions or ſhrinkings, aches & lamenes that come from cold: a plaiſter made up with it, oyle and waxe, is availeable for all theſe recited griefes, as *Galen* ſaith. The pouder of *Euforbium* mixed with *Auxungia* and anointed, cureth all ſcurfes and ſcaldneſſe of the head, and with Beares greaſe, cauſeth haire to grow on the head, or any parts of the body, where haire doth uſually grow, it being ſhed or not appearing upon ſome cauſe:

applied

applied also with oyle to the temples of such as are drousie dull and heavie to sleepe, which we call the Lethargie, doth quicken their sences, and causeth them to be more lively: the nape of the necke being anointed with the oyle of *Euforbium*, recovereth their speech againe that have lost it, by reason of the Apoplexie, or any other casualtie: it being mixed with vinegar and applied, taketh away the markes and scarres of wounds, and all other foule spots or blemishes in the outward skin: The *Anteuphorbium* is the chiefest, if not the onely remedy against the violent heate, and piercing qualitie of the *Euphorbium*, for the juyce thereof being very cooling and slimie; tempereth it so well and speedily, that it never faileth to give ease.

CHAP. XXX.

Sena. Sene or purging Sene.

THere are two sorts of this purging Sene tree, differing very little betweene themselves, as also three or foure sorts of base or bastard sorts, more churlish then the other in working, as you shall heare by and by.

1. *Sena Alexandrina.* Sene of Alexandria.

This Sene by the judgement of those that have written thereof, groweth not above a cubite high, with slender branches, set with many leaves together on a ribbe, somewhat like unto Licoris, being narrow and pointed, which being dryed and brought over unto us, if they bee fresh, will smell very like unto fresh new made hay: the flowers stand at the tops of the branches, one above another being as *Matthiolus* saith (for wee have never seene them beare flower in England) of a yellow colour, like unto the flowers of Coleworts, that is consisting of five leaves laid open, (but some rather thinke, the flowers are formed like unto those of the Spanish Broome, or of the bastard *Sena* called *Colutæa*, as most plants that beare cods do) with purveines running thorough every leafe: after which come crooked thinne huskes, fashioned somewhat like a halfe Moone: in the middle part whereof (the skinnes of the huskes growing so close together, that they can hardly be parted) growe flatseed very like unto grape kernels, but of a blackish greene colour, and somewhat flat: the whole plant perisheth (as it is sayd) every yeare, and must be new sowne of them that will have it.

1. 2. *Sena Alexandrina & Italica.*
Sene of Alexandria and of Italy.

Italica.

2. *Sena Italica.* The Sene of Italy.

This Sene differeth in no other thing from the former, but in the forme of the leaves, which are not so narrow and pointed, but broader and rounder, which difference is plainly to be discerned, by comparing the leaves of that Sene that commeth over from Alexandria, with that which groweth in Italy, and therefore there needeth no more to be sayd thereof.

The Place.

The first groweth (as it is generally thought) in *Arabia Felix*, and in *Syria* also, as some say, and brought to Alexandria in Egypt, as many other things are, which from thence is transported unto all other Countries. The other *Matthiolus* saith, was in his time frequently sowen, in the Duke of *Florence* his dominions in Italy; many Acres in a field being sowne therewith, they will hardly spring up with any leaves in our Country, for expetience hath beene made thereof many times.

The Time.

They flower in the Summer moneths, but in Italy as *Matthiolus* saith, it must not be sowne untill *May*, and will not indure but unto Autumne.

The Names.

Mesues and other *Arabians* call it *Sena*, but *Hermolaus Senna*, it is generally held by all good Authors, that it was not knowne to the ancient Greeke and Latine writers, *Dioscorides*, *Theophrastus*, *Galen*, *Pliny*, *&c.* or others that did transcribe their copies, although some would referre it to *Dioscorides* his *Delphinium*, others to *Pelecynum*, some to *Peplium*, others to *Empetron*, some to *Alypon*, and others to the *Cercis* or third *Colutea* of *Theophrastus*, or to his first *Colutæa*, all which are quite contrary thereunto, and can by no meanes agree unto them. The *Arabians* being the first finders out thereof, and of the purging quality therein; who did much use the huskes or cods, as wee call them: but later experience hath found the leaves to bee of more effect with us.

The Vertue.

The leaves of Sene, howsoever used are a very safe and gentle purger, as well made into pouder, and the weight of a French Crowne or dramme thereof taken in Wine or Ale, or broth fasting; as the infusion of halfe an ounce in Wine or Ale for a night, or the decoction of halfe an ounce, or if need be of six drammes, with some other herbes or rootes (but because they are a little windie, a few Aniseed or Fennell seede, and a little Ginger is to be added unto them to helpe to correct that evill quality) and then they purge melancholy, choler,

ler, and flegme from the head and braine, the lungs and the heart, the liver and the ſpleene; clenſing all thoſe parts of ſuch evill humours as by poſſeſſing them, are the cauſes of thoſe diſeaſes incident unto them, and comforting the ſtomacke, eſpecially if ſome cordiall or ſtomachicall helper be put with it: for *Meſues* ſaith it hurteth the ſtomacke, but *Monardus* and *Matthiolus* denye that it can doe ſo, in regard that Sene hath ſomewhat a bitter taſte, partaking of heat and dryneſſe, all which qualities are knowne rather to ſtrengthen the ſtomack, then to trouble or weaken it; it ſtrengtheneth the ſenſes both of ſight and hearing, and procureth mirth by taking away that inward humour, which was the inward cauſe of ſadneſſe in the minde, opening the obſtructions of the bowells, and cauſing a freſh and lively habit in the body, prolonging youth, and keeping backe old age: Divers things are added hereunto to quicken the working thereof, and to make it the more effectuall as Rubarbe, Agaricke, Caſſia Fiſtula drawne, Syrupe of Roſes, &c. according as the nature of the diſeaſe, the age, ſtrength, and neceſſitie of the patient doe require: *Serapio* ſaith it wonderfully helpeth ſuch as are diſtracted of their ſenſes, by the extremitie of the fits in agues, or in other diſeaſes, which wee call raving or talking idle, or ſuch as are growne ſottiſh, their braines being overdulled, or growing into a frenſye or madneſſe by inflammations of the braine, the epilepſie alſo or the Falling ſickneſſe, and the headach, all ſorts of Palſies, which are the reſolutions of the ſinewes, the lowſie evill alſo, and all ſorts of itches ſcabs and wheales or puſhes, &c. whatſoever: Sena likewiſe is an eſpeciall ingredient among other things put into a bag, to make purging Beere or Ale, fit to be taken in the ſpring of the yeare, not onely for all thoſe diſeaſes afore mentioned, but alſo to clenſe the blood from all ſharpe humours, mixed or running therewith: Purging Prunes alſo and purging Curranes are made herewith, by boyling Sene and ſome other opening herbes and rootes, or if yee will without them, with ſome Anniſeede, Fennellſeede, Cinamon, Ginger and Cloves, ſome of theſe or all of them a little quantity, and according to the proportion of your Prunes or Currans, being ſet to ſtew with the decoction of your Sene, and other things above ſpecified, theſe may be given to the daintieſt ſtomack, that is without offence and without danger, to open the body and purge ſuch humours above ſpecified, as trouble the body; And becauſe the decoction of Sene, is too unpleaſant, to many weak and tender ſtomacks, & even the ſmell thereof doth cauſe them to refuſe any potion made therewith, the infuſion thereof for a night in warme embers, and ſtrained forth in the morning is much leſſe offenſive, & yet no leſſe purging: In that infuſion while it is warme you may diſſolve ſome *Manna*, or put thereto ſome Syrupe of Roſes and ſo take it. Caſſia fiſtula alſo may be drawne with the decoction of Sene, corrected as aforeſayd, & ſo given of it ſelfe, or made into a bole with Rubarbe poudered, or with the pouder of Sene leaves, & a little Anniſeed and Licoris together: ſome alſo I have knowne, that after they have infuſed Sene, Rubarbe, Agarick, Tamarinds & Tartar, with a few Anniſeeds or Fennellſeeds, Cinamon and Cloves in white wine, whereunto ſome have put thereto juice of Fumiterry for a whole day and night, then diſtilling the water from them, they keepe it to drinke with ſome Sugar put thereto, as a moſt dainty and pleaſant purge: After this manner waters may be diſtilled from other things, as Mecoacan, Turbith, Scamony, and all the ſorts of purgers, infuſed in wine or the juice of Fumitery, or other herbs as may be thought meete; whereunto being diſtilled, Sugar, Manna or Syrope of Roſes, or Rubarbe may be added, and ſo drunke for the purpoſes aforeſaid: For the manner of diſtilling theſe things, if they be done in glaſſe they will be more neate and dainty, and the glaſſe body to bee ſet in ſand or aſhes, the water diſtilled will be the ſtronger in efficacy from the ingredients, and the weaker if the glaſſe body be ſet in *Balneo* with water: yet may they bee diſtilled in an ordinary Still, ſo as it be cloſe. If this Sene might be made to grow with us here in England in any quantity, or in any of our plantations abroad, which are more warmely ſcituate, a water might bee diſtilled from the whole plant, while it is greene and freſh, according to the manner of other waters diſtilled from herbs, which would bee as dainty a purger as could be taken. The lye wherein Sene and Camomill flowers are boyled, is mervelous good for weake braines, to comfort and ſtrengthen them, as alſo for the ſight and hearing, if the head bee waſhed therewith; the ſame lye alſo is very profitable for the ſinewes that are ſtiffe with cold, or ſhrunke with crampes, to helpe to warme, comfort and extend them: it helpeth alſo to take away the itch in the body and the hands, if they bee waſhed therewith as *Durantes* ſaith, and is availeable to clenſe and cure foule Vlcers and ſores: The *Italian* Sene worketh the ſame effects before ſpecified, but more weakely in every part.

CHAP. XXXI.

Colutea. Baſtard Sene.

OF the Baſtard ſorts of Sene there are many, differing much one from another, as ſhall be ſhewed you in this Chapter.

1. *Colutea veſicaria vulgaris.* Ordinary Baſtard Sene with bladders.

This greater Baſtard Sene groweth in time to be a tree of a reaſonable greatneſſe, the ſtem or trunck being of the bigneſſe of a mans arme or greater, covered with a blackiſh greene ragged barke, the wood whereof is harder then of an Elder, but with a pith in the middle of the branches which are divided many wayes, having divers winged leaves compoſed of many ſmall round pointed or rather flat pointed leaves, ſet at ſeverall diſtances, and ſomewhat like unto Licoris, or the Hatchet fitch, among which come forth yellow flowers like unto Broome flowers and as large; after which come thinne ſwelling cods, like unto thinne tranſparant bladders; wherein are conteined blacke ſeede ſet upon a middle ribbe within the bladders, which being alittle cruſhed betweene the fingers, will give a cracke like a bladder full of winde: the roote groweth great and wooddy, branching forth divers wayes.

2. *Colutea ſcorpioides major.* The great Scorpion podded Baſtard Sene.

This baſtard Sene groweth nothing ſo great or tall, but ſhooteth out ſundry ſtalkes from the roote; the elder whereof have a whitiſh barke, and the younger a greene, with winged leaves ſet thereon as in the former, but ſmaller, greener and more pointed: the flowers are yellow like the other, but ſmaller alſo, and with a reddiſh veine or ſtripe downe the backe of the uppermoſt leafe, the pods are ſlender and long, with ſmall ſwelling branches thereon like unto a Scorpions taile.

3. *Colutea*

1. 2. *Colutæa veſicaria vulgaris & Scorpioides.*
Common and Scorpion podded baſtard Sene.

3. *Colutæa humilior.*
The lower baſtard Sene.

3. *Colutæa Scorpioides humilior ſive minor.* Thē leſſe Scorpion Baſtard Sene.

This leſſer baſtard Sene is in all things like the formēr, but lower and ſmaller both in leafe flower and cods of ſeede which have not ſuch eminent bunches on them as the laſt. *Alpinus* hath ſet forth another of this ſort, having more leaves ſet together then the laſt and the end leafe bigger then all the reſt, being all hoarie or of a ſilver like colour, ſweete as the flowers are alſo.

4. *Colutæa maritima glaucofolio.* Small Sea baſtard Sēne.

The ſea baſtard Sene hath ſmall ſlender branches, ſeldomē longer then halfe a yard, whereon grow ſuch like winged leaves, as the former hath, but that they are a little dented at the ends of every one, making every leafe ſeeme ſomewhat like unto the forme of a hart as it is painted, and being alſo of a more blewiſh colour then any of the reſt: the flowers are yellow very like unto the former, but not growing ſo many together in a tuft, and after them come ſmall joynted or bunched pods, wherein lye ſuch like ſeede.

5. *Polygala Valentina cluſii.* Evergreene Baſtard Sene of Valentia.

The nēare reſemblance of this plant unto the formēr, hath cauſed me to joyne it with them, whoſe deſcription is this: It hath many ſmall weake, but lithy and tough ſlender greene ſtalkes, riſing ſcarce a foote high, whereon are placed without order, ſuch like wings of leaves as are in the formēr, but much ſmaller, thicker and of a blackiſh blew greene colour; like as the leaves of Rue are, of an unpleaſant and binding taſte, abiding on the branches all the winter, as well as ſummer without ſhedding: at the tops of the ſtalkes and branches, which are bare without leaves for a good ſpace, come forth many ſmall yellow flowers; very like unto the

5. *Polygala Valentina cluſii.*
Evergeene baſtard Sene of Valentia.

flowers of Mellilot, hanging downe round about them in manner of a crowne, after which succeed small long and round podds, with three or foure divisions or bunches on them, wherein lie the seede, being somewhat long hard and black; the roote is long and somewhat thicke, hard and tough withall: Of this kinde *Clusius* maketh mention of an other larger in every part, which he found also in the wooddie hills of *Valentia* in *Spaine*, and a third sort with slender greene branches full of pith, with fewer softer and thicker leaves thereon, growing on the sea coasts by *Valentia*.

Major montana & maritima.

The Place.

The two first sorts grow about *Trent* plentifully, and are kept in many gardens with us especially; the third groweth at the foote of certaine hills that are neare the Alpes, among the hedges and the borders of the vineyards about the *Danowe* or *Danubius*. The fourth groweth neare the Sea shore by *Teracinum*, and for the raritie of it brought into *Cardinall Bembus* his garden at *Padoa*. The last *Clusius* saith he found in the fields of *Salamanca*, as also in the kingdome of *Granado* and *Valentia*, in the sundry bottomes of the hills.

The Time.

They doe all flower with us in June and July, or thereabouts, and give their ripe seede the next moneth after, except the fift which being more tender seldome abideth a yeare with us.

The Names.

It is called in Greeke κολεῦται, and in Latine *Colutea*. The ordinary *Colutea Vesicaria* is taken of most Writers since *Matthiolus*, to be the *Colutea Liparæ* that *Theophrastus* mentioneth, *lib.* 3. *c.* 1. but I doe rather thinke the *Colutea Scorpioides* should be it, because it properly beareth *siliquas* poddes, when as the other hath rather *vesicas tumentes*, swolne bladders, and not properly podds or cods, and that *Theophrastus* would have given some proper note of difference from other sorts of *siliquæ* cods, if he had meant these thinne transparent skinnes or bladders, and not the other which are the more formable; even as his *Colytea* and *Cercis*, which are *arbores siliquosæ* or *siliquatæ*, and by some thought to be *Arbor Iudæ* and *Laburnum*; if I be mistaken herein let others of better judgement be umpeeres in this case. The other sorts received the name *Scorpioides*, from the forme of the pods, which are distinguished into bunches or joynts, as a Scorpions taile, and may also be called *Siliquosæ*, as a distinction from the first or greatest: they are called in English Bastard Sene, because the leaves are so like unto the leaves of the true Sene tree; *Ruellius* as I take it being the first that called it Sene. The first is by most Authors called *Colutea* yet *Cordus in historia* calleth it Sena, *Ruellius*, *Sena Mauritanorum*, and *Gesner in hortis*, saith it was called *Sena sylvestris quibusdam sed male*, but others *Colutea vesicaria*, *Cæsalpinus* calleth it *Emeri alterum genus*, the second *Emerus vulgo*, but by all others *Colutea scorpioides major*, and by *Bauhinus Colutea siliquosa major*; the third being called *humilior* or *minor* by all; the fourth is so called as it is in the title by *Bauhinus*: the last is called by *Clusius Polygala Valentina*, of the people in *Valentia Coronilladel Rey* that is *Sertula regia*, where as he saith the Apothecaries use the flowers for *Melilot*, and because he found it plentifully in divers territories of *Spaine*, as also in *Valentia*, and that the learned there (as he saith) did referre it to the *Polygala* of *Dioscorides* and *Pliny*: *Lobell* calleth it *Colutea minima*, and therefore I have you see referred it to the *Colutea's*, as being in face or shew most like unto them, and as I thinke not much differing in vertue or propertie, as by the unpleasant taste, both of leaves and seede may be gathered, I have therefore given it an English title as I thinke not unfitting it.

The Vertues.

The leaves of the greater bastard Sene with bladders, as also of the other with Scorpion pods, doe both provoke strong vomitings and purgings downewards, but very churlishly and with some trouble to the stomacke and bowells; avoiding tough flegme and choller: the seede is more forcible in each of those qualities, and worketh more turbulently in the body, and from the joynts: it is therefore seldome given to any but to strong bodies, and where any better or other purgers are not at hand: Let not therefore any take this to be good Sene, or use it instead thereof. *Theophrastus* saith it doth fatten sheepe wonderfully, and therefore much used in those countries, bnt seldome proved in ours: the qualities of the other sorts of bastard Sene, are not set downe by any, but surely their taste being unpleasant like the other, declare them to be not much differing.

CHAP. XXXII.

Genista & Spartium. Broome.

THere are many sorts of our ordinary Broome as well as *Spartum*, *Spanish* Broome, reckoned among those plants that doe purge, as also divers others smaller sorts called *Genistella*; of all which I meane to entreate in this Chapter.

1. *Genista vulgaris sive Scoparia.* Our common Broome.

Our common Broome shooteth forth many woody stemmes or stalkes, of the bignesse of a mans finger oftentimes (especially if it be suffered to grow long) at the bottome, rising to the height of a reasonable tall man spreading into divers the like wooddy branches, covered with an hard and thinne darke grayish greene barke, which shoote forth a number of slender pliant square, or cornered small twigges or branches, like rushes; whereon appeare small darke greene leaves, three or foure sometimes set together at a place, abiding but a small time, so that it is seldome seene with leaves on it: the flowers are large, and of a gold yellow shining colour, growing one above another for a good space at the toppes of the branches, which turne into hard and flat small cods, almost blacke when they are ripe, wherein is contained small and shining browniish seede: the roote is long and woddy, yet tough withall, spreading many wayes under the ground, never perishing but sending forth new shootes every yeare, and more especially when the old stalkes are cut and taken away: From the rootes hereof in many places (but more often where no Broome groweth, namely by fields and hedge sides and upon heathes) groweth another plant, whose stalke is of the bignesse of a finger or thumbe, sometimes above two foote high, having a shew of leaves on them, and many flowers at the toppe, somewhat like unto the flowers of Orchis, but larger and of a deadish yellow colour, as the stalkes and leaves are also: which perisheth without seede, or encreasing the roote, being somewhat round and scaly.

Rapum Genistæ.

2. *Genista*

2. *Genista minor foliis Hyperici.* Small or low Broome.

This differeth from the former chiefely in not growing so great or high, and that the slender branches are thicke stored with leaves like unto Saint *Johns* wort: the flowers, seede, &c. are like the former.

3. *Genista Iluensis.* Iland Broome.

This Iland Broome shooteth forth many stalkes, divided into many branches full of great joynts or knees, with divers small and narrow leaves set round about the joynts, of a pale yellowish greene colour as the stalkes are also, this hath yellow flowers and seede like the common.

4. *Genista alba tenuifolia.* White Broome.

This Broome is very like the former, but that it groweth not so great, having many twiggie branches; which in time grow to wooddy stalkes, whereon are set many smaller leaves then the former, somewhat greene on the upperside, and of a gray and shining colour underneath: the flowers, are in forme like the others but somewhat smaller, and of a whitish colour: the seedes and pods are also like the former.

5. *Chamagenista.* Dwarfe Broome.

This low or Dwarfe Broome never groweth very great or high, neither come his slender greene pliant branches to be hard or wooddy, but alwayes abideth low, rising little more than a foote in height: on whose greene pliant twigges are set small and somewhat long leaves, of a darke greene colour on the upperside and gray underneath, abiding on them all the summer long, and at the toppes grow small yellow flowers, not so yellow nor so large as the first, but like unto them for the forme, and so are the pods and seede but smaller: the roote is long, rough, and much spreading in the ground, and long lasting.

6. *Chamagenista Cretica.* Dwarfe Broome of Candy.

The Candy dwarfe Broome hath low small hoary branches lying upon the ground, not exceeding one hand in length, yet divided into branches of two or three inches long, having very small and very narrow leaves set thereon, two or three growing together, one being longer than the rest, all hoary as the stalkes are: from the joynts with the leaves come forth three or foure yellow flowers like the other.

7. *Genista tinctoria vulgaris.* Common Greeneweede or Diersweede.

Our common Diers weede hath a number of small tough greene stalkes, two foote long or thereabouts, rising from a roote very much dispersed under ground, and wooddy; whereon grow without order many small long leaves of a sad greene colour, and many yellow flowers at the toppes, very like unto Broome flowers, but lesser and somewhat paler, after which come small pods lesser than Broome, and seede therein not much unlike.

8. *Genista tinctoria Hispanica. Spanish* Greeneweede.

The *Spanish* Greeneweede hath more woddy stalkes, rising much higher than the former, and bare without either leafe or branch for a good space above the ground, and then spreadeth forth may small short and brittle branches, stored with many long and narrow leaves, somewhat like unto the leaves of Flaxe or Spurge flaxe, greene on the upperside, and of a glistering white or silver colour underneath, somewhat harsh and bitter withall in taste: the flowers are many and yellow, that stand at the toppes of the branches, like unto the former: the whole plant is very beautifull to behold, either in flower or out of flower. Vnder this herbe when it was in

1. *Genista vulgaris & Rapum Genistæ.*
Ordinary Broome, and Broome Rape.

7. *Genista tinctoria vulgaris.*
Common greene weede, or Dyers weede.

4. *Genista alba tenuifolia.*
White Broome.

8. *Genista tinctoria Hispanica.*
Spanish Greene weede.

9. *Genistella montana Germanica.*
Base Broome of *Germany*.

10. *Genistella pinnata altera Hispanica.*
Spanish base Broome.

flower, *Clusius* saith he found growing in his naturall place, such another Broome rape, as is before specified, about a foote high, stored with many large and long gaping flowers, from the middle of the stalke upward, both stalke and flowers being of a yellow colour, and full of an unctuous or oylie moisture. *Alterum Rapum Genistæ.*

9. *Genistella montana Germanica.* Base Broome of *Germany.*

From a small and much spreading roote under ground, shooteth forth divers greene weake rushy stalkes of leaves, or leafed stalkes (for the whole stalke being about a foote long, consisteth onely of small and somewhat long leaves, one springing forth from the end of another, and some likewise comming forth from the joynts of them) branched also here and there; which abide greene all the Winter, new comming up in the Spring: at the toppes of these stalkes, come forth many yellow flowers like unto Broome flowers, but smaller when they are blowen, standing at the first close together in a soft woolly head: the cups or huskes that containe the flowers, abiding woolly afterwards: the seede is small, enclosed in small pods that follow.

10 *Genistella altera pinnata, Hispanica, Spanish* base Broome.

This *Spanish* base Broome hath likwise many leafed stalks, rising from the roote to the height of a foot or lesse, branching forth in diverse places, the whole plant as the former before, consisting onely of leaves, but somewhat greater and broader than the other, waved as it were a little on the edges, and each leafe rising from the middle rib of the other, being somewhat hard and rough in handling, thicker also than the former, and each leafe pointed at the ends of them, and sometimes ending in two points: the flowers are small and of a gold yellow colour like the former, foure or five standing together at the toppes of the stalkes enclosed in soft or woolly huskes, some also of the lower leaves of the flowers, seeming downie, the pods and seede are not unlike the other, neither the roote, but not so much spreading.

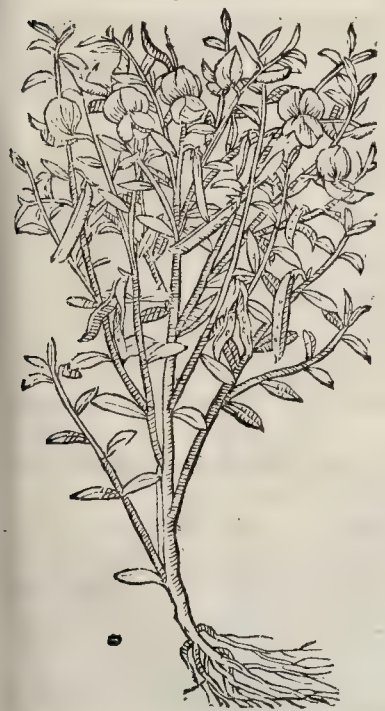
11. *Pseudo Spartum Hispanicum.* Bastard Spanish Broome.

Because this plant doth participate both with the former base Broomes in some things, and with the Spanish Broomes that follow, I have thought good to place it betweene them both, whose description is as followeth. The stemme riseth up to be two foote high or thereabouts, covered with a whitish barke, spreading into many small branches, some of them the length of ones hand, and some shorter; whereon doe grow very sparingly a few leaves, somewhat long but very narrow, which doe not abide but fall away, within a very short space after they are sprung, so that the plant for the most part is seene without leaves: on the toppe of every branch standeth one soft woolly round head, like unto the former Base Broomes, which after openeth it selfe into many small pale yellow flowers, every one standing in a woolly huske, after which come small pods wherein lyeth small seede like the others.

12. *Spartum Hispanicum frutex vulgare.* Ordinary Spanish Broome.

The ordinary Spanish Broome groweth to be five or six foote high or more, with a wooddy stemme below covered with a darke gray or ash coloured barke, shooting forth many pliant long and slender greene twigs, whereon in the beginning of the yeare are set many small and somewhat long greene leaves, which fall away quickely

12. *Spartum Hispanicum frutex vulgare.*
Ordinarie Spanish Broome.



13. *Spartum Hispanicum minus monospermon flore luteo.*
The smaller Spanish Broome with yellow flowers.

not abiding long thereon: towards the toppes of these branches grow many flowers, fashioned like unto Broome flowers, but larger and more spread open, of a more shining gold yellow colour, and smelling very sweete, after which come small long cods, crested at the backe, wherein is contained blackish flat seede fashioned like unto the kidney beanes: the roote is wooddy, disperſing it selfe diverse wayes under ground.

13. *Spartum Hispanicum minus monospermon flore luteo.* The small Spanish Broome with yellow flowers.

This smaller Spanish Broome, groweth with a stemme or stalke of the bigneſse of ones thumbe at the bottome, to bee about two foote high, whose barke is rough and straked all along, sending forth many greene slender pliant branches, which divide themselves againe into many other small twiggs, whereon for a while after they are shot forth, abide a few small leaves, untill they begin to shoote out flowers, and then fall away, leaving the branches naked and without leaves, all the reſt of the yeare after: from the sides and joynts of the smaller twigges, shoote forth small long stalks, bearing many smaller yellow flowers, than the former Spanish Broome, without any sent for the most part: After which come small round skinnie cods, conteining for the most part, but one seede in every one of them, being blackish and fashioned somewhat like unto the Kidney Beane, whichwhen they'are ripe, will by the shaking of the winde, make a noyse in their pods: the roote is hard and wooddy.

14. *Spartum Hispanicum majus flore albo.* The greater White flowred Spanish Broome.

14. *Spartum hiſpanicum flore albo.* White flowred Spanish Broome.

The other Spanish Broome (in his naturall place) groweth much higher than the former, even to any mans height, whose branches are more lithy and pliant than the other, having small leaves on them like the other, and as soone fading: the flowers also stand upon long stalkes, and are like them for the forme, but larger and of a white colour, of as small sent as they, which afterwards turne into small round pods, like the former, butsmaller, each one conteining but one seede for the most part, and smaller also.

15. *Chamæspartum montanum triphyllum.* Dwarfe Broome of Naples.

This small Broome hath wooddy stalkes from whence shoote forth rushlike branches set at distances with three small whitish hairy leaves as small as those of Sothernwood, at the toppes whereof stand yellow flowers and hoary hairy huskes succeeding.

The Place.

The first groweth plentifully in many places of our owne Country, as well as in *Spaine*, *Italy*, *France*, and *Germany*: The second is found in some places about *Mompelier* in *France*, and *Friburg* in *Germany*: The third groweth in the Iland of the *Turrhene* Sea called *Ilva*: the fourth in some places of *Spaine* only: the fift is found in many places of our own Land: the sixt groweth in *Candy*, as *Alpinus* saith, and *Bauhinus* saith he had it out of the garden of the Noble *Contarenus* at *Padoa*: the seaventh groweth in many untilled or unmanured grounds of our land, as also by the hedges, and way sides, and in some meddowes also plentifully, where they keepe it for the profit is made thereof, even as of Broome: the eight *Clusius* saith he found in no other place, than onely in the kingdome of *Murcia* in *Spaine*, and there also he saw the Broome rape, growing from the roote thereof. The ninth groweth in many dry unmanured sheepe pastures, in *Narbone* of *France*, as *Pena* and *Lobel* say: the tenth *Clusius* saith, he onely found in some rough dry grounds in the Kingdome of *Valentia*: the eleventh was found in *Spaine*, neere unto a place called *Aquas blancas*, as *Bauhinus* from Doctor *Albinus* saith: the twelth in many places of *France*, *Spaine*, and *Italy*: the thirteenth is common as *Clusius* saith, in the dry sandy grounds, of both the contries of *Castile*: the foureteenth he saith he onely found in the Island of *Gades* or *Cales*: the last *Columna* saith he found on the hils in *Naples*.

The Time.

All these flower some earlyer or later in the sommer moneths, and give their seede ripe before winter, but the *Spanish* kindes are for the most part the latest that perfect their seede.

The Names.

Genista or as some write it *Genesta*, *agenuum flexilitate & ad nexus utilis haud dubiè nominatur, vel potius quia genibus medeatur dolentibus*; and therefore diverse in former times did take *Spartium Dioscordis*, to be the *Genista latinorum*, and even *Plinye* also in his time was doubtfull whether it were not so, for *Spartium* as *Dioscorides* saith *vinculi usum in alligandis vitibus prebeant*, and therefore the controverſie among diverse writers, endured untill *Ruellius* his time, who refuted the opinions of *Hermolaus* and *Marcellus*, that tooke them to bee both one, but *Pena* and *Lobel* since them in their *Adversaria*, call [the *Genista Scoparia* (which is our common Broome) *Spartium*, as if there were no difference, when as yet they appoint the *Spartium*, or *Spartum Hiſpanicum & Narbonense*, to be the true *Spartium* of *Dioscorides*, which many call also *Genista Hiſpanica*, *Italica* and *Africana*. Many likewise mistooke the *Spartum Iuncus*, which is a kinde of Rush, wherewith in *Spaine* they make frailes or baskets, to put Rayſins, Figges, and other things in, to be the *Spartum frutex*, deceived by the name onely, without

out further examining the matter. But now in these dayes, it is evidently knowne to all that are conversant in *Herbarisme*, that *Spartium* or *Spartium* as some write it, is one plant by it selfe, and *Genista* another, although the one be somewhat like the other; and that *Spartum frutex* is differing from the other *Spartum* called *Iuncus*; the first here set downe is generally by all writers called either *Genista vulgaris* or *Genista angulosa*, or *Scoparia vulgi*. *Lonicerus* onely calleth it *Genista minor seu non aculeata*, and *Cæsalpinus Genista quadrato junco prima*: the *Rapum Genistæ* of all sorts (I meane both of this Broome, and of the other Dyers weede and of the hedge sides, &c.) are called of *Clusius Hæmoderon*, according to *Theophrastus lib. 8. c. 8.* or *Leimoderon* as others have it, and of most *Orobanche*, although according to *Theophrastus* there is another *Orobanche* that riseth up among the *Ervum* or *Orobus*, and strangleth it as Tares doe Wheate, whereof came the name: the second is called by *Lugdunensis Genista minima*, and by *Bauhinus Genista ramosa foliis Hyperici*; the third is also called by *Lugdunensis Genista Iluensis*; the fourth is by *Tabermontanus* called *Genista alba*, and by *Gerard* after him *Genista tenuifolia*. The fift is the same that *Clusius* calleth *Chamægenista Pannonica 7a.* and *Gerard Chamægenista Anglica*, howsoever the figures of them seeme diverse: it is likely also to be the *Genistæ minoris species* of *Thalius*, and of some is termed *Chamæspartium*: the sixt is not onely remembred by *Bauhinus* in his *Prodomus & Pinax*, by the same name in the title, but called also *Spartium Creticum*, by *Alpinus in lib. de plantis exoticis*. The seaventh is generally called *Genista tinctoria* or *infectoria*, and *Genistella tinctoria*. *Flos tinctorius* of *Bruhfelsius* and *flos tinctorius* of *Fuchsius*, *Lonicerus* and *Castor Durantes*; *Tragus* tooke it to be *Ferula*; *& Leonicerus Lysimachia*. *Anguillara* and *Cæsalpinus Corneola*, *Cordus* calleth it *Chamælence*, and *Bauhinus Genista tinctoria Germanica*, in *English* Greene-weede, or Dyers weede because the Dyers doe dye a yellowish greene colour with the leaves and stalkes hereof, and therefore provide thereof good store. The eight is called by *Clusius Genista tinctoria Hispanica*, of *Lobel Genistella infectoria*. *Lugdunensis* thinketh it may be the *Oricella* of *Thevet*; some take it to be the *Lutea herba* that *Plinye* mentioneth *in lib. 33. c. 3.* but therein they are much deceived, as I shall shew you when I come to speak of that hearb, *Bauhinus* calleth it *Genista tinctoria frutescens foliis incanis*. The ninth is called by many *Chamægenista*, *sagittalis*, by *Camerarius Chamægenista sagittalis Pannonica*, by *Clusius Chamægenista altera*, of *Pena & Lobel Genistella graminea montana*, *Gesner in hortis Germaniæ*, calleth it *Genista minima*, *& Cordus Genista angulosa*. *Tragus*, *Lonicerus*, *Lugdunensis*, *& Tabermontanus* call it *Chamæspartium*. The tenth is called by *Clusius Chamægenista peregrina*, *& sodoth Lugdunensis*. *Lobel* calleth it *Genistella pinnata altera Hispanica*, *Camerarius Genista pumila*, *Dodonæus Genista humilis*, *Tabermontanus Chamæspartium tertium*, and *Bauhinus Chamægenista caule foliato*. The eleventh is called by *Bauhinus* in *Prodromo Genistæ Hispanicæ affinis*, and in his *Pinax Sparto primo affinis* but because it doth participate both with *Spartum* in some things, and *Genistella montana* in others, as I have shewed in the description; I thought good to place it betweene them both, and call it *Pseudo Spartum Hispanicum*, in *English* bastard *Spanish* Broome. The twelfth is called *Spartum Hispanicum*, and *Genista Hispanica*, *Spartum Græcorum*, and *Spartum frutex*. The thirteenth is called by *Clusius Spartum 2 Hispanicum*, by *Lobel Spartium Hispanicum alterum flore luteo*, by *Dodonæus*, *Spartum frutex majus*. and by *Bauhinus Spartium alterum monospermon semine reni simili*. The fourteenth is called by *Clusius Spartum Hispanicum tertium*, by *Lobel Spartium 2 flore albo*, by *Dodonæus Spartum frutex minus*, and by *Bauhinus Spartium tertium flore albo*. The last is called by *Columna Spartum Æquicolorum minimum montanum triphyllum*. The *Italians* call *Spartum Spartio*, and *Genista Genistra*, the *Spaniards* the one *Spartio* and the other *Genistra Giesta* and *Geisteira*: the *French Geneste* and *Geneste de Espaigne*, the *Germanes* call *Spartum Pfrimmen*, and *Genista Ginst*; the *Dutch Brem* and *Spanische Brem*, and so we in *English* Broome and *Spanish* Broome.

The Vertues.

Our ordinary Broome doth much offend the stomacke and heart, if Annisseedes, or Fennell seedes, or Roses, or Masticke be not given with it, being taken inwardly: the juyce or decoction of the young branches, as also of the seede, or the powder of the seede taken in drinke, purgeth downewards, and draweth from the joynts, flegmaticke and watery humors, whereby it helpeth those that are troubled with the dropsie, the goute, the sciatica, and the paines in the hippes and joynts: it provoketh strong vomits also, and helpeth the paines of the sides, and swellings of the spleene, cleanseth also the reines, kidnies, and bladder of the stone engendred therein, and hindreth the matter from encreasing, or growing to be a stone therein againe, and provoketh urine abundantly: the continuall use of the powder of the leaves and seede, doth cure the blacke laundise: the young buds of the flowers are gathered, and kept in brine and Vinegar to be eaten all the yeare after, as a sallet of much delight, and are called Broome Capers, which doe helpe to stirre up an appetite to meate, that is weake or dejected, helpeth also the obstructions of the spleene, and to provoke urine that is stopped, opening and cleansing the uritory parts, by the use of them very effectually: The distilled water of the flowers is profitable for all the same purposes, it helpeth also surfets, and altereth also the fits of agues, if 3 or 4 ounces thereof, with as much of the water of the lesser Centory, and a little Sugar be put therein, and taken a little before the accesse of the fit, first being layd downe to sweate in their bed: the oyle or water that is drawne from the ends of the greene tickes heated in the fire helpeth the tooth-ach: There is a lye made of the ashes of Broome, which by art may be made as cleere as Claret wine, which *Camerarius* commendeth to be profitable for those that have the Dropsie. The juyce of the young branches made into an oyntment with old *Axungia*, that is Hogges grease, and anointed: or the young branches bruised, and heated in oyle or *Axungia*, and layd to the sides that are pained, either by the wind as in stitches and the like, or in the spleene, easeth them in once or twise using it: the same also boyled in oyle, is the safest and surest medicine to kill lice, and other vermine growing in the head or body, of any: the same also is an especiall remedy for joynt aches, and swollen knees, that come by the falling downe of humors upon a contusion or puncture; The Broome Rape, is commended by some to be as good a sallet as *Asparagus*, taken when they are young, and eaten either raw or boyled, but it is much more bitter: If Kine feede thereon it maketh them sooner desire the bull, and therefore in *Spaine* they call it *yervatora*: the decoction thereof in wine is thought to bee as effectuall in helping to avoyd the stone in the Kidneyes and bladder, and to provoke urine as the Broome it selfe: the juyce thereof is accounted a singular good helpe to cure as well greene wounds as old, and filthy sores, and malignant Vlcers: the insolate oyle, wherein there have beene three or foure repetitions of infusion, of the toppe stalkes with flowers strayned and cleered, cleanseth the skinne of all manner of spots markes and freckles that rise by the heate of the sunne, or the malignity of humors; All the other sorts of lesser

Broome, have the like qualities, and may be conducible for the ſame diſeaſes, but every one in his owne proper exiſtence, ſome being weaker or ſtronger than other. The *Spaniſh* Broome over and above the ſame properties, as alſo to purge downewards and to provoke vomits, eſpecially the ſeede taken to the quantitie of a dramme in mead or honied water, purgeth by vomit as Hellebor doth, without trouble or danger: the flowers thereof boyled in meade and drunke, or the pouder of them taken in a reare egge, or the jayce of the young branches drunke faſting, doe cure the Kings evill and the hippe goute, and an oximell made of them and the ſeed, often uſed, breaketh and healeth all impoſtumes of the Spleene, by cauſing the corrupt matter to void it ſelfe upwards often, and drawerh alſo flegme and raw humors from the joynts.

CHAP. XXXIII.

Caſſia ſolutiva. Purging *Caſſia.*

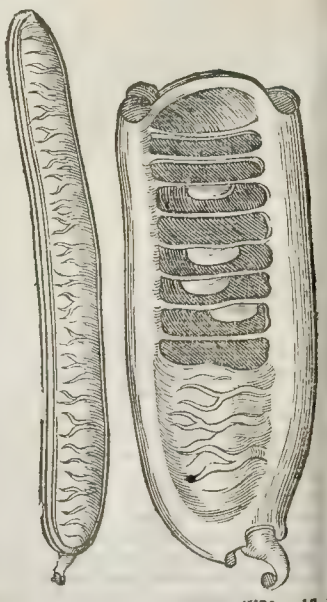
IN former times there was onely one ſort of purging *Caſsia* knowne, but there hath beene ſincē brought to our knowledge an other, whereof I meane to give you the relation in this place.

1. *Caſsia ſolutiva vulgaris.* The ordinary purging *Caſsia.*

The purging *Caſsia* tree groweth in *Aſſiria* about *Babylon*, and in the *Indies* to be a wonderfull great tree, ſpreading both in height and breadth very much, but in *Arabia*, *Egypt* and *Italy* much leſſe, yet growing to be a tree of a large ſize or bigneſſe, whoſe wood is ſolid and firme, yellowiſh towards the ſappe or outſide, and blackiſh like *Lignum vitæ* at the heart, covered with a ſmooth ſoft and aſh coloured barke, very like unto the Wallnut tree: the branches are not very great, and but thinly ſtored with winged leaves, conſiſting of eight or tenne leaves, for the moſt part five ſtanding on each ſide of the ſtalke, without any odde one at the end, each whereof is larger and longer pointed than the leaves of the *Carob* or ſweete Beane tree, that followeth in the next Chapter to be deſcribed: the flowers are yellow and large, many growing together on a long ſtalke, and hanging downe ſomewhat like as the *Laburnum* or Beane *Trefolie* doth, conſiſting of foure leaves for the moſt part, or ſometimes of five leaves, with many greeniſh threads in the middle, ſtanding about a ſmall long crooked umbone or horne, of a very ſweete ſent, eſpecially in the morning, before the Sunne ſhine upon them, but grow weaker in ſmell, as the Sunne groweth hotter upon them: the ſmall horne in the middle of the flower, groweth to be the pod, which while it is young is greene, but in time commeth to be of a darke purple colour, and being ſuffered to grow longer, or taken at the time and kept turne blacke, being of divers ſizes both for length and greatneſſe, ſome being ſmaller and ſome greater, ſome a foote, or a foote and a halfe, or two foote long, with a hard round wooddy wrinkled ſhell, not very thicke or very hard to breake, with a ſeame as it were, or liſt all the length thereof at the backe, eminent to be ſeene and with another ſmall one againſt it upon the other ſide, which cauſeth it to be eaſily broken into two parts by the middle long wayes, and

1. *Caſſia ſolutiva vulgaris.*
The ordinary purging *Caſſia.*

2. *Caſſia Braſiliana.*
The great *Caſſia* of *Braſill.*



diſtinguiſhed

distinguished inwardly into many skinny wood-like partitions: on both sides of which partitions grow a soft blacke substance like unto hony and very sweete; which is that part onely that is to be used, and no part thereof else beside: betweene these cells or partitions lie round and flat gristly seed, of a darke browniſh colour, very like unto the seede of the Carob tree: the rootes are great, and grow deepe in the ground: the choise of the best cods or canes, is that they be moist within, and that the seeds doe not rattle when they are shaken.

2. *Cassia solutiva Brasiliana.* Purging *Cassia* of *Brasill.*

There is another sort of *Cassia*, that hath beene brought from *Brasill*, which differeth not much from the former, either in the forme of the tree or fruite; for the tree it selfe groweth (as by relation it is affirmed) great, and hath such like winged leaves as the former hath: the fruit onely or chiefely differeth from the other in this, that it is about two foote long, (especially such as we have seene) and more than two inches broad, and about an inch and a halfe thicke; whose barke or outward rinde is much harder, thicker, browner and flatter than the other but with great wrinkles or furrowes crossing it, as the other hath; the seames likewise at the backe, and against it are greater and more eminent, and the seede lying in the cells, larger and flatter also, the pulpe of blacke substance lying upon the wooddy skinnes, is as sweete as the other, but of more force in working by the one halfe at the least.

The Place.

Ths first groweth plentifully in *Egypt*, but yet not naturally, for it is onely in their orchards where it hath beene planted: for it is generally held to be first brought thither, and to *Arabia* also, from *Syria* and *Armenia*, and they from the East *Indies*: it groweth also in the West *Indies*, first planted by the *Spaniards* in *Hispaniola* in so great abundance, that from thence the most store that is spent in Europe is brought: The other groweth in *Brasill*, from whence it was brought into these parts.

The Time.

The first flourisheth chiefely in *June*, and the fruite hanging upon the tree all the yeare, are gathered much about the time of the flowring: for the tree holding his greene leafe all the Winter, hath usully both blossomes and greene fruite, and ripe all as it were at one time. The other hath not beene hitherto further described or knowne.

The Names.

Casia or *Cassia* is a word of divers significations, for it is either the *Aroma* of the ancients, *Theophrastus*, *Dioscorides*, *Galen*, &c. like unto *Cinamon* called *Cassia lignea* in the Apothecaries shoppes, or this *Cassia fistula*, or else a shrubbe called *Cassia poetica* or *Monspeliaca*, but it is very likely that this tree, nor his fruite was knowne to any of the antient Greeke Writers, unlesse as *Cordus* saith it might be the *Faba Indica* of *Aristobulus* and some others; but the later Greeke Authors, as *Actuarius*, and others since his time, called it κασσια μέλαινα, *Cassia nigra*, from the *Arabians*, who first brought in the use thereof, and called it *Cassia fistula*: and because it was not knowen where else it did grow then in *Egypt*, it was called by many *Siliqua Egyptia*, and is thought by divers that it may be the *Siliqua* called *Ficus Egyptia* by *Theophrastus* in his first Booke and 18. Chapter: and of others *Cassia solutiva*: the usuall name is *Cassia fistula* in all Apothecaries shoppes: but why the name of *Cassia* should be given to this treee or his fruite, is not easie to know or learne: *Pena* and *Lobell* in their *Adversaria* thinke it might come from the Greeke word κασσος *quod coriaceum vocant*, because the cods or canes are like leather; but I verily beleeve the *Arabians* (and it may be those from whom the *Arabians* had it) called it *Cassia* in regard of the sweetenesse of the flowers, like unto the *Cassia aromatica* or *odorata*; and *Solomon* in the 4. Chapter and 14. verse of the *Canticles*, maketh mention of this *Cassia* tree, as I take it, for in the Latine Translation of Saint *Jerome*; I find it is *fistula*, which the Translators make to be *Calamus* in English: And it is not improbable that the true *Cassia aromatica*, or *odorata*, was called *Fistula*, because the peeces of the barke were rowled together, and hollow like a pipe, even as Cinamon (which is *congenor* if not *idem*) is, which in some countries is called *Canella*; and I finde that the people both in *Italy* and in *Spaine*, doe call the *Cassia aromatica* by the name of *Canella*, yet to this day, either from the forme of Cinamon, which is like unto a pipe, or from *Canna*, a reede or Cane; as I thinke rather, and the diminitive thereof, is *Canella* a small Cane reede. They are much deceived that thinke the barke of the pipes or fruite of this *Cassia fistula*, is of any more force than a dry chippe, to procure womens courses, &c. as some in former times did, for the error is grosse: The other is called by *Lobel Cassia siliqua Brasiliana purgatrix compressa*, who first gave us the knowledge thereof in his *Pharmacopœa Rondeletiana*.

The Vertues.

The inner blacke substance or pulpe, clensed from the shells, seeds, and skins that grow together with them, is the onely medecinall part that is used, taken by it selfe in balls, or bits, of in potions or drinkes, and is very effectuall to purge the reines, kidneyes and bladder, for it tempereth the heate of them, cleanseth the humors that lie therein, both by urine and the stoole, and thereby giveth much ease to those that are troubled with the stone, if they use it often: taken with Rubarbe and a few Anniseed and Licoris to correct the windinesse thereof, it is an especiall good medecine in *gonorrhœa* to clense the reines, that other helpes may be the more availeable afterwards, as also to clense the liver, the stomach and mesentery veines, from choller and flegme, cleareth the bloud and quencheth the heate thereof, and is therefore profitable in all hot agues: it is very effectuall against all Rheumes and sharpe distillations, and against chollericke and melancholike diseases: it is often used in all the kindes of pectorall diseases, as old coughes, shortnesse of breath, wheesings, and the like, if it be taken with Agaricke as some advise: it is not so convenient for those that have moist, weake and slippery bowells, unlesse it be given with *Mirobalans*, Rubarbe, Spicknard, or Masticke: else it may be safely given to all sorts of people, ages and conditions, and to prevent the danger of such lubricitie, divers doe use to give it with *Hiera picra*: The young cods taken while they are small and greene, boyled a little and then laid in the shadow a while to drie, and after boyled in Suger or Hony, doth purge the body, as the pulpe or blacke substance, and is a delicate medecine fit for tender and weake stomackes, that abhorre all manner of Phisicke; and here of the usuall quantitie is three or foure ounces to be taken at a time for elder persons, and one ounce for the younger: the use of *Cassia* outwardly either in ointments or plaisters, is much commended of many for all hot pimples, and other eruptions in the skinne, and also to ease the paines of the gout and hot inflammations, and paines in the joynts. The

other

other ſort of *Caſſia* is more effectuall in purging, for it hath beene tryed by experience, that one ounce hereof, is as forcible as two ounces of the other, and is effectuall to all the diſeaſes aforeſayd.

CHAP. XXXIIII.

Siliqua dulcis ſive Ceratonia. The ſweete Beane or Carob tree.

OF this kind of ſweete Beane or Carob tree, there hath beene one other alſo lately found out, and made knowne to the world by *Pona*: for the ordinary ſort, being well knowne to moſt, eſpecially in *Spaine* and *Italy*, and other the hotter Countries of the Eaſt, is remembred by the ancients.

1. *Siliqua dulcis ſive vulgatior.* The ordinary ſweete Beane or Carob tree.

The *Carobe* or ſweete Beane tree that hath beene of longeſt knowledge to all, groweth in the hot Countries, as *Spaine* and *Italy*, to be a very great tree covered with an aſh coloured barke, ſpreading very much in breadth with very faire great branches, the younger being reddiſh at the firſt, whereon doe grow ſparſedly winged leaves, very like unto the leaves of the purging *Caſſia* tree, but that they are rounder at the ends or points, and ſomewhat harder in handling, of a darke greene colour on the upperſide, and of a paler greene underneath: it beareth a long catkin in the winter, like unto that of the Wallnut, which in the ſpring time openeth into many darke purpliſh flowers, and afterwards bringeth crooked cods, of the bigneſſe of a large beane cod, in ſome larger in others ſmaller, greene at the firſt, and of a browniſh colour, when they are ripe; wherein are flat and round ſeedes, very like unto thoſe of *Caſſia*, and are of an unpleaſant taſte, while they are freſh, but gather more ſweeteneſſe being kept to be dry: the ſhell thereof although hard is eaten, aſwell as the inner ſubſtance; which that I may uſe the words of *Plinye*, is neither of a fleſhie wooddy or skinnie ſubſtance, but of them all as it were mixed together. In the hotter countries of *India* &c. as *Strabo* in his Geoghraphie writing of the trees of *India* doth report, there is a certaine thicke ſubſtance lying within theſe cods, which being taken forth ſerveth the *Indians*, and thoſe other people where they grow in ſtead of Sugar or Honey, to preſerve the young cods of *Caſſia*, *Gingar*, *Mirobalans*, and other fruites withall.

2. *Caroba ſive Siliqua ex Guinea purgatrix.* The Carob or purging Beane of *Ginnye*.

The *Carob* or purging Beane of *Ginny*, groweth no doubt in his naturall place, to be a great tree, but in the leſſe warme Countries, as *Italy* whereunto it was firſt brought, it cannot doe ſo: but ſheweth by the growing that it much differeth not from the former, bearing his leaves after the ſame manner; the fruite (for we have no knowledge of the flower as yet) is crooked thicke and ſhort (and as *Pona* ſaith, ſomewhat like an *Anacarde* or *Cajous*) about three inches long, of a browne colour on the outſide, very like unto the other, having a bowing or roundneſſe all the length of the backe, and an eminence or liſt as it were in the hollowneſſe: within which is foure or five ſomewhat rounder and not ſo flat ſeedes, more pointed below and round at the head: the taſte is more ſharpe and quicke, even almoſt burning the throate, which peradventure is but from the nature of the hot Country, where it grew and may grow more milde, after it hath beene inured unto a more temperate climate.

Siliqua dulcis vulgatior.
The ordinary ſweete Beane or Carob tree.

The Place.

The firſt as is before ſayd groweth in all the South and Eaſt Countries, as *India*, *Armenia*, *Syria*, *Arabia*, *Egypt*, &c and in *Greece*, *Spaine*, *Italy*, &c. frequently in many places, as both *Matthiolus* and *Cluſius* make mention: the other is originally from *Ginny*, and is ſet forth onely by *Pona* of *Verona*, in his *Italian* booke, who had it from *Signor Contarni* of *Venice*.

The Time.

The firſt flowreth in the very beginning of the ſpring, and

1. *Flores & fructus Siliquæ dulcis vulgaris.*
2. *Et ex Guinea.*

the

the fruite is riper in the hot time of the Sommer onely: of the other there is no further knowledge as yet, than of the fruite.

The Names.

It is called in Greeke κερατια, *Ceratia* of *Dioscorides*, *id est*, *siliqua*, & κερατωνια & κερωνια *Ceratonia* & *Ceronia*, *quasi cornuta Siliqua*, of *Galen*, *Æginet* and others, becauſe the cods are crooked, or bowing inwards like a ſithe or horne: But that *ſiliqua* whereof *Theophraſtus* maketh mention in his fourth booke and ſecond chapter, and which the *Ionians* called *Ceronia*, and ſome as he ſaith *ficus Ægyptia*, but falſely, with a white flower and fruite growing from the body of the tree, more plentifully than from the branches, cannot bee this *ſiliqua*, but ſome other, even as *Lugdunenſis* and others affirme alſo: *Plinie* calleth it *Siliqua dulcis* and ſo doth *Alpinus* and others: in ſome Apothecaries ſhops beyond Sea *Xylocaracta* or rather *Xylocaratia*, the *Arabians* call it *Charnebium*, in *Italy* they call it *Carobe* and *Carobole*, and in *Naples Salequa*, corruptly, from *ſiliqua* as *Matthiolus* ſaith, the *Spaniards* call it *Algarrovas*, the *Germaines* and *Dutch* call it Saint *Ioans brot*, that is, Saint *Johns* bread, ſuppoſing that Saint *Iohn* fed upon theſe fruites, and wilde honey, while he did abide in the wilderneſſe of *Iudea*, as in *Matth.* 3. 4. but they are much deceived, for the word in the Hebrew text (as *Junius* and *Tremellius* doe note upon the 22 *verſ.* of the 11. *chap.* of *Levitticus* is *Arbis*, (whereof there were foure kindes, of each whereof it was lawfull for the *Iſraelites* to eate) tranſlated into Greeke ακριδες, in Latine *Locuſtæ*, which are kindes of graſhoppers, peculiar to thoſe Eaſterne Countries, much differing from ours: but this *ſiliqua* or ſweete Beane tree, is the ſame mentioned in the 15 *chap.* and 16 *verſ.* of the Goſpell according to Saint *Luke*, whereof the ſwine fed themſelves, and the prodigall child would faine have eaten of them to ſtay his hunger, but could not have them: for in all theſe Countries where they grow, the poorer ſort of people doe often eate them, and the hogges for the moſt part conſume the reſt: the ſeede of this Beane, was that kinde of weight in ancient times called *Karat*, and among the goldſmithes a Carret, weighing ſixe graines formerly; although in theſe dayes they account it to be but foure.

The Vertues.

The fruite while it is freſh and new gathered, helpeth to purge the belly, but being dryed doth rather binde it, and is then more beneficiall to the ſtomacke, than while it is freſh, becauſe it ſomewhat troubleth it with the evill taſte, and hard digeſting thereof: the ſweete ſubſtance within them, is often alſo uſed as honey, both to looſen the belly, almoſt as much as the extracted pulpe of *Caſſia*, and is alſo good for the inflammations of the reines and backe to temper the heate, and is effectuall in the diſeaſes of the cheſt, as coughes and ſhortneſſe of breathes as *Caſſia* is, which things alſo the decoction of the cods, performeth very well: *Galen* in his ſecond booke of *Aliments*, condemneth the uſe of them for meate, ſaying they are hard of diſgeſtion, and are not eaſily avoyded forth of the body: and in his ſeventh booke of ſimple medicines, hee ſaith they are of a drying and binding quality, although they conteine in them ſome ſweeteneſſe, and that they are ſomewhat like unto Cherries, that being freſh they looſen the belly, and being dry binde it, becauſe the moyſt ſubſtance being conſumed, the thicker eſſence remaineth.

CHAP. XXXV.

Tamarindus. The Tamarind or ſower Beane tree.

THe Tamarind or ſower Beane tree groweth to be as great as a Plum tree with many branches thicke ſet with pale greene winged leaves, that is many ſet together on both ſides of the middle rib but ſmaller, then either thoſe of the *Caſſia* or Carob tree, having alwayes an oddeone at the end, which uſually cloſe themſelves together, both at the ſetting of the ſunne, and upon raine, and open againe at the riſing thereof, and faire weather, of a ſower or acide taſte: the flowers are ſomewhat large and white, like unto flowers of the Orange tree, conſiſting of eight leaves, ſmelling very ſweete, having foure ſmall white threds, ſtanding in the middle about the umbone, which after groweth to be the fruite, and when it is ripe, is much larger, than any kidney beane cod, ſome greater and leſſe than others, as in all ſorts of fruite, ſomewhat bending or crooked, wherein is contained a blacke ſubſtance, not diſtinguiſhed into cels, as the *Caſſia ſolutiva* is, but the ſeede lying diſperſed among the pulpe, hath diverſe bigge and long ſtrings running through it, of a very acide ſowre or ſharpe ſweete taſte, very pleaſing to the palate and ſtomacke: the ſeede or kernels are greater than thoſe of Caſſia, and as it were ſquare and ſomewhat flat alſo: the tree never looſeth his leafe, but will endure no cold, as hath beene often tryed in thoſe colder Countries.

The Place.

This tree naturally groweth in many places in the Eaſt Indies as *Garcias* ſaith, it is onely nouriſhed as a ſtranger both in *Arabia* and *Egypt* in their Orchards.

The Time.

We have no certaine knowledge of the time of flowring or the bearing of ripe fruite.

The Names.

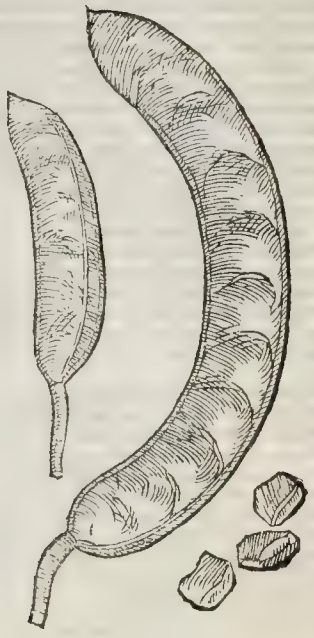
It is called by the *Arabians* (for none of the ancient Greeke writers hath made any mention of it) *Tamarindus* that is the Date tree of India, for *Tamar* ſignifieth a Date with them, and of the later Greeke writers *Oxyphenicon*, that is the ſower Date tree; but both of them very unfitly, for it may very well be perceived that it is nothing like unto any kinde of Date tree, *Lacuna* following *Meſues*, calleth it *Dactylus Indicus*, of the Greeke word *dactylus* that ſignifieth a finger, which the fruite doth very well reſemble, being bowed or crooked like unto a bowed or bended finger: ſome take it to be *Pala* of *Pliny*, whereof he maketh mention in his 12 booke and 6. chap. ſome againe thinke that it differeth nothing from the *Palmulæ Thebaicæ* of *Dioſcorides*, the Dates of *Thebes*: and becauſe it ſhould not want an *Engliſh* name, according to the property thereof, I have called it the ſowre Beane tree, for that the fruite or cod is ſo like a great kidney Beane cod.

The Vertues.

The inward pulpe of the *Tamarind* is very effectuall to purge choller, and therefore is of great good uſe in all hot or peſtileptiall agues, it openeth the obſtructions both of the liver and ſpleene, and therefore is profitable againſt

Tamarinda.
The Tamarinde or ſower Beane tree.

Tamarindi fructus cum ſemine.
The cod and ſeedes of the Tamarinde tree.



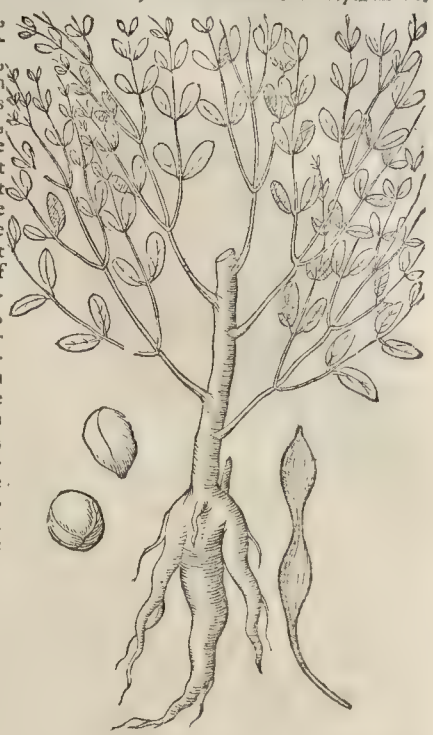
gainſt all breakings out of the skinne, which come of the heate of bloud, or of a ſharpe or ſalt water, running betweene the fleſh and the skinne, as itches, ſcabbes, leprye, and the like, and helpeth thoſe that are troubled with the Jaundies, and the ſtopping of the Spleene: it doth exceedingly helpe to aſſwage the thirſt, if an ounce thereof be diſſolved in faire water, and a little Sugar mixed therewith, or taken of it ſelfe; for the people of the hot countries, doe uſually eate thereof in their long travells to quench their thirſt, which they were never able to indure without it, to refreſh themſelves in the great heate, both of the Summer, and of thoſe drie places, where no water is to be had. It cooleth all inflammations, both of the liver and of the ſtomacke, as alſo of the reines and backe, and helpeth the *Gonorrhœa*, or running of the reines: taken with Burrage water, it quickneth the dulled ſpirits by melancholy, and ſomewhat mittigateth the fits of frenſie and madneſſe: it doth ſtay all rheumes and diſtillations, being taken with ſome Suger and the water of Maiden haire: if a ſmall quantity of the pulpe of *Tamarinds* and *Caſſia*, and the pouder of Rubarbe be mixed together, it maketh a delicate medicine to purge the ſtomacke and liver, and is very effectuall to helpe to expell all hot or burning agues, and procure an appetite: it ſtaieth alſo vomitings, and taketh away the loathing of meate: the leaves as well as the pulpe ſerve inſtead of vinegar, with many of the *Indians*, *Ethiopians*, *Arabians* and others, they give the leaves alſo to children for the wormes, and both leaves and pulpe ſerve outwardly to coole all hot inflammations, and wheales, pimples, and ſuch like. The young cods of the Tamarinds are preſerved in *Arabia* with the hony of the Carobs, or with Sugar, which ſerve for all the purpoſes before recited.

CHAP. XXXVI.

Nux Ben ſive Glans unguentaria. The oyly Nut Ben.

THis oyly Nut Ben hath undergone much controverſie, and contrarietie among thoſe Authors that have antiently written thereof, as namely *Dioſcorides*, *Theophraſtus*, *Pliny* and *Galen*: for *Dioſcorides* ſaith that the tree is like unto *Tamariske*, *Theophraſtus* ſaith it hath leaves like unto Mirtle leaves, *Pliny* ſaith like unto the leaves of *Heliotropium* or Turneſole: but that I may compoſe this controverſie and end this contrarietie betweene them, I will ſhow you here the true deſcription and figure thereof, ſuch as Doctor *Tobias Aldinus* the Cardinall *Farneſius* his Phiſition at *Rome* hath ſet it forth being well growen, for that which *Honorius Bellus* a famous Phiſition, living long in *Candie* had growing with him from the Nuts, which he planted, (and ſent the figure thereof to his friends in divers places, & eſpecially to *Iohannes Pona*, an Apothecary in *Verona*, who in the deſcription and catalogue of the names of thoſe plants that grow upon Mount *Baldus*, which he ſet forth himſelf, hath inſerted the figure hereof, as he

Nux Ben sive Glans unguentaria cum siliqua integra, & nux exempta seorsim.
The oyly nut Ben with the whole cod, and the nuts taken out and set by themselves.



he received it from the said *Bellius*) was but a young plant, of not above a yeare or two's growth. *Theophrastus* in describing the tree growen great, saith it groweth crooked, and not straight upright spreading rather in breadth than in height, whose leafe is like those of Mirtles, but longer as by this figure that you here see you may well perceive, and nothing like unto those of *Tamarike*, and that the comparison of *Pliny* in the leaves like Turnsole, is not much amisse, for if they be both compared they will not be found much to differ in the forme, I meane Turnesole leaves, from the larger Mirtle leaves, but the difference betwixt *Dioscorides*, and *Theophrastus* riseth as it is thought from the errour in the Writers out of the coppie of *Dioscorides*; the Greeke word in *Dioscorides* and *Theophrastus*, being so neare and like the one unto the other, that it might easily be mistaken, which are μυρίκη in *Dioscorides Myrica, sive Tamariscus* & μύρσινη *Myrtus* in *Theophrastus*, yet it is more probable that there is no errour in the Text of *Dioscorides*, in that his comparison of this tree unto *Tamariske* is not unto the forme of the leaves, as *Theophrastus* his is, but unto the forme of the whole body, and growing thereof: the true description therefore hereof, as *Aldinus* hath most acurately set it downe is thus. The first two or three yeares saith he, it sprang up and withered or perished downe every Winter to the roote, and rose againe a fresh every Spring, but after it became three or foure yeare old, it grew more woddy and more likely to abide without decaying: it rose up yearely after the first, with one stemme shooting forth branches of winged leaves, or rather winged branches of leaves, the barke being whitish as the leaves are also, but they are composed after such an order as no other tree doth the like; for the branches rise up with the stemme or body, divided into sundry other smaller twigges no bigger than rushes, set with two leaves at severall spaces distant farre in funder, ending in small long points like haires, but have no eyes or buddes at the feete of the leaves, as the small branches of all other trees have, which sheweth that the whole branched stalke or divided branch, is but as one winged leafe: the leaves first falling away, leaving the branches bare, which then shew like unto ordinary or *Spanish* Broome when it hath lost the leaves; and after the leaves the stalkes likewise perish that held the leaves wholly unto the very stemme, and therefore sheweth to be but as one winged leafe of a tree, as in the Ash, Wallnut, &c. the lowest of these leaves are somwhat round pointed like the herbe *Heliotropium Sunturner*, those on the middle of the branch more sharpe pointed like unto Myrtle leaves, and the uppermost smallest somewhat like unto Knotgrasse: it hath not borne either flowers or fruit in our Christian countries as yet so far as I can heare: the roote is thicke, long, white and tuberous as it were, yet ending in some sprayes being not much wooddy but rather fleshie and tender: but the nuts or fruits, such as have been brought over to us enclosed in their husks, as also out of their husks are expressed here by themselves: that is, that many, of them grow single in the husks & some two together, and that the nuts enclosed in every huske each by it selfe have their place bunched forth where each of them lie, and straightned betweene them both, the lower and upper end of the huske being small and sharpe pointed, and about an handbreadth long, round and of a darke ashcolour on the outside, and somewhat reddish on the inside, of the substance of leather, lither or ease to bow, rugged on the outside with many long streakes in it, but smooth on the inside: the nuts themselves are three square, for the most part, covered with a whitish soft and somewhat tough wooddy shell, wherein the white kernell lieth, which is not altogether insipid, but somewhat sharpe in taste and oylie withall, causing a kind of loathing upon the tasting almost ready to provoke vomiting; out of which is pressed an oyle, as *Dioscorides* and *Galen* affirme, like as is pressed out of Almonds; and not from the shells or husks as some formerly supposed, for it is commonly knowne to many here in our owne land, and to my selfe also, who have pressed as good ovle out of the kernells of the nutts, as any hath beene brought from beyond seas: and therefore *Theophrastus* was herein much mistaken, or at least misinformed, that said the oyle that served for sweete oyles and ointments, was drawne from the huskes and shells and not from the Nutts themselves, and *Pliny* also who saith the same doth erre in that, although he saith that an oyle is drawen out of the nuts, which the Physitions doe use: for the oyle to both uses is one and the same.

The Place.

These trees grow in *Syria*, *Arabia*, *Æthiopia* and *India*, and although some say in *Egypt* also, yet I thinke *Prosper Alpinus*, who was curious to set downe all the rare trees, and plants unknowne in *Italy* that grew there, would have given us some knowledge thereof, among other *Egyptian* plants, if they had beene there in his time.

The Time.

We have as I sayd before, no knowledge of the time of flowring hereof.

The Names.

It is called in Greeke by *Dioscorides*, *Galen* and others Βαλανος μυρεψικη *Balanus Myrepsica*, that is *Glans Unguentaria*,

guentaria, and by *Lobel Glans unguentaria cathartica ſiliquata*: by *Theophraſtus* Βαλάνῳ onely, and by *Pliny Myrobolanus Trogloditis*, in his 12 booke and 21. chap. but why the Grecians ſhould call it *Balanos* an Acorne, being like unto none of the kindes of Acornes, nor the fruite it ſelfe, nor ſhell or huske I know not, for if they that doe ſo call it, had ever ſeene the huskes, wherein the Nuts are encloſed, they would ſurely have given it a more proper name. *Monardus* tooke them to be the *Avellanæ purgatrices* of the Weſt Indies, becauſe the fruite is more like an Haſell nut than an Acorne, and called them *Ben Magnum*, but he was much miſtaken therein, and therefore the *Arabians* called it *Ben* and *Habben*, which ſignifieth a Nut with them, yet *Pena* ſeemeth to make the name and forme to agree together. *Rauwolfius* called it *Machalep album* ſaying it is three ſquare, and like a Beech maſt or fruite of the Beech tree, for which cauſe onely as it is likely, *Bellonius* compared the tree to a Beech, it is called either *Balanus myrepſica* or *Glans Vnguentaria*, after the Greeke ſignification of moſt writers, but we in theſe dayes more uſually call it *Nux Ben*, and the oyle *Oleum de Ben*, or as the ancients called it *Oleum Balaninum*, I have given the *Engliſh* name to it, according to the moſt proper ſignification as I thinke, calling it rather a Nut, than an Acorne as *Gerard* doth after the Greeke name.

The Vertues.

The kernells of the nuts bruiſed and drunke with *Poſca* poſſet (that is water and vinegar mingled together) doth purge the body from groſſe and thinne flegme alſo, and thereby is helpefull to thoſe are troubled with the wind collicke, if a few Aniſeede and Fennelſeede be put unto it: the oyle that is drawne out of the nuts doth the ſame alſo, and provoketh vomiting, clenſing the ſtomacke, of much foule matter gathered therein, yet it doth much trouble the ſtomack in the meane time: but the nut being toaſted at the fire loſeth much of that evill quality, oftentimes cauſing them to purge downewards only: it is with very good effect alſo put into gliſters for the ſame purpoſes, the oyle dropped into the eares, helpeth the noiſe in them, and the deafeneſſe alſo: a dragme of the kernell taken in poſſet, doth ſoften and diſſolve the hardneſſe of the ſpleene and liver. *Meſues* commendeth the drie preſſing after the oyle is taken from it, being of a clenſing as well as of a cutting qualitie, & by reaſon that the moiſture is taken from it, of a drying effect alſo, for to helpe the itch, the lepry and running ſores, and to take away the ruggedneſſe of the skin, morphew, drie ſcabbes, ſcarres, freckles, wheales and pimples, from the face or body; eſpecially if it be uſed with vinegar and niter, with which it well agreeth, and performeth the cures much better: It is alſo uſed with the meale of *Orobus* the bitter Vetch, or the meale of Darnell in manner of a plaiſter, to be laid to the ſide to conſume the ſpleene; It helpeth the gout alſo uſed in the ſame manner; uſed with barly meale, it comforteth the ſinewes, that are pained with cold, and all ſpaſmes or crampes, and uſed with hony diſſolveth all knots and hard ſwellings, the ſhells or huskes are of an exceeding binding propertie, fit to be uſed when occaſion ſerveth for ſuch purpoſes: The oyle that is preſſed forth out of the nuts is much uſed of Perfumers, although it have no ſweete ſmell of it ſelfe to commend it, yet it is of ſo excellent a qualitie, that being kept never ſo long, it will not grow ranke, and therefore it doth both preſerve the ſweete ſents of Muske, Civet, Ambergriſe and the like mixed with it, and keepeth that the gloves, leather, or other things, ſhall not gather ſpots or ſtaines in them, nor ever grow mouldy, as thoſe things that are perfumed with oyle of Almonds will doe. This oyle likewiſe is much fitter than oyle of Almonds, to receive any ſweet thing to be ſtieped in it, and to keepe the ſent thereof in it, for being utterly without ſent of it ſelfe, neither growing ranke by any time, the ſent of any thing will be the ſooner infuſed, and the longer alſo retained and kept therein.

CHAP. XXXVII.

Frangu'a ſive Alnus nigra baccifera. The blacke Alder tree.

THe black Aller or Alder tree, riſeth ſeldome to be of any great bigneſſe, but for the moſt part abideth like a hedge, buſh or tree, ſpreading into branches, the wood of the body being white, and of a darke red at the core or heart, the outward barke being of a blackiſh colour, whereon many white ſpots are noted to be ſeene; but the inner barke next unto the wood is yellow, which being chewed will turne the ſpittle yellow, as much or more than Rubarbe, neare unto a Saffron colour, the leaves are ſomewhat like unto thoſe of the ordinary Alder tree, or thoſe of the female Cornell or Dogge berry tree, but blacker, and not ſo long but rather rounder, the flowers are white comming forth at the joynts with the leaves which turne into ſmall round berries, greene at the firſt, and red afterwards, but blackiſh when they are thorough ripe, divided as it were into two parts, wherein is contained two ſmall round and flat ſeedes: the roote runneth not deepe into the ground, but ſpreadeth rather under the upper cruſt of the earth.

Alnus nigra baccifera ſeu Frangula.
The blacke Alder tree.

The Place.

This tree or ſhrubbe groweth in woods in many places of our land, as in Saint *Johns* wood by Hornſey, in the woods upon Hampſteed heath, &c.

The Time.

It flowreth in May, and the berries are ripe in September.

The Names.

It is called *Frangula quia cito frangitur*, that is, the branches be brittle and eaſie to breake, and *Alnus nigra baccifera*, that it might

be

be knowne from the *Alnus vulgaris*, whose barke is whitish and the wood more red, and beareth not berries as this doth: *Tragus* calleth it *Faulbaum* that is foule tree, of the evill sent and taste, the *Idæa ficus nostra sive Frangula vulgo* of *Lugdunensis*, differeth not from this, although he would seeme to make it. The *Italians* call it *Frangola*, the *Germans*, as is before said with *Tragus Faulbaum*, the *Dutch Sporrekenhout* and *Hondtsboom*, and we in *English* the blacke Aller or Alder tree.

The Vertues.

The inner yellow barke hereof as *Matthiolus* saith, purgeth downewards both choller and flegmē, and the watry humors of hydropicke persons, and strengthneth the inward parts againe afterwards, even as Rubarbe doth: if the barke hereof be boyled with Agrimonie, Wormewood, Dodder, Hoppes, and some Fennell and Smallage, Endive and Cichory rootes, and a reasonable draught taken every morning for some time together, is very effectuall against the Iaundise, the dropsie, and the evill disposition of the body, so as some especiall purging medicine, have beene taken before to avoyd the grosser excrements, and then it will the better loosen the belly, and keepe it soluble without trouble or danger to the stomacke, purging and strengthning the liver and spleene, in so good manner that diverse have beene cured by this onely medicine, who have had their livers and spleenes swolne with humors and hardnesse; by opening all obstructions in the inward parts, and clensing them from such evill humors as they were full of before: the dried barke is onely fit for those purposes, for the fresh or greene barke being taken inwardly, provoketh strong vomitings, paines in the stomacke, and gripings in the belly; yet if the decoction thereof may stand and settle for two or three dayes, untill the yellow colour be changed into blacke, it will not worke so violently by much as before, and in not provoking vomiting or purging, it will strengthen the stomacke, and procure an appetite or desire to meate: the outer barke contrariwise doth bind the body, and thereby is helpefull for all laskes and fluxes thereof; but this should be given after it hath beene dried also, to worke the better: the inner barke hereof boiled in vinegar, is an approved remedy to kill lice, to cure the itch, and take away scabbes, and drie them up in a very short space: the same also is singular good to wash the teeth, both to take away the paines, to fasten those that are loose, to clense them from corruption, and to keepe them sound: the leaves are said to be good fodder for Kine, to cause them give the more abundance of milke.

CHAP. XXXVIIII.

Evonymus. The Spindle tree or Pricke wood.

ALthough the former ages, were content to know but one sort of this *Evonymus*, or Spindle tree, yet *Clusius* in his *Panonicke* travells, hath set forth two other sorts, not knowne before to any, which I will here shew you together.

1. *Evonymus vulgaris.* The common Spindle tree.

Our ordinary spindle tree, is also but a shrubbe or hedgge bush, rising up with many stemmes, of sometimes

1. *Evonymus vulgaris.*
The common Spindle tree.

3. *Evonymus Pannonicus latifolius Clusii.*
Broad leafed Spindle tree of *Hungary*.

but with a few, the elder boughes, having a whitish barke, and the younger greene, with foure browniſh lines like liſts, running all the length of them, which make them ſeeme foure ſquare, the wood is ſomewhat whitiſh, hard, and yellow, it hath diverſe branches, whereon doe grow faire and darke greene long leaves, broadeſt in the middle, from among which come forth long ſtalkes, whereon ſtand foure or five white flowers, cluſtering together, conſiſting of foure leaves a peece, with ſome threds in the middle, after which come round hard huskes or red berries, divided into foure parts, in each whereof lieth a white hard ſeede, covered with a yellow skinne, which will give a yellow colour, if it be put into water: the rootes are many, not running deepe into the ground, but ſpreading rather under the upper face thereof.

2. *Evonymus Pannonicus.* The Spindle tree of *Hungarie.*

The Spindle tree of *Hungary*, hath diverſe gentle and pliant ſtemmes, riſing from the roote, which grow to be three or foure foote high, and of the thickneſſe of ones thumbe, covered with a thicke greene barke, with many blacke ſpots therein, divided into many other leſſer branches, ſet in a ſeemely or comely order one above another, about which grow many leaves, ſet oppoſite one unto another, ſomewhat likeunto the greater Mirtle leaves, but more gentle in handling, lightly dented about the edges, of a drying taſte at the firſt, but afterwards ſomewhat bitter, and hot, from among the leaves at the joynts of them come forth ſmall long ſtalkes, with two or three flowers on each of them, conſiſting of foure leaves apeece, of a ſhining purpliſh colour hanging downe their heads, and with a ſquare umbone in the middle, which grow into a foure ſquare head or berrie, like in forme unto the former, ſomewhat ſpongie or light, of a faire yellow colour on the outſide, wherein lie ſhining round ſeede, blacke on the outſide, two or three lying in one cell or partition, which are very like unto the ſeedes of baſtard Dittany.

3. *Evonymus Latifolius.* Broad leafed Spindle tree of *Hungary.*

This broad leafed Spindle tree, riſeth up (if it be manured) to be higher than any man, ſpreading his ſlender pliant branches, uneaſie to breake, whereon doe grow many faire broad greene leaves, ſet by couples, and as large as the leaves of *Laurocerasus*, or Cherry Bay tree, lightly dented about the edges, and of an unpleaſant and bitter taſte: at the joynts betweene the leaves and ſtalkes ſpring forth long ſtalkes, with diverſe flowers at the end of them, hanging downe their heads, conſiſting of foure white broad leaves, tending to a fleſh or bluſh colour, very like unto the common Spindle tree, which turne into foure ſquare heads of berries, and ſometimes into five ſquare berries, but much larger, having certaine liſts like to winges on every of them, wherein are contained white graines or kernells, covered with a yellow skinne as in the firſt.

The Place.

The firſt groweth in many p'aces of this Kingdome, in woods and untilled places, and ſerveth among other ſhrubbes for hedges; the ſecond *Cluſius* found both in the upper and the lower *Hungary*, upon thoſe hills that runne to the Alpes, as alſo in *Moravia* in the woods there. The laſt was found by *Cluſius* alſo, in a wood in that part of *Hungary* that is called *Interamnis*, and which the *Germanes* call *Windeſchlandt* beyond the river *Dravus.*

The Time.

They doe all flower about May, and their berries are ripe in September.

The Names.

This is generally by moſt Writers called *Evonymus*, and taken to be the true Ευωνύμος of *Theophraſtus*, *quam boni nominis in lib. 3. cap. ultimo*, and which hee calleth *Tetragonia* tranſlated *Quadratoria* by *Gaza* in his third Booke and ſixt Chapter; but there are diverſe, and *Lugdunenſis* with them, that have rather judged an other ſhrubbe to be *Evnonymus*, which *Geſner* in his Epiſtles, and *Cluſius* in his hiſtory of Plants, thinke to be a kinde of *Ledum*, and is by *Cluſius* called *Ledum Alpinum*, (which I have remembred before in the former Claſſis) by *Viſſes Abdroandus Nerium Alpinum*, as *Geſner* in *deſcriptione montis fracti* doth record, and is probable to be *Chamerhododendros Alpina odora* of *Pena* and *Lobel* in their *Adverſaria*, and which *Lobell* in his Obſervations calleth *Balſamum Alpinum*: but *Cluſius* ſheweth plainely, that it cannot agree therewith, not having a foure ſquare head or huske. It hath beene corruptly called *Anonymus* of diverſe, inſtead of *Evonymus*, as *Cordus* in *Hiſt.* ſaith, *Tragus* miſtaking it called it *Carpinus*. It is called alſo *Fuſanum* and *Fuſoria*, becauſe the *Italians* called it *Fuſaro*, as being uſed by Turners and others, to make ſpindles for ſpinning wheeles and other things, and by *Bauhinus Evonymus vulgaris granis rubentibus*. The ſecond is called by *Cluſius Evonymus alter, vel ſecundus* by *Camerarius* and *Tabermontanus Evonymus Pannonicus*, and by *Bauhinus Evonymus granis nigris*. The laſt is called *Evonymus ſive latifolius* by *Cluſius* and all others. It is called in Engliſh Spindle tree, Pricke timber tree and Prickwood, and in ſome countries of this land Dogge wood, and might from the forme of the berries, well be called Square berried tree. The *Italians* call it *Fuſano*, the *French Fuſin*, and *bonnet depreſtre*, the *Germans Spindelbaum*, the *Dutch Papenhant.*

The Vertues.

This is ſeldome uſed in Phyſicke with us for to helpe any diſeaſe; yet it is found by experience that three or foure kernells will purge both by vomiting & by the ſtoole, cauſing much choller and flegme to be avoided. *Theophraſtus*, and from him diverſe others, have ſaid that the leaves hereof are pernicious and deadly, eſpecially to Sheepe and Goates, unleſſe they be purged by *Anochus* (which word is not well knowne what it meaneth) *Dodonæus* interpreting it, that they ſhould be purged upward and downeward, and others underſtanding it, that they ſhould be purged by want or abſtinence from meate. *Dalechampius* as *Lugdunenſis* ſetteth it downe, confirmeth that ſaying of *Theophraſtus*, to be hurtfull to Goates by his owne experience, who ſaw flockes of Goates feeding upon the ſhrubbes that grew with this, but none of them to touch it, and that they refuſed to eat it being caſt unto them, but *Cluſius* ſaith the cleane contrary, that hee underſtood the Goates in *Hungary* did greatly deſire to eat the leaves thereof, and tooke no harme thereby, and that the *Hungarians* in their language call this ſhrubbe *Kechke rago fa, id eſt capris roſa arbor*, the Goates Roſe tree, ſo diverſe be the writings and opinions of men whereof in many other things we have ſufficient experience.

CHAP. XXXIX.

Rhamnus ſolutivus ſive Spina Infectoria. The purging Thorne.

THere are diverſe ſorts of *Rhamnus*, ſome for this *Claſsis*, others for another, as ſhall be ſhewed in their places: Of this thorne formerly, we had the knowledge but of one ſort onely, untill *Cluſius* in his *Pannonicke* obſervations ſet forth two other, the one whereof ſhall be here expreſſed, for I muſt referre the other to another place, that is to the kindes of *Lycium*, where you ſhall finde it.

1. *Rhamnus ſolutivus vulgaris.* The common purging thorne.

The purging thorne, that is frequent in our owne Land, is for the moſt part but a low ſhrubbe or hedge buſh, ſeldome growing any thing bigge or like a tree, having many ſtemmes or branches riſing from the roote, covered with a ſmooth blackiſh red barke on the outſide, and greene on the inſide, the innermoſt being yellow, the wood whereof is of a whitiſh yellow, toward the outſide, and of a reddiſh yellow inward, and at the heart

1. *Rhamnus ſolutivus ſeu Spina infectoria vulgaris.* The common purging Thorne.

2. *Rhamnus ſolutivus minor Pannonicus.* The leſſer purging thorne of *Hungary*.

1. *Rhamni ſol tivi vulgaris Exactioricom cum floribus.* A more exact figure thereof.

ſtrong, and not eaſie to bend or to breake, whereof ſtrong bowes may be made, and hath beene in times paſt: the ſmaller branches are furniſhed with many leaves like unto thoſe of the crab tree, but ſmaller, with ſmall long ſtraight thornes in many places ſet with the leaves, the ends of the branches ending in a thorne alſo; among the leaves come forth many flowers, every one upon a ſeverall foote ſtalke, conſiſting of foure leaves a peece, of a whitiſh greene colour; after which come ſmall round berries, greene at the firſt, and blacke when they are ripe, full of pulpe or juyce that is greene, with one or two ſmall graines within them of an unpleaſant taſte.

2. *Rhamnus ſolutivus minor Pannonicus.* The leſſer Purging thorne of *Hungary*.

This leſſer *Rhamnus* groweth much lower than the former, with ſmaller branches, not above a yard and a halfe high, having many leaves thereon, ſmaller and narrower than the former, almoſt as ſmall as thoſe of the blacke thorne or ſlowe tree, with a few thornes ſet here and there upon the branches, but ending alwayes in a thorne: the flowers are like unto the other but ſmaller, and of an herby, or whitiſh greene colour, with ſmaller berries alſo ſucceeding them.

The place.

The firſt groweth in many places of this land, but eſpecially in *Kent*, as at the hither end of *Dartford* next unto *London*, *Farningham* upon the Connie burrowes, and in a narrow Lane neere *South Fleete*, and in many other places. The other *Cluſius* found in *Pannonia*, and in *Germany* neere the bathes at *Baden*.

The Time.

They flower in Aprill and May, their fruite is ripe in September and October.

The Names.

It is called *Rhamnus*, although it can be referred to none, either of *Dioſcorides* or *Theophraſtus*, yet all agree, it is a *ſpecies* or kind of *Rhamnus*, and ſo even the thornes declare, and therefore the word *ſolutivus* is added thereunto, to denominate the difference. *Matthiolus* I thinke firſt called it *Spina infectoria*, and is by many followed therein. *Tragus* calleth it *Rhamni alia ſpecies*, yet knew not of any purging quality in it. *Dodonæus* called it *Rhamnus ſolutivus*, and *Lugdunenſis Rhamnus Catharticus* & ſo doth *Bauhinus*; *Coraus* calleth it *Cervi ſpina*, *Geſner Spina Cervina*, and *Caſalpinus Spina Cervalis vulgo*, and ſome alſo *Burgi ſpina*, from the *French* word *Bourgeſpine* whereby they call it as alſo *Nerprun*. The other is called of *Cluſius Spina Infectoria pumila prima*: although *Gerard* hath called it in *Engliſh Laxative Ram* and *Bucke horne*, yet I have rather entituled it a purging thorne, as moſt fitting to it.

The Vertues.

The berries hereof dryed and a drame of the powder, given in wine or the broth of fleſh, doth purge both flegme and groſſe thicke humors alſo, yet *Pena* ſaith it rather draweth forth thinne flegme, and that from the joints and Arteries, and therefore is ſingular good for dropſies; ſome doe make an Electuary and ſome a Syrupe of the juyce of the berries clarified, and Sugar or Honey put thereto, but becauſe it worketh a little troubleſomely, ſome ſpices are to be added thereto to aromatiſe it, as Cinamon, Ginger and Cloves, and ſome adde Maſticke and roſes alſo, which doth correct the evill quality therein, and cauſe it worke without paine: an ounce or more of either Electuary or Syrupe may be given at a time, diſſolved either in wine or in the broth of fleſh, which will draw forth raw whayiſh humors, and choller aboundantly, as alſo thicke clammie flegme, for it worketh not with any troubleſome heating of the parts, but doth ſtrengthen them after purging, not cauſing any flux to follow: Of theſe berries are made three ſeverall ſorts of colours, as they ſhall be gathered; that is being gathered while they are greene and kept dry, are called Sappe berries, which being ſteeped in ſome Allome water, or freſh bruiſed into Allome water, they give a reaſonable faire yellow colour, which painters uſe for their workes, and Bookebinders to colour the edges of bookes, and leather dreſſers to colour leather, as they uſe alſo to make a greene colour called Sappe greene, taken from the berries when they are blacke, being bruiſed and put into a braſſe or copper kettle, or pan; and there ſuffered to abide three or foure dayes, or a little heated upon the fire, and ſome beaten Allome put unto them, and after preſſed forth, the juyce or liquor is uſually put up into great bladders, tyed with ſtrong thred at the head, and hung up untill it be drye, which is diſſolved in water or wine, but ſacke is the beſt to preſerve the colour from ſtarving as they call it, that is from decaying and to make it hold freſh the longer: the third colour (whereof, none that I can finde hath made mention, but onely *Tragus*) is a purpliſh colour which is made of the berries ſuffered to grow upon the buſhes, untill the middle or end of November, that they are ready to droppe from the trees.

CHAP. XL.

Anagyris & Laburnum. Beane Trefoiles.

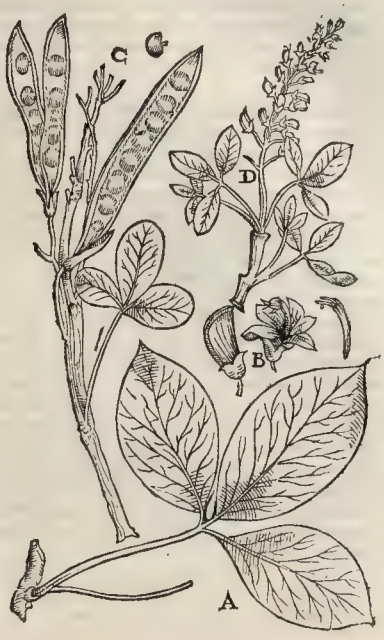
THe *Anagyris* and *Laburnum* are ſuch *congeneres*, ſo like the one unto the other, that diverſe writers doe call that *Anagyris*, which others call *Laburnum*, and indeed I know no other diſtinction betweene them, than of *fœtens & non fœtens*, *major & minor*.

1. *Anagyris fœtida.* Stinking Beane Trefoile.

The ſtinking beane Trefoile in his naturall places, which are the hot Countries of *Spaine* and *Narbone* in *France*, ſeldome groweth to be higher than a man, but tranſplanted into more cold and temperate climates, riſeth twiſe ſo high; having the barke of the body, and elder boughes, of a darke grayiſh greene colour, the younger of a freſher greene, from whence ſhoote forth at diverſe places three ſomewhat large leaves together, ſtanding upon a pretty long footeſtalke, of a greene colour on the upperſide, and of an hoary or ſilver ſhining colour underneath; of a ſtrong unpleaſant ſent, like unto ſtinking *Gladwin* eſpecially in the hot countries, for in the colder countries it is nothing ſo much, and very little in ours, as I have tryed, who have had it many times growing with me: at the joynts with the leaves come forth many flowers, ſtanding upon a long ſtalke, one by another, which are larger than in any *Cytiſus*, almoſt as great as the *Colutea*, the lower leaves being of a paler yellow colour, and the uppermoſt which cover them, of a deeper gold yellow, which after turne into large and long flattiſh cods; wherein lye foure or five ſeedes, twiſe as big as in the other, almoſt as big as Kidney beanes, and more diſcoloured than the other, that is of a darke purple ſpotted, which were of a fairer purple, before they were

1. *Anagyris fœtida.*
Stinking Beane Trefoile.

2. *Laburnum majus.*
The greater leſſe ſtinking Beane Trefoile.



were thorough ripe: the roote thruſteth not deepe into the ground, but is well faſtened with branches and fibres within the ground. Of this kind there is one growing in *Candy*, whereof *Honorius Bellus* gave knowledge to *Cluſius*, that hath rounder leaves, which as yet I never ſaw.

2. *Anagyris non fœtida ſive Laburnum majus.* The greater leſſe ſtinking Beane Trefoile.

This Beane Trefoile groweth larger in body and branches, than the former, and ſometimes ſhooteth forth diverſe ſtemmes from the roote, the wood whereof is very firme and hard, yellow toward the barke, and blackiſh at the heart, (whereof the ſtrongeſt bowes are made, and ſtakes that will abide hard in the ground longer than others) with leaves larger than either the former or the ſmaller ſort, of a darkiſh greene above, and ſilver colour underneath like them: the flowers are more in number, and ſmaller than in the former, the ſtalkes of flowers, hanging downe and not ſtanding up, being ſometimes almoſt a foote long, and not ſo long as in the former, and are for the moſt part all of one pale yellow colour, the cods likewiſe are blacker, ſhorter and ſmaller, and ſo are the ſeedes within them alſo, yet greater than in the leſſer ſort, elſe much alike, being blackiſh and very hard, ſcarce yeelding to be mollified in water: the leaves and flowers have but little ſent at all to diſcommend them, in any that I have ſeene and ſmelt.

3. *Laburnum minus.* The leſſer Beane Trefoile.

This leſſer Beane Trefoile is in moſt things like unto the laſt deſcribed but that it groweth not ſo great, nor are the leaves ſo large by the halfe, nor yet either flowers or ſeede.

The Place.

The firſt as is before ſaid groweth in hot Countries: the ſecond, and ſo doth the leaſt alſo, in many of the woods of *Italy*, and the higher parts of *France*, and other places, and upon the Alpes.

The Time.

The firſt ſeldome abideth with us to ſhew his flower: but in his naturall places, it flowreth early even in *Ianuary* and *February*, in *Spaine* as *Culſius* ſaith, but in *Aprill* and *May*, in other places; and the ſeedes are ripe in the Summer time after in *Spaine*, but not untill *September* in other places: the other flowreth in *May* and *Iune*, and the ſeede ſometimes ripeneth well, but not untill *September*, but the leaſt ripeneth well.

The Names.

The firſt is called of *Dioſcordes* ἀνάγυρις & ἀνάγυρος *Anagyris & Anagyros*, which *Pliny* ſaith ſome called *Acopon*: *vera & fœtida*, is uſually added to it to diſtinguiſh it from the other, which is alſo called *Anagyris* of ſome, but *altera* or *non fœtida* which ſecond or *non fœtida*, *Matthiolus* calleth *Anagyris prima & major*, as he calleth the leaſt *Anagyris altera*, but he contendeth againſt *Geſner* who did in following other mens opinio, make the great *Laburnum* or *Anagyris altera* to be *Laburnum* of *Pliny*, which is the leaſt and called *Egheło* of thoſe that dwell about *Trent*. *Camerarius in horto* calleth it *Laburnū*, when as he calleth the leaſt, *Anagyris altera* of *Matthiolus*, *Anguilara* ſaith it is called by the inhabitants *Egano*, & thinketh it may be *Ebeni ſecunda ſpecies Theophraſti*; *Lugdunenſis* alſo calleth it *Laburnum primum*, and the leaſt *Laburnum alterum*, and ſaith it might be called *Anagyris Alpina*: *Cordus*

calleth it *Arbor trifolia*, diverſe doe call the leaſt *Laburnum*, *Faba inverſa*, *Gerard* his figure of *Anagyris fœtida*, and *Anagyris*, are the ſame that are in *Matthiolus*, but the titles are contrary, for *Gerard* his *Anagyris fœtida*, is the *Egbelo* or *Anagyris altera* in *Matthiolus*. It is probable in my opinion, that the ſmaller *Laburnum* ſhould be that *Colutea* of *Theophraſtus*, which is ſet down in the 14. *c.* of his third book, with a willow leafe: for if you take any one leafe by it ſelf, it may wel reſemble a Willow leafe; both for forme and colour, and beareth ſmall ſeeds in cods, like unto pulſe as that doth: *Geſner* did referre this kinde unto the mountaine *Cytiſus*, but *Matthiolus* reprooveth him for it: the great booke of *Eyſtetenſis* calleth it *Anagyris laifolia*, but I call it *Laburnum majus*, as I doe the laſt *Laburnum minus*.

The Vertues.

The leaves as well as the ſeede of the firſt Beane trefoile, are a ſtrong vomit, eſpecially in the hot Countries, where it groweth, and *Honorius Bellus* writing thereof to *Cluſius*, ſaith that in *Candy*, where that kind groweth with rounder leaves, if the Goates or ſheepe do chance to feed thereon, the milke which they give will cauſe any that ſhall take it, to fall as well into extreame ſcouring downewards as ſtrong caſting upwards, and that many thereby have beene brought in danger of their lives: the young leaves ſaith *Dioſcorides* applyed unto tumors or ſwellings, diſcuſſeth and repreſſeth them; and if a dram of the powder of them, be drunke in wine, as he ſaith alſo, it expelleth both the dead birth, and the ſecondine, and likewiſe bringeth downe the monethly courſes of women; if ſome of the leaves, be bound to thoſe that have hard and uneaſie travell in child bearing, it cauſeth a ſpeedy delivery of the birth, but they muſt bee taken away preſently afterwards; they are likewiſe given in wine to thoſe that are ſhort winded, and to ſuch as are often troubled with the head-ach: the barke of the roote hath a digeſting ripening and diſcuſſing quality: both the other ſorts here ſet downe, have the ſame properties, for they are alſo of the ſame temperature, but *Matthiolus* ſaith, that he hath knowne, that ſome that have taken ignorantly of the ſeede of the leſſer Beane trefoile, have had ſtrong vomitings even unto blood: *Solerius in ſcholiis in Ætium* ſaith, that by certaine and undoubted experience it hath beene found, that a dramme either more or leſſe, of the dryed bark thereof made into powder, and taken in any kind of drink, purgeth very ſtrongly both upwards and downewards, but in a diverſe manner; for if as he ſaith, (which I take rather to be but a conceite) the barke be pulled off from the tree upwards, it will cauſe vomitings, if downewards great purging of the belly downewards: the Bees ſaith *Plinie*, refuſe to touch the flowers of this *Laburnum*, which is the leſſer Beane Trefoile, but it hath beene truely obſerved, that both in the naturall places where it groweth, as alſo with us, that the Bees doe not refuſe to feede upon them: the *Grecians* have an uſuall proverbe with them, *Anagyrin commovere* when they would ſignifie one, that worketh as wee ſay his owne woe, or is the cauſe of his owne harme.

CHAP. XLI.

Myrobalani. Myrobalans or purging Indian Plummes.

ALthough there be none of theſe Myrobaland trees (whereof are 5 ſorts of fruites well known & diſtinguiſhed in the Apothecaries ſhops) growing in any of theſe Chriſtian Countries of *Europe*, as far as ever I could learne, yet I could doe no leſſe than make mention of them here, both becauſe the fruites are often uſed in Phyſicke among other purgers, and to make it knowne to all that might be miſtaken by the name, and thinke that the Myrobalane Plummes, the red and the white that I have remembred in my former booke, be ſome of theſe kindes: but ſo they are not, neither for forme nor quality: as alſo to ſtir up ſome ingenious mind among our Merchants, that trade to *Aleppo* & *Cairo*, & into *Perſia* and the Eaſt Indies, to give order to their factors, if they doe it not themſelves, to enquire and ſeeke out ſuch of the ſorts that are to be found in the places of their abode, and either to plant the ſtones of theſe ſeverall kinds in thoſe warmer countries, if they abide any time in them, that when they are a little growne they might then ſend them hither: or ſend the freſh ſtones over hither to us (for thoſe are too dry that are brought for phyſicke uſe) that wee may plant them here to try if they will not growe and abide with us, that at leaſt, having but a ſight of the forme of the leaves of any ſort, we might compare them with the deſcriptions that writers have made of them, whether they are anſwerable thereunto: I muſt in the meane time therefore but ſhew you them as *Garzias* and others before me have done, with ſuch deſcriptions as they gave of them, and are extant, not knowing whether they be true or no.

1. *Myrobalanus Citrina.* The yellow Myrobalane or purging Indian Plum.

The tree that beareth theſe yellow Myrobalanes is ſaid to grow as great as a Plum tree, having many branches and winged leaves on them like unto the true Service tree: the fruit is for the moſt part as bigge as reaſonable Plums, ſomewhat long and not fully round, but having many faire ridges on the outſide, eſpecially when it is dryed, ſhewing it to be five ſquare though round, of a yellower colour on the outſide then any of the reſt; the fleſh or ſubſtance being of a reaſonable thickneſſe, yet not ſo thicke as the Chebuli, or Emblici, nor ſo thin as the Bellerici; the ſtone is white thicke, and very hard to breake, with emniences and ridges alſo therein, and a very ſmall long kernell lying in the middle, of an inſtringent taſte as the dryed fruit is alſo, but much more then it: this hath no ſuch kernell that thereout may be preſſed an oyle, as *Bellonius* noteth of the kernells of that fruit that hee tooke to bee the yellow Myrobalane tree, in the plaines of *Hiericho* as he noteth it, *in lib. Obſervationum* 2. *cap.* 86.

2. *Myrobalanus Chebula.* The purple Myrobalane, or purging Indian Plum.

This kind of Myrobalane tree growing in ſtature and branches like a Plum (as *Garzias* ſaith all the ſorts are) bearing leaves on the branches like unto the Peach tree: the fruit hereof is the greateſt and longeſt of all the five ſorts, of a blackiſh purple colour on the outſide while it is freſh, which it holdeth in the dry fruit; (which *Matthiolus* commended for the beſt) being five ſquare as the former, of the thickeſt ſubſtance, and more fleſhy then any other, and with the ſmalleſt ſtone in the middle, not fully ſo hard to breake as the former, but with the ſmalleſt kernell therein.

3. *Myrobalanus*

Myrobalanorum 5. Genera.

Fructus Emblicorum cum nucleo interiore barbato.

3. *Myrobalanus Bellerica.* The round Myrobalane, or purging Indian Plum.

The round Myrobalane is like the reſt for growth, but bearing leaves like the Bay tree, yet of a paler greene colour, and ſomewhat aſhcoloured (underneath peradventure) withall: the fruit is of a meane bignes, round and ſmooth, yet being as it were three ſquare in many, and of a pale ruſſettiſh colour when they are freſh, but of a darke or duſty whitiſh colour on the outſide, being dry, of the thinneſt ſubſtance or leaſt fleſhy of any of them: the ſtone whereof is thicke greater then any other, proportionable to the fruit, very hard to break, with a kernell within of a reaſonable bigneſſe.

4. *Myrobalanus Emblica.* The bearded or ſix ſquare Myrobalane or purging Indian Plum.

The tree that beareth this Myrobalane or delicate Plum, being like a Plum tree for height and manner of growing (as you have heard before that *Garzias* ſaith ſo of them all) hath leaves of a palme or handbreadth long, very finely cut in or divided on the edges: the fruit is round in ſhew, but doth ſeparate or will be broken into ſix parts, as both we have obſerved in the dry fruit, alwayes brought unto us, broken into ſmall peeces, without any ſtones; and more plainely in the fruit preſerved, whereof good ſtore hath beene brought over many times unto us, which will be divided into many parts: the ſtone whereof within it is ſix ſquare, with three greater ridges, and three leſſer lying betweene them, and bearded at the head of the three greater ridges, the kernell within it being ſeparated into the three ſeverall diviſions, having each of them two calls, wherein the parts of the kernell lye almoſt three ſquare.

5. *Myrobalanus Indica.* The blacke Myrobalane or purging Indian Plum.

The blacke Myrobalane tree is like the reſt; whoſe leafe (as *Garzias* ſaith) is like unto a Willow leafe: the fruit ſaith *Garzias* is eight ſquare, which may be when they are freſh, but they cannot be ſo plainely diſcerned in thoſe that are brought over unto us dry, the ſmalleſt of all the reſt, ſomewhat long, altogether fleſhy, without any ſtone in the middle, and the blackeſt of any.

The Place.

All theſe fruits grow in the Eaſt Indies wild and not manured, but in divers provinces, as ſome in *Goa* and *Batecala*, others in *Malavar* and *Dabul*. Yet *Garzias* ſaith foure ſorts grow in the kingdome of *Cambaya*, and the *Chebuls* in *Biſnagar*, *Decan*, *Guzarate* (which we call at this time *Surrate*) and *Bengala*: *Belonius* ſaith in his booke of obſervations that the yellow Myrobalanes grow in *Arabia* and *Syria*, and alſo in the plaines of *Hiericho*, but I doe much doubt of the certainty thereof and thinke rather that he was miſtaken.

The Time.

We know ſo little of the trees, that we know leſſe of their time of flowring or bearing fruit.

The Names.

Theſe kind of fruits were not any of them knowne unto any of the antient Greeke writers, as *Dioſcorides*, *Theophraſtus* or *Galen*, neither unto *Pliny*, for although hee maketh mention of a Myrobalanus, yet hee addeth *Trogladytes*, which is the *Nux Ben*, *Balanus Myrepſica*, or *Glans Vnguentaria*, as I ſhewed you a little before, yet

yet both *Balanus Myrepsica* and *Myrobalanus* have but one signification in the Greeke tongue. The *Arabians* were the first that made them knowne to the world, and called them all in generall by the name of *Delegi*, as by the writings of *Mesues* and *Serapio* doe appeare; but the Greekes that translated these *Arabians*, gave the names of Myrobalanes unto these fruits, because (as it is likely) they thought the fruit was like unto an Acorne, and therefore gave the name *Balanus*; but why they should give the other word *Myros*, which signifieth an ointment, cannot be understood by any, for none of these were ever used in any pretious or sweet ointment, and *Myrobalanos* signifieth as much as *Balanus Myrepsica Glans unguentaria*, the Acorne for ointments. *Actuarius* among the latter Greeke writers maketh mention of them, but that none of these did grow among the *Arabians* their ignorance of their growing declareth plainely: for *Mesues* writeth that the *Citrini Chebuli* and *Nigri* doe all grow upon one tree, and for that they beare twice in a yeare, the *Citrini* are the unripe, and the *Nigri* are the ripe of the first bearing, and the *Chebuli* the fruit of the later bearing, which how contrary unto truth it is, *Garzias* doth declare, in his booke of the Drugges of the East Indies, where hee plainely sheweth that all the five sorts, grow severally each upon a severall tree, as I have shewed you before: the *Indians* call the *Citrini* or *Flavi Arare*, but the Physitions *Aritiqui*, and the *Indici* or *Nigri* they call *Rezenvale*, the *Bellerici* *Gotini* or *Gotni*, the *Chepuli* or *Chebuli Aretca*, and the *Emblici* or *Amuale* as *Garzias* hath it, or *Anuale* as *Acosta*. I have you see intituled them all purging Plums, as most proper for them in my judgement, and given them their sundry Epithites according to their quality as I thinke.

The Vertues.

All these sorts of Myrobalanes have a gentle purging quality, some more and some lesse then others, some also purging choller, some flegme, and some melancholy; but they have in them also an astringent quality, much more then is in *Rubarbe*: the *Citrines* and *Bellericks*, that is the yellow and the round Myrobalanes doe purge choller gently: the *Chebules* and *Emblici* that is the purple and six square Myrobalanes doe purge flegme: and the Indies or black ones melancholly: the decoction or infusion of them all doth purge better then any wayes else, yet so gently that in evacuating the humors, they strengthen the stomacke, the liver and the heart, but given in pouder they binde the body more then purge it, and indeed the binding quality in them all, especially in the dryed fruits, is more prodominant, and as *Garzias* saith, the Indians wholly use them for that purpose; and therefore they are the best medecines to be mingled with *Scamony* and all other violent purgers, to restraine their violence and to correct their fierceneese, and yet as *Mesues* saith they are often put with *Cassia, Manna, & Tamarindi*, to helpe the working of them, as a most safe medecine: the *Bellericks* and *Emblicks* by purging the stomack from rotten flegme lying therein, and strengthning the braine and joynts, the heart and liver, and binding all other loose or fluent humors in the parts of the body, are very effectuall, as also for the trembling of the heart, and to stirre up the appetite, stay vomiting and restraine the fury and belchings of choller, to increase the power and facultie of the spirits, to qualifie the excessive heat of the inward parts, and the thirst is raised thereof, and doe helpe and give ease to those that are troubled with the hemorrhoides or piles, by restraining the fierceneese of choller flowing unto them, and for this last effect, the *Citrines* are most used: also for all hot constitutions, and in all hot agues where there are no obstructions, for (they as all the other sorts also) doe rather cause obstructions, and therefore in all such when they are to be used they are to bee corrected with Wormewood, or the juice of Fumiterry, or with Rubarbe, Agarick, Spiknard and the like, as also with other opening and diuretical things: the *Chebules* in especiall doe purge flegme, sharpen the memory, cleare the eye sight, clense and strengthen the stomacke, and are very effectuall against the dropsie, and all old agues: the Indies or blacke Myrobalanes in speciall, doe purge melancholy, and blacke or burnt choller, and thereby are availeable for the quartaine Ague, the Lepry or foule evill, and all paralaticke diseases: the Embliks and Bellericks in especiall purge flegme and comfort the braine very much, as also the heart and stomacke, stay vomiting and stirre up the appetite. They all of them in generall are of especiall use in all Fluxes both of the stomack and belly, by gently purging the maligne fluxibilitie of the humors, and strengthning and binding the parts afterwards; but as an especiall receit to binde or stay an old continued Laske, I have knowne this medicine doe much good. Take and burne a pint of Claret wine, with a little Rosemary and Sugar, whereinto put to steepe all night one dram of Rubarbe, first sliced and tosted at the fire, and halfe a dram of Chebule Myrobalanes, which standing by the fire all night, and strained forth in the morning, is to be taken at two severall times, a draught in the morning fasting, which if it helpe not sufficiently the first time, being renewed and taken two dayes more, will certainly stay the laske wholly, if the malignity and sharpenesse of the humors bee not so strong that scarse any medecine will cure it. The Chebule Myrobalanes broken and steeped in Rosewater, or in the clarified juice of Fennell for two or three dayes, and after strained forth; this water dropped into the eyes doth clere the sight, and a fine cloth wet therein and often applyed, taketh away the heat and inflammation in them, and stayeth rheumes and distillations into them: the pouder of any of the Myrobalanes and Masticke, put into running Vlcers and sores, dryeth up the moysture and consolidateth them: The Chebules and the Emblicks are often brought over unto us preserved, whereof the Chebules are more used Physically for such purposes as are before set downe, then the Emblicks are, which being nothing harsh in taste as the Chebuls, but being very pleasant, are more often used as a delicate preserved Plum, among other junckets, then for any Physicall respect.

CHAP. XLII.

Agaricus & Terebinthina ex Larice. *Agaricke* growing on the Larch tree, and the fine cleare Turpentine taken from it also.

BEcause the Rosin or Turpentine of the Larch tree doth gently open and purge the belly; but more especially the Agaricke that groweth thereon, I must to shew you the manner of growing of Agaricke, give you also the view of the body of the tree, from whence it is taken, and some branches and leaves thereon to be knowne by: but the description of the tree it selfe, shall be shewed you among the other *Coniferas & Resiniferas arbores*, trees that beare Cones or Pine apple like fruit, and out of which

is

is extracted a cleare liquid Rosin or Turpintine, called in shoppes *Venice* Turpentine, by boring the tree to the heart, and receiving it into vessells, and from the body of the tree when it is growne great and old in many places, and from the greater armes and boughes also, groweth certaine excressences like Mushromes but greater, called Agaricke of divers and severall sises, that is from the bigneſſe of ones hand leſſe or more, to be as bigge as any mans head, and sometimes greater, covered with a hard blackish barke, which being cut and pared away, the substance under it appeareth very white, and if it be of the best sort, very light also, easie to breake, loose or spungie and without strings through it, somewhat sweete in taste at the first, but very bitter afterwards, and not having any hard barke on the outside: the blacke, heavy, and hard, is utterly unfit to be used in Physicke.

Agaricus ex Larice.
Agaricke growing on the Larch tree.

The Place.

The Larch tree groweth in many woods about *Trent* and *Brixia* in *Italy*, and neare the rivers *Benacus* and *Padus*, and in *Galatia* a Province of *Asia*, as *Dioscorides* and *Galen* doe record, and in *Agaria* a country of *Sarmatia*, from whence the Agaricke tooke the name; in *Silesia* also *Moravia*, *Lusatia*; And the Agaricke is gathered in most of these places, so is the Turpentine likewise, but especially from the woods about *Trent*, &c.

The Time.

The Rosin or Turpentine is gathered in the hottest time of the yeare, and the Agaricke at the latter end thereof, that is November and December especially.

The Names.

This tree is called λάριξ in Greek and *Larix* or *Larice* in Latin. *Pliny* hath in no one thing in all his History, shewed his inconstancie and repugnancie, more than in this one tree, not onely in not knowing that whereof he writeth, but denying that which is found true by good experience, and saying that in one place, which hee contrarieth in an other, as in his 16. Booke and 21. Chapter, hee reckoneth the Larch tree among those wild trees, that doe not shed their leaves, and are sharpe pointed, where it seemeth he tooke the Larch tree, for the Pine tree, as hee doth in the 20. of the same 16. Booke: and whereas *Theophrastus* in his third Booke, and tenth Chapter, speaking of the difference betweene the Pine and Pitch tree, saith, that the Pine tree being burnt downe to the rootes springeth not from them againe, but as some say the Pitch tree doth as it hapned in *Lesbos*, when the wood *Pyrrheus* was fired, which was stored with Pitch trees. This very narration *Pliny lib.* 16. *cap.* 139. in citing, applieth to the Larch tree, which *Theophrastus* doth to the Pine tree. And in another place *Theophrastus* saith, that a kinde of femall Pine is called *Egis* or *Egida*; and *Pliny* saith the femall Larix is called *Egida*, by all which places it may be plainely seene, that *Pliny* mistooke the Larch tree for the Pine tree. For *Theophrastus* hath not made mention of the Larix in all his History, whereby many did judge that it did not grow in Greece, for else he would have knowne it, and spoken of it. In one place againe *Pliny* maketh the leaves of the Larch tree to be soft, woolly, thicke and fat, and in another place hard & drie: againe he saith that the Larch tree hath not flowers nor any cones to commend it, when as they have cones, and the blossomes on them are very beautifull: and lastly *Pliny* saith (it should seeme following *Vitruvius*, who before him said the same) that the wood of the Larch tree, will not burne, nor make a cole, nor will consume in the fire, any otherwise than a stone, when as himselfe saith and acknowledgeth, as *Vitruvius* also doth, that it yeeldeth forth a Rossen; and how could any man thinke, that a tree yeelding Rossen should not burne, when as the very earth and stones that have any bituminous or resinous qualitie in them, will burne exceedingly, as is plainely seene in our turfe, in pit and sea coales which maintaine our fires, in many places of our Land, and elsewhere also. This I thought good to set downe, not so much to declaime against *Pliny*, as to forewarne others that translate or write others opinions, to be judicious and examine by reason, whether that which others have written, agree with the truth of the matter, and not hand over head either beleeve or set downe, whatsoever others have written, be it true or false. Concerning the cleare Turpentine, of this tree called *Venice Turpentine*, there is some controversie among Writers, some alleadging it to be taken from the Firre tree, as *Fuschius* and others, and *Matthiolus* contending there against, that of his owne knowledge and experience, it is onely taken from the Larch tree and no other, for no other Turpentine was to be had in the former times for many ages, because the Merchants neglected to bring the true Turpentine of the *Terebinthus* Turpentine tree, and therefore this onely was used: and no other sort of Turpentine was fit to be taken inwardly in stead of the true from the Turpentine tree, which we doe usually call *Cipresse* Turpentine, because as it is thought the best is gathered in the Iland *Cyprus*, those about *Trent* as *Matthiolus* saith use to call it *Larga*, derived as is likely from *Laricea*, yet *Pliny*, *Galen*, and others of the ancients have set downe, that the Larch yeeldeth whitish yellow Rossen, like unto the hony of *Athens* or *Spaine*, but in little quantitie and soone waxing drie, which is that Gumme or Rossen that sweateth out of the tree in Summer of its owne accord without boring: There is also some controversie and contrarietie both in the ancient and moderne Writers, concerning Agaricke, *Dioscorides* and *Galen* thinking it to be a roote, like unto that of *Silphium*, yet doubting somewhat thereof. *Dioscorides* saith that some hold it to be a Mushrome, or Excrescence engendred from the rottennesse of the trees, as Mushromes are from the earth. *Pliny* writeth, *lib.* 16. *cap.* 8. that it was said that those trees, that bare Acornes in the countrie

tries of *France*, did beare Agaricke: and in his 25. Booke and 9. Chapter, he saith that Agaricke was but a Mushrome of a white colour, growing upon a tree about the *Bosphorus*, and in another place that it groweth upon the Cone-bearing trees, among the which the Larch tree is the chiefest: whereby it is plaine, that the ancients did not well know it. *Brasavolus* saith, that in riding neare *Comalch*, he found Agaricke upon diverse Oakes, and in especially upon Ilex or evergreene Oake, which saying *Matthiolus* contradicteth, saying that in all *Tuskany*, and other places of *Italy*, as also in diverse countryes of *Germany*, *Carniola* and *Dalmatia* which abound with all the kindes of Oake, he could never see, nor so much as heare that any Agaricke grew on them; but that he saw diverse other hard dry Mushromes, both white and blacke called touchwood growing upon diverse, wherewith the people use to take fire, that the steele and flint doe give, and use it in stead of Match to discharge their fowling peeces with all. As also that he never saw Agaricke growing upon any tree, but the Larch tree onely, in all the mountaines of *Trent* and *Anania*, where there be many Oakes growing, as well as Firres, Pines, and Pitch trees, and Larch trees abundantly: yet many doe affirme there is growing in many places upon the bodies of many trees a kinde of white Mushrome, so like unto Agaricke, that many mistake it for Agaricke.

The Vertues.

There is in the leaves, barke, and fruit of the Larch tree, the same temperature that is in the Pine tree, the Turpentine thereof taken to the quantitie of an ounce will gently open the belly, and move to the stoole, provoke urine, cleanse the reines kidnies and bladder, and helpeth to breake and avoid the gravell and stone, and to give ease to those that have the gout: if it be first washed with Plantaine and Rose water, then made into pills, with the pouder of white Amber, red Corall, Masticke, and a little Camphire, it doth wonderfully helpe to stay the *Gonorrhea* or running of the reines, if they be taken for certaine dayes together, and taken simply rowled in Sugar it helpeth it well: it is profitable also for the Ptisicke or Consumption of the lungs, being taken with hony in an Electuary, it helpeth to expectorate rotten flegme, from those are troubled with a continuall cough: the Turpentine as it is the cleerest for inward uses, and serveth in stead of the true Turpentine, so is it the best also for outward salves, and doth both draw, cleanse and heale all sores or ulcers, either new or old, and greene wounds also, and therefore there is scarce any salve made for ulcers and greene wounds, wherein Turpentine is not put, there is likewise an oyle drawne chimically from Turpentine, which is singular good to be used in wounds, being more drying and consolidating than the Turpentine it selfe, as also to warme and ease the paines of the joynts and sinewes caused of cold: the water that is distilled with the oyle, is used for freckles and spots in the face, a scruple in waight of that water, taken in white wine procureth a vomite, thereby giving much ease to such as have their stomacks overcharged with flegme, the oyle is profitably used in hollow ulcers, being dropped into them, or a tent dipped in it and put into the ulcer: it is good also for the wormes and deafenesse of the eares used with a little Oxe gall: some use to mingle bay salt and Turpentine together, and therewith spread a girdle of leather, and tie it about their wastes that have an itch, which by wearing some small time, will cure the itch that is spread over the bodie, as well as the hands. Agaricke is a medicine of frequent and familiar use, often by it selfe, but most commonly with other purgers, to open obstructions of the liver, spleene, and intralls, purging flegme in especiall, but in generall all other vitious humors, offending any member of the body, and because it doth somewhat trouble the stomacke, and procure casting, it is usually corrected with Ginger, and given with Oximell that is syrupe made with vinegar and hony: for it purgeth both thinne and rotten tough flegme, both yellow, hard, blacke, and burnt choller from the head and braine, from the breast and lungs, from the stomacke, liver, and spleene, from the reines and blacke, and from the wombe, as also from the joynts, sinewes and muscles, and here by helpeth to cure the diseases that proceede from them, that is such as are troubled with the gout, dropsie and falling sickenesse, jaundise, the chollicke and hardnesse to make water, the sciatica or paine of the hips, the pale colour in women caused by the staying of their courses, the shortnesse of breath, the cough and consumption of the lungs, the spitting of bloud, the paines of the mother, the sharpenesse of urine and the wormes: it is helpefull also to cure all sorts of agues, either tertians or quotidians, to ease the griping paines of the stomacke and belly, or such as have had falles or bruises, or are burstен bellied, all which actions it chiefely performeth, by purging those grosse and vitious humors that trouble the parts and members of the body, and are the causes of all these diseases: it is an antidote against all poisons, and cureth the bitings of Serpents very quickly, halfe a drame, or two scruples being taken in wine, either by the infusion or the pouder: for the other diseases afore specified, a dramme sliced, and put into a gentle purging decoction but not violent, or into an infusion, is the most generall manner of preparing it to be given; if it be boyled in lye with other Cephalicall helpes, it much comforteth the braine and memorie, and giddinesse of the head to be washed therewith, as also helpeth to stay the rheumes and catarrhes thereof, and cleanseth it much from scurfe and dandraffe.

CHAP. XLIII.

Zizyphus sive Iujuba. The Iujube tree.

ALthough in former times, there was but one sort of *Iujube* knowne, yet now we have two or three which shall be shewed in this chapter.

1. *Zizyphus sive Iujuba major.* The greater Iujube tree.

The Iujube tree groweth sometimes to be very high, but more often to a reasonable height, having his stemme or body, bowed or crooked, and spreading rather in breadth, the wood whereof is whitish and hard, covered with a rugged barke, from whence spread great branches, and from the lesser and slender whitish twigges, about a foote long, full of leaves set on both sides, not usually directly one against another, but one alittle above another, with an odde one at the end, each whereof is small, somewhat broad and pointed at the end, dented or finely nicked about the edges, with long veines in them, smooth and somewhat hard in handling, each standing on a short foote stalke, and very like unto the leaves of *Paliurus* or Christs thorne:

at

at the foote of every leafe towards the toppes of the twigges come forth, ſmall yellowiſh flowers, of five leaves a peece, where afterwards ſtand the fruite, which is ſomewhat like unto a ſmall Plumme or Olive, but a little long, greene at the firſt, and then it is ſomewhat harſh, and yellowiſh after, but red and of a reaſonable ſweeteneſſe, yet ſharpe withall, and ſomewhat clammy when they are ripe, flat as it were at the lower end, next the ſtalke, whoſe skin is thicker and harder than a plumme, and the ſtone within it is ſmall firme and ſolid, long, round and pointed like unto an Olive or *Cornelian* Cherry ſtone, both for forme and hardneſſe: all the branches both greater and ſmaller are armed with thorns, two alwayes at a joynt, wherof the one is long, ſtrong, ſharpe pointed and ſtaight, and the other crooked, both of them of a blackiſh red colour, like unto the elder branches: the rootes are long and firme in the ground.

2. *Zizyphus ſive Iujuba minor.* The leſſer Iujube tree.

This leſſer Iujube tree is very like unto the former, both for the forme of branches, leaves and flowers, but lower and ſmaller in all parts, the fruite alſo is alike, red when it is ripe, with ſuch an hard firme Olive like ſtone, as the former, but the fruite hereof is ſmaller and rounder, and not long like as the other is: it is as thickely and ſtrongly armed with thornes though ſomewhat ſhorter than the other.

3. *Zizyphus ſive Iujuba ſylveſtris.* The Wilde Iujube tree.

This low Wilde Iujube tree groweth much lower and more like a ſhrubbe than the laſt, and more cruelly armed alſo with ſmall ſharpe thornes: the leaves are like but ſmall, growing in the ſame manner, but fewer on a twigge: the flowers are like the other, the fruite is round and red like the laſt, and ſomewhat leſſer, but dryer of ſubſtance, not having ſuch a pulpie ſubſtance as either of the former have, and more auſtere even when it is ripeſt.

1. *Zizyphus ſive Iujuba major.* The greater Iujube tree.

The Place.

The firſt groweth naturally in *Africa*, *Egypt*, *Arabia* & *Syria* & thoſe more Eaſterly Countries, frō whence as *Pliny* ſaith it was brought into *Italy*, and planted there in his time by *Sextus Papinius*, in the latter end of *Cæſar Auguſtus* his reigne, which now a dayes is very frequent, not onely in many gardens, and Orchards of *Italy*, but in *Provence* of *France* alſo: it is ſo tender that it ſeldome abideth long in our Country, becauſe it cannot endure the cold; The other likewiſe was brought into *Italy* in theſe later times from *Syria*, where it is onely to be ſeene, but with a few that are lovers of rarities. The laſt groweth wilde, in the fieldes by the hedges, not farre from *Verona*, abundantly as *Pona* ſaith.

The Time.

They all ſhoote forth in *Aprill* (for none of them doe hold their leaves all the winter) and flower in *May*: their fruite is ripe in *September*.

The Names.

It is called in Greeke Ζίζυφα & Ζιζύφα *Zizypha & Zinzipha*, of *Columella Ziziphus*, of *Cluſius Ziziphus rutila*, of others *Rubra* and *Punicea*, and of the *Arabians* from whom the Apothecaries tooke it *Iujube*, and ſo doe *Lobel* and *Pena*, *Angvillara* thinketh it to be the *Lotus* of *Athenæus*, as alſo the *Lotus* of *Theophraſtus*, that grew in the Iſland *Pharis*, mentioned in *lib.* 4. *c.* 4. which is moſt likely, for it hath a dented leafe as he ſaith like unto *Ilex*, whereunto this is more like, than the leafe of the *Lotus arbor*, whereof I have made mention in my former booke. Some doe thinke that this fruite is that which *Galen* in 2. *alimentorum* calleth *Serica*, and unto this opinion many doe adhere, eſpecially becauſe *Avicen* entreating of Iujubes calleth them *Serica*, for his title is thus, *De Iujubis ideſt Sericis*, yet it is no other likely, but that he was miſtaken, for many worthy and learned men, doe doubt of it: but *Pliny* maketh mention of *Sericum*, before *Galens* time, in his 15. booke and 14. chap. to be one of the kindes of Tuberes (which we take to be *Nuci perſica Nectorins*, for in his 16. booke 25. chap. he reckoneth the Tuberes, with the Almonds, Peaches, and Apricocks, as if they were all of one kindred, and in his 17 booke and 10. chap. he ſaith that the Tuberes, are beſt grafted on the Wilde Plumme &c. and therefore it is likely he thought them of that kinde of Plummes) of the colour of raw ſilke (and we have a yellow *Nectorin* neere unto that colour) whereof came the name; which maketh me thinke that *Galen* his *Sericum* ſhould not differ from *Plinyes*, ſeeing they lived not any long time, one before the other in *Rome*, and therefore the name could not bee there altered: for *Galen* rather allowing of thoſe things that were conducible to medicine, (and we know that Iujubes are ſo) then of ſuch as did pleaſe the palate onely, as *Nectorins* are, and were fit and deſired of wanton women and children onely as he ſaith, did not greatly commend the fruite for any good to the bodies health, yet I verily thinke, and of this opinion is *Cornarius* alſo, that his and *Plinyes Sericum* are all one. And although *Matthiolus* ſeemeth to finde fault with *Plinye* his booke to be falſe, in naming but one ſort of *Zizyphus*, and two of the Tuberes, when as *Columella*, *Avicen*, and *Sethi*, make two ſorts of *Zizyphus*, yet aſſuredly their other white *Zizyphus* is good onely to kill all foure footed beaſts, in the ſame manner that *Oleander* doth. The other *Cordus* in his hiſtory of plants maketh mention of, and calleth it *Iujuba minor*, and whichmaketh me to thinke it to bee a Tuber, it is very probable to be the *Paliurus Africanus* of *Theophraſtus*, and the *Zizyphus ſylveſtris* of *Lugdunenſis* for

for I thinke he knew not the next hereunto which I call *ſylveſtris*, and is called *Zizyphus ſylveſtris* alſo of *Camerarius*, of *Lobel* & *Pena Iujuba ſylveſtris*, who think it to be *Rhamnus altera* or *Paliurus Theophraſti*, mentioned in his 4. booke and 4. chap. of *Iohannes Pona* in the deſcription of *Mons Baldus Chamæzizypha* and *Zyzypha ſylveſtris*. The *Arabians* call it *Hanen* and *Hanab*, and *Zufalz*, of the *Italians Guggiole*, the *Spaniardes Azufeoſa & Acofeiſo*, the *French Iujubes* and of ſome *Guindoules*, the *Germanes Rothuſtbeere*, and *Bruſtbeerlin*, the *Dutche Iujuben* and in *Engliſh Iujubes*.

The Vertues.

The Iujubes (eſpecially while they are freſh much more than being dry) doe open the body and gently purge choller, and cleanſe the blood: thus ſaith *Actuarius* and *Simeon Sethi*, yet *Matthiolus* following the opinion of *Avicen*, denyeth that they have any purging quality in them at all: all authors doe agree, that they coole the heate and ſharpeneſſe of the blood, and therefore good in hot agues, and doe helpe them that have a cough, to expectorate tough flegme, and is good for the other diſeaſes of the cheſts and lungs, as ſhortneſſe of breath, hot diſtillations, &c. proceeding from hot humors: it is alſo to good purpoſe uſed to cleanſe the raines and the bladder from gravell, which it performeth by the viſcuous quality in them, in making the paſſages ſlippery, and the gravell and ſtones to avoyd the more eaſily, they alſo ſtay vomitings procured by ſharpe humours; but they are hard of diſgeſtion, and doe not eaſily paſſe out of the ſtomack, being eaten either freſh or dryed, they are therefore uſed in decoctions alwayes with other things, fit and convenient for thoſe griefes aforeſaid.

CHAP. XLIIII.

1. *Myxos ſive Sebeſten.* The Sebeſten or Aſſyrian Plum.

THe Sebeſten tree groweth ſomewhat lower then the Plum tree, covered with a whitiſh barke, the branches are greene, whereon grow rounder thicker and harder leaves then they; the bloſſomes are white conſiſting of five leaves a peece, growing many together on a long ſtalke, which afterwards turne into ſmall Berries rather then Plums, of a blackiſh greene colour when they are ripe, every one ſtanding in a little cup, of a ſweete taſte, and glutinous or clammy ſubſtance, and a very thicke skinne: within which lyeth a threeſquare hard ſtone, with a thicke ſhell and a ſmall kernell: theſe are gathered and laid in the Sunne, whereby they grow wrinkled, and ſo they are kept, and brought over unto us in boxes.

Sebeſten. The Sebeſten or Aſſirian Plum.

2. *Sebeſten ſylveſtris.* The wilde Sebeſten.

The wild Sebeſten is in all things like the other, but that it groweth lower, more like unto a hedge buſh, and with leſſer and thinner leaves; the flowers and fruit are alike but leſſe.

The Place.

The firſt groweth in *Syria*, and is but planted in *Egypt*, as *Alpinus* ſaith, and from thence were brought into *Italy*, in *Pliny* his time, which were grafted on the Service tree, and do now grow in many places there in their Orchards: it is ſo tender, not enduring the cold with us, that wee can as hardly keepe it, as cauſe it to ſpring, the ſhell of the ſtone being ſo thicke and the kernell ſo ſmall: The other as *Alpinus* ſeemeth to averre, is naturall of *Egypt*.

The Time.

They flower in *May*, and the fruit is gathered in *September*.

The Names.

The tree is called in Greeke μυξῶ and the fruit μύξαι μύξα and μυξεια a *muccoſo fructus lentore*: μύξον *enim muccum ſignificat*, in *Latine myxos* for the tree, and *Myxa* and *Myxaria* for the fruit: it is thought as *Ruellius* ſaith that the *Syrians* in honour of *Auguſtus*, called them *Sebaſte*, from whence the *Arabians* called them *Sebeſten*; and the Apothecaries in their ſhops uſe that name onely.

The Vertues.

The Sebeſtens by the judgement of both Arabians and Greekes doe open the body in the ſame manner, or rather more by reaſon of the muccilagines in them, then Damaske prunes, yet more while they are greene, and leſſe when they are dry, yet the decoction of them, or the infuſion of them in broth, although dryed and taken whole worketh effectually, which *Fuſchius* denyeth, affirming that they binde rather; they ſerve to coole any intemperate heate of the ſtomack or liver; and therefore are good in hot agues, and to purge choller whereof they come: *Matthiolus* ſaith that he hath often found by his experience, that ten drams or twelve at the moſt of the pulpe of Sebeſtens, taken from the skins and ſtones, worketh as well and to as good purpoſe, as the pulpe of *Caſſia Fiſtula*: they are very effectuall alſo to lenifie the hoarſeneſſe and roughneſſe of the throate: they helpe the cough and wheeſing of the lungs, and diſtillations upon them, by lenifying the paſſages and cauſing much flegme to be avoyded: they alſo give eaſe to them that are troubled with paines in their ſides, and merveilouſly helpeth them that are troubled with the ſharpeneſſe of their urine, proceeding from choller or ſalt flegme: the

they also drive forth the long wormes of the belly. There is a kinde of Birdlime made of these fruites, by boyling them a little in water to take away their skinnes and stones, and after boyling them more to a consistence, the which as *Matthiolus* saith was used at *Venice* to catch birds, but *Alpinus* saith they use it in *Egypt*, as a plaister to dissolve hard tumors or swellings.

CHAP. XLV.

Ruscus. Butchers Broome.

THe first shootes that sproute from the roote of Butchers Brome are thicke whitish and short, somewhat like unto those of Asparagus, but greater, which in some places are eaten in the same manner that Asparagus shootes are; these rising up to be a foote and and a halfe high are spread into diverse branches, greene and somewhat crested with the roundnes, tough, pliant, and flexible, whereon are set some what broad and almost round, hard leaves, sharpe and prickely pointed at the ends, of a darke greene colour, and somewhat like unto Mirtle leaves, two for the most part set at a place very close or neare together: about the middle of the leafe on the backe or lower side from the middle ribbe breaketh forth a small whitish greene flower consisting of foure small round pointed leaves, standing upon a very short or no foote stalke, and in the place whereof commeth a small round berry green at the first, and red like an Asparagus berry when it is ripe, but greater wherein are two or three white hard round seedes contained: the roote is thicke, white, and great at the head, and from thence sendeth forth diverse thicke, long tough white strings.

Ruscus. Butchers Broome.

The Place.

This groweth generally throughout this Land, in copses, and upon heathes and waste grounds, and oftentimes under or neare the Holly bushes.

The time.

It shooteth forth his yong buds in the Spring, and the berries are ripe about September, the branches and leaves abiding greene all the winter.

The Names.

It is called in Greeke ὀξύμυρσινη *Oxymyrsine*, i. *acuta Myrtus* μυρσίνη ἀγρία, *Myrtus sylvestris*, (but there is another *Myrtus sylvestris* accounted of among the ancients, which is like unto the tame or manured kinde;) and *Pliny* in his 15. Booke and 7. Chapter, confoundeth both these together, in giving to the one the faculties of the other.) μυρτακανθα *Myrthacantha*, *Myrtus spinosa*, μύαινα ἄκανθα *Murina spina*, and of *Theophrastus* κεντρομυρσίνη *Centromyrrhine*, *Pliny* saith they called it *Chamæ myrsine*, and *Acaron* or rather *Aceron* which is one of their bastard names, of the Latines *Ruscus* and *Ruscum*, in the Apothecaries shops *Bruscus*, and of some as *Marcellus* saith *Scoparegia*. The *Arabians Serapio*, and others fowly erred in calling the berries hereof *Cubebe*, which are certaine aromaticall graines or berries like unto Pepper, but with a small point or end. *Ruellius* translation of *Dioscorides* Greeke coppie is faulty herein, that he saith the berries hang downe from the leaves, when as the Greeke words are, it hath round berries in the middle of the leafe, which *Theophrastus* confirmeth in his 3. Booke and 17. Chapter, saying it is proper as well to *Laurus Alexandria* as *Ruscus* to beare the fruite on the leafe. The *Italians* call it *Rusco* and *Pongitopo*, as if you would say Prickemouse, even as the *Germans* doe *Mueſſdorn*, and both from the Greeke μυάκανθα *Murina spina quod arcendis muribus a salsa carne appensa circumligetur*: the *Spaniards* call it *Ius barta & Gilbarbeyra*: the *French Buis piquant*, the *Dutch Stekende palmre*: and we in English Kneeholme and Butchers Broome.

The Vertues.

The rootes and leaves of Butchers Broome are hot in the second degree, and dry in the first with some tenuitie of parts: the young shootes are eaten like unto Asparagus, but because they are more bitter, they are rather used Physically, and are very profitable to open obstructions, to provoke urine, and to amend the strong smell thereof, and is one of the five opening diuretically rootes in the Apothecaries shoppes, helping to expell gravell and the stone, strangury, and womens monethly courses by drinking the decoction of the rootes made with wine: the same also helpeth the yellow jaundies, and the head ach, and with some sugar or hony put thereunto helpeth to expectorate flegme, and to clense the chest of much clammy humours gathered therein: *Dioscorides* attributeth to the leaves & berries the same effects: yet some doubting of the operation hereof to such purposes as afore is said, do hold it to be as effectuall in knitting and consolidating of broken bones and parts out of joynt, as *Solomons* seale Comfrie or the like, to drinke the decoction of the rootes, and apply them poultis wise unto the affected place. The pliant twigges or stalkes with leaves served in former times for many uses, to binde their vines or other things, as *Virgil* his Verses doe testifie in the second of his *Georgicks* in these words,

----*Nec*

——Nec non etiam aſpera Ruſci,
Vimina per ſylvam, & ripis fluvialis arundo. Cedatur;

and to preſerve hanged meate from Miſe eating, from whence came the *Italian* name of *Pongitopi*, and for to make Broomes to ſweepe the houſe, from whence came the name of *Scoparegia*, but the Kings chamber is by revolution of time turned to the Butchers ſtall, for that a bundle of the ſtalkes tied together, ſerveth them to cleanſe their ſtalles, and from thence have we our Engliſh name of Butchers Broome.

CHAP. XLVI.

Seſamum. The oyly purging Pulſe *Seſamum.*

THis plant upon the firſt ſpringing thereof from the ſeede, riſeth up with foure ſmall long and ſomewhat broad leaves, betweene which come forth other, that when they are full growne, are as large and long as the great Nightſhade leaves, but ſome deepelier dented than others, and even almoſt torne; eſpecially at the lower end of the leafe next the ſtalke, each ſtanding on a long footeſtalke: the ſtalke riſeth from among the lower leaves, being ſtraight, thicke, fat, ſtrong and round, two or three foote high; from whence ſhoote forth on all ſides (if it obtaine a ſtrong fat ground, and a warme place) diverſe ſtalkes of leaves, like unto the other, (or elſe abideth bare or without branches) two for the moſt part ſet at a joint, and at each joynt of the ſtalke up to the toppe, commeth forth one flower, of a whitiſh colour, which is ſomewhat long like vnto a Bell flower, made of one leafe without diviſion at the edges, having a few long threds at the bottome, not riſing ſo high, that they may be ſeene without opening the flower: after the flowers are paſt, there come up in their ſteede, ſmall long hard cods, having three or foure or five ribbes or creſtes, which doe open themſelves into ſo many parts, having in each part ſmall whitiſh yellow flat ſeedes lying therein: the roote is ſomewhat great and long, with many ſtrings and fibres at it, taknig as faſt hold in the ground, as a Sowthiſtle doth: both leaves, ſtalkes, and ſeedes are very bitter while they are greene, that cattle will not touch them, but being dried they become more pleaſant for them to eate: and the ſeede becommeth more oyly than Linſeede, from whence is preſſed forth a whitiſh oyle, very ſweete while it is freſh, and will not in a long time decay or grow ſtronger.

Saſamum. The oyly purging pulſe *Seſamum.*

The Place.

It groweth naturally in the *Indies* and other Eaſterly countries, but is onely ſowen in the fields, of *Syria*, *Egypt*, *Sicily*, *Candy*, *Greece*, and other places there abouts, it is to be had but in the gardens of lovers of rare plants in all *Italy*, neither in the tranſalpine countries: the Apothecaries in our land doe ſeldome uſe either ſeed or oyle, few or none of them ever ſaw the ſeede, much leſſe the plant.

The Time.

It floweth not untill July, and ripeneth not the ſeede untill September.

The Names.

It is called σήσαμον and σήσαμη in Greeke, and *Seſamum* and *Seſama* in Latine of all Writers thereof. *Alpinus* ſaith it is called in *Egypt Sempſem*, the oyle thereof *Syris*, and the footand grounds of the oyle *Thaine*. All Authours almoſt doe number it among the graines and cornes, as a kinde thereof, and not of the pulſe, which doe all for the moſt part beare cods, yet of diverſe faſhions, but why they ſhould doe ſo, I cannot conceive any other reaſons, than that it was put into bread as Poppy ſeede was, the ſeede being ſomewhat like unto Millet, and that it was ſowen in the fields, as other graine and pulſe were; for *Theophraſtus* in diſtinguiſhing the kinds of graine, *lib.* 8. *cap* 1. maketh 3. ſorts, the firſt wheate, barly, &c. the ſecond beanes, peaſe &c. the 3. Millet, Panicke and *Seſamum*, whereof corne beareth ſpikes or eares, pulſe beare cods, and thoſe that are like Millet, Panicke, &c. doe beare a *juba* or *maine*, for ſo he calleth that reede-like tuft or buſhy feather like toppe which the Millet and Panicke doe beare, and ſetteth downe *Seſamum* among them: now *Seſamum* hath no ſuch buſhy feather toppe as Panicke or Millet, or as the like have, but rather ſeverall cods as the pulſe, allthough in differing manner; but *Galen in primo Alimentorũ* doth number it among the pulſes, and ſaith it was in his time eaten of many as pulſes are. *Bellonius* in the 29. Chapter of his third booke of Obſervations, ſetteth downe the manner of making the oyle of *Seſamum*, which if any be deſirous to know, I referre him to the Author.

The Vertues.

The ſeede and oyle of *Seſamum* are all of one qualitie and temperature, being neere the ſecond degree of heate and moiſture, both mollifying and diſſolving: but the leaves eſpecially while they are greene, are more cooling, fit to repreſſe the inflammations and griefes of the eyes, by way of fomenting them, the ſeede is taken inwardly in decoctions or other wayes, or uſed in gliſters to looſen the belly, when it is bound or pained by the chollicke, which

which it worketh by his unctuous or oylie quality, and therefore the oyle is often uſed for the ſame purpoſes: both *Dioſcorides* and *Galen* ſay that it troubleth and overturneth the ſtomack, by reaſon of his unctuoſity, and doth hardly digeſt with them that eate it, yeeldeth a groſſe nouriſhment unto the body, and filleth it up with fat fleſh quickly: it cauſeth a ſtinking breath becauſe it often ſticketh in the teeth when it is eaten, whereby it is offenſive: *Alpinus* ſaith that the Egyptians uſe the decoction of the ſeede, to thoſe that are troubled with the cough, the ſhortneſſe of breath, the pleureſie or hard ſcirrhous ſwellings of the liver, and *Meſues* ſaith, it lenifieth the roughneſſe or hoarſeneſſe of the throat, and voyce, making it cleare and free of paine: it cureth the bitings of the horned ſerpent *Ceraſtes*, and eaſeth the paines of the head, proceeding of the heate of the ſunne: the decoction of both herbe and ſeedes with ſome honye, is very profitable for women to ſit in whoſe wombes are hard or ſwollen, and to bring downe their courſes when they are ſtayed, as alſo to waſh their heads, that are much troubled with dandraffe, or ſcurfe, or dry ſcabbes: the herbe or ſeede ſtayeth vomiting taken in an egge: *Meſues* ſaith alſo that the ſeede or oyle doth fatten the body, and encreaſeth ſperme. The oyle is of great uſe and effect to anoint the face or hands; or any other part of the body, to cleanſe the skinne, and to take away ſunburning, morphew, freckles, ſpots or ſcarres or any other deformities of the skinne, proceeding of melancholy: it is good alſo to anoint any part ſcalded or burnt with fire: it helpeth thoſe ſinewes that are hard or ſhrunke, or thoſe veines that are too great. The ſeede was in ancient times much uſed in bread for to reliſh and make it ſweeter, as alſo in cakes with honey as Poppie ſeed was.

CHAP. XLVII.

Iris. The Flowerdeluce.

HEre are ſo many ſorts of Flowerdeluces, that to ſhew you them all here againe (having deſcribed them all exactly in my former booke) would make this booke too voluminous, I muſt therefore referre you thereunto, and give you here ſome deſcriptions and figures with the vertues.

1. *Iris major latifolia.* The greater broade leafed Flowerdeluce.

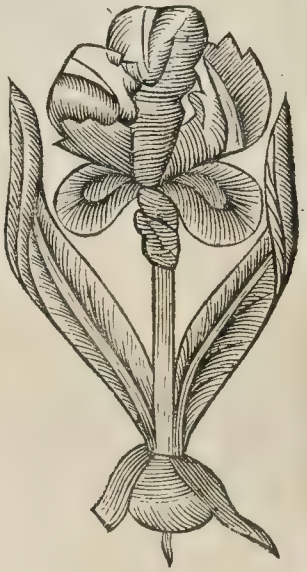
This Flowerdeluce hath many heads of very broad and flat greene leaves encloſing or foulding one another at the bottome, and after divided in ſunder with thinne edges on both ſides like a ſword and thickeſt in the middle: from the middle of ſome of theſe heads of leaves riſeth up a round ſtiffe ſtalke two or three foote high bearing at the toppe one two or three large flowers out of everall huskes or skinnes conſiſting of nine leaves, three whereof fall downe, having a freeze neere the bottomes, three other ſmaller than they bowed or arched cover the bottomes of the falling leaves, each of them divided at the ends and turning up a little, and three other the largeſt of them all ſtand upright but bow themſelves a little that they may all for the moſt part meete together at their toppes or ends: in ſome white,

1. *Iris major latifolia.*
The greater broad leafed Flowerdeluce.

2. *Iris major anguſtifolia.*
The greater narrow leafed Flowerdeluce.

3. *Iris sylvestris Lusitanica.*
The Portingall Flowerdeluce.

4. *Gramineus latifolia.*
Dwarfe Flowerdeluce with broad leaves.



Chamæ Iris angustifolia.
The narrow leated dwarfe Flowerdeluce.

5. *Xyris sive Spatula fœtida.*
Stinking Gladwin.

in others blew or purple, or blackiſh purple ſpotted, and in others of ſuch varietie of mixture in colour, that it is admirable, as you may ſee in my former booke, where I am too copious to bee here expreſſed, and therefore muſt referre you thereunto: the ſeede is encloſed in thicke ſhort pods, being flat, and lying in rowes cloſe one upon another: the roote is tuberous ſhooting forth on all ſides the like knobs.

2. *Iris major anguſtifolia.* Narrow leafed Flowerdeluce.

This other ſort of the greater Flowerdeluces, differeth not in roote, leafe, flower or ſeede from the former, but in having the leaves narrower than it, and the flowers to be various as the former yet not ſo much.

3. *Iris biflora Luſitanica.* Portingall Flowerdeluce.

This alſo hath no greater difference to diſtinguiſh it than that it will ſometimes flower twiſe a yeare, and the flowers ſometimes have 12 leaves, 4 falling downe, 4 ſtanding up, and 4 arched to cover the falls.

4. *Chamæ iris latifolia.* Broad leafed dwarfe Flowerdeluce.

The dwarfe kinds likewiſe grow both in roote, leafe, flower and ſeede like unto the greater kindes in all reſpects except the lowneſſe, for ſome will ſcarſe riſe above a foote high, others not halfe a foote, and ſome ſcarſe ſo high, as their leaves, which in this ſort is broader, in others narrower: the flowers alſo varying in colour one from another, but not mixed with that variety that is in the former.

5. *Xyris ſive Spatula fœtida.* Stinking Gladwin.

The ſtinking Gladwin is one of the kindes of wilde Flowerdeluces, both in forme and propertie, as I ſaid before, and therefore muſt be numbred among them. It hath diverſe leaves riſing from the rootes, very like unto a Flowerdeluce, but that the leaves are ſharpe edged on both ſides, and thicker in the middle, of a deeper greene colour, narrower alſo and ſharper pointed than the leaves of moſt of the Flowerdeluces, and of a ſtrong or evill ſent, if they be rubbed or bruiſed betwixt the fingers: in the middle riſeth up a reaſonable ſtrong ſtalke three foote high at the leaſt, bearing three or foure flowers at the toppe, made ſomewhat like the flower of a Flowerdeluce, having three upright leaves, of a dead or ſullen purpliſh aſh colour, with ſome veines diſcoloured in them, the other three doe not fall downe, nor the three other ſmall ones are not ſo arched, nor cover the lower leaves, as thoſe doe in the Flowerdeluce, but ſtand looſe or a ſunder from them: after they are paſt, there come up three ſquare hard huskes, opening wide into three parts when they are ripe, wherein lye reddiſh ſeede, and turning blacke, when it hath abiden long: the roote while it is young is but ſmall, and full of ſtrings, but being growne elder they are greater, and faſhioned like unto a Flowerdeluce roote, but reddiſh on the outſide and whitiſh within, very ſharpe and hot in taſte, and of as evill a ſent as the leaves.

6. *Iris bulboſa latifolia prima Cluſii.* The firſt broad leafed bulbed Flowerdeluce of *Cluſius*.

This kinde of Flowerdeluce hath diverſe long ſomewhat broad and hollowiſh leaves not ſtiffe like the other ſorts but ſoft, greeniſh on the upperſide, and whitiſh underneath: among which riſeth up one ſtalke and ſome-

6. *Iris bulboſa prima latifolia Cluſii.*
Cluſius his firſt bulbed Flowerdeluce with broad leaves.

8. *Iris bulboſa minor ſive anguſtifolia.*
The leſſer bulbed Flowerdeluce.

times more, not above halfe a foote high, bearing at their toppes one flower a peece, and seldome more, somewhat like unto a Fowerdeluce, consisting of nine leaves, whereof those three that stand upright are shorter, and more closed together than in others, the three that fall down turne up their ends a little, and those three that in others doe cover the falls at their bottomes, stand like the upright leaves in other Flowdeluces, and are parted into two ends like unto two eares: the colour of the flowers is blew, either paler or deeper, or white, which is more rare, smelling very sweete; the roote is round and white under the blackish coates that cover it, having sundry long white rootes in steede of fibres like unto an *Asphodill*.

7. *Iris bulbosa major Anglica.* The greater bulbed Flowerdeluce.

This hath five or sixe long hollowish or guttured whitish greene leaves, broader than in any of the lesser sorts, among which riseth up a stiffe round stalke two foote high sometimes, at the toppe whereof, out of a skinnie huske breaketh forth one or two flowers consisting of nine leaves likewise, standing in the same manner that the former sorts doe, but each of the falling leaves have a yellow spot neere their bottomes, and the three upright leaves are small, and narrow at their bottomes but broad upwards: the colour whereof is all blew, purple, or white, or mixed very variably, as is in my booke expressed: the heads for seede are smaller than the former, and so is the seede, and not so flat: the roote of this is usually greater than in the other smaller bulbous sorts with long haires or threds, in the outer browne coates which are not in the others.

8. *Iris bulbosa minor sive angustifolia Hispanica.* The lesser bulbed Flowerdeluce.

This lesser sort groweth in the same manner that the greater doth, but hath narrower long pointed leaves: the flowers likewise are smaller, shorter and rounder than in the other, but of the same fashion, and vary much more in the diversitie of their colours than it: the seedes are smaller, and the pods longer and slenderer, and the roote also smaller, but more encreasing in bulbes.

The Place.

The Flagges or Flowerdeluces here mentioned as well as the bulbous kindes grow in diverse Countries as *Africa*, *Greece*, *Italy*, and *France*, and some in *Germanie*, and in our owne Countrie, but are chiefely nursed up in their gardens that are lovers of such delights; the *Gladwin* groweth as well upon the upland grounds, yet in moyst places, as in woods and shaddowie places by the sea sides in many places of this land, and is continually nursed up in gardens; yet in paticular you may finde it growing, by a foote path, not far from the hither end of *Dartford* towne in *Kent*; as also neere to *Kentish* towne, which is hard by *London*, if it be not digged up and carryed away, for I doe verily thinke, it is not naturall in that place, but some seede by chance, hath beene brought among the soyle, whereby it grew there.

The Time.

The dwarfe kinds of Flagge Flowerdeluces flower in *Aprill*, the greater in *May*, and the bulbous sorts not untill *June*, the Gladwin flowreth later than any Flowerdeluce doth, that is to say not untill *July*, and the seede is ripe in the end of *August*, or in *September*, yet the huskes after they are ripe opening of themselves, will hold their seedes within them for 2 or 3 moneths, and not shed them.

The Names.

The greekes call it Ἶρις; as also Ῥοδάκινον; *Iris* and *Hieris*, *quasi sacra*, which made *Gaza* finding it so written in some coppies of *Theophrastus*, to translate it *Consecratrix*; but it was called *Iris*, *a celestis arcus similitudine*, *quam flores ejus representant*, from the Rainbow whose various colours the flower thereof doth imitate, the old ignorant age made a difference betweene *Iris* and *Ireos*, according to the Latine verse extant thereof, which is this, *Iris purpureum florem gerit Ireos album*. The *Iris tuberosa*, which is a peculiar kinde, as you shall finde it in my former booke, is called of *Matthiolus Hermodactylus verus*, because the rootes are like unto fingers, and from him diverse did so call it, but most erroniously: for a while *Dodonæus* tooke it to be a kind of wild Flowerdeluce, and that truly: yet some did take it to be *Lonchitis prior* of *Dioscorides*: the *Arabians* call it *Asmeni juni* or *Ajersa*, the *Italians* *Iride & Giglio azurro & celeste*, the *Spaniards* *Lirii cardeno*, the *French* *Flambe*, the *Germanes* *Gilgan* and *Himmelschwertsol*; but why *Lobel* should call the *Iris bulbosa Anglica* by the name of *Hyacinthus poetarum*, I see no reason for it hath none of those mourning markes are in the *Iris*, nor is it of the forme of a Lilly. *Gladwin* is called in Greeke Ξύρις, *Xyris ob folii similitudinem quasi rasorium cultrum*, *aut novaculum dixeris*, and in Latine *Spatula* or *Spathula fœtida*, for *Spatha* is taken for a sword as *Gladium* is, and for that the leaves being bruised smell very strong, his denomination in *Latine* and *English*, hath risen sutable thereunto: *Theophrastus* calleth it *Iris agria*, *Tragus* in mistaking it, did take it to be *Gladiolus*, the *Arabians* call it *Casoras*, the *Italians* *Spatola fœtida*, the *French* *Glaieul puant*, the *Germanes* *Wendeleufkrant*.

The Vertues.

All the Flowerdeluces especially the Flagge kindes are very neere of one quality, but of the bulbous kindes I finde no Author to write, or experience to teach whether they be of the same or differing propertie. The juyce or the decoction of the greene rootes of the Flag Flowerdeluce, with a little honey drunk, doth purge and clense the stomack of grosse & tough flegme and choller that lyeth therein, which might be the cause of diverse agues; it helpeth the Iaundise also, and the dropsie, by evacuating those humors both downwards and upwards; and because it doth somewhat hurt the stomack, it is not to be given but with honey & Spiknard: the same being drunk, doth ease the paines and torments, or wringing of the belly, and sides, the shakings of agues, the diseases of the liver and spleene, the wormes of the belly, the stone in the raines, convulsions or crampes that come of cold humors, by warming them and comforting the parts; as also helpeth those whose seede passeth from them unawares or unwillingly, yet as one saith, it doth consume and waste it very much also; and is a remedy against the bitings and stingings of venemous creatures, being boyled in water and Vinegar and drunke: the same rootes being boyled in wine and drunke provoketh urine, helpeth the collicke, bringeth downe womens desired sicknesse, and made up into a pessary with honey, and put up into the body, draweth forth the dead childe: it is much commended against the cough, to cause tough flegme to be the more easily extenuate, and to be expectorate and spit forth; and therefore the *Diaireos* in the Apothecaries shoppes, either in the powder, or made into a *Lohoc* or licking Electuary, is effectuall for the same purpose; it conduceth much to ease the paines in the head, and to procure sleepe and rest: being applyed with rosewater rosecake and vinegar, to helpe watering eyes, by clensing the moyst sharpe humors, and drying them up: being put up into the Nostrils, it procureth neesings, and thereby

also

alſo purgeth the head very much of flegme: the juice of the root applyed to the Piles or the Hemorrhoides, giveth much eaſe: and for the Dropſie, an Electuary made of the juice thereof, with other things in this manner, is held very effectuall: Take of *Galanga*, and of *Zedoarie*, of each two drams, of Cinamon and Cloves of each one dram and a halfe, of the leaves of Sea Bindweede called *Soldanella* in the Apothecaries ſhoppes, halfe an ounce; make theſe into pouder, and with ſo much hony, wherein three drams of the juice of the rootes of Flowerdeluces hath beene boyled, and is ſufficient, make them up into an Electuary; whereof halfe an ounce taken in the morning faſting, for divers dayes will doe much good: it doth alſo wonderfully helpe the paines and ſwellings of the cods in this manner, Take foure drams of the pouder of the rootes thereof, of Cinamon and of Dill, of each two drams, of Saffron one ſcruple, mix theſe well together and apply them to the cods, being firſt laid upon a ſcarlet cloth, moiſtned in white wine, and warmed in a diſh, over a Chafing diſh with quick coales therein: the decoction of the rootes gargled in the mouth eaſeth the toothach, and a ſtrong or ſtinking breath: the oyle called *Oleum Irinum*, if it be rightly and truly made of the flowers of the great broad Flagge Flowerdeluce, of what colour I thinke it greatly mattereth not (but not of the flowers of the greater blew Engliſh bulbous Flowerdeluce, as I know ſome Apothecaries have and doe uſe) and rootes of the ſame ſorts of Flowerdeluces, is very effectuall to warme and comfort all cold joynts and ſinewes, as alſo the Gout and Sciatica, and mollifieth, diſſolveth and conſumeth tumours or ſwellings, although they be ſcrophulous in any part of the body, as alſo of the matrix: It helpeth the Crampe and Convulſion of the ſinewes, warming them, and helping to extend them; the head and temples annointed therewith, helpeth the Catarrhe or thin Rheume diſtilling from thence; and uſed upon the breaſt or ſtomack helpeth to extenuate the tough cold flegme, making it eaſie to be ſpit out; it helpeth alſo the paines and noyſe in the eares, and the ſtench or evill ſavour of the noſthrills; it giveth alſo much eaſe unto the painefull Piles: The roote it ſelfe either greene or in pouder, helpeth to clenſe, heale and incarnate wounds, and to cover with fleſh the naked bones, that ulcers have made bare, and is alſo very good to clenſe and heale up Fiſtulaes and Cankers, that are hard to be cured: divers doe uſe to beate the greene rootes, and ſo apply them to the face or other parts, but it is better tyed in a faire linnen cloth, and laid for a day and a nigh in faire or Roſe water, with which water you may wet or moiſten the skin of the face, hands or neck, that are ſunburned or deformed with the Morphew, black or blew markes or ſcarres, or any other diſcolouring of the skinne, but they that uſe it had neede to take heede that they uſe it not too ſtrong, nor let it lie on too long, but rather waſh it off againe with faire water, within two or three houres after it hath beene uſed: The dryed rootes called Orris, being beaten either alone of themſelves into pouder, or with other ſweete things, are uſed to be layd in preſſes, cheſts and wardrops, to ſweeten and perfume garments of linnen, and ſilke eſpecially, and all things that you will put it to, and thus much of the Flowerdeluce. But there are but few that have written of the Gladwin, or that have remembred the purging qualitie therein, yet many of our country people in many places, doe with the decoction of the rootes purge themſelves, and thereby avoyd much corrupt tough flegme and choller: yet ſome that will not have it worke ſo ſtrongly, doe but infuſe the ſliced rootes in Ale, and ſome take the leaves which ſerveth well for the weaker and tender ſtomacks: the juice hereof procureth ſneezing, being put up or ſnuffed up into the noſe, and draweth downe from the head much corruption, and the pouder thereof doth the ſame: the pouder alſo drunke in wine helpeth thoſe that are troubled with Crampes and Convulſions, or with the Sciatica or Goute, and giveth eaſe to thoſe that have any griging paines in their body or belly: and helpeth thoſe that have the Stranguric, that is, that cannot make their water, but by drops: it is with much profit alſo given to thoſe that have had long Fluxes by the ſharpe and evill qualities of humors, which it ſtayeth having firſt clenſed and purged them, by the drying and binding propertie therein, even as Rubarbe and ſome other ſuch like things doe; the roote procureth Womens monethly courſes very effectually, if it bee drunk after it hath beene boyled in wine, and ſome of them ſhred and boyled in wine and vinegar, in equall parts, that ſhee may ſit over the hot fumes, being cloſe covered untill it grow neare cold: the roote uſed as a peſſarie, worketh the ſame effect, but in women with child it cauſeth Abortion, that is, the delivery afore the due time: the ſeed beaten to pouder and taken to the quantity of halfe a dram in wine, helpeth thoſe that cannot make water very effectually: the ſame taken with vinegar diſolveth both the hardneſſe & the tumors of the ſpleene: the root is very effectuall in all wounds, and ſpecially of the head, as alſo to draw forth any ſplinters, thornes, broken bones, or any other thing ſticking in the fleſh without cauſing any paine, uſed with a little Verdigreaſe and hony, and the great centory roote: the ſame alſo boyled in vinegar and layd upon any hard tumors, doth very effectually diſſolve and conſume them, yea even thoſe ſwellings of the throate, called the Kings Evill: the juice of the leaves and rootes is profitably uſed to heale the itch, and all running or ſpreading ſcabs or ſores, and blemiſhes or ſcarres in the skinne: ſome doe ſuppoſe by the ſharpeneſſe of the taſte in the roote (eſpecially more then in the ſeede, which is more drying) that it hath as well a corroſive as opening quality therein: ſome alſo doe appropriate it to the effects of the cheſts and lungs, for which the Iris or Flowerdeluce is more proper and effectuall: ſome alſo to ſtay the involuntary paſſage of the ſperme, following *Pliny* therein: and ſome alſo to heale the hemorrhoides, and others the diſeaſes of the fundament: it is thought alſo to bee effectuall againſt the poyſon of Serpents; and thus much for the ſtinking Gladwin.

CHAP. XLVIII.

Cnicus ſive Carthamus. Baſtard or Spaniſh Saffron.

ALthough theſe ſorts of *Cnicus* might well be placed among the Thiſtles, as other Authors doe, and with theſe that other wilde kind, called *Attractylis*, but becauſe theſe onely have purging qualities; I thought it beſt thus to ſeparate them and intreate of theſe in this place.

1. *Cnicus ſive Carthamus ſativus.* The manured baſtard Saffron.

The manured baſtard Saffron hath ſundry large leaves lying next the ground, without any pricks, or with very few white ones at the corners of the leaves and diviſions, among which riſeth a ſtrong hard round ſtalke three or foure foote high, branching it ſelfe up to the top, bearing ſhorter leaves, ſharpe pointed,

1. *Cnicus ſive Carthamus ſativus.*
The ordinary Spaniſh Saffron.

2. *Cnicus alter Creticus.*
Wilde or baſtard Saffron of Candye.

ted, and prickly at the edges, and at their ends a great open ſcaly head, out of which thruſteth forth many gold yellow threds, of a moſt orient and ſhining colour, which being gathered in a dry warme time and kept dry, will abide in the ſame delicate colour that it bare when it was freſh for a very long time: the ſeed when it commeth to maturity, is white and hard, ſomewhat long and round, and a little cornered: the roote is long white and wooddy, periſhing yearly after ſeede time. This hath beene found with a white flower but very bare.

2. *Cnicus alter Creticus.* Wild or baſtard Saffron of Candy.

This other baſtard Saffron of Candye, from a thicke and long blacke root riſeth one ſtraight round ſtalke, halfe a cubit high, ſet here and there with long ſharpe pointed leaves, thicke ſet with prickles at the dentes of the edges, at the toppe whereof ſtandeth a ſcaly head compaſſed with prickly leaves, of the bigneſſe of the *Atractylis* or Diſtaffe Thiſtle. out of which breake forth divers thicke yellow Saffron like threads thicke thruſt together, after which the ſeede groweth therein being white, and as great as the greater Centory ſeede.

3. *Cnicus alter perennis Cluſii.* *Cluſius* his everliving baſtard Saffron.

This baſtard Saffron riſeth up with divers hard ſtrong and round ſtalkes, without any branches at all from them, to the height of three or foure foote, bearing thereon at ſeverall places ſomewhat large and long leaves, dented about the edges, of a ſad or duskie greene colour: at the top of every ſtalke, ſtandeth one great cloſe hard ſcaly head, but not prickly at all, not ſo great as the other *Cnicus* or baſtard Saffron, never opening the ſcales of the head as it doth; from the middle whereof commeth divers threds, yet nothing ſo many as in the other, of a ſad blewiſh aſhcolour, and whitiſh at the bottome of them, the ſeede which lyeth among the downe in thoſe heads is greater, (although *Cluſius* ſaith ſmaller, for I ſet

3. *Cnicus alter perennis Cluſii.*
Cluſius his everliving baſtard Saffron.

you

you forth the plant as it groweth with us) then of the other thick and short, but not white, and in lesser quantity then it: the rootes runne downe deepe into the ground, and being there encreased doe runne and spread themselves, taking up a great deale of roome.

The Place.

The first is generally sowen in *Spaine*, *Italy* and other places, for the especiall use thereof: The second *Alpinus* saith was brought out of *Candye*: The last groweth wilde in *Spaine*, as well about *Sevill* as *Cordula*, and in other places as *Clusius* saith, *Pona* remembreth it to grow upon Mount *Baldus*.

The Time.

They flower in the end of *July*, or about the beginning of *August*, and the seede is ripe about the end thereof.

The Names.

It is called in Greeke κνῆκος and κνῆκος, *Cnicus* and *Cnecus*, either ἀπὸ τοῦ κνίζειν *quod est pungere vel mordere*, or ἀπὸ τοῦ κνησμοῦ, *quod pungendo pruriginem excitet*, but is more properly to be understood of the wilde kind: or rather a *floris colore*, *cum* κνῆκος *exponatur croceus vel rutilus*: it is called *Cnicus* and *Cnecus*, also in Latin, and *Carthamus* in the Apothecaries shops, ἀπὸ τοῦ καθαίρειν as it is thought, *quod est purgare*, but more truly from the *Arabians Kartam*. The first is called *Cnicus sativus urbanus* and *vulgaris* by most Authors, and *Carthamus* as I said in the Apothecaries shoppes, of some also *Crocus Saracenicus*. The second is remembred onely by *Alpinus* in his booke *de plantis exoticis* by the name of *Cnicus singularis*: the last *Clusius* calleth *Cnicus alter cæruleo flore*, and so doe all other after him without any great variation. The *Arabians* call it *Kartam*, the *Italians Safferano Saraseniſco*: the *Spaniards Alacor* and *Azafran salvaje*: The *Germaines* call it *Wilder Saffran*, the *French* Saffran *bastard* and *graine de Perroquets*, because they use to feede Parrats with the seede: in English Wilde Saffron, Bastard Saffron, Spanish Saffron, and Catalonia Saffron.

The Vertue.

The first Spanish Saffron flowers are much used in *Spaine* and other places, to bee put into their brothes and meates, to give them a yellow colour, which doth much please them: for as for any relish of spice, or hot quick taste they have none, nor any comfortable qualities, that they should be desired or used, neither have they any great use in Physicke that I know: but many pounds of them are spent in dying silke into a kind of Carnation colour: the seede is chiefly used in Physick, or rather the kernells within the seede, which beaten and the emulsion thereof with honyed water, or with the broth of a pullet, taken fasting, doth open the body, and purgeth waterie and flegmatick humours, both upwards and downewards, which humors also it voydeth if the emulsion of the seede be given in a glister, and thereby helpeth the collicke and dropsie, and those other diseases that proceede from those humors: being made into a Lohoc or licking electuary, with Sugar and hony, and a few almonds and pine kernells, it clenseth the brest and lungs of flegme sticking therein wonderfully, causing it to be easily spit forth, it also cleareth the voyce, and encreaseth sperme, by the often use of it: but it doth somewhat trouble the stomacke, and therefore some stomachicall helpers are fit to be given with it, as Aniseede, Galanga, Masticke, or if neede be of more forcible, *Cardamoms*, Ginger, *sal gemma*, *&c.* a dram of the flowers in pouder taken in *hydromel* or honyed water, or in barly water helpeth the Iaundise: a dram of the pulpe of the seede taken with an ounce of the Syrupe of Wormewood, doth the like also: the confection made of the seeds hereof, called in shoppes *Diacarthamum*, is an especiall good medecine both to purge choller and fleagme, as also to cleare and clense the body of the watery humors of the Dropsie. Parrots doe most willingly feede upon this seede, yet doth it not move their bodies a white. The second sort *Alpinus* saith is used by the naturalists in the same manner, and to the same purposes to purge that the first is used. Of the last there is little written, but wee may onely suppose that being so like in forme, it should so be also in quality.

CHAP. XLIX.

Papaver corniculatum, Horned Poppie.

THere are at this day two or three sorts of horned Poppies knowne to us, whereas there was but one sort knowne to *Dioscorides*, and other the antient Greeke and Latin writers.

1. *Papaver corniculatum luteum.* Yellow horned Poppie.

This horned Poppie hath divers long and somewhat large whitish or hoary leaves, lying upon the ground, very much cut in or torne on the edges, and somewhat rough or hayrie, from among which rise up divers weake round stalkes, leaning downe rather then standing upright, somewhat hayrie also, spreading forth into some branches, and bearing a large flower, at the top of every one of them, consisting of foure leaves of a fine pale yellow colour, with a few threds in the middle, standing about a small crooked pointell which in time groweth to be a long naked round pod, halfe a foote long or better; with a small head or button, as it were at the end thereof, wherein is conteyned small blackish round seede: the roote is white long and tough, spreading divers wayes, enduring many yeares, and keeping his leaves all the winter; every part hereof yeeldeth forth a yellow juice being broken, of bitter taste.

2. *Papaver Corniculatum rubrum.* Red horned Poppie.

The red horned Poppie hath fewer, lesser and more jagged leaves then the former, nothing so whitish, but of a sullen greene colour, somewhat hairy also: the stalks are slenderer and lower, bearing flowers at the tops of them, like the other, and consisting of foure leaves a peece, but much smaller and of a pale reddish colour, for the most part, yet sometimes sadder; after which come such like crooked or horned pods, but smaller then the other; having such like small blackish seede within them: the roote is long and slender, perishing every yeare, and raiseth it selfe oftentimes from it owne sowing, or else must bee sowen every yeare in the spring: this yeelderh no yellow juice, when it is broken like the other.

3. *Papaver Corniculatum flore violaceo.* Blew horned Poppie.

The blew horned Poppie groweth much lower, and with smaller leaves, very much or finely cut and divided into many parts, of a sad greene colour: the stalkes are low and slender, yet somewhat hairy, rising not much above

1. 2. *Papaver corniculatum luteum sive rubrum.*
Horned Poppie yellow and red.

3. *Papaver corniculatum violaceum.*
Blew Horned Poppie.

above a foote or halfe a yard high at the most, with small flowers at the toppes of them, like unto the last for t
forme, that is consisting of foure leaves, but of a faire deepe purple colour almost like unto a violet: after which
come small slenderer and shorter pods, not above a fingers length, wherein lyeth such like blackish seede, but
smaller; the roote is small and perisheth every yeare.

The Place.

The first groweth naturally by the sea side, as well beyond sea, as on the coastes of our owne country in many
places, both of the Kentish and Essex shore, as at *Ric* and *Lid*, at *Harwich* and *Whitstable*, in the Iles of *Tennet* and
Sheppy: and is much desired and planted in Gardens, for the beautifull aspect thereof, as well as the vertues: the
other two *Clusius* saith, hee first found in Spaine, growing by the way sides, and in the corne fields; as also
in *Austria* and *Bohemia*, that with the red flower, *Matthiolus* long before his time remembreth to have
found there.

The Time.

The first flowreth from *May* all the Summer long, untill the end of *August* oftentimes, and his seede ripeneth
in the meane time. The second flowreth seldome before *July*, and giveth ripe seede every yeare, if the time
prove not too unkindly: but the last as it is late before it spring, so it commeth late in the yeare to flowring, and
seldome giveth good and perfect seed with us.

The Names.

It is called in Greek κὸρυδαλὶς ἠ κερατίτης, and in Latin thereafter *Papaver corniculatum*, or *Cornutum*, *a siliquarum effigie in corniculorum modo inflexa*, because the pods are crooked like a Cornet or Horne, *Pliny* and others say it was
called also *Paralion*, that is *marinum*, and of some *papaver sylvestre*. Divers doe thinke that *Glaucium* was made
hereof, as *Dioscorides* saith himselfe; *Pliny* saith in his time it was so called, deceived as *Dioscorides* saith by the
likenesse of the leaves: but *Dioscorides* in describing *Glaucium*, saith it is the juice of an hearbe, that hath
leaves somewhat like unto Horned Poppie, but fatter, yeelding a yellow juice, so that if it bee but like it, it
cannot be the same thing: *Clusius* saith that the Spaniards called the last *Rosetta* and some *Amapolos morados*, because the flowers give a juice like Mulberries: It is called in English of some Sea Poppie: they of *Mompelier* as
Pena saith, were wont to call it *Anemone corniculata*: The *Arabians* call it *Almacharam*, the *Italians Papavero cornuto*, the *Spaniards Dormidera marina*, the *French Pavot cornu*, the *Germans Gelb Dalmagen mon* and *Gelb delmagen samen*, the *Dutch Geel Heul* oft *Harne heul*, and we in English Horned Poppie.

The Vertues.

The seede of the Sea or Horned Poppie, doth purge the belly gently, if it be taken in meade or honyed water:
the roote thereof boyled in water unto the halfe, and drunke, helpeth the obstructions and other diseases of the liver, and the paines of the Sciatica or hucklebone: it provoketh urine also, and is very good for those that voyd
foule matter, like ragges in their urine; the leaves and flowers as *Dioscorides* and *Galen* say, cleanse fowle and virulent Vlcers, and that so powerfully, that *Galen* adviseth that they should not be applyed unto those sores or
Vlcers,

ulcers, that are already clenſed, leſt they conſume the quicke fleſh alſo, it taketh away alſo by the ſtrength and force of the clenſing qualitie, even thoſe cruſts that ulcers many times doe get by ſufferance or ill looking unto: the leaves and flowers ſaith *Dioſcorides*, being uſed with oyle, cleanſe the eyes of cattle, that have ſpots or filmes in them.

CHAP. L.

Papaver Spumeum ſive Ben album vulgo. Spatling Poppie.

THis ſmall low herbe hath diverſe weake tender ſtalkes, full of joynts, about halfe a yeard or two foote long, uſually lying on the ground, whereon grow many pale whitiſh greene leaves, two alwayes ſet together at the joynts, one againſt another; having many times upon the leaves, but more often about the joynts of the ſtalkes a certaine white frothy ſubſtance, like unto that is called Cuckow ſpittle: at the toppes of the ſtalkes ſtand many flowers together, every one on a pretty long foot ſtalke, hanging down their heads, which are white, compoſed of five ſmall white leaves a peece, with a deepe notch in the middle of every one of them, making it ſeeme to conſiſt of more than five, ſtanding in a large looſe huske ſtriped, the flower ſcarſe appearing above it, wherein afterwards is contained blacke ſeede: the roote is white and ſpreadeth in the ground abiding ſundry yeares.

Papaver ſpumeum; Spatling Poppie.

The Place.

It is found generally through *England*, in many places and paſtures, and by the hedges ſides, yet it is much deſired to be planted in gardens.

The Time.

It flowreth from June untill the end of July or later, and the ſeede ripeneth in the meane time, the roote abideth all the Winter, and ſo doe ſome greene leaves with it.

The Names.

It is generally called *Papaver Spumeum*, and of ſome *Ben album*, as a difference both from the *Valeriana rubra Dodonei*, red *Valerian*, and *Muſcipula Lobelij*, each of them called *Ben rubrum*, yet neither of them is the true *Benalbum* or *rubrum* of the *Arabians*. *Dodonæus* taketh it, as others doe alſo, to be the *Polemonium* of *Dioſcorides*, but he is therein more miſtaken in my judgement, than thoſe he thinketh are, that take it to be the *Papaver Spumeum* or *Heracleum* of *Theophraſtus*, *Dioſcorides*, and *Galen*: but *Pliny* ſheweth his miſtaking the Greeke words σεσελι ορεινον in the deſcription thereof wonderfully, comparing the leaves to the wings of Sparrowes or birds, when as *Dioſcorides* intendeth the herbe *Struthium*, called *Radicula* or *Lanaria herba*, (which ſome with us take to be *Saponaria*,) becauſe in ancient times they uſed to whiten linnen clothes with the rootes thereof, and *Theophraſtus*, if *Pliny* had regarded the place, *lib. 9. cap. 13.* (ſpeaking of *Papaver Heracleum*, ſaith it hath leaves like *Struthium*, called *Radicula*, wherewith they uſe to whiten linnen) might have eſchewed that errour. It is accounted a kinde of *Lychnis* by moſt of the beſt Herbariſts, and therefore *Bauhinus* nameth it *Lychnis ſylveſtris qua Ben album vulgo*: ſome with us call it Knapbottle, and others Spatling or Frothy Poppy.

The Vertues.

The ſeede of ſpatling Poppie purgeth flegme ſaith *Galen*, and cauſeth vomitings ſaith *Dioſcorides*, being taken in meade or honied water, and is eſpecially good for thoſe that are troubled with the falling ſickneſſe.

CHAP. LI.

Thalictrum ſive Ruta pratenſis. Medow Rue.

THere are ſundry ſorts of Medow Rue, ſome growing in our owne Land, others in ſeverall countries abroad as ſhall be deſcribed in this Chapter.

1. *Thalictrum majus vulgare.* The greater common Medow Rue.

This Medow Rue riſeth up from a yellow ſtringie roote, much ſpreading in the ground, and ſhooting forth new ſprouts round about, with many herby greene ſtalkes, two foote high, creſted or cornered all the length of them, ſet with joynts here and there, and many large leaves on them, as well as below, being divided into ſmaller leaves, nicked or dented in the forepart of them, of a ſad greene colour on the upperſide, and pale greene underneath: toward the toppe of the ſtalke there ſhooteth forth

forth diverſe ſhort branches, on every one whereof ſtand two or three or foure ſmall round heads or buttons, which breaking the skinne that encloſeth them, ſhew forth a tuft, of pale greeniſh yellow tufts or threds, which falling away, there come in their places ſmall three cornered cods, wherein is contained ſmall long and round ſeede, the whole plant as well leaves, as flowers, have a more ſtrong unpleaſant ſent than the next Spaniſh kinde.

2. *Thalictrum latifolium Hiſpanicum.* Spaniſh Medow Rew.

1. *Thalictrum majus vulgare.* Ordinary Medow Rue.

5. *Thalictrum minus.* The leſſer Medow Rue.

There is another of this kinde whoſe leaves ſtanding one againſt another are not divided at all but are whole and longer, a branch whereof I give you here to ſee.

Thalictrum latifolium non inciſis foliis. Medow Rue with uncut leaves.

2 *Thalictrum majus album Hiſpanicum.*

Great Spaniſh white Medow Rue.

The leaves hereof are much larger than the former, and more divided at the edges, and ſo like unto Columbine leaves that they eaſily deceive one not well acquainted therewith, yet are they leſſer and of a ſadder colour ſtanding on long ſtalkes, among which riſeth up a ſtrong round ſtalke three foote high at the leaſt, branching forth into two or three parts, with leaves at the ſeverall joints of them, at the toppes whereof ſtand many ſmall round yellowiſh buttons in a tuft together encloſed in a white skinne, which breaking each button ſheweth to be a ſmall tuft of threads like the former but greater, and of a white colour tipt with yellow and ſomewhat purpliſh at the bottome, of a ſtrong ſent abiding long in flower if it grow not too open and then fall away like ſhort threads: the ſeede is like the former but greater, and ſo are the rootes likewiſe and yellow like it, which retaine neither ſtalke nor leafe all the Winter, but ſhooteth a new in the Spring.

3. *Thalictrum montanum majus.*

The greater mountaine Medow Rue.

This Mountaine kind hath as large ſtalkes as the former great kinde, and riſeth up as high, but are not creſted or cornered at all, the leaves are divided like unto them, and of a ſad greene colour alſo; the flowers are white, which ſmell as ſtrong as they, and the leaves are rather ſtronger than the firſt: the rootes likewiſe are yellow, and ſpreading almoſt as much.

4. *Thalictrum montanum minus album.* The leſſer mountaine Medow Rew.

This is like unto the laſt in all things, but in the ſmallneſſe of the plant, and in the ſmell, which is nothing ſo ſtrong or unpleaſant, for the leaves are greene as they, and the flowers white in the ſame manner; and the roote yellow

yellow and somewhat creeping: There is also another sort hereof differing little from it, but in the colour of the flower which is of a pale Violet colour with yellow tips. *Floreo purpureo.*

5. *Thalictrum minus.* The smaller Medow Rue.

This small kind is almost in all things like unto the former, but smaller both in leaves, being of a little fresher greene colour, somewhat more shining; and in the stalkes being round and not crested, and in the flowers being somewhat whiter: the rootes likewise are yellow, but doe not spread or creepe, so much as the former.

6. *Thalictrum minimum.* The least Medow Rue.

The smallest kind of Medow Rew, hath such like small or rather smaller, divided and notched leaves than the fourth kind hath, but they are of a whitish greene colour; the stalkes rise not above a foote high or a little more, the flowers are more yellow, and the rootes runne in the ground, rather more than any of the former.

7. *Thalictrum angustissimo folio.* The narrowest leafed Medow Rue.

This kinde of Medow Rue hath yellow stringie rootes, like unto all the former sorts, from whence springeth up a stalke, very much crested or cornered, three foote high, bearing many sad greene leaves at the joynts, which are smaller and longer than any of the former, and ending most commonly in three points longer than any of the rest: the toppe of the stalke is branched, bearing many small pale yellow tufts of flowers, like unto the others. Of this kinde there is another whose leaves being smaller than of that former sort, with uncut leaves or without any division in them likewise, doe not otherwise differ either in height or colour of flowers from the fourth sort: both these sorts with uncut leaves, I saw in a Booke of dried herbes, belonging to Doctor *Foxe*, President of the Physitians Colledge of *London*. *Minus non incisis fo. lijs.*

8. *Thalictrum minimum fœtidissimum.* Stinking Medow Rue.

The stinking Medow Rue hath his stalke round and greene, which is sometimes purplish, not above a foote high with diverse leaves thereon, divided for the most part into three parts, each whereof hath two dents or notches, of as sad a greene colour on the upper side, and of as pale a greene underneath, as the first kinde here set downe, the toppe of the stalke is branched, and on them stand small round mossye or threadie flowers, like the rest, of a pale yellow colour: the small cods that follow are cornered with a crooked end, five or seven standing together, wherein is inclosed small seede: this smelleth most strong and unsavory of all the rest, in his naturall place, but by transplanting and manuring, it loseth part of the virulencie and becommeth lesse offensive.

9. *Thalictrum Americanum.* The *American* Medow Rew.

This stranger is in face and outward habit so like a white Spanish kinde, that they can hardly be knowne asunder, but that it is fuller of stalkes and leaves; the flowers of the toppes of the branches are at the first of a pale blush colour, but being blowne open consist of five white leaves, and a number of white threds in the middle, tipt with yellow. There is another smaller sort hereof whose flowers are purple tipt with yellow. *Alterius unipurpureum.*

The Place.

The first as I said groweth in many places of our owne Land, in the borders of moist Medowes, and by ditch sides. The second was sent us out of *Spaine*, is found likewise in our moist Medowes and by ditch sides, but nearer the sea, and at *Margate* on the chalkie cliffe on the left hand, as you goe from the towne to the sea side; and in other countries farther from the sea side. The third and fourth were found by *Clusius* on the hills in the lower *Austria* and *Hungarie*. The fift and sixt was found by *Clusius* also in the lower grounds, by the rivers sides. The seaventh is said to grow in the fields by *Mychfield* in *Switserland*. The eighth grew in the countrie of *Valesia*; and the two last came from *Virginia*.

The Time.

They doe all flower about July, or in the beginning of August.

The Names.

It is generally held by our best moderne Writers, to be the *Thalictrum* of *Dioscorides*, called in Greeke Θαλίκτρον and Θαλίκτρον ἀ θάλλω *vireo*, as some thinke, *eo quod dum germine protrudit eleganter vireat*. Some also have called it *Pigamum quasi* πίγανον, that is *Ruta*, for the forme or likenesse of the leaves, and so have entituled it *Ruta palustris* or *pratensis*; others from the yellow colour of the rootes, have called it *Pseudo rhabarbarum* Bastard Rubarb: but I thinke more truely of the purging and binding qualitie, both joyned together like unto Rubarbe: Most Writers now doe call all these kinds of herbes by the name of *Thalictrum* or *Thaletrum*, with their severall distinctions. For the first here set downe is called by most *Thalictrum jus*, and of some *Ruta pratensis*, as *Lobel* doth: of *Cæsalpinus Ruta sylvestris*, of *Lugdunensis*, it is set forth for *Pigamum quasi* πίγανον, *i. Ruta*, and of some as *Gesner* saith, *Saxifraga lutea*, *Camerarius* calleth it *Thalictrum Germanicum latifolium*, and the *Hispanicum* which is here the second he calleth *Italicum*. The fift is *Lugdunensis* his *Hypecoum*, in his Booke *de palustribus*, and is the *minus* of *Dodonæus*, or *Ruta pratensis tenuifolia* of *Lobel* and others. The third is the first great *Montanum* of *Clusius*, and the sixt of *Camerarius flore albo*. The fourth is *Clusius* his small Mountaine kinde, with a white flower, as the purple floured kinde is his third Mountaine sort. The sixt is *Camerarius* his *Thalictrum tertium angusti folium*, and *Clusius* his seventh or last. The seventh *Bauhinus* calleth *Angustissimo folio*, as he doth the eight *minimum fœtidissimum* as their titles declare. The two last are called by those that sent it us, as it is in their titles.

The Vertues.

Dioscorides saith that being bruised and applied to old sores, it bringeth them to cicatrizing, that it doth perfectly cure them: and the distilled water of the herbe and flowers doth the like, for as *Galen* saith it drieth without any heate or sharpenesse: The herbe is of some used to be put among other pot herbes, to helpe to move or open the body, and make it soluble: but the rootes washed cleane and boyled in ale and drunke, doth provoke to the stoole more than the leaves, but yet very gently: It is said (according to many other superstitious conceits in other things) that if the whole plant both herbe and roote, be hung up in a chamber, or tied to the necke of any person doth free them from any danger or harme. The rootes hereof boiled in water, and the places of the body most troubled with vermine or lice, washed therewith while it is warme, destroyeth them utterly: In *Italy* it is used against the Plague, and in *Saxonie* against the Jaundise as *Camerarius* saith: *Lugdunensis* in transferring the name *Pigamum* hereunto doth therewith set downe a vertue proper to Rue, as if it did belong to this, that is, that it raiseth up him from his fit that hath the falling sickenesse, if some of the juice be put up into his nostrills, and there kept a while.

CHAP. LII.

Asarum. Asarabacca.

I Have in my former Booke given you the knowledge of this Asarabacca, but because I have not there expressed it so sufficiently, as it ought to be, I have here amplified my selfe in some particulars. Now although there was but one sort of *Asarum*, with all Writers now adayes, yet wee have received annother sort out of *Virginia* somewhat differing from the other; and although the name hath beene formerly misapplied to many other herbes, as is in part shewed in the 38. Chapter of the former tribe, and shall be further declared in this; yet now I hope that it is so sufficiently knowne, there is no cause of errour, but *Matthiolus* doth adde another herbe somewhat like unto it in leaves, whereof I meane to speake also here.

1. *Asarum vulgare.* Common Asarabacca.

Asarabacca hath many heads rising from the rootes, from whence come many smooth leaves, every one upon his owne footestalke, which are rounder and bigger than Violet leaves; thicker also, and of a darker greene shining colour on the upper side, and of a paller yellow greene underneathe, little or nothing dented about the

1. *Asarum vulgare.* Common Asarabacca.

2. *Asarum Americanum. Virginia* Asarabacca

3. *Asarina Matthioli.* Bastard *Asarum* of *Matthiolus.*

edges: from among which rise small round hollow brownē greene huskes upon short stalkes about an inch long, divided at the brimmes into five divisions, very like unto the cuppes or heads of the Henbane seede, but that they are smaller, and these be all the flowers it carrieth: which are somewhat sweete being smelled unto, and wherein when they are ripe is contained small cornered rough seede, very like unto the kernells or stones of Grapes or Raisins: the rootes are small and whitish, spreading diverse wayes in the ground, and increasing into diverse heads, but not running, or creeping under ground, as diverse other creeping herbes doe, which are somewhat sweete in smell, resembling *Nardus*, but more being drie, than when they are greene, and of a sharpe but not unpleasant taste. *Camerarius* saith that *Gesner* found a greater kinde hereof, and more sweete, upon the Alpes in *Switzerland*, which *Bauhinus* as it should seeme never saw, and therefore doubted of the truth.

2. *Asarum Americanum. Virginia* Asarabacca.

The *Asarum* of *Virginia* groweth very like the former, but the leaves are a good deale larger, stiffe also and thicke, somewhat crumpled about the edges, of a darke greene colour, but not so much shining as it, and not so

rou

round but a little pointed at the end, some also will be spotted or straked: the flowers have usually but three divisions or points of a paler greene colour: the rootes are somewhat greater and fuller of substance spreading in the same manner and smelling somewhat more fragrant, and a little hot in taste biting a little the tongue.

3. *Asarina Matthioli.* Bastard Asarum of *Matthiolus.*

Bastard *Asarum* is a low herbe also, creeping upon the ground, somewhat like unto *Asarum*, having such like leaves upon long hairy footestalkes, but rounder and rougher than they, and somewhat dented about the edges: the flowers are like unto Camomill flowers, but that they are smaller by much, and wholly yellow, as well the border of leaves as middle thrume, and are not unpleasant in smell; the rootes are slender small and long, creeping under the upper crust of the earth, and not shooting downe deepe somewhat of a sharpe taste, and a little bitter withall.

The Place.

The first groweth under trees and upon shadie hills, in *Pontus* and *Phrygia*, as *Dioscorides* saith, and in *Italy* also, and in sundry other places, and is frequent in gardens, The second came from the parts in or about *Virginia*. The third as *Matthiolus* saith is found upon some mountaines of *Bohemia* and likewise in *Somersetshire* in our owne Land, found by Dr. *Lobel*.

The Time.

The first and second keepe their greene leaves all the winter, but shoote forth new in the spring: and with them come forth those heads or flowers, which give ripe seede about Midsommer, or somewhat after: the other doth follow much the same course.

The Names.

It is called in Greeke Ἄσαρον *quasi* ἀκόσμητον *inornatum non veniens*, as *Plinye* saith because *in coronis non addatur*; but the text of *Dioscorides* is flat against him, for he saith it is πρὸς ἀνάδεσιν στεφανωμάτων, a sweete herbe used in garlands: it is also called Νάρδος ἀγρία, in *Latine Asarum & Nardus sylvestris* or *Nardus rustica*, and as *Macer* saith *Vulgago*, as by his verse appeareth; *Est Asaron Græcè Vulgago dicta Latinis*: The former times as I sayd before, thought *Asarum* and *Baccharis* to be one herbe, and therefore not knowing what *Baccharis* was, they called this *Asarum Asarabaccara*, which name is continued both in *Spaine* and other places, and with us also to this day: but the descriptions of them being so diverse (if they had beene regarded or lookt into, which was utterly neglected, and those times led onely by tradition, without searching out the veritie of things) would make one mervaile how they could be so much mistaken, as from the ignorance of some that called *Asarum Bacchar*, to make one name of both: but the errour being so old even before *Plinye* his time, may seeme to make it the more excusable, but we should not continue in the same course, they formerly did: seeing *Plinye* sheweth the errour, and findeth fault with them that were so led, as is shewed in the chapter of *Baccharis*. The first is called *Asarum* by all our later writers, except *Lobel* that calleth it *Asarum Baccharis sive Bacchatus*. The second we have imposed the name according to the forme it carrieth as it is in the title. The third *Matthiolus* first called *Asarina*, and so doe others that set it forth after him, onely *Clusius* doth much suspect it, to be his second *Tussilago Alpina*, and that his figure was taken from a dry plant, and before it had brought forth the flowers to perfection: but by the sharpe taste and creeping roote, it may more probably be taken to be the *Catyledon palustris acris* or *urens*. The *Arabians* call it *Asaron*, the *Italians Asaro* and *Bacchara*, the *Spaniards Asarabaccara*, and we in *English Asarabacca* or *Asarobacca*.

The Vertues.

Dioscorides saith it hath an heating quality, where or howsoever applyed, and that it provoketh urine, & easeth the paines of the stone, is profitable for dropsies, and for the old paines of the Sciatica: and that sixe drammes of the rootes being drunke in honeyed water procureth womens courses, and purgeth like unto blacke Hellebor: *Mesues* placeth it among other purging hearbes and so doe I, for being drunke it not onely provoketh vomiting, but worketh downewards, and by urine also, purging both choller and flegme: it is made the more strong if some Spiknard be added, with the whey of goates milke or honyed water; but it purgeth flegme more manifestly than choller, and therefore doth much helpe those that are troubled with the paines in the hippes, and the parts thereabout, especially if it be either steeped or boyled in whey: it doth wonderfully helpe the obstructions of the liver and spleene, and therefore profitable for those that are troubled with the dropsie, and the overflowing of the gall, which is the Iaundise, being steeped in wine and drunke; it helpeth those continuall agues, that come by the plenty of stubborne humors: An oyle made thereof by setting it in the sunne, and whereunto some *Ladanum* is added, provoketh sweating, if the ridge of the backe be annointed therewith, and thereby driveth away the shaking fits of agues. It will not abide any long boyling, the chiefest strength thereof vanishing thereby; nor much beating, for the finer powder doth provoke vomits and urine, and the courser purging downewards, thus saith *Mesues*: hereby as *Matthiolus* saith, the *Germaine* Country people were taught to cure, both *tertian* and *quartaine* agues, by drinking a draught of the decoction thereof made with wine, wherein a little Mace or Cinamon or honey is put, either every day or every other day, which purgeth the body and often procureth vomitings: as also they anoint the ridge of the backe, and the soles of their feete with the warme oyle made thereof by long sunning, upon the accesse or comming of the fit, being in their warme bed, whereby they prevent the shaking fits, and provoke much sweate, and are thereby cured, that have long lingred under the disease: It is profitable for those that have convulsion of the sinewes, and an old cough. The common use hereof is to take the juyce of 5 or 7 leaves in a little drinke to cause vomitings: the rootes also worke in the same manner, but not so forcibly; but an extract made thereof according to art with wine, might be more safe and effectuall, and may be kept all the yeare, to be at hand ready to be given, when there is occasion, the quantity onely is to be proportioned according to the constitution of the patient, as the learned Phisition can best appoint: It is also effectuall against the bitings of serpents, (the roote especially) and therefore is put among other simples, both into *Mithridatum* and *Andromachus* Treakle, which is usually called Venice Treakle: *Galen* saith that the rootes of *Asarum*, have the same property that *Acorus* hath but more strong, and *Paulus Ægineta* agreeth with him; but *Lugdunensis* findeth fault with them both, because they have a purging quality, whereof they make no mention, A dramme of the roote in powder given in white wine, a little before the fit of an ague, taketh away the shaking fit, and thereby causeth the hot fit to be the more remisse, and in twise taking expelleth it quite: It is said that

the leaves being a little bruiſed, and applyed to the forehead and temples, doe eaſe the paines of the head, and procureth ſleepe; and applied to the eyes, taketh away the inflammation of them: the juice with a little *Tutia* prepared, put to it and dropped into the corner of the eyes, ſharpneth the eyeſight, and taketh away the dimneſſe and miſtineſſe that is often in them. The leaves and rootes being boyled in lye, and the head waſhed therewith often while it is warme, comforteth the head and braine, that is ill affected by taking cold, and helpeth the memory alſo. The *Virginia Aſarum* hath beene but little experienced by any that I know, and therefore can ſay nothing thereof, but it is probable to be of the like effects, being ſo much more aromaticall and ſweet. The Baſtard *Aſarum* as *Matthiolus* ſaith, hath a little clenſing quality, but a greater propertie to attenuate, or make thin that which is thicke, to cut or breake that which is tough, and to open that which is obſtruct: a dram of the pouder hereof taken in ſweete wine, or honyed water doth looſen the belly, and purgeth from thence tough and thicke flegme, and blacke or burnt humors: It is to very good purpoſe and profit, given to thoſe that have the Yellow Iaundiſe, to thoſe that have the Falling ſickneſſe, and to thoſe that have the Palſie, the herbe eyther taken of it ſelfe, and eatenas in Sallets, or the decoction thereof made and drunke: It killeth alſo the wormes of the belly: I confeſſe I might have placed theſe herbes among the other ſorts of ſweete herbes, but the purging qualities being ſo prevalent, both in procuring vomit and working downewards by the ſtoole, hath rather moved me to inſert them here.

CHAP. LIII.

Braſſica. Colewort.

ALl the edible ſorts of Coleworts and Cabbiges with ſome others of delight, I have mentioned in my former worke ſo amply, that who ſo will may finde them there at large declared, I will onely in this place give you ſome figures of them and their vertues more amply, becauſe I was then ſo briefe, and with them ſhow you ſome wilde kinds, as alſo the Sea Colewort, which for the purging quality is firſt for this place.

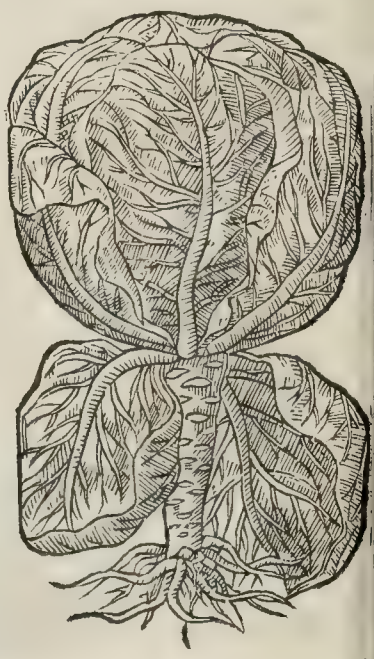
1. *Braſſica ſativa.* Garden Cabbiges and Coleworts.

The Cabbige (as I have ſhewed) is of many ſorts, ſome greater others ſmall, ſome white others red or between white and red, and all theſe cloſe their innermoſt leaves ſo intricate that they grow into a round head, the outmoſt leaves onely abiding looſe and open. The Colewort is well knowne never to cloſe the leaves, but to grow alwayes ſpreading: the ſecond yeare after the ſowing they ſhoote forth ſtalkes, bearing pale yellow flowers, and afterwards ſmall long pods with ſmall round ſeed in them.

Beſides thoſe ſorts there are others alſo as the Coleflowers and the Colerape delicate meates: There are likewiſe ſome garden ſorts of Coleworts not ſo much uſed to be eaten, as pleaſant to the ſight in regard both of the

Baſſica ſativa. Garden Coleworts.

Braſſica capitata. Cabbiges.



Brassica florida. Coleflower.

2. *Brassica sylvestris.* Wilde Colewort.

Brassica Laciniata. The fine cut Colewort.

3. *Brassica spinosa.* The thorny Colewort.

4. *Brassica marina monospermos.*
Sea Colewort.

fine crumpling forme of the leaves, and of the variable mixture of colours in them, as greene, white, red and yellow, which maketh them to be beheld with the more admiration: of all which I have spoken in my former book, unto these I must joyne the wilde sorts.

2. *Brassica sylvestris.* Wilde Coleworts.

The wild Colewort groweth with many long grayish round leaves, much gashed or torne on the edges, among which rise the stalkes bearing such like but smaller leaves on them, and yellowish flowers at the toppes, succeded by small rough pods with small round seede in them: the roote is white, hard and somewhat woddy.

3. *Brassica spinosa.* Thorny Coleworts.

The whitish woddy stalke of this thorny Colewort riseth to be more then two foote high, branching forth into sundry striped or crested branches, and they againe into other lesser slender twigges, each of them ending in small sharp white thornes, and on each of them under the thornes groweth one flower, in forme like unto an Hiacinthe of a pale redde or blush colour, from which rise small round peaselike heads pointed, wherein lyeth the seede: the leaves that grow without order on the branches are somewhat long and narrow, a little dented or waved about the edges, and with other smaller sometimes set together, of a grayish greene colour.

4. *Brassica marina monospermos.* Sea Colewort.

The Sea Colewort hath divers somewhat broad and large thicke wrinckled leaves, or as it were curled about the edges, growing each upon a severall thicke footstalke and very easy to be broken, of a grayish greene colour; from among which ariseth up a strong thicke stalke two foote high and better, with some leaves thereon to the toppe; where it brancheth forth much, and on every branch standeth a large bush of pale whitish flowers, consisting of foure leaves a peece; after which come small thicke and short pods, conteining but one roundish grayish seede a peece, much greater then *Soldanella* or Sea Bindweede seede; the roote is somewhat great and shooteth forth many branches underground, keeping the greene leaves all the winter.

The Place.

The manured edible sorts are onely nursed up in Gardens: the second groweth wilde on many ditch bankes, as well in the uplands as neare the sea sides: the third is noursed in the curious Gardens of *Italy*: the last groweth in many places upon our owne coasts, as well the *Kentish* as *Essex* shore, as at *Lidde* in *Kent* and *Colchester* in *Essex*, and in other places also, and in other countries likewise.

The Time.

Their flowring time is towards the middle or end of *July*, and the seede is ripe in the end of *August*.

The Names.

The Greeks call it κεφάλη and *Attice* κραβάλη, or κεφάλλαι so called as it is supposed by some, *quod* κεφὰς, *i.e. oculorum pupillas obtundat & hebetet*, because it dulleth and dimmeth the eyesight, which *Columella* signifieth by this *Distichon*, *Oculis inimica coramble*, but he doth contrary himselfe, for both he and other good authors say that it is good for dim eyes, as also to take away the canker in the eyes; others say *quod τὸ κεφάλαιον vel rectius ἀπὸ τῆς κεφαλῆς, quod crapulæ satietatique adversatur*. *Theophrastus* and other Greeke Authors before him, doe call it ῥάφανον & *Raphanus*, *ob mutuam* (as some thinke) *quondam amicitiam & affinitatem utriusvis seminis, vetustioris præsertim, utramvis plantam generand*; because of the likenesse of the seed, they supposing that if it were old, the one would degenerate into the other; which error in this as in many other things, is fatall to the old world, and I would to God it were not so also to ours; for the opinion is almost hereditary, at the least growne so old by custome, that there is small hope to roote it out of the mindes of a great many, that the seeds doe often change into other herbes, then such as they were taken from, which is quite contrary to the Text of the Scripture, *Genesis* 1. 29. that saith God did appoint every herbe and tree to have the seede of his owne kind within it selfe, and not of another kind; and I would faine have any man of judgement, to tell me if hee thinke it possible that the seede of Cabbiges should bring forth Raddishes, or Raddish seede Cabbages; but *Pliny* and others also before him, mistaking the Greeke word of *Theophrastus* and others, which is understood by all of good judgement to be *Brassica*, transferreth all the properties of *Brassica* to *Raphanus*, that is, to Raddish: It is called also in Latin *Brassica*, *quasi præseca* as *Varro* saith, *quod hujus scapus minutatim præsecatur*; or as others thinke of *Passica*, *quod ex caule minutatim præsecato passa fiat*; or as some ἀπὸ τοῦ ῥάξειν, *id est a vorando*, because poore people did most of all call for them to eate them: It is called also in Latin of many *Caulis quia præceteris grandi, validoque turgescit caule*. And from thence as I thinke came our English word Cole, whereby anciently the Colewort was called: the second is usually called *Brassica sylvestris* by all, or *Arvensis* as *Bauhinus* hath it: but that it should be that of the auncients I make great doubt: the third is also called *Brassica spinosa*. both by *Alpinus* and *Bauhinus*, who onely that I know have written thereof: The last is thought by some, as *Turner*, *Anguilara* and *Cæsalpinus* to bee the κεφαλὴ θαλασσία of *Dioscorides*, and that not without good reason, the face thereof so well resembling a Colewort, and the bitternesse answerable likewise. *Lobel* calleth it *Bassica marina sylvestris multiflora monospermos*, but *Bauhinus Brassica maritima*; *Gerard* calleth it *Brassica marina Anglica*, as if it were onely proper to our coasts. The *Arabians* call Cabbiges *Corumb* and *Karumb*; the *Italians Cavolo* and *Verza*, the *Spaniards Colbes* and *Couues*, the *French Choulx*, the *Germans Koll*, the *Dutch Cabuischoolen*, and wee in English Cabbige and Colewort.

The Vertues.

The Cabbiges or Coleworts (for they are in a manner of one operation) themselves being boyled gently in broth,

broth, and eaten doe open the body, but being twice boyled or the ſecond decoction of them doth binde: the nitrous quality therein, being quite conſumed and ſpent by the twice boyling: the juice thereof drunken in wine, helpeth thoſe that are bitten by Adders or Vipers, and the decoction of the flowers bringeth downe womens courſes, and hindreth conception as it is ſaid, if it be uſed as a peſſary: being taken with hony it recovereth the hoarſeneſſe or loſſe of the voyce: it helpeth thoſe that are entring into a Conſumption, if they uſe to eate them well boyled and often: the pulpe of the middle ribbes of Coleworts boyled in Almond milke, and made up into an Electuary with hony, is very profitably uſed by thoſe that are ſhortwinded and are purſie, if they often take thereof; being alſo boyled twice and an old Cocke boyled in the broth, this being drunke helpeth thoſe that are troubled with griping paines in their ſtomacke, or belly: the ſame broth or decoction is very good, for thoſe that are troubled with the paines and obſtructions of the liver and ſpleene, and the ſtone in the backe and kidnies: the juyce thereof boyled with hony, and dropped into the corner of the eye cleareth the ſight, by conſuming any filme or cloud beginning to dimme it, as alſo conſuming the kanker growen therein: the juyce is ſafely given to thoſe that have eaten Muſhroomes, if they prove offenſive unto them: they are much commended being eaten before meate, to keepe one from ſurfetting, as alſo from being drunke with much wine, by reſtraining the vapours that elſe would intoxicate the braine, or being drunke, will diſperſe the vapours and make them quickly riſe ſober againe; and even *Galen* himſelfe applied the juyce thereof, to the temples of them that had paines in their heads cauſed by drunkenneſſe; for as they ſay there is ſuch an antipathy or enmity betweene the Vine and the Colewort, that the one will die where the other groweth: ſwollen and gouty legges and knees, where into many groſſe or watery humors are fallen, being bathed warme with the decoction of Coleworts have found eaſe thereby, for it taketh away the paine and ach, allayeth the ſwelling and waſteth and diſperſeth the humors: it helpeth alſo old and filthy ſores, being waſhed therewith, it healeth all ſmall running ſores and ſcabbes, puſtules or wheales that breake out in the skinne; yea it clenſeth ſo ſtrongly ſaith *Galen*, that it will cure the lepry; the aſhes of Colewort ſtalkes, are of ſuch a drying quality, that they become almoſt cauſticke, or burning, and being mixed with old greaſe, are very effectuall to anoint the ſides of thoſe, that have had long paines therein, or any other place pained by the acceſſe of melancholike and windie humours, helping mightily to digeſt them: It is thought to be effectuall for all the diſeaſes of the body, either inward or outward, and therefore *Chryſippus* wrote a volume of the vertues, applying it to every part of the body: and the old *Romanes* having expelled Phyſitions out of their territories, did for ſixe hundred yeares maintaine their health, and helped their infirmities, by uſing and applying it, for their onely medicine in every diſeaſe. The broth or firſt decoction of the ſea Colewort likewiſe doth by the ſharpe nitrous and bitter qualities therein, open the belly and purgeth the body, (but the ſecond decoction is ſaid to bind the body,) yet as *Galen* thinketh not without ſome hurt thereto, becauſe it much varieth as he ſaith from the temperature of our bodies, being hotter and drier than the garden kindes, and therefore as all other wild herbes, are ſtronger in operation, and ſo this clenſeth and digeſteth more powerfully than they: the leaves while they are young, although bitter, being boyled (in lye ſaith *Dioſcorides*, but in faire water, is moſt uſuall with us in theſe dayes) are eaten as other Coleworts are, by diverſe poore people neare the ſea, the boyling, taking away much of the bitterneſſe thereof: the ſeede hereof bruiſed and drunke killeth wormes; the leaves or the juyce of them applied to ſores or ulcers clenſeth and healeth them, and diſſolveth tumors or ſwellings, and taketh away the inflammations.

CHAP. LIV.

Centaurium minus. The leſſer Centory.

THere was formerly but one kinde of ſmall Centory knowne, but there hath beene ſince found out diverſe other ſorts, referred thereunto, both for forme and qualities.

1. *Centaurium minus vulgare flore rubente.* The red ordinary ſmall Centory.

The common ſmall Centory groweth up moſt uſually but with one round and ſomewhat creſted ſtalke about a foote high or better, branching forth at the toppe into many ſprigges, and ſome alſo from the joynts of the ſtalkes below, the flowers that ſtand at the tops as it were in an umbell or tuft, are of a pale red, tending to a Carnation colour, conſiſting of five, or ſixe ſometimes ſmall leaves, very like unto thoſe of Saint *Johns* wort, opening themſelves in the day time and cloſing at night: after which come ſeede in little ſhort huskes in forme like unto wheate cornes: the leaves are ſmall and ſomewhat round, very like unto *Hypericum*, but without any holes therein as it hath: the roote is ſmall and hard, periſhing every yeare: the whole plant is of an exceeding bitter taſte.

2. *Centaurium minus flore albo.* White flowred Centory.

This ſmall Centory differeth not from the former, neither in ſtalke or leafe, neither in forme or height, but onely in the colour of the flower, which is white, as the other is red.

3. *Centaurium minus ſpicatum album.* Small ſpiked Centory.

The ſpiked Centory hath his creſted ſtalke divided at the bottome, into two or three branches, and they againe into others, having his loweſt leaves next the ground, ſomewhat broad and round, yet pointed at the ends; but thoſe which are upon the ſtalke, and are for the moſt part two at a joynt, are ſmaller, long and narrow: at the joints with the leaves all along the ſtalkes up to the toppe, moſt on the one ſide come forth the flowers, one only at a place, which ſtand in ſmall huskes, made as it were of ſmall leaves divided, which conſiſt of five white leaves, and after they are paſt, come ſuch like ſmall ſeedes as is in the former.

4. *Centaurium minus luteum.* Small yellow Centory.

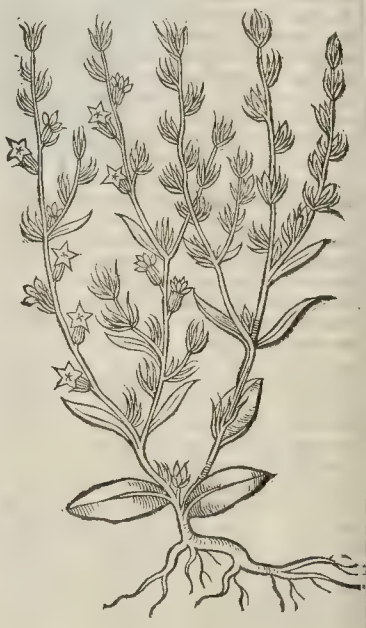
The ſmall yellow Centory, is ſomewhat like unto the former, but ſomewhat greater, the leaves being larger and broader, and broad at the bottome, yet not compaſſing it as the next: the flowers likewiſe are ſomewhat greater and yellow, wherein it differeth from the other, and is not ſo bitter.

5. *Centaurium minus luteum, perfoliatum ramoſum.* Small yellow thorough leafed, branched Centory.

This yellow Centory hath ſome ſmall leaves next the ground like unto the former Centories, but ſomewhat greater:

1 *Centaurium minus vulgare.*
The ordinary small Centory.

3. *Centaurium minus spicatum album.*
Small spiked Centory.



4 *Centaurium minus luteum vulgare.*
Small yellow Centory.

5.7. *Centaurium minus luteum perfoliatum & minimum luteum.*
The small yellow thorough leafed and branched Centory; and the least yellow.

greater: the ſtalke ſendeth forth, ſometimes diverſe long branches from the joynts, and ſometimes but onely at the toppe, at the joynts whereof ſtand two ſomewhat broad and long pointed leaves, ſo compaſſing the ſtalke about the bottome, and making it ſeeme as if it ranne thorough them, that they will hold the dew or raine that falleth upon them, the flowers that ſtand at the toppes of the ſmall branches, are ſomewhat larger than thoſe of the ordinary ſort, compoſed of ſixe or eight leaves, of a fine pale yellow colour, and ſometimes deeper, after which come bigger heads, and ſomewhat greater ſeede than the other: the roote is ſmall and white like the former: this is not ſo bitter as the former.

6. *Centaurium minus luteum non ramoſum.* Small yellow unbranched Centory.

There is another of this kind of yellow Centory found, that differeth not in leafe or flower from the former, but the ſtalke bearing perfoliated leaves, brancheth not forth, but beareth onely one flower at the toppe, which hath made it noted to be a different kinde from the other.

7. *Centaurium minimum luteum.* The leaſt yellow Centory.

The leaſt yellow Centory differeth not much from the laſt deſcribed, ſaving that it is leſſe in every part, and beareth two or three or more ſmall flowers, at the toppe of each ſtalke.

The Place.

Moſt of thoſe Centories are found in our owne country in many places, the ordinary ſort almoſt every where in fields, paſtures, and woods, yet that with the white flower more ſparingly by much than the firſt: the ſpiked kinde groweth about *Mompelier*, and upon the *Euganean* hills neare *Padoa*: The firſt yellow Centory groweth in many places of *Kent*, as in a field next unto Sir *Francis Carew* his houſe, at *Bedington* neare *Croydon*, and in a field next beyond South-fleete Church towards *Graveſend*, and in many other places where the other ſorts are ſometimes found.

The Time.

They doe all flower in *July* or there abouts, and ſeede within a moneth after.

The Names.

It is called in Greeke Κεντάυειον τὸ μικρὸν. *Centaurum parvum & minus*, *Pliny* maketh three ſorts, his *Centaurea Chironia* is *Dioſcorides* his *Centaurium majus*, his *Centaurium* is this little Centory, and his third he nameth *Centauris triorchis* miſtaking *Theophraſtus* his meaning, *lib.9.cap.9.* where he ſpeaketh of that kinde of Hawke called in Latine *Buteo* a *Buſſard*, and in Greeke τριόρχης of whom they that did gather this Centory ſhould take heed to be hurt. *Geſner* and *Dalechampius* doe both note *Pliny* of this his errour herein: of ſome *Centaurea*, and for the exceſſive bitterneſſe *fel terræ*, and for the qualitie *febrifuga*, of ſome alſo *Multi radix*, but for what cauſe I know not; *Dioſcorides* ſaith it was called *Limneſion*, and *Pliny Libadion*, becauſe it loveth to grow in moiſt places: It is thought to be that herbe that *Theophraſtus*, counted among the *Panaces*, and called *Leptophyllum*: *Pliny* ſaith it was called of the *Gaules* in his time *Exacon* becauſe it did purge by the belly, all other evill meditines out of the body: It is called in *Italian Biondella*, becauſe women did with the lye thereof cleare and whiten their haire as *Matthiolus* ſaith, but *Lugdunenſis* ſaith, it doth make the haire yellow: *Bauhinus* calleth the third *Centaurium minus ſpicatum album*: *Lugdunenſis* calleth the ſixt *Centaurium luteum alterum*, and *Fabius Columa* the laſt, *Centaurium minus luteum non deſcriptum*, or *Centaurium luteum novum*. The yellow Centory is called by *Meſues*, *Centaurium floribus luteis ſive citreis pallidis*, and is thought by ſome to be the *Achylleos vera*, that *Pliny* mentioneth in his 35. Booke and 5. Chapter; and therefore *Geſner in hortis* calleth it *Perfoliata Achyllea*. The *Arabians* call it *Kantarion ſages & Canturion ſege* or *Segir*, the *Italians*, as is before ſaid *Biondella & Cantaurea minore*; the *Spaniards Cintoria & fel de tierra*; the *French Petite Centoire*; the *Germans Tauſent guldenkyant* and *Fieberkyaut*; the *Dutch Klein Santory unde Eerdegall*; and we in *Engliſh* ſmall Centory.

The Vertues.

Dioſcorides, *Pliny*, *Galen*, *Meſues*, and the other *Arabian* Phyſitions with diverſe others doe all agree, that the leſſer Centory being boyled and drunke, purgeth chollericke and groſſe humors, and helpeth the Sciatica; and yet *Dodonæus* ſeemeth to averre, that it hath no purging qualitie in it, that he could finde by much experience thereof: which words and ſaying *Gerard* ſetteth downe, as if himſelfe had made the experience, when as they are the very words of *Dodonæus*: it is much uſed with very good effect to be given in agues, for it openeth the obſtructions of the liver, gall and ſpleene, helping the jaundiſe and eaſing the paines in the ſides, and hardneſſe of the ſpleene uſed alſo outwardly; making thinne both the bloud and humors, by the clenſing and bitter qualities therein: it helpeth alſo thoſe th at have the dropſie, or the greene ſickneſſe as the *Italians* doe affirme, who much uſe it for that purpoſe in pouder; it is of much uſe to be boyled in water and drunke againſt agues as all know: it killeth the wormes in the belly found true by daily experience; it helpeth alſo to drie up rheumes as *Galen* ſaith, being put with other things for that purpoſe: the decoction thereof alſo (the toppes of the ſtalkes with the leaves and flowers are moſt uſed) is good againſt the chollicke, and to bring downe womens courſes, helpeth to avoid the dead birth, and eaſeth the paines of the mother, and is very effectuall in all old paines of the joynts, as the gout, crampes, or convulſions: a dramme of the pouder thereof taken in wine, is a wonderfull good helpe againſt the biting and poiſon of the Adder or Viper: the juice of the herbe taken while it is greene, as is uſed in other herbes, and dried in the Sunne, or by decoction and evaporation by the fire, as was uſed in ancient times, worketh the ſame effects: but the diſtilled water of the herbe, as it is more pleaſant to be taken, ſo it is leſſe powerfull, for any the purpoſes before ſpoken of, becauſe it wanteth that ſubſtance and bitterneſſe that is in the herbe: the juice thereof with a little hony put to it, is good to cleare the eyes from dimneſſe, miſtes, or cloudes, that offend and hinder the ſight, it is ſingular good both for greene or freſh wounds, and alſo for old ulcers and ſores, to cloſe up the one, and clenſe the other, and perfectly to cure them both, although they be hollow or fiſtulous, the greene herbe eſpecially being bruiſed or laid too: the decoction thereof dropped into the eares, clenſeth them from wormes, clenſeth the foule ulcers, and ſpreading ſcabbes of the head, and taketh away all freckles, ſpots, and markes in the skinne being waſhed therewith. The yellow Centory ſaith *Meſues* worketh the ſame effects, that the other with the red flowers doth:

CHAP.

CHAP. LV.

Rubia major. Madder.

BEſides the manured and wild Madder, which were both knowne to the ancients, there are at this time many other ſorts found out, not knowne to them, as well of the greater as leſſer kinde, ſome growing on mountaines, ſome in Medowes and paſtures, and ſome by the ſea ſide: but becauſe I would not cumber one Chapter with too many of them, let me onely in this ſhew you the greater ſorts, and in the next following the leſſer.

1. *Rubia major ſativa ſive hortenſis.* Garden Madder.

The Garden Madder ſhooteth forth many very long, weake, foure ſquare reddiſh ſtalkes trayling on the ground a great way, very rough or hairy (which therefore *Pliny* calleth *ſpinoſus* prickly) and full of joynts; at every of theſe joynts come forth, diuerſe long and ſomewhat narrow leaves, ſtanding like a ſtarre or the rowell of a ſpurre, about the ſtalkes, rough alſo and hairy: towards the toppes whereof, come forth many ſmall pale yellow flowers; after which come ſmall round heads, greene at the firſt and reddiſh afterwards, but blacke when they are thorough ripe, wherein are contained the ſeede: the roote is not very great, but exceeding long, running downe halfe a mans depth into the ground, red, and very cleare while it is freſh, ſpreading diverſe wayes.

2. *Rubia ſylveſtris.* Wild Madder.

The wild Madder is in all things like unto the manured, but that the ſtalkes are ſmaller, not ſpreading ſo farre, nor yet ſo rough or hairy; the leaves are leſſe, the flowers are white, and the roote groweth greater, but not fully ſo red, nor cleare as the Garden kinde.

3. *Rubia ſylveſtris longioribus foliis.* Wild Madder with long leaves.

This wild Madder hath diverſe round joyned ſtalkes, two or three foote long or there abouts, ſomewhat ſmooth, or at leaſt nothing ſo rough, as the other wild ſort: the leaves that ſtand at the joynts, are ſomewhat rough, narrower and longer than the other, ſeven or eight at a diſtance: at the toppes of the ſtalkes, ſtand many white flowers, made of foure ſmall leaves a peece, which turne into ſmall round ſeede like the other: the roote is ſmaller, but red like the former.

4. *Rubia lævis Taurinenſium.* Smooth leafed Madder.

This ſmooth Madder hath diverſe round ſmooth ſtalkes, two or three foote long, pointed in like manner as the other, but not ſo frequent, whereat ſtands foure leaves uſually, not rough at all but ſmooth, larger and broader than the Garden Madder: towards the toppes of the branches, and at the joynts with the leaves come forth diverſe flowers, ſtanding round about the ſtalkes, which conſiſt of five or ſixe ſmall pure white leaves: the rootes are ſmaller than the other, and runne not farre in the ground.

5. *Rubia lævis arboreſcens Cretica.* The great ſmooth Candy Madder.

This Madder hath a thicke ſhort ſtalke about a fingers thickneſſe, from whence iſſue ſundry ſtraight ſmooth

1. *Rubia major ſativa.* Garden Madder.

4. *Rubia lævis Taurinenſium.* Smooth leafed Madder.

branch

branches with ſmall ſhort leaves, ſet at diſtances like the former ſorts, at the toppes of the branches come forth two or three ſlender ſprigges, bearing whitiſh flowers not unlike to the ordinary Madder: the roote is long and ſomewhat reddiſh: there is no roughneſſe in any part of this plant: but the roote is ſomewhat bitter with a certaine auſtere taſte alſo.

6. Rubia Marina. Sea Madder.

The Sea Madder ſpreadeth many ſquare hard, ſomewhat rough ſtalkes, round about the roote, upon the ground and full of joynts, from whence grow many ſmall long leaves, ſomewhat rough, broadeſt at the bottome and pointed at the end, more white in the naturall places, then being tranſplanted, from among which growing leſſer towards the toppes, come forth ſmall whitiſh flowers, ſtarre faſhion like the other, but longer: the roote is more red on the outſide than within, harder and more wooddy than the other.

The Place.

The firſt is onely manured either in gardens or larger fields in many Countries of *Europe*, for the profit that is made thereof. The ſecond groweth in fieldes and by hedge ſides neere *Spire* and many other places in *Germanye*, and ſo doth the third likewiſe, it groweth alſo in many places, in our owne land, as at a place called *Hodhill* in *Dorſetſhire*, on that ſide is next to the river, in the pariſh of *Stompaine*, 2 miles from *Blandford*: at *Warrham* likewiſe in the ſame ſhire. on a mud wall in the ſame towne; and at a place called Somerpill, neere to a Chappell, which is by the landing place, as ye come from *Aſtferry* to *Cheſell* in great aboundance. The fourth as *Lobel* and *Pena* ſay, groweth by *Turin*, on the hils of *Piemont*. The fift in *Candye*; and the laſt by the ſea ſide in *Provence*, and neere *Mompelier*, and in *Spaine* alſo as *Cluſius* ſaith.

The Time.

They flower toward the end of Sommer, and the ſeede of ſome of them ripeneth quickly after, but the ſea Madder, doth ſeldome give ripe ſeede in our Country.

The Names.

It is called Greeke ἐρυθρόδανον & ἐρευθέδανον, *Eruthrodanum* and *Ereuthedanum*. *Nicander* in *Theriacis* calleth it σχοινον *Schyrium*, in *Latine Rubea* and *Rubia*, and both Greeke and Latine from the colour of the roote, and of the dying cloth, or leather into a red colour. The firſt is generally called *Rubia ſativa*, and *Rubia tinctorum* in ſhoppes: The other have their names in their titles, as moſt writers doe call them by: The *Arabians* doe call it *Pave* and *feve alſa bagin*: the *Italians Rubbia* and *Robbia*, the *Spaniards Rubia* and *Granza*; the *French Garance*; the *Germanes Terberroet*: the *Dutch Crappe Roote oft Mer*. and we in *Engliſh Madder*.

The Vertues.

There is ſome controverſie betweene our moderne and the ancient writers concerning the vertues of Madder, whether it open or bind the body: the ancient writers *Dioſcorides* and *Galen* affirming, that the roote hereof doth open and cleanſe the body, of much tough and groſſe flegme, that it provoketh urine plentifully; and hath ſo ſtrong and powerfull an opening quality, that it bringeth downe womens courſes, driveth forth the dead childe and afterbirth: but others, and *Dodoneus* among the reſt, denyeth it to have any ſuch ſtrong opening quality, and ſaith that both *Dioſcorides* and *Galen* were much miſtaken therein; becauſe that *Dioſcorides* ſaith, it expelleth urine even unto blood, it being but the tincture of the roote in urine, and no blood that is voyded at all, ſaying that it hath onely a binding or aſtringent quality, inſomuch that it helpeth ruptures, ſtayeth the fluxe of womens courſes, the fluxe of the hemorrhoides or piles, the laske, and the abortment, or untimely delivery of women: whoſe very words and ſayings, *Gerard* tranſlateth and ſetteth downe in his booke, as if he had made the experience, and this conteſting with *Dioſcorides* and *Galen*, had beene out of his owne judgement and tryall: but we muſt needes ſay according to the truth, that it hath an opening quality, and an aſtringent property alſo: the opening quality is well perceived, by colouring the urine red, even as Rubarb will dye it yellow; the poperty in them both being a like, to open and then to binde and ſtrengthen: it is an aſſured remedye for the yellow Iaundiſe, by opening the obſtructions of the Liver and gall, and cleanſing thoſe parts; it openeth likewiſe the obſtructions of the ſpleene, and diminiſheth the melancholike humour; it is availeable alſo for thoſe that have the palſie, and feele the paines of the hippes, called Sciatica: it is uſually given with good effect, to thoſe that have had bruiſes, by falls or blowes, and inwardly felt as much as outwardly: and therefore it is much uſed in vulneraſie drinkes: the roote for all theſe purpoſes aforeſayd, it to be boyled in wine or in water, as the cauſe doth require, and ſome honey or ſugar put thereto afterwards: the ſeede hereof taken with vinegar and honey, helpeth the ſwellings and hardneſſe of the ſpleene: the decoction of the leaves and branches, is a good fomentation for women to ſit over, that have not their courſes: the leaves and rootes, beaten and applyed to any part that is diſcoloured, with freckles, morphew, the white ſcurfe, or any other ſuch deformitie of the skinne, cleanſeth them throughly, and taketh them away.

CHAP. LVI.

Rubia minor. Small or little Madder.

THe ſmaller madders are many that have beene lately found out, by the diligence of painefull Herbariſts or lovers of herbes, ſome in one Country, ſome in another; all which I meane to comprehend in this Chapter, that ſo you may have them all recorded together; but although there be diverſe other herbes as *Aſperula*, *Aparine*, *Gallium*, *Mollugo*, and *Cruciata*, that may be reckoned as kinds of Madder, and might and ſhould be joyned together, if I follow the courſe of other Herballs, that doe or ſhould joyne the congeners: yet becauſe I have tyed my ſelfe to another courſe, let me referre them to another fit place, but not expell them from your ſight and knowledge.

1. *Rubia ſpicata Cretica latiore folio.* Candy Madder, with a ſpiked head and larger leaves.

This ſmall Madder ſhooteth forth diverſe ſquare rough ſlender ſtalkes, full of joynts, from whence grow many branches, and where alſo ſtand 4 or 5 ſmall leaves compaſſing them, and ſomewhat rough: the top branches, end in ſmall long ſpiked heads foure ſquare, compoſed of many ſhort rough huskes, ſet cloſe together one above another;

1. 2. *Rubia ſpicata Cretica latifolia & anguſtifolia.*
Candye Madder with ſpiked heads, and with larger and ſmaller leaves.

5. *Rubia pratenſis minor cæruleo.*
Small Madder with purpliſh blew flowers.

ther; from whence comè forth ſmall whitiſh grēenē flowers, ſcarcē to be ſeenē: after which come forth ſmall greeniſh ſeede: the roote is compoſed of many ſmall fibres, ſet unto a reddiſh bigger ſprigge, ſomewhat woody and periſhing every yeare.

2. *Rubia ſpicata anguſtifolia.* Spiked Madder with ſmaller leaves.

This ſpiked Madder is a kinde of the former, differing in this onely, that it is leſſe both in ſtalkes, branches, and leaves, not growing above an hand breadth high, and with as ſmall leaves as Knawell, periſhing every yeare.

3. *Rubia pratenſis lævis acuto folio.* Small ſmooth Madder with ſharpe pointed leaves.

This ſmooth Madder ſhooteth forth, one ſmooth ſquare joynted ſtalke, for the moſt part, halfe a yarde in length; from the joynts whereof grow other ſmaller branches, whereat are ſet foure ſmall long leaves uſually and no more, ending in a ſmall point: the flowers that come forth at the toppes are ſmall and yellow at the firſt, and of a pale white colour afterwards, made of foure leaves.

4. *Rubia quadrifolia rotunda lævis.* Small ſmooth Madder with round pointed leaves.

This other ſmall ſmooth Madder, hath many ſquare ſtalkes, halfe a foote long, ſending forth other ſmaller branches, and at every joynt, foure ſmall round pointed leaves, that are not altogether ſo ſmooth as the laſt, but rather a little rough: at the toppes whereof ſtand ſmall white flowers, upon ſmall threddie foote ſtalkes, made of foure leaves a peece; the roote is ſmall, threddie and reddiſh.

5. *Rubia minor pratenſis cærulea.* Small creeping Madder with purpliſh blew flowers.

This ſmall Madder creepeth upon the ground, with many ſmall ſquare ſmooth branches, much divided or ſeparated into other ſmall ones; full of joynts and at every of them, five or ſixe ſmall round and very freſh greene leaves, ſmooth alſo, or but very little rough: from theſe joynts and roundels of leaves, as well as from the toppes of the branches come ſeverall ſmall flowers, made of five blewiſh purple round pointed leaves, with ſome ſmall threds in the middle; the ſeede is ſmall and long pointed, two for the moſt part ſtanding together: the roote is ſmall and of a reddiſh yellow colour, abiding all the winter with greene leaves thereon, and will encreaſe plentifully from the ſeede it ſheddeth every yeare.

6. *Rubia minima ſaxatilis.* The ſmall rocke Madder.

This ſmalleſt Madder, groweth not much above an hand breadth high, with a ſquare ſtalke, ſpreading ſmall branches from the joynts, at which grow 7 or 8 ſmall long pointed leaves, even the ſmalleſt and narroweſt of any before mentioned, being ſomewhat rough alſo: the flowers are very ſmall, and of a pale red or bluſh colour, ſtanding in tuftes or umbels, at the toppes of the branches: the roote is ſmall and reddiſh as all the other ſorts are.

7. *Rubia Echinata ſaxatilis.* Small Rocke Madder with prickely heads.

This ſmall Madder ſhooteth forth from a ſmall whitiſh threddie roote, many tender ſquare branches, ſmall and ſlender below, next unto the roote, and thicker up higher, diſtinguiſhed by many thicke and hayrie joynts whereat grow foure ſmall leaves leſſer than thoſe of Rue: betweene the leaves and the branches come forth

ſmall

ſmall greeniſh flowers for the moſt part ſtanding together upon a foote ſtalke, each of them conſiſting of foure leaves, with certaine ſmall threds in the middle, after which riſe ſmall heads ſomewhat rough, which when they are thorough ripe and dry are more ſharpe and prickly, divided into foure parts as armes or wings on each ſide of the head, the middle part alſo being prickely, wherein is conteined ſmall yellow ſeede: it flowreth by degrees, the loweſt joynts firſt, and the higher afterwards.

8. *Rubia argentea Cretica.* Candy ſilver-leafed Madder.

This ſmall Madder is like the former ſmall Madder, but that the leaves are longer and whiter, and the flowers yellow.

The Place.

The firſt groweth in *Candye*, and abideth well with us: the ſecond groweth upon the hils not farre from *Mompelier*: the third in *Germany* in the fields neere the bathes of Luke, and by *Lipſwick* alſo: the fourth on the hils in *Switzerland*, & about *Straſbourg* likewiſe: the fift groweth plentifully in many places of our owne land: the ſixt groweth alſo in diverſe places with us, and upon the chalkie hils neere *Drayton*, over againſt the Iſle of *Wight*; the ſeaventh was found by *Fabius Columnus*, on the ruinous moyſt walls of *Dioclefians* bathes in *Rome*: the laſt in *Candye* as *Alpinus* ſaith.

6. *Rubia minima ſaxatilis.* The ſmall rock'e Madder.

The Time.

They all flower in the Sommer Moneths, and give their ſeede ſhortly after.

The Names.

All theſe ſmall Madders have their denominations in their titles, as they are called by *Cluſius*, *Bauhinus* and others that have mentioned them: onely the fift I take to be the *Myagrum alterum minus Dalechampii* of *Lugdunenſis*; and the ſeaventh is called by *Fabius Columna*, *Cruciata nova Romana minima muralis*, and peradventure is the ſame that *Ceſalpinus* calleth *Cruciata minima in maritimis*, which *Bauhinus* hath altered, and called *Rubia echinata ſaxatilis*.

The Vertues.

Theſe ſmall Madders, as by their taſte and temperature may be gathered, are of the ſame property with the greater kindes, but are leſſe effectuall in every reſpect.

CHAP. LVII.

Pſyllium. Fleawort.

THe ancient writers have delivered us, but one ſort of Fleawort, but there hath beene in later times, ſome others knowne, which ſhall be here ſet forth together.

1. *Pſyllium vulgare.* The ordinary Fleawort.

The ordinary Fleawort riſeth up with a ſtalke two foote high or more, full of joynts and branches, on every ſide up to the toppe, and at every joynt two ſmall long and narrow whitiſh greene leaves, ſomewhat hayrie: at the toppes of every branch ſtand diverſe ſmall ſhort, ſcalie, or chaffie heads, out of which come forth ſmall whitiſh yellow threds, ſuch as the Plantaine heads doe give, which are the bloomings or flowers: the ſeede encloſed in thoſe heads is ſmall, and ſhining while it is freſh, very like unto fleas, both for colour and bigneſſe, but turning blacke when it groweth old: the roote is not long, but white hard and woodie, periſhing every yeare, and rayſing it ſelfe againe of it owne ſeede, for diverſe yeares if it be ſuffered to ſhed: the whole plant is ſomewhat whitiſh, and hayrie ſmelling ſomewhat reſinous or like Roſſen.

2. *Pſyllium majus ſemper virens.* The greater ever greene Fleawort.

This Fleawort differeth not from the former in the manner of growing, but onely that his ſtalke and branches, being ſomewhat greater doe a little more bow downe to the ground; the leaves are ſomewhat larger, the heads ſomewhat leſſer, the ſeede alike; and the roote and leaves abide all the winter, and periſh not as the former.

3. *Pſyllium Indicum foliis crenatis.* Indian Fleawort with dented leaves.

Indian Fleawort hath a wooddy reddiſh rough ſtalke, next to the ground, about a foote high, ſpreading forth into diverſe branches; the leaves that ſtand at the joynts thereof are ſomewhat long, narrow pointed at the end, and notched, or rather ſomewhat torne on the edges, and hayrie alſo like the former; the toppes of the branches are more ſtored with heads than the former, but of the ſame bigneſſe and faſhion, with flowers and ſeede ſhining like the other.

4. *Pſyllium minus.* Small Fleawort.

The ſmall Fleawort hath ſmall round reddiſh branches, leaning downe to the ground, not above a handbreadth high, ſpreading into more branches, as having three or foure at a joynt, and two leaves ſtanding at every of them, one againſt another as in the former, but very ſhort and narrow: the ſmall heads that ſtand at the tops of the ſtalkes, have two ſmall long leaves, and ſometimes more, ſet under every of them, one longer thenano-

ther, and in time bowing downewards and somewhat hard: the bloomings or flowers are white, and the feede that flowreth is shining, and like the other, but smaller: the roote is small and white with divers Fibres thereat.

The Place.

The first groweth in the fields and untilled places of *Spaine* and *Italy*, but with us no where but in gardens: The second groweth more plentifully in the fields that are neare the sea. The third is thought to come out of the *Indies*, as the name importeth, but we are not sure thereof. The last is naturally of *Egypt* or *Arabia*, and grew in the most noble Signior *Bembo*, his garden at *Padoa*.

The Time.

All these Fleaworts flower in *July* or thereabout with us, but in their naturall places, all the Summer long, yet the last, is the latest with us.

The Names.

It is called in Greeke Ψύλλιον, in Latine *Psyllium*, *Pulicaris herba*, & *Pulicaria*, because the seede is like unto Fleas, and not because it driveth away Fleas, being brought greene into the house, for that is false: there is also another *Pulicaria* called *Conyza*, which we have shewed before: The *Arabians* call it *Bazara Chatama*, and *Bezercothune*. The *Italians Psyllio*, the *Spaniard Zargatona*, the *French Herbe aux Poulx*. The *Germans Pfilenraut*; and wee in English Fleawort, and not Fleabane, for that is *Conyza*, as is shewed before: The first is generally called *Psyllium* of all writers. *Gesner in hortis Germaniæ* calleth it *Cynops* of *Theophrastus*. The second is called by *Matthiolus Psyllium alterum*, *Gesner* and *Camerarius* call it *Psyllium perenne*; *Lobel* in his *Adversaria* calleth it *Psyllium Plinianũ forte majus radice perenne*: the third is *Anguillara* his first *Psyllium* and thought by *Bauhinus* to be the true *Psyllium* of *Dioscorides* and by him called *Indicum*, because the seede came to him under that name. The last as *Bauhinus* saith he had from the most noble *Bembus* his Garden at *Padoa*, under the name of *Gottne rabrum*, as he had another called *album*, which is a kind of *Holosteum*. *Bauhinus* mentioneth *Prosper Alpinus* to call it *Gottne rubrum*, but I can finde no other then *Gottne mſegiar Gossipium arboreum* in his *Egyptian* plants: he saith also that it was sent him from *Heidelberg*, by *Sprengerus*, with the name *Botrio rubro*.

1. *Psyllium vulgare.*
The ordinary Fleawort.

The Vertues.

All Authors doe confirme that the seede of *Psyllium* is cold which *Mesues* attributeth to the barke or outside, saying that the inward pulpe thereof, is hot sharpe and drying, but divers doe utterly mislike and refuse that opinion: the muccilage of the seed made (but indeed the seede is seldome buised by any Artist, but alwayes steeped whole) with barly water, and some syrupe of Roses or Violets put thereto and drunke, doth purge downewards grosse flegme and burnt choller; but the seede being fryed and so taken, stayeth the flux or laske of the belly, and the corrosions that come by reason of hot, chollericke, sharpe and malignant humors, or by the superpurgation of any violent medicine, such as Scamony or the like worketh: the muccilage of the seede made with Rosewater and a little Sugar Candy put thereto, is very good in all hot agues, and burning feavers, and other inflammations, both to coole the thirst, and to lenifie the drineſse and roughnesse of the tongue and throate: it helpeth also the hoarsenesse of the voyce, and diseases of the brest and lungs caused by heat, or sharpe salt humors, and the Pleurisie also: the muccilage of the seede made in Plantaine water, whereunto the yolke of an egge or two, and a little Populeon is put, is a most safe and sure remedy to ease the sharpenesse, prickings, and paines of the hemorrhoides or piles, if it bee laid on a cloth and bound thereto: it helpeth also all inflammations in any part of the body, and the paines that come thereby, as the headach and meagrime, and all hot impostumes or swellings, or breakings out in the skin, as blaines, wheales, pushes, purples and the like, as also the paines of the joynts, and of those places that are out of joynt, the paines of the Goute and Sciatica, the bursting of young children, and the swelling out of the navell, applyed with oyle of Roses and Vinegar; the same also is very often and with good successe applyed to heale the Nipples, and the sore breasts of women laying it often thereon: the juice of the herbe with a little hony put into the eares, helpeth the running of them, and the wormes breeding in them: the same also mixed with Axungia, and applyed to foule corrupt and filthy Vlcers and sores, clenseth and healeth them, by cooling the heate and repressing the sharpenesse of the humors, flowing unto them: Whereas divers have written that the frequent use of the seede inwardly taken is very dangerous, it is no otherwise true, then as it falleth out in all other great cooling herbes, as Nightshade, Houseleeke, Henbane, and the like, which are all safe herbes, being wisely and conveniently applyed: but ignorance, rashnesse and indiscretion, in the applying of remedies, hath alwayes done more harme and brought more discredit unto them, then any danger in them can threaten it: and therefore it is not sufficient to know that a medicine is good for such a disease,

ſeaſe, if there want judgment and diſcretion, how, to whom, and when to apply it: and this I thinke is a good caveat for women leeches, and impudent bold practiſers of Phiſicke and Surgery.

CHAP. LVIII.

Kali. Glaſſewort or Saltwort.

THere are diverſe ſorts of *Kali*, with the aſhes whereof they uſe to make glaſſe, and other things, which were none of them knowne to the ancient authors, but remembred onely by the later *Arabian* Philoſophers and Chymickes, of which I meane to entreate in this Chapter, and becauſe diverſe doe thinke, that ſome of theſe is the *Anthyllis altera Ajugæ foliis* of *Dioſcorides*, for the likeneſſe they have with them; I will in the next chapter, ſhew you all thoſe herbes called Anthyllides, that are moſt worthy of that name; for unto ſome herbes the name *Anthyllis* is falſely impoſed, whereof I meane not here to ſpeake.

1. *Kali majus cochleatum.* Great Glaſſewort with Snaile-like ſeede.

The great *Kali* riſeth up with a bigge round reddiſh fleſhy ſtalke, very like unto Purſlaine, two foote high or thereabouts, divided into many branches, whereon doe grow many thicke, long, round fleſhy leaves, pointed at the ends, growing without order, ſometimes but one or two, and more often, more ſtanding at a place; here and there alſo diſperſed upon the branches, come forth ſmall yellowiſh flowers, and after them ſmall browniſh heads, turned round like ſnailes, wherein lye ſmall round ſeede: the roote is ſomewhat long, with many fibres thereat, and periſheth every yeare, after it hath given ſeede for the moſt part: this hath an evill taſte but ſaltiſh.

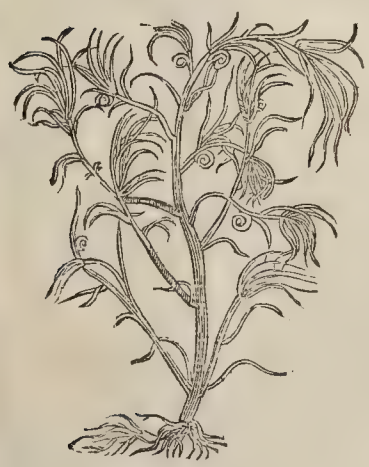
2. *Kali minus album.* Small white Glaſſewort.

This leſſer white *Kali*, hath diverſe whitiſh greene branches riſing from the roote, nothing ſo high as the former, and bending or leaning downe to the ground, ſpreading it ſelfe into other ſmaller branches, full of joynts; whereon grow more ſtore of ſmaller and ſhorter, round and pointed leaves, nothing ſo fleſhie as the former, and of the ſame pale greene colour with the ſtalkes: the flowers are white, and ſtand ſingly on the toppes of the branches: after which come ſmall huskes, wherein lyeth the ſeede, which is ſmall blacke and ſhining, like unto Sorrell ſeede: the roote hereof likewiſe is ſmall white and wooddy, and periſheth after it hath given ſeede.

3. *Kali Ægyptiacum.* Glaſſewort of Egypt.

The *Egyptian Kali* groweth up with one ſlender ſtalke, bending it ſelfe downewards, and branching forth at the joynts into other ſmall ones, which for the moſt part ſtand more upright, and at every of the joynts, two very long and ſomewhat hayrie leaves, bowing themſelves downewards, becauſe of the length of them: the ſmall branches are bare without leaves unto the toppes or ends of them, where there grow many ſmall and long leaves, hayrie like the former, but nothing ſo long: from among which grow ſmall whitiſh purple flowers, with many ſmall threds in the middle of them: Of this ſort there is ſome other with ſhorter leaves differing in little elſe. *Aliud foliis brevioribus.*

1. *Kali cochleatum majus.*
Great Glaſſewort.



2. *Kali minus album.*
Small white Glaſſewort.

4. *Salicornia sive Kali geniculatum.*
Ioynted Glasswort.

4. *Kali geniculatum sive Salicornia.* Ioyntēd Glasswort.

This ioynted *Kali* riseth up usually, but with one upright round thicke, almost transparent stalke, a foote high or better, thicke set and full of ioynts or knots, without any leaves at all on them, but shooting forth ioynts, one out of another, with short cods at the heads of them, and also such like smaller branches on all sides, and they also divided into other smaller ones: this is thought to beare neither flower nor seede, the roote is small long and threddie.

Kali geniculatum tuberum.

There are some other kindes hereof found, differing a little in the forme of the ioynts one from another, and one that is wholly reddish, not differing in any thing else from the formē of the other ioynted ones.

The Place.

The first groweth by the sea sides, in diverse places both in *Syria*, *Africa*, *Italy*, and *Spaine*, as also in *Provence* and *Aquitaine* or *Gascoigne*, where also they sow large fields therof, for the profit is made thereof. The second groweth not onely in those places, but in other colder climates also, and not onely by the Sea, but by the Salt pits in *Saxonie* as *Camerarius* saith, and upon our owne coasts likewise in many parts, especially of the West Countries; the third is more particular to *Egypt* as *Alpinus* saith, yet *Columna* saith it is frequent on the *Neopolitan* West shore. The last is generally growing among other Sea plants, in all Countries almost, and on our coasts in many places, as also in *Saxony* and other places of *Germanye*, where there are lakes of salt water, whereof they make salt.

The Time.

They all flourish in the Sommer, and those that perish givē their seede in *August* and sometimes later: the last abideth the Winter.

The Names.

The namē *Kali* camē first from the later *Arabians*, as it is commonly thought (for *Pena* thinketh that nonē of the ancient writers either Greckes or *Arabians*; have made any mention of them, or of their propertie to make glasse, which was not made but of the ashes of this hearb; of the same ashes also made into a lye being boyled with oyle was used to be made our ordinary sope; out of the said ashes also they extracted a salt called *Sal Kali* or *Sal Alkali*, so much desired and used by *Chimists*: for the herbe being dryed and burnt in great quantitie together, doth melt, and runne into a lumpe of a blackish ash colour, and is called by diverse *Soda*, and of some *Alumen Catinum*, or peradventure *Calinum*, onely by the alteration of one letter: and of the ashes of any of these herbes, but especially of the 3 former sorts, beaten to powder and mixed with a certaine kind of sand, the glassemen by the heate of fire, in their fornace being molten, doe make those fine Christall glasses serviceable to drinke in (but those other glasse bottles, &c. which serve to keepe Rosewater, and other distilled waters in, are made of other things, as also that glasse which serveth for the Windowes of houses) and from this glasse, while it is in the furnace a boyling and refining, riseth a kinde of scumme, which they that tend the furnace, doe diligently take of; and this is called *Axungia vitri*, in *French Suin de verre*; the salt of glasse, and wee in *English* much thereafter *Sandiver*, and is indeed but the salt part of the ashes separated by the fire from the rest of the molten substance, for it tasteth like salt, and will relent, grow moyst, and consume like salt, if it be not continually kept dry as it is: Of the ashes of the *Kali* like-wise relented into a lye, and boyled with oyle of Olives they of *Spaine*, &c. use to make a kind of hard sope towash with, the one sort comming from *Spaine*, &c. we call Castle sope, another from *Venice*, &c. white or *Venice* sope; but now it being for the most part spent in making of glasse, there are found out other things sufficient, to make our ordinary sope at a farre easier and cheaper rate. The first is called of *Lobel* and *Pena* in their *Adversaria*, *Kali magnum Sedi medii foliis semine cochleato*: *Matthiolus* (and *Castor Durantes* following him in all things) in describing this kind confoundeth it with the last, making them seeme but one. *Camerarius* nameth it *Kali cochleatum majus*, and saith it is that *Anthyllis salsa*, that *Iohannes Major* doth mention in these Epitaphicall verses.

E cineris massa, salsaque Anthyllidis herba
Formari flammis lucida vitra solent.
Sic cinis ater eram, cineres nunc solvor in atros;
Sed nitidum summo corpus habebo die.

Bauhinus calleth it *Kali majus cochleato semine*. *Cæsalpinus* *Salsolæ genus in hortis*, and is generally called of most in *Italy* where it groweth *Igaro*: the second is usually called *Kali album*, & in *French* as *Pena* saith *Blanchette*, as a distinction from the former: it is also called *minus* for the same cause, & is usually called in *Italy* where it groweth *Borda*: it is very likely to be *Anthyllis Chamæpitys similis* of *Cordus*, in his Annotations upon *Dioscorides*, and is likely also to be the *Anthylloides* of *Thalius* in his *Hercynia Sylva*, *Bauhinus* calleth it *Kali minus villosum*; the third is the third sort of *Kali Ægyptium* with *Prosper Alpinus*, because it is more proper to *Egypt* than to other places, as he thinketh: *Bauhinus* calleth it *Kali Ægiptiacum foliis valde longis hirsutis*. The last is called of most writers

Kali

Kali genicvlatum, and of some *Salicornia*; of *Cordus* in *Observationum sylva*, *Anthyllis constans veluti tritici grauis*, and of *Cæsalpinus*, *Salsolæ genus aliud*, it is called in *English* Glassewort and Saltwort of some; the people that dwell neare it by the Sea side, call it Frogge grasse and Crab grasse.

The Vertues.

All these sorts of *Kali* have a clensing qualitie in them, without any manifest heate; the pouder of any of them, or the juyce which is much better, taken in drinke doth purge downewards flegmaticke, watersh and adust or melancholike humors, and therefore are often used for the dropsie, to provoke urine, and to expell the dead birth, as also to open the obstructions of the liver and of the spleene, and to consume the hardnesse thereof; they are somtimes mixed with those things, that are used as corrosives to consume proud or spongie superfluous flesh, that groweth in foule and virulent ulcers, but the ashes themselves are very sharpe and biting like a caustike, and the lye that is made thereof is so strong, that it will fetch off the skinne from the hands, or any other part of the body; and therefore if any use it to clense the skinne from spottes, freckles, morphew, or the like, they had neede to be cautelous in the using of it, and apply it very sparingly, or delay it sufficiently, and so it may doe good. If the Sope that is made of the lye of the ashes of these *Kalies* or Saltworts, be spread upon a peece of thicke course browne paper, cut into the forme of their shooe sole that are causually taken speechles, and botind to the soles of their feete it will bring againe the speech and that within a little time after the applying thereof, if there be any hope of being restored while they live: this hath beene tried to be effectuall upon diverse persons: *Sandiver* worketh much to the same effect with *Kali*: it is used often being made into pouder either to be blowne into horses eyes, or being dissolved squirted into them, to take away any skinne that beginneth to grow there, and dimme the sight: both of them likewise serve to drie up running sores and scabbes, tetters, ringwormes and the like, and to helpe the itch.

CHAP. LIX.

Anthyllis maritima. Sea Chickweede and sea ground Pine.

Dioscorides maketh mention of 2. sorts of *Anthyllis* only, the one with leaves like Lentilles, the other with leaves like unto *Ajuga* or ground Pine, unto each of these some have appropriated certaine herbes, and called them after those names, because they neareste resemble them; but it is judged an hard matter certainely to affirme any of them for the right: of the most likelieste of them, as I said before I shall speake in this Chapter, and referre these other sorts that are not properly called *Anthyllis*, unto their proper places.

1. *Anthyllis maritima incana.* Hoary sea Chickweede.

This small *Anthyllis* also hath diverse hoary branches, set with many small whitish or hoary leaves by distances

1. *Anthyllis maritima incana.* Hoary Sea Chickweede.

2. *Anthyllis maritima lentifolia.* Sea Chickweede with Lentillike leaves.

3. *Anthyllis altera herbariorum.* Sea Ground Pine.

about

about them, as ſmall as any Chickweed almoſt, the flowers are white, and ſtand at the toppes of the ſtalkes; after which come ſmall ſeede.

2. *Anthyllis maritima lentifolia.* Sea Chickweed with Lentill like leaves.

This Lentill leafed *Anthyllis*, hath diverſe ſhort creſted branches lying upon the ground, of a pale greene colour, and not much above an hand breadth long, ſpreading forth diverſe ſmall branches, whereon are ſet many ſmall winged whitiſh greene leaves, many together upon a ſtalke, ſomewhat like unto thoſe of the leſſer Lentilles ſomewhat narrow: the flowers ſtand at the toppes of the ſtalkes and branches, like pointed ſtarres, of a yellow greene colour, after which come three ſquare heads, like unto a *Tithymall* or Spurge, wherein is contained ſmall round ſeede: this alſo is ſalt in the taſte, but ſomewhat bitter and hot withall.

3. *Anthyllis altera herbariorum.* Sea ground Pine.

This *Anthyllis* (which is referred unto the ſecond *Anthyllis* of *Dioſcorides*, and that not without good judgement) hath divers hard hairy ſtalkes, without branches upon them, whereon doe grow many ſomewhat long and narrow leaves without order one above another, thicke buſhing at the toppe, ſomewhat like unto thoſe of *Chamæpitys* or *Ajuga*, but dented about the edges and hairy alſo, ſomewhat of a warming hot taſte, and ſtrong unpleaſant ſavour: the flowers ſtand among the leaves upon the branches, like unto the flowers of *Chamæpitys* or gronud Pine, but of a purple reddiſh colour, after which come ſmall grayiſh rough ſeede, ſomewhat long, foure for the moſt part in every huske: the roote is ſomewhat thicke and white.

The Place.

The firſt groweth neare the ſea in *Narbone* of *France* as *Pena* ſaith, as alſo in the kingdome of *Valentia* in *Spaine*, as *Cluſius* ſaith. The ſecond hath beene found in the Iland of *Portland* in the Weſt parts of this land by *Lobel*, and ſet forth in his *Adverſaria*: the laſt groweth about *Mompelier*, and was alſo found by *Cluſius* in *Portugall* and *Valentia*.

The Time.

They flower in July and Auguſt, and their ſeede is ripe in September.

The Names.

It is called in Greeke ἀνθύλλις, in Latine alſo *Anthyllis*, *quaſi florida dicta videtur*. There is much controverſie among Writers, concerning theſe *Anthyllides*, imputing them to be ſome of *Dioſcorides*, every one almoſt ſetting forth ſome herbe or other, under the name of the one or other *Anthyllis*; ſuppoſing them to be the right, or at leaſt wayes, to be referred for its likeneſſe unto them; *Lobel* and *Pena* ſet forth three ſorts, whereof the firſt two here mentioned are two of them. The firſt is called by *Lobel* and *Pena*, *Anthyllis marina incana Alſinæ folio Narbonenſium*: of *Matthiolus* and *Anguillara*, it is ſet forth under the name of *Paronychia altera* of *Dioſcorides*, and by *Ceſalpinus* called *Centum grana*: it is thought alſo by *Anguillara* to be the *Gramen ſecundū Plinij*, whereof he maketh mention in his 24. Booke, and 19. Chapter. The ſecond is called by *Lobel*, *Anthyllis prior lentifolia maritima Pephos effigie*; by *Durantes Anthyllis minima* & is the *Anthyllis Portlandiæ lentifolia Penæ* of *Lugdunenſis*. The laſt is called by thoſe of *Mompelier Iva Moſchata*, and is with them alſo accounted to be the *Anthyllis altera* of *Dioſcorides*. *Pena* calleth it *Anthyllis Chamæpityoides*. *Cluſius Anthyllis altera*, and ſaith it is very like unto *Chamæpitys*. *Lugdunenſis* ſaith it is called *Anthyllis 2. herbariorum*: *Bauhinus* in his *Pinax* refuſeth to name this among his *Anthyllides*, but putteth it among his *Chamæpityoides*, and nameth that for *Anthyllis Chamæpityoides fruteſcens*, which *Pena* calleth *Sedum marinum vermiculatum*, doubting to call it *Chamæpitys major Dioſcoridis*, but rather *Chamæpitys altera vermiculata*, *Sedi effigie*; for he himſelfe miſliketh to call it *Anthyllis*, ſaying it hath no likeneſſe thereunto, in compariſon of the other he calleth *Anthyllis Chamæpityoides*, and called *Iva Moſchata* by thoſe of *Mompelier*; but aſſuredly the *Anthyllis altera Chamæpity ſimilis* of *Cordus*, expreſſed in his annotations upon *Dioſcorides*, and the *Anthylloides minor* of *Thalius* are none of them *fruteſcentes plantæ*, which *Bauhinus* maketh to be all one with his *Anthyllis Chamæpityoides fruteſcens*, whereunto he referreth his *Anthyllis*, as I have ſhewed you.

The Vertues.

The likeneſſe of theſe Sea Chickweedes unto the *Anthyllis prior* of *Dioſcorides*, as alſo the ſalt taſte perſwadeth diverſe, that they are not inferiour in qualitie unto that of *Dioſcorides*; who ſaith that both his *Anthyllides* are very helpefull to the raines and bladder and to provoke urine, as alſo to mollifie the hardneſſe of the *matrix*, and being uſed with oyle of Roſes and milke, to heale up wounds in the body or fleſh; and beſides theſe properties; he ſaith that his ſecond *Anthyllis*, doth helpe the falling ſickneſſe being taken with Oxymel or honied vinegar, but *Cluſius* ſaith he learned both of the *Portugalls* and *Spaniards* in *Valentia*, where he found it growing, that they uſed it much and to every good purpoſe, to purge and cleanſe the bloud, when it waxed foule; which ſheweth that moſt of the ſea plants, whether ſaltiſh or not, have a clenſing quality in them, and might be to good effect applied, if wiſely conſidered, and experience made of them.

CHAP. LX.

Chamæpitys ſive Iva Arthretica. Ground Pine or herbe Ivie.

Dioſcorides ſetteth downe three ſorts of *Chamæpitys*, whoſe deſcriptions I will here expreſſe; that comparing them with thoſe here ſet downe, you may ſee how fitly they doe agree unto them: the firſt *Dioſcorides* ſaith is a ſmall crooked herbe, creeping by the ground, with leaves like the ſmall Houſeleeke, but much thinner or ſmaller, fatter alſo and hairy, many growing about the roote ſmelling like the Pine tree leaves, (ſo hath *Matthiolus*, but *Lugdunenſis* hath the Pitch tree, for it is generally held that Πίτυς in Greeke ſignifieth the Pitch tree, and Πεύκη the Pine, although ſome are of the contrary opinion) the flowers are ſmall and yellow, or white, the roote is like that of Succory, the other is a kinde of *Ajuga* and hath very ſmall branches of a cubit long crooked like an anchor; the reſt is like the former, but hath a white flower and blacke ſeede, and ſmelleth alſo like the Pine tree (or Pitch tree as *Lugdunenſis*) leaves: the third which is called the male which is a ſmall herbe, having white hairy ſmall leaves, the ſtalke alſo rough and white, with yellow flowers; the ſeede groweth under the leaves, and ſmelleth alſo as the Pine (or Pitch leaves) both theſe are in quality like the former but weaker.

1. *Cham-*

1. *Chamæpitys vulgaris* Common Ground Pine. 2. *Chamæpitys odoratior.* The ſweet Ground Pine.

1. *Chamæpitys vulgaris.* The ordinary or common Ground Pine.

Our common Ground Pine groweth low, ſeldome riſing above an handbreadth high, ſhooting forth diverſe ſmall branches, ſet with ſlender ſmall long narrow grayiſh or whitiſh leaves, ſomewhat hairy, and divided into three parts many times, many buſhing together at a joint, and ſometimes alſo ſome growing ſcatteredly upon the ſtalkes, ſmelling ſomewhat ſtrong like unto Roſſen; the flowers are very ſmall, and of a pale yellow colour growing from the joynts of the ſtalkes, all along among the leaves, after which come ſmall long, and round huskes: the roote is ſmall and wooddy periſhing every yeare.

2. *Chamæpitys odoratior.* The ſweete Ground Pine.

This other Ground pine is alſo a ſmall herbe, growing up with many hairy and hoary white ſlender branches, not above an hand breadth high, whereon are ſet many ſmall long leaves, yet ſhorter than the former, hairy alſo and hoary white not in tufts or buſhes, but growing by couples cloſe together all along the ſtalkes, cut in, or divided into ſome parts, of a ſtrong but ſweeter ſent, by much than the former: at the toppes of the branches grow the flowers many together, of a pale yellowiſh white colour: the roote is ſomewhat long and fleſhy like the roote of Succory or Dandelion, with many fibres thereat, but ſmaller.

3. *Chamæpitys Auſtriaca Cluſij. Cluſius* his Ground Pine of *Auſtria.*

This kind of Ground Pine hath diverſe ſquare ſtrong hairy ſtalkes, a foote long, with many joynts on them, whereat grow two ſomewhat long and hard leaves, ſomewhat like unto the firſt but broader, greene and ſhining on the upper ſide, and ſomewhat hoary and full of veines on the underſide, divided into three or foure parts, or ſometimes into more, ſomewhat hot in taſte but not unpleaſant, nor of any diſpleaſing ſent: from the joynts ſpring forth ſmaller branches, with the like leaves on them but leſſer divided, and toward the toppes nothing at all but ſmooth, and long like unto Roſemary leaves; from the upper joynts and ends of the ſtalkes and branches ſtand diverſe gaping flowers, like unto Germander, of a deepe purple or violet colour, for the moſt part, but ſometimes of a lively red colour, and ſometimes of a bleaker blew, or skie colour, the lower leaves or chappes of the flowers being whitiſh, ſpotted with reddiſh ſpots: after which come blacke ſhining ſomewhat long and cornered ſeede, foure for the moſt part encloſed in every of thoſe rough huskes, wherein the flowers ſtood before: the roote is compoſed of many blacke and hard ſtrings, growing ſomewhat deepe in the ground, and ſpringing afreſh every yeare.

4. *Chamæpitys adulterina ſeu Pſeudo Chamæpitys.* Baſtard Ground Pine.

The baſtard Ground Pine is a ſmall low buſhing herbe, very like unto the common kinde, having ſmall hairy ſtalkes, ſet full of long hairy leaves all alongſt them, parted into three long parts, of no ſent almoſt, but an unpleaſant herby one rather, the flowers ſtand at the joynts with the leaves, at the toppes of the branches, very like unto thoſe of the common Ground Pine, but of a white colour, and ſomewhat greater: the ſeede that followeth is grayiſh, greater than the common and rounder, foure for the moſt part contained in every huske: the roote is ſomewhat thicke and white and abideth the Winter.

The Place.

The firſt is the moſt common in our land, yet not growing in many other ſhires thereof then *Kent*, as farre as ever I could yet heare or learne: but there it groweth in many places, from on this ſide *Dartford* along to *Southfleete*, *Cobham* and *Rocheſter*, and upon *Chatam* downe hard by the Beacon, and halfe a mile from *Rocheſter* in a field nigh a houſe called *Selſey*. The ſecond is more rare to be found ſaith *Pena*, who onely ſaw it on the dry hills

and

3. *Chamæpitys Austriaca Clusij.*
Clusius his *Austrian* Ground Pine.

4 *Chamæpitys adulterina seu Pseudo Chamæpitys.*
Bastard Ground Pine.

and higher medowes of *Savoy*, but heard it grew also by *Genua*. The third *Clusius* saith he found plentifully a mile and a halfe from *Vienna* in *Austria*, and in other places there abouts. The last *Clusius* saith groweth in many unmanured places of *Spaine*.

The Time.

They all flower and give their seede in the Sommer moneths.

The Names.

It is called in Greeke *χαμαίπιτυς*, and in Latine also *Chamæpitys*, *quasi humipinus*, *vel picea* as I said before: it is called also in Latine *Ajuga* and *Abiga*, *ab abietis odore*, as *Pena* thinketh. but of the most, *ab abigenda partu & procurando abortu*: and as *Pliny* saith, *Dicitur propter abortus, & ab alijs Thus terræ*: some also, (as it is likely by an Ecclipsis of *Ajuga*) call it *Iva*, and adde thereto *Arthretica* or rather *Arthrytica*, because of the propertie conducing helpe to the gout and other joint aches: the first is generally in these dayes helde by the best to be the third kind of *Dioscorides*, and not the first as *Matthiolus* and others make it: the second is *Chamæpitys prima Dioscoridis* of *Pena*, and called *odoratior* for the sents sake, and is the third sort both with *Matthiolus* and *Dodonæus*. The third is remembred first by *Clusius*, from whom others call it *Chamæpitys Austriaca*, and *cærulea* of *Bauhinus*, and is most likely to be his *Chamædrys Austriaca*, mentioned in his *Pinax*. and described in his *Prodromus*. The last also *Clusius* calleth *Pseudo Chamæpitys* and *Lobel Camæpitys adulterina*; *Dodonæus* calleth it *Champitys spuria*, but putteth two figures thereof, whom *Lugdunensis* followeth therein: it is called in *English* Ground Pine, and Ground Ivie after the Latine word *Iva*: and field Cipresse after the low *Dutch* name *Veltcypres*; and forget me not after the *Grmane* name *Vergiss mien nicht*; for which name *Matthiolus* findeth fault with *Brasavolus*, whose *Germane* Apothecary so informed him; and saith it is called by the *Germans Ie lenger, je lieber*, that is the longer the more lovely, which as *Pena* and *Lobel* say, is the more proper name of *Dulcamara*, the wood Nightshade; it is called of the *Italians Chamæpitys*, and *Iva*; and of the *Spaniard*, *Penilho* and *Iva artetica*; of the *French Iva Moschata* and *artetique*: and of the *Arabians Hamæsiteos* and *Chamæsithius*.

The Vertues.

The decoction of Ground Pine drunk, doth wonderfully prevaile against the strangury and stoppings of urine, or any inward paines rising from those diseases of the reines and urine, and is specially good also for all obstructions of the liver and spleene, for it clenseth the grosse impure bloud, and expelleth that which is congealed, and gently openeth the body, to which purpose they were wont in former times, to make pilles with the pouder thereof and the pulpe of figges: it doth also mervelously helpe all the diseases of the mother, used inwardly or applied outwardly, procuring the courses, expelling the dead child and afterbirth, yea it is so powerfull upon those feminine parts, that it is utterly forbidden to women with child, in that it will cause abortment or delivery before the time: It is as powerfull and effectuall also in all the paines and diseases of the joynts, as gouts, crampes, palsies, sciatica and aches, either the decoction of the herbe in wine, taken inwardly or applied outwardly, or both,

for

for ſometime together: for which purpoſes the pilles that are made with the pouder of Ground Pine, and of *Hermodactyles*, with *Venice* Turpentine are very effectuall; theſe pilles alſo are of a ſpeciall good uſe for thoſe that have the dropſie, to be continued for ſome time: the ſame alſo is an eſpeciall good helpe for the jaundiſe, and alſo for thoſe that have any griping paines in the belly or joynts, or any other the inward parts: it helpeth alſo all diſeaſes of the braine, proceeding from cold and flegmaticke humors and diſtillations, as alſo for the falling ſickneſſe: it is an eſpeciall remedy for the poiſon of the Aconites of all ſorts, and other poiſonfull herbes, as alſo againſt the ſtinging of the Scorpion, and all other venemous creatures; it is a good remedy for a cold cough eſpecially in the beginning, or that it bee not growne inveterate: it procureth alſo ſweate if it bee anointed, ſaith *Pliny*, but applied like other ſudorificks, it is likely to bee more convenient: for all theſe purpoſes aforeſaid the herbe being tunned up in new drinke, and drunke, is almoſt as effectuall, but farre more acceptable to weake or dainty ſtomackes: And the diſtilled water of the herbe alſo hath the ſame effect but more weakely; the conſerve of the flowers doth the like, which *Matthiolus* much commendeth againſt the palſie: the greene herbe or the decoction thereof being applied, diſſolveth the hardneſſe of the wemans breſts, as alſo all other hard tumors in any other part of the body: the greene herbe alſo applied, or the juyce thereof with ſome hony, doth not onely cleanſe putride and ſtinking, foule and malignant and virulent ulcers and ſores of all ſorts, but healeth and conglutinateth or ſodereth up the lippes of greene wounds in any part alſo: *Matthiolus* commendeth certaine pilles againſt the Palſie, which are made in this manner; Take ſaith he, of Ground Pine, Stœchas, Betony and Roſemary flowers, of each one dram, of Turbith one dram and a halfe, of Agarick two drams, of Coloquynthis halfe a dram, of Ginger and Sal gemme of each ten graines, of Rubarbe one dram and a halfe, of Spiknard ſeaven graines, of the pouder called *Hiera picra ſimplex* halfe an ounce, of *diagridium* one dram; let all theſe be made up into a maſſe, according to art, with the juice of Ground Pine; (but I would and thinke it more convenient, I am ſure more durable, that it be made up into a maſſe, with a Syrupe made of Hony or Sugar and the juice of the herbe,) for ſo they will not dry or wax hard ſo ſoone, of a dram whereof let nine pills bee made, and three of them taken by thoſe that are paralitick, every night when they goe to bed; and this ſaith he will give a preſent and ſpeedy helpe.

CHAP. LXI.

Cochlearia. Spoonewort or Scurvigraſſe.

ALthough our Engliſh Scurvigraſſe groweth plentifully in the ſalt marſhes, in many places of our land, and might therefore be ſet among the other marſh plants, yet becauſe I am to ſet downe the other ſorts, let it alſo take up place here for companies ſake.

1. *Cochlearia vulgaris*, Common Scurvigraſſe.

Our ordinary Engliſh Scurvigraſſe hath many thicke fat leaves, more long them broad, and ſometimes longer and narrower, ſometimes alſo ſmooth on the edges, and other whiles a little

1. *Cochlearia vulgaris.* Common Scurvigraſſe.

2. *Cochlearia major rotundifolia ſive Batavorum.* Dutch or Garden Scurvigraſſe.

waved.

waved, for all these formes are to be seene, as also plaine smooth and pointed, & sometimes a little hollowed in the middle, and round pointed, of a sad green colour, & somewhat browniſh sometimes, every one standing by it selfe upon a long foote stalke, which is browniſh or greeniſh also, from among which rise small slender stalkes, bearing a few leaves thereon like the other, but longer and lesser for the most part; at the tops whereof grow many whitish flowers, with yellow threds in the middle; standing about a greene head, which becommeth the seed vessell, which will be somewhat flat when it is ripe, very like unto some of the kinds of *Thlaspi* or Treakle Mustard, wherein is contained reddish seede, tasting somewhat hot: the roote is made of many white strings, which sticke deepely in the mudde, wherein it chiefly delighteth: yet will it well abide in the more upland and dryer grounds, and tasteth a little brackish or saltish even there, but nothing so much as where it hath the salt water to feed upon.

2. *Cochlearia major rotundifolia sive Batavorum.* The great Dutch or Garden Scurvigrasse.

This Dutch or Garden Scurvigrasse (which is most knowne and frequent in gardens) hath divers fresh greene and almost round leaves rising from the roote, nothing so thicke as the former, yet in some places, as in a rich strong dunged ground, very large, even twice so bigge as in others, nothing at all dented about the edges, nor with any sensible hollownesse, perceived in the middle, every one also standing upon a long footestalke; from among these rise up divers long slender weake stalkes, higher then the former, and with more store of small white flowers, at the tops of them, which turne into smaller pods, and smaller browniſh seeds then the former: the roote is white, small and threddy: the tast of this is nothing salt at all, but hath an hot aromaticall taste almost like spice.

3. *Cochlearia minor rotundifolia.* Small Dutch Scurvigrasse.

This small Scurvigrasse groweth like the last, with many small roundish leaves, sometimes a little crumpled at the edges, not bigger then the nayle of ones litter finger, every one upon his owne foote stalke, which abide all the winter if it be sowed before winter, or that it rise from it owne sowing; otherwise if it bee sowen in the spring, it shooteth forth divers long slender stalkes lying on the ground a foote long or better, whereon grow such like small round leaves, very thinly set up to the tops, whereon doe stand many small white flowers, like the last, but much smaller, according to the proportion of the plant, with small seede answerable thereunto: the roote is very small consisting of a few Fibres, which perish as soone as it hath perfected the seede; and will spring up againe in the same place owhere it doth shed it selfe; for doe what you can almost, if you will gather any ripe seede, there will be some shed before you can gather it.

4. *Cochlearia minima rotundifolia.* The least Scurvigrasse.

The least Scurvigrasse is in all things like the last, but that it is much lesser, not growing above three or foure inches long, but lying upon the ground like *Herniaria* or *Rupturewort*: *Bauhinus* in his *Prodromus* setteth forth another small one, as though it differed from this last, which therefore he calleth *erecta* upright, wherein is shewed no other difference, and therefore I thinke may be the very same growing in another place.

The Place.

The first groweth all along the Thames side, on both the *Essex* and *Kentish* shore, from *Woolwich* where the brackish Sea water is felt, round about the Seacoasts even to *Dover*, as also from *Dover*, round about the coasts to *Portsmouth*, and even to *Bristow* where it is had in plenty: but I have not heard by any that it groweth on the Northern coasts at all: But the other with round leaves groweth in the marshes in *Holland* in *Lincolneshire*, as well as in the Low Countries *Holland*, as also in the other places of *Lincolneshire*, by the Sea side and thereabouts: It hath been also found growing upon *Ingleborough* hill in *Lancashire*, assured me by a worthy Gentlewoman Mrs. *Thomazin Tunstall*, remembred in my former booke for many things, found growing in those parts by her meanes, which were not knowne to be growing in England, and thereof shee sent me up some for a manifestation of the truth; I heare also that it groweth nigh unto a Castle in the Peake of *Darbishire*, which is 30 miles distant at the least from the Sea, and that the late Earle of *Rutland*, and divers other personages of good note, had some brought from thence for their owne use; it prospereth well in Gardens being sowen in some moist and cold shadowed places, and yet it will endure the Sunne also: many in many upland countries of this land, doe now use to sow good quantities thereof, for their owne spending, or to make profit thereof to sell unto others: The smaller sorts have beene brought unto us from *Denmarke*, where they grow in an Iland called *Almagria*.

The Time.

They all flower betimes even in *Aprill* oftentimes and in *May*, and give their ripe seede quickly after.

The Names.

It is thought that none of these were knowne unto any of the ancient Greeke or Latine writers, for although some doe imagine it to be the *Britannica* that *Pliny* maketh mention of in his 25. and 3. Chapter, wherewith *Cæsar Germanicus* his Souldiers were cured of the disease that raigned amongst them, called by the Physitions *Stomacce* and *Sceleterbe*, in plaine English the Scurvey; (which is a disease incident and more frequent to those that are at Sea, then that live upon the land, but yet many have it that never went thither, or ever saw the sea,) which *Pliny* describeth to have a blackish leafe somewhat long and a blacke roote, &c. which it is very likely he taketh from *Dioscorides* his *Britannica*, whom *Galen* also followeth, saying it hath leaves like a wild Docke, but hairy, and a small roote: *Gesner* also taketh it to be *Britannica*, yet assuredly this our *Cochlearia*, as you may well perceive by comparing them cannot be *Britannica*: it is so called from the forme of a spoone, being round as well as hollow; we call them most commonly Scurvigrasse, and not spoonewort after the Latin name, and to distinguish them, call the one English, the other Dutch Scurvigrasse: *Lacuna* tooke the round leafed kind to be *Telephium*: the *Germans* call it *Leffelkraut*, the Low countreymen *Lepelcruut*, and the *French L'herbe aux cuilliers*.

The Vertues.

The *English* Scurvigrasse is more used for the salt taste it beareth which doth somewhat open and clense, but the *Dutch* Scurvigrasse is of better effect, and chiefely used, if it may be had by those that have the Scurvie, especially also to purge and clense the blood, the liver and the spleene; for all which diseases it is of singular good effect, by taking the juyce in the spring, every morning fasting in a cup of drinke; the decoction is good for the same purpose, and the herbe tunned up in new drinke, either by it selfe, or with other things, for it openeth obstructions

ctions and evacuateth cold clammie and flegmaticke humors, both from the liver the ſeate of blood, and the ſpleene, waſting and conſuming both the ſwelling and hardneſſe thereof, and thereby bringing to the body a more lively colour: the juyce alſo helpeth all foule ulcers and ſores in the mouth, if it be often gargled therewith, and uſed outwardly doth clenſe the skinne from ſpots, markes or ſcarres that happen therein: the conſerve made of the leaves thereof I meane the round leafed kind, is a fine delicate medecine for weake and tender ſtomackes, and worketh to the ſame effect, although a little ſlowly.

CHAP. LXII.

Fumaria. Fumiterrie.

THere are diverſe kinds of *Fumiterrie*, as they ſhall be declared by and by; but there are accounted as kindes thereof, the *Fumaria bulboſa*, or *Radix Cava*, whereof I have ſet forth all the ſorts in my former booke: I will therefore here only give you ſome figures of them without further deſcriptions: yet of each of theſe kindes we have received from *Canada*, one which ſhall bee ſet forth accordingly.

1. *Fumaria vulgaris.* Common Fumiterrie.

Our common Fumiterry is a tender ſappy hearbe, ſending forth from one ſquare ſlender weake ſtalke, and leaning downewards on all ſides, many branches two or three foote long, with finely cut and jagged leaves, of a whitiſh or rather blewiſh ſea greene colour, ſomewhat like unto Coriander leaves; at the toppes of the branches ſtand many ſmall flowers, as it were in a long ſpike, one above another, made like little birdes, of a reddiſh purple colour with whitiſh bellies: after which come ſmall round huskes, conteining ſmall blackiſh ſeede: the roote is yellow ſmall and not very long, full of juyce while it is greene, but quickely periſhing with the ripe ſeed: In the cornefields of *Cornwall* this beareth white flowers. *corubenſis alba.*

2. *Fumaria minor ſive tenuifolia.* Fine leafed Fumiterrie.

This ſmall Fumiterrie groweth not ſo high but more upright than the former, with ſlender ſquare ſtalkes, whoſe lower leaves are very like unto thoſe of the former Fumiterry & of the ſame colour but ſmaller, but thoſe that grow above upon the ſtalke, are ſmaller and finer cut in, and the higher the finer and ſmaller, the higheſt even as ſmall as Fennell leaves: the flowers grow in the ſame manner that the other doe, but rather more ſtore together, of a deeper reddiſh purple mixed with white and yellow, the ſeede and roote is ſmall and white, but like the former: this is not altogether ſo bitter, but more ſharpe than the other.

3. *Fumaria major Cretica.* Candie Fumiterry.

This Candy Fumiterry groweth with crooked bowing ſquare ſtalkes, like the common, and of the ſame

1. 2. *Fumaria vulgaris & tenuifolia.*
Common and fine leafed Fumiterrie.

4 *Fumaria lutea montana.*
Yellow Fumiterrie.

height,

6. *Fumaria tuberosa.*
Climing Fumiterry.

Radix Cava.
Hollow rooted.

7. *Radix Cava viridi flore.*
Hollow roote with a greene flower.

7. *Fumaria tuberosa flore viridi.*
Round rooted Fumiterry with greene flowers.

height, the leaves are as finely cut in and divided as the laſt, and of the ſame colour, but ſomewhat harder, and not ſo tender and ſappie: the flowers at the toppes of the branches, are like the other for forme, but of a white colour, marked with browniſh ſpots: the ſeede and rootes differ not from the former.

4. *Fumaria lutea montana.* Yellow Fumiterrie.

The yellow Fumiterry groweth like the other Fumiterries, about a foote high, with many leaves like unto the common Fumiterry, or like unto thoſe of the *Fumaria bulboſa*, or *Radix Cava*, the hollow roote, but ſmaller & of the ſame blewiſh greene colour with them: the flowers are yellow and in ſome places white, and grow at the toppes of the branches like the other, in forme of little birdes as *Matthiolus* ſetteth it forth, both by his deſcription and figure, but *Lobel* and *Lugdunenſis* ſay they are ſtarre faſhion, like unto the *Chelidonium minus* or ſmall Pilewort, and yet both of them give the figures of *Matthiolus*, with the flowers of Common Fumiterry like little birds, and not ſtarre faſhion like the Pilewort: after the flowers are paſt come ſmall hornes or long pods, like unto the *Chelidonium majus* or *Radix cava*, but leſſer; wherein is conteyned ſmall whitiſh greene and round, and ſomewhat flattiſh ſeede: the roote is compoſed of many white long ſtrings, and thicke fibres buſhing thicke together, which periſheth not as the former, but abideth many yeares, ſhooting forth new ſtalkes, the old ones alwayes periſhing.

5. *Fumaria ſiliquoſa Americana.* Indian Fumiterry.

The ſtalke hereof riſeth to be about a foote high, the leaves are in forme and colour like the ordinary or the laſt but larger enduring greene all the winter: the flowers grow ſpike faſhion on the toppe of the ſtalke formed like thoſe of the Hollow roote, whoſe bellies are bluſh and mouthes gold or paler yellow: the ſeede is conteined in crooked long pods, being round, flattiſh and yellowiſh. the roote is thicke and fibrous, the whole plant is more bitter than the ordinary, and therefore more effectuall.

6. *Fumaria alba latifolia.* Climing Fumiterrie.

The climing Fumiterrie riſeth up with ſmall ſlender ſtalkes, not able to ſuſtaine themſelves, but catching hold by certaine ſmall tendrels, it ſendeth forth at the ends of the ſmaller branches, on any thing that ſtandeth nigh unto it, whereby it climeth upon the hedges or other hearbes, it ſendeth forth diverſe ſtalkes of ſmall leaves, ſet 2 or 3 or more together, not dented or divided on the edges at all, of a blewiſh greene colour, very like unto Fumiterry: at the toppes likewiſe of the ſmall branches come forth many ſmall whitiſh flowers, tipt with bluſh, ſet together nothing like the former, but made like ſmall long hollow huskes or Bell flowers, ending in five ſmall points: after which come ſmall ſeede enclоſed in ſmall broad huskes or pods: the roote is ſmall and long growing downe deepe into the ground, and abideth the winter, ſhooting forth new branches, for the old periſh every yeare.

7. *Fumaria tuberoſa flore viridi.* Bulbous Fumiterry with a greene flower.

This hath diverſe greene ſtalkes, with ſuch like leaves thereon as the ſmall Hollow roote hath, but ſomewhat larger and greener: at the toppes of the ſtalkes ſtand ſmall greeniſh flowers at ſeverall places with diverſe ſmall greene leaves ſet under them the roote is two or three times bigger than the roote of the ſmall *Capnes fabacea radice*, but yellow like unto it, and the ſtalkes with leaves and flowers, periſhing as quickely as the others.

5. *Fumaria ſemper virens Americana ſiliquoſa.* Indian Fumiterrie. 8. *Et Bulboſa Americana.* Knobbed Indian Fumiterrie.

8. *Fumaria tuberoſa Americana.* Knobbed Indian Fumiterry.

This kinde of Fumiterrie hath two ſmall round ſolide rootes like teſticles, with diverſe ſmall fibres thereat, from betweene which riſeth up a ſtalke of ſundry winged leaves, two ſet together at a joynt, variouſly divided, and ſo ſmally that they almoſt reſemble Iuniper leaves, of a blewiſh greene colour, the flowers have ſundry colours in them, but ſuppoſed of ſome to be but white, it is almoſt without either ſent or taſte.

The Place:

The firſt groweth aſwell in the corne fields, almoſt every where, as in gardens alſo, and that with white flowers in *Cornwall* in their corne fields. The ſecond groweth in the fields of *Spaine* in many places, as alſo in the fields and Vineyards about *Mompelier*, and in other places alſo. The third groweth in *Candy* from whence *Cluſius* ſaith he had the ſeede. The fourth groweth on the hils in *Apulia* and *Calabria*, in the Kingdome of *Naples* and ſome other places in *Italy* and in *Illyria* alſo. The fift groweth in *Virginia* and the backe parts thereof called *Canada*. The ſixt by the hedge ſides, and among buſhes, in ſome places of *Brabant*, in the low Countries, and about *Frontignana*, and *Mompelier* in *France*, it is found about *Naples* with a yel-

low flower. as it is reported: the seaventh is found likewise in the woods of *Germany*: and the last in *America* or the *West Indies*.

The Time.

They all flower early even in May for the most part yet the yellow flowreth much later, as many times not untill August, and their seede ripeneth shortly after.

The Names.

It is called in Greeke κάπνος and καπνίον, *Capnos* and *Capnion*, *quasi fumus, eo quod succus occulis inditus lachrimationem movet sicut fumus, & claritatem eorum efficit*, in *Latine Fumaria & Fumus Terræ*; of the *Arabians Scheiteregi*; of the *Italians Fumoterre* and *Fumostomo*, of the *Spaniards*, *Palonima*, of the *French Fumoterre*, of the *Germans*, *Erdrauch* and *Danben Kropf* as *Tragus* saith, and of the *Dutch Grijseiom* and *Duive Kernel*. The first is of all Authors called *Fumaria* or *Capons Famaria* of *Lobel*. The second is called *Fumaria minor*, or *tenuifolia*, to distinguish it from the other. The third is remembred by *Clusius* by the name in the title, and it may be also the *Syriaca* of *Camerarius*. The fourth is called *Fumaria Coridalis* of *Matthiolus*, and of some as he saith *Split*; of *Gesner* and *Tabermontanus Fumaria montana* of *Lobel Fumaria lutea montana*, who taketh it also to be *Chelidonium capnitis* of *Ætius*, of *Camerarius* and *Anguillara Corydalis*, of *Cæsalpinus Split vulgo*, and *Split Illirica* or *Sclavonica herba* of others. The fifth hath its name in the title, and reckoned a kind of the fourth. The sixt is called *Capnos* of *Lobel*, who saith it is also called of some *Split albuni*; of *Dodonæus* it is thought to be the first *Capnos Plinij*, which hee saith was called in his time *Pedes gallinaci*, and saith also that some called it *Corydalis*, and *Splith*; and the common sort *Corydalion*, hee calleth it also *Fumaria altera*, and *Capnos phragmites*, as *Gesner* doth also: but divers of the best moderne Herbarists, doe rather thinke that the *Radix Cava*, is the *Capnos prior Plinij* then this; *Camerarius Fumaria Clematites*, and *Bauhinus Fumaria claviculis donata*, and is his sixt *Fumaria*, and yet is the same with his second, if there be not a greater and a lesser as some doe set it downe. The seventh is the *Radix Cava viridi flore* of *Lobel*, which although *Bauhinus* thought it to be referred to the *Radix Cava* as a sort thereof, yet the roote sheweth it to belong unto the *Capnos fabacea radice*, and so both his description and the title which afterward he amended do declare. The *Arabians* call it *Schebiterig*, and *Sabeteregi*. The *Italians Fumoterra*; the *Spaniards Palamilha*; the *French Fumeterre*; the *Germanes Erdrauch* and *Katzenkernel*; the *Dutch Erdtrook* and *Duynekervel*.

The Vertues.

y the bitternesse of common *Fumiterry*, (it is by diverse of the best moderne Writers held to be hot, and not cold, as diverse others from the *Arabians* have set downe) and sharpenesse joyned therewith, it doth open and clense, and by the drienesse doth strengthen and binde after the clensing. The juyce or syrupe made thereof, or the decoction made in wheye by it selfe, with some other purging or opening herbes and rootes, to cause it worke the better, it selfe being but weake, is very effectuall for the liver and spleene, opening the obstructions and clarifying the bloud from saltish cholericke and adust humors, which is the cause of the lepry, scabbes, tetters, and itches, and other such like breakings out in the skinne, and after the purging doth strengthen all the inward parts, not leaving any evill qualitie behind it, and therefore is reckoned a most safe remedy against all the diseases that rise from those humors, or from obstructions that are the cause of cholericke and putride feavers: the same is good also for the jaundise, and spendeth it by the urine, which it procureth in abundance as *Ægineta* saith. The juyce thereof saith *Tragus* and the pouder of the roote of *Esula* prepared in equall proportion, that is a dramme, provoketh vomiting where there is cause, being taken in warme water and cureth the dropsie: because it is somewhat windie it is good to use aniseede and fennellseede with it: the pouder of the dried herbe given for some time together, hath cured a melancholy person as *Brasavola* saith, but the seede is strongest in operation for all the purposes aforesaid. The distilled water of the herbe is much used also, and thought to cause good effect in all the former diseases; and beside, as *Tragus* saith, conduceth much against the Plague or Pestilence, being taken with good Treakle, which it driveth forth by sweate: the same water also with a little water and hony of Roses, helpeth all the sores in the mouth and throate, being gargled often therewith: the juyce dropped into the eyes cleareth the sight; and taketh away the rednes and other defects in them, although it procure some paine for the present, and bringeth forth water or teares: *Dioscorides* saith that it hindereth any fresh springing of the haires on the eye liddes, if after they be pulled away the eye browes be anointed with the juyce that hath Gun Arabeck dissolved in it; the juyce of *Fumiterry* and of Docks mingled with vinegar, and the places gently washed or wet therewith, cureth all sores of scabbes, itches, wheales, pimples or pushes that rise in the face or hands, or in any other part of the skinne of the body. The lesser or fine leafed *Fumitterry*, as also the climing *Fumiterry* worke to the same purposes but more weakely: the yellow *Fumiterry* is also effectuall in most of the diseases aforesaid, and besides that it provoketh urine abundantly; it is very effectuall for the cholicke taken greene or dry in wine for many dayes. Those *Fumiteries* with hollow and firme rootes are each of them effectuall, both against poison and the pestilence being made into pouder and drunke, and afterward the party laid to sweate: the same also provoketh urine and helpeth the jaundise: the seede being bruised and drunke helpeth fluxes and laskes: the rootes are also singular good to heale and drie up putrid and running ulcers.

CHAP LXIII.

Aristolochia. Birthwort.

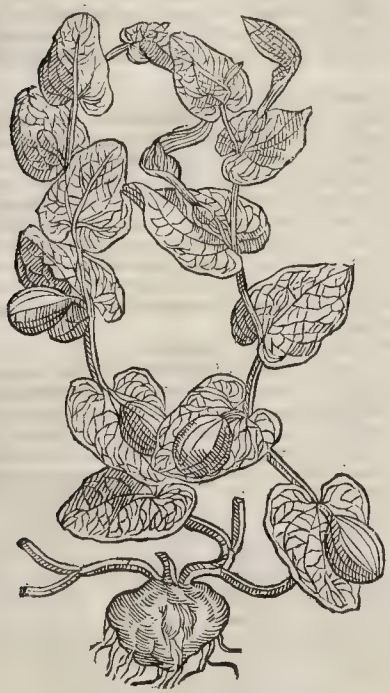
ALthough divers doe thinke that none of the *Aristolochia's* or Birthworts, doe purge or open the belly at all, yet because *Mesues* the great *Arabian* Physitian, numbreth it among his purging plants, and *Dodonæus* doth in the same manner: I thinke it not amisse to doe so likewise. Of these Birthworts, *Dioscorides* and *Galen* have onely made three sorts, which are the round, the long, and the running Birthworts. *Pliny* hath added a fourth, which he calleth *Pistolochia*, or *Polyrrhizos*, of all which there are some differences observed in these latter dayes, which shall be declared in this Chapter.

1. *Aristolochia rotunda vulgatior.* The more ordinary round rooted Birthwort.

This round rooted Birthwort, sendeth forth diverse long trayling square stalkes, sometimes halfe a yeard long or

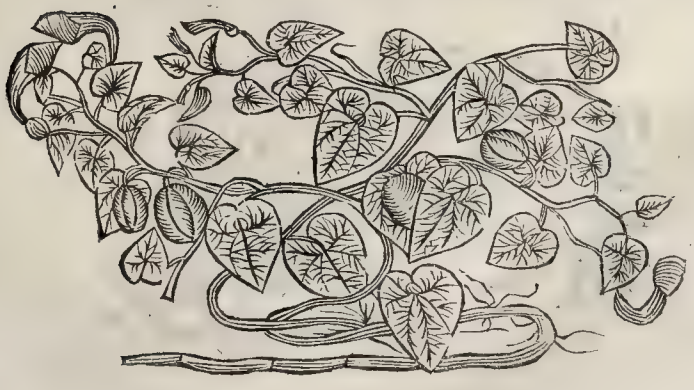
or better, not able to ſtand upright, but lie or leane downe to the ground, with few or no branches iſſuing from them, but with many round yellowiſh greene leaves full of veines, ſtanding at diſtances without order, one beyond the other, every one upon a ſhort footſtalk; at every joynt with the leaves, from the middle of theſe ſtalks upwards to the top, commeth forth one long hollow flower apeece, ſmaller at the bottome, broader at the top, with a long peece or ſlippet as it were, at one ſide of the top, bending downe, both of them of a deadiſh yellow or ſomewhat browniſh colour, and ſomewhat blackiſh purple on the inſide: (this flower *Dioſcorides* compareth to a cap or hood, which as it ſhould ſeeme was their faſhion in his time) after the flowers are paſt come in their places, ſmall round and ſomewhat long fruite of diverſe ſiſes, ſome as bigge as a Wallnut without the ſhell, ſome as bigge as it is with the outward greene ſhell, and ſome leſſer than both, which when it is ripe openeth into three parts, ſhewing the ſeede lying in order within it, ſeparated by certaine skinnes ſomewhat flat and round: the roote is tuberous, bunched out diverſly, of a darke or ſwart colour on the outſide, and more yellow within.

1. *Ariſtolochia rotunda vulgatior,* Round rooted Birthwort.



3. *Ariſtolochia longa vera.* The true long rooted Birthwort.

5. *Ariſtolochia Clematitis.* The running rooted Birthwort.



2. *Ariſtolochia rotunda altera.* Another round rooted Birthwort.

This other Birthwort is like the former for the manner of growing, but the ſtalkes are more and ſhorter, the leaves are ſomewhat greater, and have each alonger foote ſtalke; the flowers are of a pale or whitiſh purple on the outſide, and browne on the inſide, with a few haires ſet therein, ſcarſe to be diſcerned as is uſuall to all the ſorts: the fruite is ſomewhat longer and peare faſhion, more pointed at the end: the ſeede is flat, ſomewhat leſſe and red: the roote is like the other, but a little yellower.

3. *Ariſtolochia longa vera.* The true long rooted Birthwort.

The long rooted Birthwort is ſo like unto the round, that it is very hard for one not throughly exẽrciſed in the knowledge of both to diſtinguiſh them: the chiefe differences be theſe, the ſtalke is ſhorter, the leaves are ſmaller, harder and paler, the flowers are more whitiſh and greeniſh, but like in forme, the fruite is ſomewhat long like a peare, ſomewhat like the other, or laſt round rooted Birthwort, but not ſo much pointed: the ſeede differeth not, but the roote hereof is long and not round or tuberous like the other, as bigge as a mans wreſt ſometimes or bigger, but moſt uſually leſſe, of halfe a foote or a foote in length ſometimes.

4. *Ariſtolochia longa Hiſpanica.* The Spaniſh long Birthwort.

This Spaniſh kinde differeth very little from the laſt recited long rooted Birthwort, for in the flowẽr and rooté is the onely difference to be obſerved; the flower in this is ſomewhat more purple, both the ſlippet or eare, and the innerſide of the toppe of the flower: the roote likewiſe is ſhorter for the moſt part, and blunter at the lower end, or nothing ſo much pointed.

5. *Ariſtolochia Clematitis.* Thẽ running rooted Birthwort.

The running rooted Birthwort, groweth with longer, ſtronger and rounder ſtalkes than the former, even three or foure foote long, branched oftentimes like the long rooted kind, whereon grow much larger and broader leaves, and of a paler greene colour, then any of the other: at the joynts with the leaves come forth the flowers, as the other ſorts doe, but whereas none of them bring above one flower at a joynt, this bringeth three or foure like unto the reſt for forme, but of a pale greene colour like the long: the fruite hereof likewiſe is greater than any of the other, as the ſeede is likewiſe: the roote hereof hath a ſtronger ſweete ſent than any of the former, and is ſmaller, of the bigneſſe of the bigger rootes of *Aſparagus*, many growing from one head, and running very farre under ground, and ſpringing up againe in many places, of as indureing a nature as the Couch graſſe almoſt, for if never ſo little a peece, be left in the ground as broken off from the reſt, that is taken up, it will ſhoote forth leaves, and there grow againe, ſo that oftentimes it becommeth no leſſe a plague to a ground, than a couch, or any other ſuch like running or creeping herbe.

6. *Ariſtolochia Clematitis Batica.* Spaniſh Climing Birthwort.

The Spaniſh climing Birthwort, hath diverſe ſmall long twining branches, ſpreading into many other ſmall ones, running upon ſmall trees and hedge buſhes, winding themſelves very much about them, like unto the greater Bindweedes, or like unto Hoppes, and often overtopping them, whereon doe grow ſeverall leaves, upon long footeſtalkes, being round and broad, ſomewhat like unto the Scammony of *Mompelier*, or unto the other Birthworts, but ſharper pointed, ſmooth and greene on the upperſide, and of a whitiſh purple underneath; the flowers ſtand ſingly at the joynt, as the former ſorts doe, and not as the laſt, having the longeſt footeſtalke of any; of the ſame forme, but of a ſad or darke purple colour, and hairy on the inſide; the fruite is as great as the laſt, and ſo is the ſeede, but openeth it ſelfe, at the bottome, contrary to all the former ſorts: the roote runneth into the ground like the rough Bindweede, whereunto it is very like, of a pale whitiſh colour on the outſide, and of the bigneſſe of the laſt, of nothing ſo ſtrong a ſent as it, and of no unpleaſant, but of a ſharpe and an aſtringent taſte.

7. *Piſtolochia vulgatior.*
The buſhie rooted Birthwort.

8. *Piſtolochia Cretica ſemper virens.* Ever greene buſhie rooted Birthwort.

7. *Piſtolochia vulgatior.* The buſhy rooted Birthworte.

The buſhy rooted Birthwort hath many ſlender long branched ſtalkes, a foote long or more, ſtraked and creſted as is both the long and the round, whereon grow at diſtances as in the former, diverſe round leaves, ſmaller, rougher, and blacker than the long, whereunto it is moſt like, but a little waved as it were about the edges: the flowers alſo are very like them, but in ſome very darke, and in others of a greeniſh yellow colour: the fruite is round and ſomewhat long, and round at the end or point, like unto the fruite of the firſt round kinde but ſmaller, which openeth it ſelfe alſo as the laſt before doth at the bottome next unto the ſtalke, and ſhewing ſuch like ſeede within but ſmaller: the rootes are many, and ſmall, bigger than bullruſhes for the moſt part, ſhooting from one head with many ſmall fibres thereto, of a yellowiſh colour as all the reſt are: this looſeth the leaves in winter as all the former doe.

8. *Piſtolochia Cretica ſemper virens.* Ever greene buſhie rooetd Birthwort of *Candye*.

The ever greene buſhie rooted Birthwort of *Candye*, ſendeth forth many very ſlender flexible and trayling cornered ſtalkes, branching into diverſe other ſmaller, about a foote long or better, and of a ſad greene colour, whereon are ſet round leaves long pointed, full of veines, but leſſer than the former, and of a ſad greene colour, ſo abiding all the winter: the flowers are like unto thoſe of the long kinde, ſtanding upon long footeſtalkes, of a very ſad red colour on the outſide and yellowiſh within: the fruite and ſeede is ſmaller than in any other: the rootes likewiſe are like the laſt but ſmaller, and ſmelling ſomewhat ſweet.

The Place.

The three firſt more ordinary kindes grow as well in *Narbone* and *Provence* in *France*, about *Mompelier* in the fields and vineyards, eſpecially the running kinde, that it maketh their wine, where it is frequent, to taſte thereof, as alſo in *Spaine* and *Italy*: the other three that are like unto them, *Cluſius* ſaith he found in *Spaine* in diverſe places; and *Honorius Bellus* ſaith in *Candye* alſo, in his firſt Epiſtle to *Cluſius*, and *Petrus Bellonius* in his firſt book of obſervations and 17 chap. doth alſo. The ſeaventh groweth in the ſtony Ollive yards of *Provence* and *Spaine*; and the laſt in *Candye*.

The Time.

Theſe doe not flower with us until the middle or end of *Iuly*, and their fruit doth hardly ripen before the winter, yet in the warmer countries they flower and ſeede early: ſome of theſe doe flower much later with us, if with all the care we can uſe unto them, we can preſerve them in the winter, as both the ſorts of long rooted and buſty rooted kinds, for the other are more hardy.

The Names.

It is called in Greek ἀριστολοχία *quaſi* ἄριστα τῶν λοχείων, *i. e. optima puerperis*, but not *prægnantibus* as *Pliny* hath it, it is good to helpe women that are ready to be delivered, and that are delivered, and not thoſe that are with child, not ready to be delivered, for in ſuch it may cauſe abortment, or delivery before the time: In former times, when ignorance had hid in a cloud all ſorts of learning and knowledge, from all our Chriſtian world, many falſe herbes were obtruded for the right, and in thoſe errours many lived and dyed: but the induſtry of this later age, hath ſearched out, found and detected many, and among others this of *Ariſtolochia*; many taking the *Rad. x Cava major* to be it, and the *minor* to be the *Piſtolochia* of *Pliny*, but all now by the ſight and knowledge of the true, are aſhamed that any ſuch errour ſhould at any time creepe in among wiſe men: There is alſo ſome controverſie among the later authors, which ſhould be the *Ariſtolochia Clematitis* of *Dioſcorides*; the Apothecaries of *Italy* in and before *Matthiolus* his time, uſed this roote of *Ariſtolochia Clematitis* in ſtead of the true long Birthwort, not knowing either the true long or that this their *longa* was *Dioſcorides* his *Clematitis*: *Lonicerus* and others found out this errour, wrote againſt it, and ſhewed that is was not the long one of *Dioſcorides*, but his *Clematitis*; but *Matthiolus* conteſteth againſt them with many words, both for it, and becauſe they found fault with the text in *Dioſcorides*, who ſaith that *Ariſtolochia Clematitis* hath ſlender branches, ſomewhat round leaves like unto Houſeleeke, and the flowers of Rue: The Greeke word is ἀειζόον μικρὸν *aizoon* or *ſempervivum parvum* and they thought it ſhould be rather ἄσαρον μικρὸν *aſarum parvum*, becauſe the *Ariſtolochia Clematitis* hath round leaves like *Aſarum*: but *Matthiolus* in ſhewing that the words are the ſame that *Oribaſius* hath alſo who wrote the ſame that *Dioſcorides* did, as alſo that *Serapio* and *Avicen* have the ſame words, and that therefore the text is uncorrupted, would thereupon conclude, that the *Ariſtolochia longa*, then uſed in the Apothecaries ſhops, could not bee *Dioſcorides* his *Clematitis*, and the rather, becauſe the flowers of his *Clematitis* are like Rue, which thoſe of their *Ariſtolochia longa* are nothing like, againe he ſaith the rootes are ſmall, longer then the other; and have a thicke barke that covereth them, but the longe *Ariſtolochia* of the ſhops hath a thinne rinde as all know, that have ſeene it: yet *Matthiolus* is forced to grant, that the *Ariſtolochia longa*, that was uſed in the Apothecaries ſhops, was not the ſame *Ariſtolochia longa*, that *Dioſcorides* maketh mention of, how then could he not perceive it to be his *Clematitis*, when he had ſet forth both the long and the round, and knew that the *Ariſtolochia longa* of the ſhops, was like unto the other two ſorts, but differing in rootes onely from them; but ſaith, he thinketh it might be the *Piſtolochia* of *Pliny*, or a *ſpecies* of that kind of long, whereof no mention was made by the antient writers; yet how far from likelihood theſe words of *Matthiolus* are, let others judge: but aſſuredly the text of *Dioſcorides*, and ſo likewiſe of thoſe that have followed him, cannot be exempt from blemiſh, or elſe neither we, neither any before us, have or know *Dioſcorides* his *Ariſtolochia Clematitis*: for he in deſcribing the three ſorts of *Ariſtolochia*, maketh the two former to agree in leafe, flower and fruit, and to differ onely in the roote, whereunto all doe agree, but in declaring the *Clematitis*, he ſetteth downe the leafe and flower, to be farre differing, but ſheweth nor what fruit it beareth, yet maketh it agree with the other two in properties, although leſſe forcible: but ſeeing there is another herbe knowne to be ſo like the other two. *Ariſtolochia's*, and to differ in nothing from them, ſo much as in the roote, which is ſweete, ſmall and longer then any of the other, as *Dioſcorides* maketh his *Clematitis* to bee, and the very name *Clematitis* anſwerable to the plant, what ſhould let it to be the right, and indeede it is ſo accounted of all now a dayes without doubt or queſtion, notwithſtanding the text of *Dioſcorides*; as alſo that their *Ariſtolochia longa* of former times, according to *Lonicerus* judgement, and thoſe Monkes, that commented upon *Meſues*, is *Dioſcorides* his *Clematitis*: Another doubt there is likewiſe riſen of late dayes, what *Ariſtolochia* was ment by *Andromachus* ſenior, that he appointeth to be put into his *Theriaca*; for his elegiack verſes maketh no diſtinction: and becauſe *Galen* doth ſhew in *ſecundo*

alimentorũ that *Andromachus junior*, *Adromachus senior* his son, in setting downe his fathers *Theriaca* in prose, doth explaine divers things, that were doubtfull in his verse, as for the *Mel Cecropium* he expresseth it *Mel Atticum*: for *Centaurium* without difference either of greater or lesser, he setteth downe the lesser, and for *Aristolochia* which was left indefinite, he setteth downe *lepte tenuis*, the small. Now here lyeth the doubt, what *Aristolochia Andromachus* and *Galen* should meane, by this *lepte tenuis*: *Matthiolus* seemeth to answer this doubt, in shewing that they would not meane any other *Aristolochia*, then the *Clematitis*, because they mention but three sorts; and this *Clematitis* is the smallest roote of the other, and that the *tenuis Aristolochia*, is not the Long of *Dioscorides*, whose rootes he saith were of the thicknesse of a finger; when as of the true Long none are found so small unlesse they be very young rootes, nor yet any other different kind from the *Clematitis*, as divers did thinke; and yet *Galen in lib. 6. simp. med.* in setting downe the properties of all the three sorts of *Aristolochia*, commendeth the round as most excellent, and of most subtill parts, and to all purposes more effectuall then both the other: the Long he saith is nothing so subtill, or of so thin parts, but is more hot and clensing; and of the *Clematitis* he saith onely that it is sweeter in smell then the other two, and therefore is more used in sweete oyntments then otherwise, and is more weake for medicines, or the cure of any disease; why therefore the *Clematitis* should be taken for *Andromachus* Treacle with our Apothecaries I doe somewhat admire, seeing *Galen* saith that the other are more effectuall for all purposes: The severall appellations of authors of these *Aristolochia's*, are not so divers that they neede any long repetition, for they all as it were agree together, the variation being so small, that it is not worthy the reciting; onely I will shew you how *Bauhinus* in his *Pinax* doth distinguish them severally differing from the titles I give them: the first here set forth, he calleth *Aristolochia rotunda flore ex purpura nigro*: the second he calleth *Aristolochia rotunda flore ex albo purpurascente*: the third hee calleth *Aristolochia longa vera*: the fourth *Aristolochia longa Hispanica*: the fift *Aristolochia Clematitis recta*: the sixt *Aristolochia Clematitis serpens*: The seaventh *Aristolochia Pistolochia dicta* (and is *Aristolochia Polyrrhizos* of *Lobel* and *Pliny*) the last he calleth *Pistolochia Cretica*. The *Arabians* call it *Zaranud Masmocra* and *Zaraved*: the *Italians Aristologia*: the *Spaniards Astronomia*, the *French Saraſine* and *Fozerne*, the *Germans Osterlucey* and *Holtwortz*: the *Dutchmen Osterlucye* and *Sarasincruidt*.

The Vertues.

Galen, lib. 6. simpl. med. as I shewed you before sheweth the severall properties of these *Aristolochia's*, the roote saith he of *Aristolochia* is of most use for medicines, being bitter and somewhat sharpe, the round is the most subtill of them all, and of more effect for all diseases; that which is called *Clematitis* is sweeter in sent then the other two, and therefore those that make sweete ointments, doe use it in their ointments, but it is of lesse force and vertue in the curing of any disease; the Long hath lesse tenuity of parts in it, then the round, but yet is not without efficacy, for it hath a clensing and heating power therein, yet it clenseth and digesteth lesse then the round, but healeth no lesse, yea peradventure more, and therefore the long is of more use, for those that have neede of a meane clensing in the tuberous swellings of the flesh, and in fomentations of the mother, but where there is neede of a stronger extenuating faculty, there the round is of more use: and therefore the round Birthwort, doth more helpe to cure those greefes and diseases, that rise from the obstruction or aboundance, and grosseneſse of raw and windy humors: it draweth forth thornes, and splinters, &c. out of the flesh, it healeth all putrefactions, it clenseth and maketh sound foule and filthy Vlcers, it clenseth the gums, and the teeth, and maketh them white; it is profitable for those that are troubled with the shortneſse of breath, with the hickocke, with the Falling sickneſse, or with the Gout, if it be drunke with water, (or wine rather) as also for those that are burſten or are troubled with Crampes or Convulsions, or shrinkings of the sinewes and veines, and is as profitable as any other medicine whatsoever: and thus farre are the words of *Galen*, in the place before recited: *Mesues*, *Paulus*, *Aegineta* and *Aetius* do shew the purging qualitie therein, which *Dioscorides* and *Galen* either knew not (as in *Rubarbe*) or past it over in silence, who saith, that the roote either of the round or running Birthwort, doth purge downeward flegmaticke and cholericke humors also: it clenseth the lunges and the parts of the breast, from the toughneſse and rottenneſse of humors; whereof a plaine demonstration is, that it helpeth those that are flegmaticke or shortwinded very much: if it be taken inwardly or applyed outwardly to the part, it mightily draweth downe womens courses, expelleth the dead child and afterbirth, and in the paines of delivery hath very good effect to cause the more speedy ease and delivery, and to cleare the parts, of what is accessary: the roots in pouder taken with Mirrhe & Pepper in wine, is used also for the same purposes; it resisteth poyson of all sorts, the long resisteth the venome of Serpents, and other living creatures, the round resisteth all other sorts of poyson: but *Pliny* inverteth this order: the roote of the round being taken in water, helpeth those that are bruised by falls, blowes, &c. as also the paines of the sides; the running Birthwort helpeth the falling downe of the mother, being eyther applyed in pessarie or in fume, and the place bathed with the decoction; it is said that divers in *Spaine* doe use the rootes of the Spanish running Birthwort with no lesse good succeſse, then they doe the rootes of *Sarsaparilla*, to all the uses whereunto the *Sarsa* serveth: the distilled water of the greene herbe, when it is in flower is profitable for all the diseases aforesaid, and in especiall preserveth from the Plague, and is an especiall good remedy for the winde collicke: the *Pistolochia* or bushy rooted Birthwort, is commended by *Pliny* for all the aforesaid womens diseases, to be as effectuall as the other, and that it is very profitably applyed to those that are troubled with Convulsions and Crampes, or those that have beene bruised by stroakes or falles, if it be drunke with water, the seede worketh more strongly: the roote of the round Birthwort helpeth to draw forth broken bones, or any other hurtfull thing lying in the flesh, if the fresh roote bee applyed and bound thereto: the pouder of the dryed roote is of singular good use in all eating, or running, foule and rotten Vlcers, as also that are hollow and Fistulous, by clensing and filling them up, or causing the flesh to grow soundly, especially for Fistulaes, if a little Hony, and the roote of Iris or the Flowerdeluce bee used with it: it healeth also all wounds in the head: the fumes thereof, or the pouder in a quilted cap, stayeth all Fluxes and distillations of thinne rheume from the head? and it is an usuall saying, that without Birthwort no Chirurgion can performe any great cure: the long Birthwort is used as well as the round, in most of those diseases either inward or outward, and some also doe hold that the *Clematitis* or running kind is no lesse effectuall, but you heard before the judgement of *Galen* concerning it. *Pliny* in his 25. Booke and 8. Chap. saith that the fishermen in *Campania* did call the roote of the round Birthwort the venume of the earth, and that having bruised it and minced it with

Lime

Lime and Chalke, and caſt it into the Sea, all the Fiſhes within a great way thereof would with incredible deſire gather themſelves thereto, and preſently upon the taking thereof become as dead, whereby they might eaſily be taken: but *Lonicerus* noteth it as an errour in *Pliny*, who referreth that quality to the roote of *Ariſtolochia* which ſhould be attributed to *Cyclamen*, which he ſaith is called by the Greekes ἰχθυοφόνον, *id eſt*, *piſcium venenum* becauſe it killeth them.

CHAP. LXIIII.

Mercuralis. Mercurie.

VNder the titles of *Mercuries* I muſt comprehend alſo the *Phyllon* of *Theophraſtus* and *Dioſcorides*, for that they are out of doubt *congeners* of the ſame kindred: they are in face and forme the one ſo like the other: and with them I thinke it not amiſſe to remember in this place alſo, the *Mercurialis ſylveſtris altera* of *Tragus*, called by *Lobel*, *Noli me tangere*: for although *Bauhinus* place it with the *Balſamina*; yet others reckon it with the Mercuries.

1. *Mercurialis vulgaris mas & fœmina.* French Mercury, the male and female.

I comprehend as you ſee, both the male and the female Mercury under one deſcription, becauſe as all do agree, they both riſe from the ſeede of the one as Hempe doth, and they both are ſo like, that but for the flowers and ſeede, that ſhew their difference, they could not bee diſtinguiſhed the one from the other: it riſeth up with a ſquare greene ſtalke full of joynts, two foote high or thereabouts, with two leaves at every joynt, and branching likewiſe from both ſides of the ſtalkes, ſet with freſh greene leaves, ſomewhat broad and long like unto the leaves of Pellitory of the wall, but leſſer and much about the bigneſſe of the leaves of Baſſill, finely dented about the edges: towards the tops of the ſtalkes and branches, at every joynt come forth, in that which is called the male, two ſmall round greene heads, ſtanding together upon a ſhort footeſtalke, which growing ripe are the ſeede, not having any flower, that ever I could diſcerne; in the female the ſtalke is longer, ſpike faſhion, and ſet round about with ſmall greene huskes, which are the flowers made like ſmall branches of grapes, which give no ſeede that ever I could finde, but abide in that manner a great while upon the ſtalkes without ſhedding: the roote is compoſed of many ſmall Fibres, which periſheth every yeare, at the firſt approach of winter, and raiſeth it ſelfe up againe of it owne ſowing, for where it is once ſuffered to ſow it ſelfe, the ground will never want it afterwards, even of both ſorts, for I yet never ſaw it grow in any place, where either of them was wanting.

2. *Mercurialis ſylveſtris Cynocrambe dicta vulgaris.* The ordinary wilde Mercury or Dogs Mercury.

This Dog Mercury is likewiſe diſtinguiſhed into male and female, and riſeth up with many ſtalkes, ſlenderer and lower then Mercury, and without any branches at all upon them; the male is ſet with two leaves at every joynt ſomewhat greater then the female, but more pointed, and full of veines, and ſomewhat harder alſo in handling, of a darker greene colour, and leſſer ſnipt or dented about the edges at the joynts, with the leaves come forth longer ſtalkes then in the former, with two hairy round ſeedes upon them, twiſe as bigge as thoſe of the former Mercury: the taſte hereof is herbie, and the ſmell ſomewhat ſtrong and virulent: the female of this kind hath much harder leaves, and ſtand upon longer footeſtalkes, and the ſtalkes alſo are longer; from the joynts come ſuch like long or rather longer ſpikes, of greeniſh flowers as are in the former female Mercury, with many ſmall threds in them, which give no ſeede, no more then the other Mercury: the rootes of them both are many, and full of ſmall Fibres, which runne under ground, and mat themſelves very much, not periſhing as the former Mercuries doe, but abiding the winter, and ſhoote forth new branches every yeare, for the old dye downe to the ground.

1. *Mercurialis mas & fœmina.*
French Mercury, male and female.

3. *Cynocrambe legitima Dioſcoridis Bauhino.* The true Dogs Mercury by *Bauhinus*.

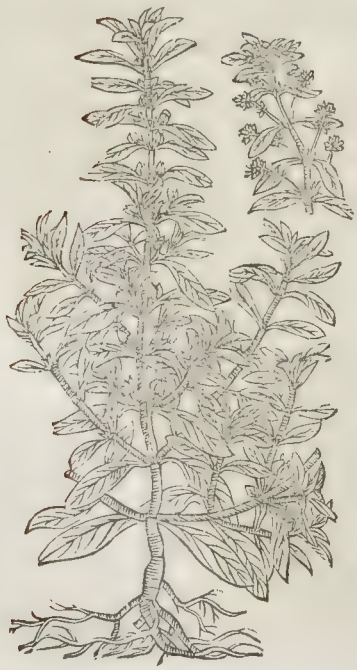
The true Dogges Mercury is a tender ſmall and ſappie herbe, and riſeth up like unto the ordinary Mercury, with a round greene creſted ſtalke, about a foote high ſet with many joynts, branching forth from every joynt; whereat commeth forth at the firſt two ſmall leaves, and ſomewhat round like unto Chickweede, after which two other ſpring forth from the ſame joynt, which are much larger and broader, and from the ſame place alſo afterwards come divers other ſmaller leaves then the firſt, and this proportion it holdeth, not at one joynt alone, but at every one thorough the whole plant: from the loweſt joynt almoſt of the ſtalke and branches, up to the top, where come forth three or foure ſmall whitiſh greene flowers, with many threds in the midſt of them, which turne into ſmall hard round ſeede, like unto thoſe of Mercury but ſomewhat leſſer, greene at the firſt, but of a blackiſh aſhcolour when they are ripe: the roote is white, long and fibrous.

Phyllum

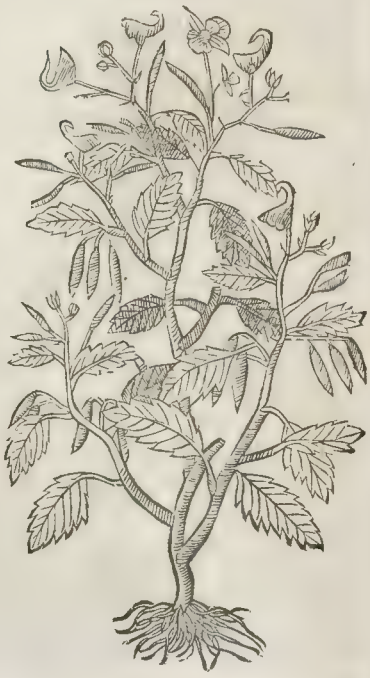
2. *Cynocrambe vulgaris.*
The ordinary wilde or Dogs Mercury.

3. *Cynocrambe legitima Dioscoridis Bauhino.*
The true Dogs Mercury by *Bauhinus.*

4. *Phy'um marisicum & foemineum.*
Childes Mercury male and female.



5. *Mercurialis sylvestris Noli me tangere dicta sive Persicaria siliquosa.* Wilde Mercury called Quicke in hand.



4. *Phyllum marificum & fœminificum.* Childing Mercury male and female.

Childing Mercury also is divided into two kindes, as the former Mercuries are, whereunto it is so like in all the parts thereof, that many have beene of opinion, that it is but plaine Mercury, growing in a hotter Country: It hath a branched square stalke (I give you one description for them both, as I did in the former, although others give them severall) full of joynts and branches, in the male lower and more upright, in the female higher and more bushie: at the joynts stand alwayes two soft woolly leaves, somewhat narrower and longer, than in the former, and not dented or but seldome about the edges, of an acide and saltish taste: at the joynts in the male come forth short stalkes, bearing two small round seedes together at the toppe, like unto the male Mercury, (for it doth not give any flowers) which are of an ash colour before they are perfect ripe, but then they turne to be more blew; in the female the stalkes are longer, and beare many small pale mossie flowers, which seldome beareth any seede, which when it doth it is small and round like the other, sometimes two and sometimes more growing together: the roote is white, hard and wooddy; of the bigneſse and length of a finger, perishing every yeare, and raysing it selfe againe from it owne seede, in the naturall places: this hath a stronger sent and taste, than any of the former Mercuries; *Dioscorides* his description of this *Phyllum* is inverted, for unto the male he giveth spiked or bushie heads, and unto the female seedes like poppie: but as hee saith himselfe *Crateuas* was his author, and not his owne knowledge.

5. *Mercurialis sylvestris noli me tangere dicta sive Perſicaria ſiliquoſa.* Wilde Mercurie called Quicke in hand.

This kinde of wilde Mercury (which for the varietie of the forme hath beene diversely named of writers) riseth up with a round joynted stalke, two foote high sometimes, branching from thence in many places, whereat continually standeth but one leafe upon a very slender rough foote stalke, most like unto those of *French* Mercury, but longer pointed, and somewhat smaller at the stalke, not so finely, but as it were grossely indented about the edges, being thinner, softer, and of blewish greene colour; from every joynt with the leafe from the middle upwards, and at the toppes of the branches also commeth forth one long browne foote stalke, as small and fine as any haire, bearing one flower thereon, and sometime two or three, somewhat close together, hanging downewards, composed of sixe leaves a peece, somewhat like unto those of the Hollow roote, but greater) of a faire gold yellow colour, *Bauhinus* saith it is found also of a paler colour: two of them that stand like winges at the sides, are larger than the other two that stand under them, which are small and round, the lowest is longer than the other two small ones, and broade at the end: the uppermost endeth in a short crooked horne or heele behinde: the bottome on the inside is whiter than the rest, which have sometimes some red spots in them: after these flowers are past, there come up in their places, small long joynted pods, hanging downewards, striped as it were all the length of them, wherein is conteined small long and somewhat flat seede, of a duskie colour, which is so hardly gathered, in regard that even before it be thorough ripe, if it be but very lightly handled, the pods will breake, and twine themselves a little, as the pods of some certaine pulses will doe, and the seed will leape forth, yea for the most part, the very shaking of the branches by the winde, causeth the pods to breake open, and shed their seede on the ground, where the ripest may best be gathered if they be taken in time: the roote is blackish and threddie, perishing every yeare; the taste hereof is small and waterish, as *Columna* saith in the greene hearbe as my selfe can testifie, and little otherwise in the dryed, and which gave him no offence nor me also, either in the tasting or handling, but whether there were any further danger in taking a greater quantity, because *Lobel* saith it was venemous, was I doubt but onely an heare-say by tradition, yet neither he nor I would make any further experience therein.

The Place.

The two first Mercuries are found wilde in diverse places of our owne Country, as very plentifully by a village called *Brookeland* in *Rumney* Marish in *Kent*; the other called Dogge Mercury is found in sundry places of *Kent* also, and elsewhere, the female kinde is more seldome found than the male: the true Dogges Mercury is not found wild with us, neither the childs or childing Mercuries, but grow about *Mompelier* in *France*, and in *Spaine* and *Italy*: the last groweth in the shadowie woods of *Italy*, *France*, and *Germany*: it hath beene found likewise by the shadie woods sides, of the mountaines and their vallyes in *Wales*, by an industrious Gentleman, and Herbarist, Mr. *George Bowles*; and will abide in our Gardens, every yeare sowing it selfe being set in a shadowie place.

The Time.

They all flourish in the Sommer Moneths, and therein give their seede; but the Childs Mercury flowreth so late with us, that it hardly beareth ripe seede. The quicke in hand flowreth and presently after seedeth, in his naturall place about the middle and end of *August*, but in gardens in *June* and *July*.

The Names.

French Mercurie is called in Greeke λινόζωστις *Linoſoſtis* & ἀρσενὸν βίτανον ἑρμῆ πᾶλι, *Mercurii herba*, & παρθένιον *Parthenium*; in Latine *Mercurialis*, becausse as *Pliny* saith it was found by *Mercury*: Dogges Mercury is called κυνία & κυνοκράμβη, *Cynea* and *Cynocrambe* which is *Canina Braſſica*, but becausse it hath no agreement with any Cabbage (unlesse you would say it were meate, or a Cabbage for a dogge) others have called it in Latine *Mercurialis Canina, propter ignobilitatem*, others *Mercurialis ſylveſtris*: The childs or childing Mercury is called in Greek φυλλὰν & ἐλαιοφυλλον *Phyllum & Elæophyllum, quaſi Oleæfolium*. *Theophraſtus* in his ninth booke and 19. chap. saith that they called one herbe *Phyllum Arrhenogonon*, and another *Thelygonon Mariparũ, & Fœminiparum*, which diverse doe thinke is but the former *French* Mercury, becausse he saith they have leaves like Bassill, whereunto the *French* and not the Childs or childing Mercury is most like, and the rather for that *Dioscorides* appropriateth to his Mercuries those effects of bearing male and female children, that the *Phyllum* of *Theophraſtus* and *Dioſcorides* hath. The *French* Mercury is generally of all writers almost, called *Mercurialis mas & fœmina*, *Cordus* upon *Dioſcorides* thinketh them to be the *Phyllum Arrhenogonon*, and *Thelygonon* of *Theophraſtus*; and *Bauhinus* calleth them *Mercurialis teſticulata & ſpicata*: the *Italians* call it *Mercorella*; the *Spaniards Mercuriale*: the *French Mercuriale & Vignoble*; the *Germanes Bengelkraut*, and the *Dutch men Bingelcruyte & Mercurial*. The second is called *Mercurialis ſylveſtris*, by *Tragus*, *Lonicerus*, *Cordus & Thalius*, & *Cynocrambe* by *Matthiolus*, *Fuchſius*, *Dodonæus*, *Camerarius* and *Lobel*, who in one figure represenceth both the male and female.

Columna

Columna calleth it *Mercurialis Canina*, and *Bauhinus Mercurialis montana testiculata & spicata*, neither of them both thinking it worthy of the name of *Cynocrambe*, for that they knew it was not answerable to *Dioscorides* his *Cynocrambe*, who doth not make it a Mercury, whereof there is male and female, for if it had beene so, hee would have remembred it, but he putteth it indefinitely not naming either male or female: The third is called by *Bauhinus*, who first set forth the figure and description thereof in his *Matthiolus, Cynocrambe vera Dioscoridis*, and *Pona* in his description of *Mont Baldus, Cynocrambe legitima Belli*. *Cæsalpinus* tooke it to be an *Alsine*, and *Columna* calleth it *Alsines facie planta nova*. The fourth is generally taken of all to be the *Phyllum* of *Dioscorides* and *Theophrastus*. *Bauhinus* calleth it *Phyllum testiculatum* and *spicatum*, as he did the former Mercuries: The last is called of *Tragus Mercurialis sylvestris altera*, in his Chapter of Mercury, but putteth the figure thereof in the chapter of *Esula*; of *Lonicerus Tithymalus sylvestris*: of *Camerarius*, *Tabermontanus*, *Lobel*, and *Gesner*, *Noli me tangere*, who also calleth it *Milium Caprearum*. It is also called *Persicaria siliquosa* of *Camerarius*, *Thalius*, *Lugdunensis* and *Lobel*; of *Dodoneus Impatiens herba*, of *Cæsalpinus Catanance altera*, of *Columna Balsamita altera*, and of *Lugdunensis Chrysæa*; *Bauhinus* calleth it *Balsamina lutea, sive Noli me tangere*. I have called it *Noli me tangere*, and placed it in the Chapter of Mercuries, and given it an *English* name, proper for it as I take it, let others call it as they please.

The Vertues.

The decoction of the leaves of Mercurie, or the juyce thereof taken in broth or drinke, and with a little Sugar put to it, to make it the more pleasant, purgeth chollericke and watery humors: *Hippocrates* commendeth it wonderfully for womens diseases, which none of the Physitians of our dayes, I thinke ever put in practise, for he applyed it to the secret parts to ease the paines of the mother, and used both the decoction of it to procure womens courses, and to expell the afterbirth, and the fomentation or bathing for the same causes; he also gave the decoction thereof with Myrrhe or pepper, or used to apply the leaves outwardly against the strangury, and the diseases of the reines and bladder; he used it also for sore and watering eyes, and for the deafenesse and paines in the eares, by dropping the juyce thereof into them, and bathing them afterwards in white wine; the decoction thereof made with water and a cocke chicken, is a most safe medicine to be taken against the hot fits of agues: it also clenseth the breast and lungs of flegme troubling them, but it doth a little offend the stomacke; the juyce or distilled water thereof, cast or snuffed up into the nostrils, purgeth the head and eyes of catarrhes and rheumes, that distill downe from the braines into the nose and eyes, as also sometimes into the eares: Some use to drinke two or three ounces of the distilled water with a little Sugar put to it, in a morning fasting, to open the body, and to purge it of grosse viscous and melancholicke humours; as also mixing it with May dew taken from Rose bushes, and Manna dissolved therein, for the same purpose, which thereupon some call *Rhodomanna*, which purgeth choller also; It is wonderfull (if it be not fabulous) that the ancient writers, *Dioscorides*, *Theophrastus* and others doe relate, that if women use these herbes either inwardly or outwardly, for three dayes together after conception, and that their courses be past, they shall bring forth male or female children, according to that kinde of herbe that they use: *Matthiolus* saith that the seede of both the kindes of *Mercury*, that is both male and female, boyled with wormewood and drunke, cureth the yellow Iaundise, in a most speedie and merveilous manner: the leaves themselves or the juyce of them rubbed upon wartes or bound unto them for a certaine time, doth take them cleane away: the juyce mingled with some Vinegar, helpeth all running scabs, tetters, ringwormes and the itch; *Galen* saith that who so will apply it outwardly in manner of a pultis, to any swellings or inflammations, shall finde it to have a digesting quality, that is, it will disgest and spend the humours, that was the cause of the swelling, and alay the inflammations proceeding thereupon, it is frequently and to very good effect given in glisters, to evacuate the belly from those humors that be offensive therein, and worketh as well after that manner, as if so much Sene had beene put into the decoction. The common Dogges Mercury is seldome used, but may serve in the same manner, and to the same purpose that the other is put to, for purging watery and melancholicke humors. The childes Mercury, although no other hath written of any purging qualitie in it, yet the forme thereof so like unto Mercury, and the saltish acide taste should demonstrate in my opinion an irritating quality: *Theophrastus* and *Dioscorides* have onely mentioned the childing quality, for women to beare either males or females, that use this herbe, according as is before sayd of *French* Mercury. The *Noli me tangere*, or the Quicke in hand, hath a stronger purging quality, but it is by vomite, and therefore I thinke *Lonicerus* and *Tragus*, have put it under the names of *Tithymales*, as neerest partaking of their nature, which caused *Lobel* and *Pena* to say, it was venemous and deadly, and yet say it wanteth not his prayse for other effects, but shew not what they are: *Camerarius in horto* saith some doe apply the distilled water of the herbe upon the places pained with the goute, with good successe.

CHAP. LXV.

Malva. Mallowes.

THere are three kinds of Mallowes, one with whole leaves, but little inciséd or cut in on the edges, called *Malva*; an other more deepely jagged or cut called *Alcea*, the third more soft in handling called *Althea*. Of each of these three divisions the varieties shall be reckoned together by themselves, that so each kinde may be separated. Some of each of these kindes I have set forth in my former Booke, whose descriptions neede not to be here repeated, and those are *Malva Hispanica flore carneo amplo*: The *Spanish* blush Mallow, *Alcea vulgaris flore carneo*, Vervaine Mallow with blush flowers. *Alcea peregrina sive Vesicaria, Venice* Mallow, or good night at noone. *Alcea fruticosa pentaphyllea, cinque foile* Mallow. *Sabdariffa seu* Alcea *Americana*, Thorny Mallow. *Bamia seu* Alcea *Ægyptia*. The Mallow of *Egypt*. *Althea frutex flore albo vel purpureo*, Shrub Mallow with a white or purple flower. *Malva hortensis Rosea simplex & multiplex diversorum colorum* Hollihockes single and double of many colours; and *Malva crispa, French* Mallowes; yet the figures of some of them that are next at hand I will insert here: those which remaine to be intreated of I shall remember in this Chapter.

Divisio

Diviſio prima. The firſt Diviſion.

1. *Malva vulgaris flore purpureo.* The common Mallow with purpliſh flowers.

The common Mallow hath many large ſoft greene roundiſh leaves, yet ſomewhat cornered and dented about the edges, ſtanding upon long foote ſtalkes, next the ground, from among which riſe up, diverſe round greene ſtalkes growing in time to be three or foure foote high, eſpecially in good grounds, and to be more hard and almoſt woddy, eſpecially at the bottome, divided into many branches, towards the tops and with many leſſer leaves, and more divided upwards; where it bringeth forth many flowers, ſtanding in ſoft huskes, which flowers twine themſelves, at their firſt ſhooting forth before they open themſelves into fine large, broad pointed leaves, of a fine delayed purpliſh red colour, with many ſtripes or veines running thorough every leafe, of a deeper colour, which maketh the flower ſeeme very beautifull: after which come round flat caſes, with many blackiſh ſeede, ſet in order, round about in them: the roote is long and white, growing downe deepe into the ground, tough and ſomewhat wooddy.

2. *Malva vulgaris flore albo.* Common Mallow with white flowers.

This Mallow groweth like the former, both for leaves and height of ſtalkes, the cheefeſt difference conſiſteth in the flowers, which are not fully ſo large as the former, and are of a pure white colour, without any ſtripe or veine, of any other colour running thorough them, the ſeede and rootes are alſo alike.

3. *Mala ſylveſtris minor.* Small wilde Mallow.

This ſmall Mallow lyeth with his branches upon the ground, having many ſmaller and rounder leaves, not cut in, or very ſeldome, and leſſe dented on the edges than the common: the flowers hereof are very ſmall and white: the ſeede and rootes are like the common.

4. *Malva Montana.* The mountaine Mallow.

The mountaine Mallow, hath his lower leaves as large as the common wilde Mallow but longer, with ſome round diviſions or cuts therein, but not deepe, ſomewhat like unto an Ivye leafe: the ſtalke groweth not ſo great and high as the common, with ſmaller leaves thereon, upwards ſomewhat rounder and leſſe: the flowers are like the common, and ſo is both ſeede and roote.

5. *Malva trimeſtris ſive Æſtiva.* The Sommer Mallow.

The Sommer Mallow hath ſoft round greene leaves, without diviſions, yet dented about the edges, ſomewhat paler underneath; the ſtalke riſeth up to but halfe a yard high, bearing ſmaller leaves, and a little divided ſomewhat like thoſe of Marſh Mallowes: the flowers are of a paler purpliſh colour then the common and leſſer, the bottome of whoſe leaves are of a deeper colour, ſtanding upon longer foote ſtalkes, and not ſo many together, the ſeede is ſmall, and ſo is the roote, and periſheth with the firſt cold or froſt that commeth; but ſometimes if the Sommer be kindly, it giveth his ripe ſeede, before any froſty nights doe come.

6. *Malua Arborea* Tree Mallow.

The tree Mallow groweth with us to be a great tall tree more likely than an herbe, having his ſtemme ſomewhat wooddy, and oftentimes ſo great in compaſſe that no man can graſpe it round with both his hands, the

Malva vulgaris & criſpis foliis.
Ordinary and French Mallowes.

Malva Hiſpanica flore carneo amplo.
Spaniſh bluſh Mallowes.

leaves

5. *Malva Hortensis sive Æstiva.*
Summer Mallow.

Malva Rosea simplex.
Single Hollihockes.

Malva Rosea multiplex.
Double Hollihockes.

8. *Malva rosea arborea Indica simplici & duplici flore.*
The Indian tree Hollihocke with single and double flowers.

leaves are twise as great and large, as any common Mallow, and as soft and woolly in handling as the Marsh Mallow but not so white or woolly, yet often somewhat crumpled about the edges: this flowreth not the first yeare of the springing up with us, but in the second Sommer, if the sharpe Winter hath not rotted his stalke in the first yeare (not then being growen to his ful strength) being more tender than afterwards; it spreadeth some branches, with leaves on them, but smaller, among which stand faire great and large deepe purple flowers, with stripes and veines in them like the common Mallow; after which rise such like round cases, with blackish seede in them, but larger according to the proportion of the plant, but seldome commeth to maturity in our countrie: the roote and stalke perish usually with us, after it hath abiden two yeare at the most with us; whereas in the warmer and naturall places, it abideth diverse yeares, and groweth to be as high and great as many trees.

7 *Malva arborea marina nostras.* Englisn Sea tree Mallow.

This tree Mallow of our owne countrie, is very like the former tree Mallow, having a wooddy stemme, as great as a mans arme, of a russet or hoary colour; whereon grow soft whitish woolly leaves, almost as large as the other, and as smooth as velvet: the flowers hereof are large, and of a whitish or delayed purple colour, like in forme unto a wild Mallow flower, but somewhar large, yet not so great as the former: the roote is white, great and woddy, with diverse long strings annexed unto it.

8. *Malva Rosea arborea Indica.* The *Indian* tree Hollihocke.

If I should *Baptista, Ferrarius*-like of a mole hill make a mountaine in the description hereof, I might be held over tedious, howsoever he by his elegant Latine stile, may passe with greater delight to his reader, both in his ample narration and fabulous concertation betweene Art and Nature, in that he giveth a greatfull *Vehiculum* to ease the long journey: but this large volume will not admit such spacious relations, and therefore I will abreviate his long discourse, with as briefe a description as the subject will permit, and referre those to the authour that list to reade all at large. In a small time (that is in two or three yeares in a warme countrey) this riseth up to be like a pretty great shrubbe or small tree, whose stemme or trunke being somewhat white and wooddy, five or sixe inches thicke covered with a smooth whitish barke whose lower branches being pruined the upper boughes spread into a round compasse, whereon are set diverse broad rough leaves somewhat like to Vine leaves cut into severall partitions and nicked about the edges, of a faire greene colour on the upper side and grayish underneath, on thicke, long and rough reddish foote stalkes, sometimes but one, and often two or three at a joynt, which doe abide the Winter without falling away: at the toppes of the branches come forth the flowers standing in greene huskes divided at the toppes into five parts: in some of these plants the flowers will be single, consisting of five, sixe, eight or tenne large crumpled leaves, all white or a little blush towards the edges: in others the flowers will be very double, and as large as a Provence Rose of the same colours, but after they have abiden a while blowen open they change more blush and on the fading deeper, these changes are often seene in one and the same day, yet many times not in two or three dayes abiding; in the middle of the flowers standeth a greene head, compassed with many yellow threds as the Rose hath, which head growing to maturitie, hath sundry ridges and furrowes on the outside and full of seede within, distinguished by severall partitions, and are reddish somewhat small long round and crooked, and a little hairie at the backeside, 163. seedes have beene numbred to be taken out of one seede vessell: the roote is long, white and woody diversly spread under ground, with some small fibres issuing from them.

Divisio secunda. The second Division.

1. *Alcea vulgaris sive Malva Verbenaca.* Fine cut or Vervaine Mallow.

The lower leaves of this Vervaine Mallow are soft and greene, somewhat like unto the wild common Mallow leaves, but lesser and more cut in on the edges, besides the denting, but those that grow up higher upon the stalke, (whose barke may be broken into threds like hempe, and is sometimes as high as the ordinary wild kinde is) are more cut in and divided, somewhat like unto Vervaine: the flowers hereof are of a paler purple colour than the common mallow, but in most not so much divided into severall leaves, and laid so open, but abiding more close, or lesse spread, and without those stripes oftentimes, being smooth and somewhat shining: the seede and seede vessels are like the common Mallow, the roote also is long tough and white, but somewhat more wooddy within.

2. *Alcea vulgaris flore albo.* Vervaine Mallow with white flowers.

This Vervaine Mallow that beareth white flowers, doth somewhat differ in leaves from the former, for that they are more finely cut in on the edges, then it is; in the flower consisteth a chiefe difference also, which is white, yet tending alittle to a blush: the seedes and rootes differ not.

3. *Alcea minor.* Small Vervaine Mallow.

There is a lesser kinde of the Vervaine Mallow, never growing so great or high, but alwayes abiding lower, like as the small Mallow doth: the leaves hereof, are more divided and cut in on the edges, and most usually into five parts, and deepely dented also: the flowers are purple like the ordinary Vervaine Mallow, but lesser, and that maketh the difference.

4. *Alcea minor villosa.* Small hairy rough Vervaine Mallow.

The small hairy Mallow, hath many very low and hoary stalkes, not above a foote high, divided into lesser branches, set with diverse small hoary hairy leaves, cut into three or more divisions: at the tops of the stalkes and branches, grow diverse large purple flowers, like unto the first, but every one standing in a hairy huske, almost prickly; after which commeth black seede, contained in those hairy husks, that bore the flowers, but more closely inclosed in them: the roote is of a pale browne colour, about the length of an hand, with small fibres hanging at it.

5. *Alcea Ægyptia moschata.* The Egyptian Muske Mallow.

One sort of Egyptian Mallow I have, as I said, in the beginning of this Chapter set forth already, but this differeth from that in these particulars, both stalke and leaves, are all hairy over: the leaves are parted into seven or eight parts or corners; the flower is sharper pointed, more yellow, and as sweete as Muske, and so is the blacke seede also, but more neare unto Civet, which is like unto the seedes of Mirtle berries, but greater: the roote is great and fibrous; the whole plant is full of slimie juyce, and of an herby taste.

1. *Alcea vulgaris.*
Fine cut or Vervaine Mallow.

Alcea vesicaria sive Venera.
Venice Mallow or Goodnight at noone.

Alcea pentaphyllea.
Cinquefoile Mallow.

Sabdariffa seu Alcea Americana.
The Mallow of America or Thorny Mallow.

Alcea Ægyptia vulgaris.
The ordinary Egyptian Mallow.

5. *Alcea Ægyptia moschata Abelmoscb dicta.*
The Egyptian Muske Mallow.

Divisio tertia. The third Division.

1. *Althæa vulgaris.* Common marsh Mallowes.

Our common marsh Mallowes hath divers soft hoary white stalkes, rising to be three or foure foote high, spreading forth many branches, the leaves whereof are soft and hoary, or woolly, somewhat lesser then Mallow leaves, but longer pointed, cut for the most part into some few divisions, but not deepe: the flowers are many but smaller then those of the Mallow, and white or tending to a blush colour, after which come such like round cases, and seede as is in the Mallow: the rootes are many and long, shooting from one head, of the bigneſſe of a thumbe or finger, very pliant tough and bending like Licoris, of a whitish yellow colour on the outside, and more white within, full of a slimie viscous juice, which being layd in water, will so thicken it, as if it were gelly.

2. *Althæa Pannonica.* Marsh Mallow of *Hungarie.*

This *Hungarian* Marsh Mallow differeth not in rootes, stalkes or seede from the former, but onely in leaves, that they are somewhat harder in handling and in the flowers which are much larger and greater then those of Vervaine Mallow, and of a purple colour for the most part: yet there is some that beare white flowers as large as the former, and some that have not so large flowers as they, yet larger then those of the common kind.

3. *Althæa rosea peregrina.* The strange Rose marsh Mallow.

This Mallow shooteth forth about *May* sundry round greenish soft branched stalkes, like the former marshe Mallow, beset with divers soft greene leaves, and gray underneath, resembling the other but longer pointed: at the tops of the stalkes and branches stand severall white flowers, made of five large leaves a peece, somewhat like a Hollihock with a tuft of white threds, compassing a middle pointell, issuing out of a greene button or huske, which is as it were ribbed and broad at the bottome, narrowing to the toppe before the flower blow, without any sent like the Hollihocke: all the stalkes die downe every yeare to the ground, the roote is thicke white and fleshy abiding safe in the earth all the winter.

4. *Althæa semper virens Bryoniæ folio.* Ever greene marsh Mallowes.

This evergreene marsh Mallowe, hath many faire large whitish greene leaves, somewhat thicke, full of veines and rough or hairy, but whitish or hoary underneath, cut in or divided into five parts usually, somewhat like a Bryonie leafe: the stalkes are hoary white and round, rising to be two or thee foote high, having such like large leaves upon them, and smaller also among them, standing all of them upon long footestalkes: the flowers are like unto those of the Mallowes, and much about the same colour, consisting of five broad pointed leaves, having many red threds in the middle: after which come flat leafed heads, such as other Mallowes have, wherein is conteined such like small seede: the rootes are dispersed into severall parts under ground, and dye not, but retaine some of the leaves upon them all the winter, although the stalkes dye downe and perish to the ground.

1. *Althæa vulgaris.*
Ordinary marsh Mallow.

3. *Althæa rosea peregrina.*
The strange marsh Mallow Rose.

5. *Althæa lutea seve Abutilon Avicennæ putatum.*
Yellow marsh Mallow.

6. *Abutilon Indicum Camerarii.*
Camerarius his white Indian marsh Mallow.

7. *Althæa paluſtris Cytini flore.* Red flowred marſh Mallow.

Althæa frutex. Shrubbie marſh Mallow.

5. *Althea lutea ſive Abutilon Avicennæ putatum.* Yellow marſh Malſow.

The yellow Mallow or marſh Mallow riſeth up with one ſoft woolly greene round ſtalke for the moſt part, and ſeldome with more; divided oftentimes even from the bottome into divers branches: at every joynt ſtand ſeverall large round leaves as ſoft as velvet, pointed at the ends, and dented about the edges, hanging downe at the end of long ſtalkes, which ſtand forth right; the flowers ſtand ſimgly but one at a joynt with the leafe, which is ſmall and yellow, compoſed of five ſmall pointed leaves, ſtanding in a ſmall greene huske, which being paſt, there ſucceede ſoft greene pods or ſeede veſſels, turning blacke when they are ripe, compoſed of many ſmall hornes or pods, ſet together like unto an head or ſeede veſſell of Fraxinella, in every one whereof is conteyned ſmall blacke roundiſh ſeede: the roote is not great nor long, but with divers fibres at it, and periſheth every yeare.

6. *Abutilon Indicum Camerarij.* *Camerarius* his white Indian marſh Mallow.

This Indian marſh Mallow riſeth up with an upright ſtraight hairy ſtalke, ſhooting from the joynts in divers places ſmall branches, whereat likewiſe are ſet ſuch like ſoft round and pointed leaves, as are in the laſt hanging downwards for the moſt part, at the end of long ſtalkes which are ſomewhat hairie alſo: the flowers ſtand in the ſame manner that the other doe, but are ſomewhat larger, and of a white colour, and yellow at the bottome, with divers threds in the middle: the roote is full of ſmall fibres, and periſheth every yeare, in the like manner.

7. *Althæa paluſtris Cytini flore.* Red flowred marſh Mallow.

The red flowred marſh Mallow ſendeth forth many ſoft leaves, ſomewhat like unto thoſe of the ordinary marſh Mallow, but not ſo ſoft or whitiſh, but of a pale greene colour on the upper ſide, and whiter underneath longer alſo and dented ſomewhat deeper about the edges, ſtanding upon long footeſtalkes, among which riſe up divers round greene ſtalkes, three or foure foote high, bearing the like leaves on them at ſeverall diſtances: from the joynts of the leaves towards the tops of the ſtalkes, and at the tops of them likewiſe come forth the flowers, conſiſting of five leaves longer and narrower then in other Mallowes, not broad but pointed at the ends, of a deepe reddiſh purple colour, tending to an orenge, and ſometimes paler or more delayed, and in ſome plants of a white colour, with divers threds ſtanding in the middle, about a ſmall greene head, which in time becommeth the ſeede veſſel, growing like the cod or ſeede veſſel of the Birthwort, of a ſad browniſh colour on the outſide, parting into five diviſions, wherein lye ſmall browniſh ſeede: the roote is long, white and tough, ſomewhat like a marſh Mallow, but nothing ſo great, or Muccilaginous, that is ſlymie.

8. *Althæa arboreſcens Provincialis.* Tree marſh Mallow of France.

This tree marſh Mallow is very like unto the Shrubbe Mallow, ſet forth in my former booke, but yet is not the ſame, differing in ſome not able points from it: for although the ſtemmes thereof are more wooddy then the former tree Mallow, yet are they not altogether ſo hard and woody as the ſhrub Mallow, but groweth much higher, even to a mans height ſometimes, having many whitiſh hoarie leaves in the naturall places, but of a whitiſh greene growing in our climate and not hoary at all, ſomewhat rough, broad and round, and not ſo long pointed as the Shrubbe Mallow, yet cut in into ſome diviſions, and dented at the edges; at the toppes of

the ſtemmes and likewiſe from the ſides growe many flowers like unto thoſe of the marſh Mallowes, but of as deepe a colour almoſt as the wilde mallow, yet ſmaller then thoſe of the ſhrub mallow, after which come ſuch like flat huskes and ſeede as the other mallowes give: the roote is great and wooddy, ſpreading many branches under ground, abiding long, and ſometimes holding the ſtalkes, with the leaves upon them all the winter, the tops being cut off, yet ſometimes alſo if the winter be over ſharpe or it bee not planted or remooved into a warme place, or defended from the extremitie thereof, they will periſh downe to the ground, but the next yeare freſh ones will ariſe againe from the roote.

9. *Althea fruticoſa Cretica.* Shrub marſh Mallow of Candy.

The Shrub marſh mallow of Candy, in the ſecond yeare after it is ſowen riſeth up with divers wooddy greene ſtalkes, covered over with much downe, or woollineſſe, three or foure foote high, whereon grow hoary large leaves, cut into corners, and dented about the edges, ending in a point: the flowers grow at the tops of the ſtalkes, made of five leaves like mallowes and broad at the points, but of a fine delayed red colour, tending to a bluſh, having a ſtile or pointell in the middle, compaſſed about with whitiſh threds, which flowers are nothing ſo great as the former, being not much bigger then the flowers of the ordinary marſh mallow, after which come ſuch like round caſes and ſeede as they give: the roote is long, tough and white like the common marſh mallow, but more wooddy, and endureth divers yeares, ſhooting forth new branches in the ſpring.

The Place.

In the firſt diviſion common Mallowes are knowne to grow every where: but that with a white flower is more rare growing not in very many places, but in Kent in diverſe places, as at *Aſhford* and at *Thrapſtone* in *Northamptonſhire*, *&c.* and in diverſe other places; the third is found under hedges and walls in many places; the fourth is oftner found upon hils: the fift in *Spaine*; the firſt tree Mallow groweth neere *Venice*, all along the *Tirrhene* ſhore, and on the *African* ſhore alſo, in which places it abideth many yeare: Our owne Country tree Mallow, groweth in an Iſland called *Dinnie*, three miles from *Kings Roade*, and five miles from *Briſtow*, as alſo about the Cottages neere *Hurſt* Caſtle, over againſt the Ile of *Wight*. The eight was firſt brought from *Japan* I meane the ſeede, unto *Rome* or ſome parts of *Italy* where it was ſowne; whoſe ripened ſeede afterwards was communicated into ſundry Countries, The firſt of the ſecond diviſion, is very familiar in *Kent*, as in many other places of our owne Land, being in ſome places more frequent, than the common wilde kinde: it groweth in a field, as you goe to *Hamſteed* Church from the towne; but the ſecond which beareth a white flower, at *Weſterham* in *Kent*, the third is likewiſe found in ſome places of *Kent*, the next two are ſometimes found wild alſo with us. The fourth groweth at the foote of the mountaine *Iura* in *Helvetia* by *Savoye*: the fift in *Egypt*. The firſt of the third diviſion or marſh Mallowes groweth in moſt of the Salt marſhes, from *Wolwich* downe to the ſea, both on the *Kentiſh* and *Eſſex* ſhore: the ſecond in *Hungary*; the third was brought out of *Africa* as *Cornutus* ſaith; the fourth is not knowne from whence; the fift groweth in many places of Italy, in the wet grounds, neere unto lakes, rivers and ponds; the ſixt is thought, to come from the Indies, but is more likely to be found in ſome places of *Italy*, it is ſo like the former, and ſent by *Joſephus de Caſſabone*, to *Camerarius*, who onely hath ſet out the figure thereof. The ſeventh *Camerarius* ſaith he found in *Italy* abundantly about the river *Ameſis*, hard by *Anguilara*, where men paſſe the river; The eight groweth in *Provence* of *France*, as *Lobel* and *Pena* ſay, but in *Turin* among the *Switſers* as *Camerarius* ſaith, who hath ſet forth a figure, which is very likely to be the ſame as he ſaith, with that of *Lobel*; The laſt was ſent to *Cluſius* by *Joſephus de caſa bona*, which he gathered in *Candie*.

The Time.

They all flower all the Sommer Monethes, even untill the winter pull them downe, yet the tree Mallowes and the tree marſh Mallow, and *Egyptian* Mallow, doe flower later than the reſt; the yellow, the Indian, and red flowred Mallow, doe flower in the latter end of Sommer, yet ſo as if the yeare be not kindly, there is never ſeed gathered ripe from them, but from the tree and *Egyptian* Mallowes never with us, except that tree Mallow of our owne Land.

The Names.

It is called in Greeke μαλάκη *ab emoliendo ventre*, yet it is written μολόκη in *Epicharmes* and *Antiphanes* copies; in the *Aulularia* of *Plautus* they are called *Molochinarii*, that dyed cloth into a purple colour, and *Lucius Columella* hath this verſe, which is not eaſily interpreted, except of the *Malva horacia*.

Et Moloche primo ſequitur quæ vertice ſolem.

Tragus thinketh that he meant it by the leſſer Mallow, and that it turneth his leaves and flowers with the Sunne; *Plinye* hath *Molope quaſi movor*, which he referreth to the manured, and in Latine *Malva quaſi Molva, quod alvum molliat*, in *Engliſh Mallow quaſi Mellow*, either from the ſoftneſſe of the leafe, or from the ſoftning of the belly and hard tumors, or peradventure from the Latine. The *Arabians* call it *Chubeze* and *Chubes*, and the ſeede thereof *Bizeri Chubeiz*, the *Italians Malva*, The *Spaniards Malvas*, the *French Mauve*. The *Germanes Pappeln*, the *Dutchmen Malwe*, and *Kerkens cruyt*. The Garden Mallowes, which we call *Hollihockes*, are called *Malva ſativa*, *Malva Romana*, and by the *vulgar* in *Italy* in admiring the beautie and varietie of their colours, *Roſa ultramarina* or *Tranſmarina*, beyond Sea Roſes, and ſome alſo as the *Dutch* men doe Winter Roſes, for that their beautifull flowers ſhew themſelves, from the end of Sommer untill winter: Ἀλθαία in Greeke as alſo *Alcea* in Latine, is taken from ἀλκὴ *robur*, *præſidium*, *quaſi cæteris robuſtior & efficatior foret*, ſaith *Lobel* and *Pena*; of the *Italians Biſmalua* and ſo doe ſome in Latine call this *quaſi bis efficacior Malva* (but others more truely referre this word to the *Althæa*) and *Malva ſalvatica* and *buon Viſchio*, of the *Spaniards Malva de Vngria* and *Malva Monteſina*; of the *Germanes Sygmarts wurtſel* and *Symons wurtſel*, that is *Radix Simeonis* or *herba Simeonis*, and of ſome *Malva Vngarica*: Ἀλθαία *Althæa* in Greeke, *quaſi medica Latinè dici poſſet*, of the healing and remedying many diſeaſes: it is alſo called ἰβίσκος and ἑβίσκος. *Ibiſcus* and *Ebiſcus*, and ἰσχίον *Hibiſcus*, with the *aſpiration*, as it is alſo of ſome Latine writers, of *Barbarus Ariſtalthæa* from the excellencie of the effects, of *Galen* it is called *Anadendromalache Malva arborea*, but that is thought more fitly to agree to the *Hollihocke*, which as *Theophraſtus* ſaith, groweth in a few moneths to be ſo great, that the ſtalkes ſerved as ſtaves for men to walke with, and of ſome *Olus Iudaicum* the Iewes *pot-herbe*: *Pliny* in his 19. Booke and 5. Chapter calleth it *Paſtinaca*, for he ſaith

saith it differeth from the *Parsnep root*, in being more small and slender, not to be used in meates, but good for medecines, and in his 26. Booke and first Chapter, he saith *Ibiscus* is like unto *Pastinaca* which sheweth a wonderous great errour in him, that from the whitenesse, length and likenesse of the roote of *Althæa*, unto the *Pastinaca*, would conclude it a *Parsnep*, without regard of other forme or qualities; of the *Arabians* *Chitini Chateni*, and *Rosa zameni*, and *Serapio* in one place *Alsam*; of the *Italians* *Malvavisco*, and I thinke from them divers Latine Authors call it *Malvaviscus* derived as it were from *Malva* and *Ibiscus*, of the *Spaniards* *Malvavisco*; of the *French* *Guimauve*, of the *Germans* *Ibisch* and *Meilwurtz* or *Hisopwurtz*, of the *Dutch* *witte Huenst* and *witte Malwe*, wee in English call it marsh Mallow, from the place where it chiefly groweth in the salt marshes as I said before, or white Mallow from the colour of the leaves, and of some *Wimote*. The first of the first division is called of all *Malva vulgaris*, and of some *sylvestris major*, of *Brunfelsius* *Malva Equina*. The third is called *Malva sylvestris* or *Agrestis minor* of most, and of *Lobel* and others *Malva sylvestris repens pumila*. The fourth is *Matthiolus* his fourth Mallow, which he calleth also *Hederacea* and *Montana*, but of *Lugdunensis* *Malva major tertia* *Matthioli*: the fift is called by *Clusius* *Malva trimestris*, and of *Bauhinus* *Malva folio vario*. The first of the tree Mallowes is called by *Matthiolus* *Malva major altera* and *Arborea*, and so likewise of *Lobel*, of *Dodoneus* & *Camerarius* *Malva arborescens*. The next never had any other author to expresse it before now we therefore call it *Nostras* or *Anglica*, the eight is called by *Baptista Ferrarius* in his booke *de florum cultura* *Rosa Sinensis*, because he first received the seedes thereof from *China* but as he saith some called it *Malva Iaponica*, others *Indica*, of the naturalls *Fujo*: I have as you see joyned it to the Hollihocks, and because it abideth greene alwayes like the tree Mallow, I have intituled it *Indian* tree Hollihock, if any think better to alter it, *per me licet*. The first of the second division is called *Alcea* and *Alcea vulgaris* or *major* of most authors, but of *Anguillara* and some others it is called, *Canabis sylvestris*, and thought to be that of *Dioscorides*, he also calleth it *herba Vngarica*. The third is the *Alcea* of *Matthiolus*, *Tragus*, and others: The fourth *Lugdunensis* calleth *Alcea villosa* *Dalechampii*: the fift is thought by *Pona*, in his *Italian* description of *Mont Baldus*, to be *Abutilon Avicennæ*, which as he saith the *Ægyptians* call *Abelmoschi*, because of the sent like Muske, and saith that the Turkes doe counterfeite Muske with the seedes thereof, and contendeth that it is the true *Abutilon* of *Avicen*, and not the other that is so called; this is very like unto the *Alcea Ægyptia*, shewed you here and in my former booke, but more hairy as I said in the description, and therefore *Bauhinus* in his *Pinax* calleth it *Alcea Ægyptia villosa*: The first of the third division is called *Althæa*, and *vulgaris* of most Writers; yet *Cordus* upon *Dioscorides*, and in his History of Plants, calleth it *Malva palustris*, and *Gesner in hortis Germaniæ* *Malvæ agrestis genus*, of *Anguillara* *Malvaviscus*, of *Lobel* *Althæa Ibiscus*, as is before said. The second *Clusius* maketh his *Althæa Pannonica secunda*. I think, but is his third in his History, according to *Bauhinus*, who calleth it *Althæa flore majore*, of *Camerarius* *Althæa flore grandi Alcea*, & *Althæa Thuringica*. The third *Iacobus Cornutus* expresseth in his History of *Canada* plants under the same title here. The fourth *Bauhinus* onely setteth forth under the name of *Althæa frutescens Bryoniæ folio*. The fift is called *Abubilon Avicennæ* of *Anguillara*; *Matthiolus*, *Dodonæus* and *Camerarius*, of *Lobel* *Althæa floribus luteis*; *Gesner in hortis Germaniæ* calleth it *Althæa peregrina*, as also *Althæa Theophrasti*; but *Pona* in his *Italian* description of *Mont Baldus*, contesteth against those that call it *Abutilon Avicennæ*, saying that it is but an *Althæa palustris*, with a yellow flower, in that *Avicen* attributeth to his *Abutilon* or *Arbutilon*, the leafe of a Gourd which he saith this hath not, and the fruit long, like a Medlar, (where as this is round) and not long; *Dodonæus* likewise contendeth that it cannot be the yellow *Althæa* of *Theophrastus*, because the rootes of his *Althæa*, will condensate water, which the rootes of this will not. The sixt, *Camerarius* who had the seede sent him, from *Joseph de casa bona*, chiefe Herbarist to the Duke of *Tuscanie* or *Florence*, by the name of *Abutilon Indicum*, doth so call it also, saying it may be referred to the *Althæa's*: the seventh is thought to be the *Sida* of *Theophrastus*, which he mentioneth in his 4. Booke and 11. Chapter, for *Camerarius* calleth it *Sida vulgo*, but *Dodonæus* is against that opinion; for in reciting the text of *Theophrastus*, he sheweth that *Theophrastus* maketh his *Sida*, to be an herbe growing within the water, and lifting up the leaves above the water, and bowing downe the head after it hath done flowring unto the water againe, which this doth not: some therefore thinke that *Theophrastus* meaneth the *Nymphæa lutea*, or yellow water Lillie, which hath the like propertie, and the rather because it is a water herbe as all know, and that *Theophrastus* mentioning those plants that grow in the famous lake of *Orchomenis* maketh no mention of water Lillies, which as it is thought, that lake is not without; the chiefe repugnancy may seeme to be in the colour of the flower, which yet he plainely mentioneth not, but not in the forme; *Dodonæus* therefore calleth it *Althæa hortensis sive peregrina*, and *Lobel* *Althæa palustris Cytini flore* as I doe, and *Bauhinus* *Althæa palustris*. The eight is that *Althæa arborea*, that *Pena* and *Lobel* set forth to grow in Provence in *France* neere *Olbia*, and differeth from *Clusius* his *Althæa frutex secunda* (set forth in my former Book) as he doth plainely shew in his Historie of plants. *Camerarius* calleth it *Althæa arborescens*. and so doth *Tabermontanus*. *Lugdunensis* entendeth the first of *Clusius* which hee nameth *Althæa Ignosa Dalechampij*, having round leaves and a white flower greater than the common *Althæa*; for *Bauhinus* maketh his fourth and fifth *Althæa frutescens*, to differ from themselves, naming his fourth *Althæa frutescens*, *folio rotundiore incano*, and referreth it to *Clusius* his *Althæa frutex prima*, in his History of plants, which *Clusius* saith himselfe is not the same that *Lobel* calleth *Althæa arborea Olbia*; but maketh his fifth *Althæa frutescens*, *folio acuto parvo flore*, to be *Lobel* his *Althæa arborea*, which *Camerarius* also doth acknowledge, calling it *Althæa arborescens*, yet *Lobel* would seeme to make them both one. The last is called by *Clusius* *Althæa frutex tertia*, differing from both the former sorts, for *Clusius* there saith the seede came to him from *Candy*, and grew onely in his friends garden, to whom he imparted it.

The Vertues.

The young leaves both of the common and fine cut Mallowes, as also of the *French* Mallow and the garden Hollihocke, were in former times, and yet are in some countries eaten as a sallet herbe, to mollifie and open the belly, either greene or boyled, as *Martiall* the Poet testifieth in these Verses.

Exoneraturus alvum mihi vilica Malvas,
Attulit, & varias quas habet hortus opes.

The leaves of any of the Mallowes, and the rootes also boyled in wine or in water, or in broth, with Parsly or

or Fennell rootes, doth helpe to open the body, and ſome alſo apply the leaves warme after they are boyled, to the belly for the ſame purpoſe, and is very convenient in hot agues, and other diſtemperatures of the body; for by the mollifying quality, it not onely voideth hot cholericke and other offenſive humors, but eaſeth the paines and torments that come by obſtructions and conſtipation of the belly; and therefore they are uſed in all gliſters conducing to thoſe purpoſes: the ſame uſed by Nurſes that give ſucke to children, procureth ſtore of milke in their breaſts: the decoction of the ſeede of any of the ordinary Mallowes made in wine or in milke, doth marvellouſly help all the diſeaſes of the cheſt and lungs that proceede of hot cauſes, as excoriations, the ptiſicke, pluriſie, and the reſt, if it be continued for ſome time together: the leaves and the rootes worke the ſame effects, let any one take which of them they thinke beſt, or moſt ready at hand, agreeing to their diſpoſition: they helpe much alſo in the excoriations of the guts and bowells, and hardneſſe of the mother, and in all hot and ſharpe diſeaſes thereof, as alſo the *Alcea fruticoſa pentaphyllea*: the juyce drunke in wine, or the decoction of them in wine, doth help women to a ſpeedy & eaſie delivery: the common *Alcea* or Vervaine Mallow is thought to be moſt effectuall for burſtings or ruptures, and the bloudy flixe, and alſo for the ſhrinking of ſinewes and the crampe: the diſtilled water of them when they are in flower, worketh to the ſame purpoſes, but more weakely, yet it is much commended to be uſed in hot agues or fevers. *Pliny* ſaith, that whoſoever ſhall take a ſpoonefull of the juyce of any of the Mallowes, ſhall that day be free from all diſeaſes that may come unto him; and that it is eſpeciall good for the falling ſickneſſe. The ſyrupe alſo and conſerve made of the flowers are very effectuall for the ſame diſeaſes, and to open the body when it is coſtive or bound, by accident or a naturall diſpoſition: the young leaves are often eaten with ſalt as a ſallet: the leaves bruiſed and laid to the eyes with a little hony, taketh away the impoſtumations of them, which by ſufferance might grow to a Fiſtula: the leaves bruiſed or rubbed upon any place ſtung with Bees, Waſpes, or the like, yea of the Scorpion, and the biting of the deadly Spider called *Phalangium*, and is ſaid preſently to take away paines, redneſſe and ſwellings that riſe thereupon, and keepeth them from ſtinking, if they be rubbed therewith aforehand; and as *Dioſcorides* ſaith, the decoction of the leaves and rootes, helpeth all ſorts of poyſon, ſo as the poyſon be preſently voided by vomite; a pultis made of the leaves of Mallowes, boyled and bruiſed, whereunto ſome Beane or Barley flower and oyle of Roſes is put, is an eſpeciall remedy againſt all hard tumours, and inflammations of impoſtumes and ſwellings of the coddes and other parts, and eaſeth the paines of them, as alſo againſt the hardneſſe of the ſpleene or liver, to be applied to the places: the juyce of Mallowes boyled in old oyle and applied, taketh away all roughneſſe of the skinne, as alſo the falling of the haire, the ſcurfe, dandruffe, or drie ſcabbes in the head, or other parts, if they be anointed therewith, or waſhed with the decoction: the ſame alſo is effectuall, againſt the ſcaldings by water, and burnings by fire, and to helpe alſo the diſeaſe called Saint *Anthonies* fire, and all other hot, red and painefull ſwellings, in any part of the bodie: the flowers of Mallowes boyled in oyle or water, (as every one is diſpoſed) whereunto a little hony and allome is put, is an excellent gargle to waſh any ſore mouth or throate, for it clenſeth and healeth them in a ſhort ſpace; if the feete be bathed or waſhed with the decoction of the leaves, rootes and flowers, it helpeth much the defluxions of rheume from the head, which roſe out of the ſtomack; & if the head be waſhed therewith, it ſtayeth the falling and ſhedding of the haire thereof: the greene leaves ſaith *Pliny*, beaten with niter and applied draweth out thornes or prickes in the fleſh. The *French* and curled Mallowes, and the Hollihocks, are of the ſame nature and quality, and work to the ſame effect that the other do. The Marſh Mallow is the chiefeſt Mallow of all other, and moſt effectuall in all the diſeaſes before ſpecified, and therefore as I ſaid before, it was called *Biſmalva*, for that it was twiſe as good in effect as the other; the leaves are likewiſe uſed in ſtead of the common Mallowes, to looſen the belly gently, and are effectuall in decoctions of gliſters for to eaſe all the paines of the body, opening the ſtraight paſſages, and making them lubricke, whereby the ſtone may deſcend the more eaſily and without paine out of the reines and kidnies and the bladder, and to eaſe the torturing paines comming thereby; but the rootes are of more eſpeciall uſe for thoſe purpoſes, as well as for the diſeaſes of the breaſt and lunges, as coughes, hoarſeneſſe of the throate and voyce, wheefings and ſhortneſſe of breath, &c. being boyled in wine, or honied water and drunke: the rootes boyled in water very well, and after they be ſtrained forth the decoction being boyled againe with Sugar to a juſt conſiſtence and thereof made into rowles or trochiſces, or the like, are a *Potychreſton* and much uſed for all the purpoſes aforeſaid: the rootes and ſeedes of the Marſh Mallow, boyled in wine or water, is with good effect uſed by them that have any excoriations in the guts or the bloudy flixe, not ſo much by any binding qualitie in them, as by qualifying the violence of the ſharpe cholericke fretting humors, that are the cauſe thereof, and by the ſlimineſſe eaſing the paines and healing the ſoreneſſe, and in ſome ſort ſtaying the further eruption of bloud therefrom, at that time, or any other after: it is profitably taken of them that are troubled with ruptures, crampes or convulſions of the ſinewes, and boyled in white wine for the impoſtumes of the throate, called the Kings evill, and of thoſe kernells that riſe behind the eares, and inflammations or ſwelings in womens breaſts: the dried rootes boyled in milke and drunke, are ſpecially good for the chin cough: *Hippocrates* uſed to give the decoction of the rootes, or the juyce thereof to drinke, to thoſe that were wounded, and were ready to faint, thorough the expenſe and loſſe of bloud, and applied the ſame mixed with hony and roſen unto the wounds: the rootes boyled in wine he gave alſo to drinke, to thoſe that had received hurt by bruiſes or falls, or by blowes and ſtripes, to thoſe that had any bone or member out of joynt, and to thoſe that had any ſwelling paine or ach in the muſcles, ſinewes, or arteries of the body; it is good alſo to be uſed in all the ulcers and ſores that happen in any cartilaginous place: The Muccilage of the rootes, and of lineſeede and fenegrecke put together, is much uſed in pultiſes, ointments, and plaiſters, that ſerve to mollifie and digeſt all hard tumors and the inflammations of them, and to give eaſe of the paines in any part of the body: the ſeede either greene or drie, mixed with vinegar clenſeth the skinne, of the morphew, and all other diſcolouring thereof whatſoever, being bathed therewith in the Sunne, the ſeede of the yellow Mallow hath beene tried (even as the ſeede of the Marſh Mallow hath beene alſo) to be of ſingular good effect againſt the ſtone, if a dramme, or a dramme and a halfe at the moſt being made into pouder, be given at a time, and if the effect preſently follow not, let it be repeated the ſecond time, or the third, and it will give helpe; it provoketh alſo urine, and eaſeth the paines that come thereof, and of the ſtone: it is uſed by the Turkes to procure reſt and ſleepe, as *Paludanus* ſaith: the leaves or juyce or pouder of them, or of the ſeede, is uſed with good effect, to clenſe and heale greene wounds, by ſodering up the lippes of them quickly: The reſt of the Mallowes doe participate of the properties of the common,

in

in that all of them have in some measure or other that clammie juyce that is in them.

CHAP. LXVI.

Melochia sive Corchorus. The Iewes Mallow.

THe Iewes Mallow (for unto that family I referre it, both for some forme like thereunto, but more for the properties) is a small low hearbe, rising up a foote and a halfe high, from whose stalkes shoote forth diverse branches on all sides, whereon grow many leaves without order, up to the toppes, which are somewhat longer and broader than the leaves of *Bassill* some likewise shorter and broader, almost round, yet all of them pointed, and finely nicked about the edges, having at the bottome of each leafe, a small thred as it were on each side, which are of a little sowrish taste, the flowers come forth singly for the most part, but one standing at a place, every one upon a short foote stalk; consisting of 5 broad small pointed leaves, of a yellow colour, with some threds in the middle, which being past, there rise up slender long pods, somewhat like unto those of Swallowwort, which when they are ripe, open into five partitions, shewing within them small seede, somewhat like unto *Nigella*, but lesser, and of a blewish greene colour: the roote is somewhat long, with many threds or fibres thereat, which perisheth every yeare.

Melochia sive Corchorus.
The Iewes Mallow.

The Place.

It groweth in *Asia*, *Syria*, *Egypt*, and those places aboundantly, in the gardens where it is sowne, as also in many places of *Spaine* and *Italy*, but the naturall place is not knowne: It is so familiar in *Egypt*, as *Alpinus* saith, that the feast or meales meate that is made without a dish thereof, being boyled in water or fresh broth, is not thought to be sufficient plentifull.

The Time.

It seldome flowreth with us in regard that our Sommers are not hot enough to bring it to maturity, for having often sowen it, we could never have it grow above an hand high, the first cold ayre in the night causing it to perish quickly.

The Names.

It is called of most *Melochia* or *Molochia* of *Serapio*; it is thought by *Lobel* to be the *Corchorus* or *Corcorus* of *Plinye*, which he mentioneth in his 15 booke and 22 chap. but not that which he speaketh of in his 25. booke and 13 chap. which is that of *Dioscorides* and *Theophrastus* in his 7 booke and 7 chapter; for that is generally thought to be *Anagallis* or *Pimpernell*, as you shall heare when we come to it; *Rauwolfius* saith in his *Iournall* that in *Syria*, *Egypt*, &c. they call it *Moluchi*, and is that *Olus Indicum* that *Avicen* speaketh of. *Matthiolus* thinketh that *Halimus* Sea Purslane is the *Melochia* of the *Moores* and *Arabians*, because it was usually eaten as a sallet herbe.

The Vertues.

It is as *Alpinus* saith in faculty very like unto the marsh Mallow, for it is much used to suppurate, digest, resolve, and mollifie all hard tumors in that the mucilage thereof is more slimie than that of the marsh Mallow, 2 drammes of the seede he saith is usually taken at a time to purge plentifully all sorts of humours: the decoction of the leaves is very familiarly used against dry coughes, hoarsenesse of the throate and voyce, and shortnesse of breath, and with sugar candy is a present remedie: the oyle thereof is used so familiarly by the *Egyptians* in their meales as *Alpinus* saith, and that they seldome eate without it, notwithstanding that it breedeth many obstructions, and the viscous nourishment that it giveth, though little, turneth into melancholy and other diseases.

Vnto this Classis also might be added diverse other herbes, some whereof are set forth in the foregoing, and others in the succeeding *Classis*, each as they doe more especially partake with that Tribe wherein they are placed, as *Epithymum* before, and *Pollipodie* afterwards, and diverse others also among the bulbous and tuberous rootes, set forth in my former booke, as Daffodills, Sowbread, &c. And thus have I shewed you not onely all the strong purgers, but many others that are but moderate, conducing or helping, to open or loosen the belly. And now it is meete that I convert my stile to another Classis, or sort of hearbes, which are those that are venemous, and deadly, or dangerous at the least; as also sleepie and hurtfull Plants, and after them with those that are *Alexipharmaca*, the Antidotes, or Counter-poysons, of poysonfull or dangerous Hearbes.

VENEMOVS SLEEPIE AND HVRTfull *Plants*, and their *Counterpoysons.*

CLASSIS TERTIA, *THE THIRD TRIBE.*

CHAP. I.

Aconitum Lycoctum. Wolfes Bane.

I Have in my former booke given you the knowledge and deſcription of ſome of the Aconites or Wolfes bane, and therefore I ſhall not neede to deſcribe them againe, I will onely recite them unto you, and ſo follow on with the reſt: thoſe already ſet forth are theſe, *Aconitum hyemale*, Winter Wolfes bane, *Aconitum luteum Ponticum precox.* The earlier whitiſh yellow Wolfes bane. *Napellus verus flore cæruleo*, Blew Helmet flower, or Monkes hood, and *Anthora*, the holſome helmet flower or counterpoyſon Monkes hood; yet ſome of their figures I will inſert among the reſt.

1. *Aconitum Ponticum ſerotinum flore albido.* Late flowring Wolfes bane.

This late pale yellow or whitiſh Wolfes bane, hath as large leaves as the other, that I have ſet forth in my former booke, and divided into as many partitions, cut alſo on the edges ſomewhat deepely, but of a freſher greene colour, and not riſing or ſpringing up out of the ground, for almoſt a moneth after the former is come up; the ſtalke with leaves thereon, riſeth to be foure or five foote high, as the other doth, and with as long a branched head, of pale yellow coloured flowers, almoſt whitiſh, as it doth; but flowreth later by almoſt a moneth, than the other: the cods, ſeede, and rootes, differ not from the other.

2. *Aconitum flore Delphinii majus.* The greater leafed Wolfes bane, with Larkes heele flowers.

This Wolfes bane, hath diverſe greene leaves, riſing from the roote, of a very ſad or darke greene colour, ſtanding upon reaſonable long foote ſtalkes, cut in on the edges, into five deepe diviſions for the moſt part, even to the ſtalke, ſomewhat rough or hairy, each part whereof is alſo dented about the edges: from among which riſeth up a reaſonable great and ſtrong hairy round ſtalke, about two foote high, having ſome ſuch like leaves thereon, as grow below; at the toppe whereof is ſet many flowers ſpike faſhion, one above another, which are faſhioned ſomewhat like thoſe of Larkes heeles but larger and thicker, with a ſhort thicke crooked heele, behind them, of a very dead or ſad blewiſh purple colour, ſeeming as if they were rugged or crumpled withall, which addeth a greater evill favouredneſſe unto them, on the outſide, but of a little freſher or more lively blew colour, and ſmooth on the inſide: after which doe come diverſe ſmall rough cods, ſtanding together like as other *Aconites* and *Columbines* doe, wherein is conteined a rugged blacke ſeede: the roote is ſomewhat thicke long and blackiſh, with diverſe fibres and long ſtringes faſtned thereunto, whereby it taketh ſtrong hold in the ground: both ſtalkes and leaves dye all downe to the ground every yeare, and ſhoote forth new every ſpring.

3. *Aconitum flore Delphinii minus.* The finer leafed Wolfes bane with Larkes heele flowers.

The leſſer Larkes heele Wolfes bane, hath diverſe ſmooth greene leaves, upon very long foote ſtalkes, but they are not altogether ſo large, or of ſo ſad a greene colour, and much more finely cut in and divided into many jagges or parts, than the former: the ſtalke alſo riſeth not up ſo high, and beareth ſome ſmaller and finer leaves thereon, which endeth in a ſmaller ſpike or head of almoſt as large flowers, with a ſhort ſpurre or heele behind, as the other, but of a fairer blewiſh purple colour, and more lively, as well on the outſide as inſide: the cods and ſeede are like the former, but the roote differeth having three or foure thicke ſhort blackiſh rootes, ending in ſmall long points, faſtned together at the head.

4. *Aconi-*

1. *Aconitum luteum Ponticum serotinum.*
Late flowring Wolfes bane.

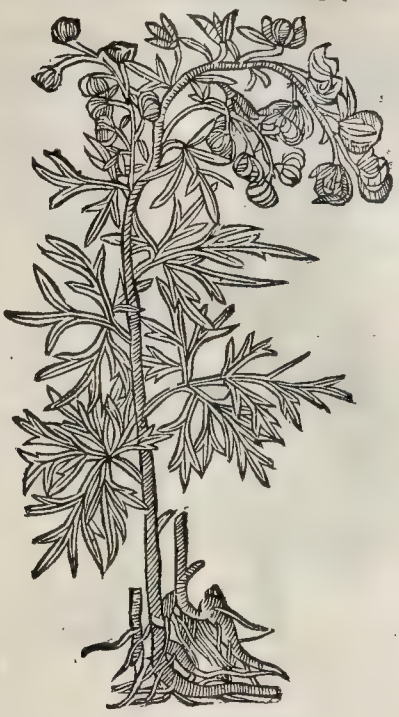
2. 3. *Aconitum flore Delphinii majus & minus.*
The greater and lesser Wolfes bane with Larkes heele flowers.

4. *Aconitum cæruleum minus sive Napellus minor.*
The small blew Helmet flower.

5. *Aconitum Lycoctonum præcox.*
The early flowring Wolfes bane.

6. *Aconitum cæruleum autumnale.*
The harveſt Helmet flower.

7. *Aconitum maximum coma nutante.*
Great Woolfes bane with a bending top.



4. *Aconitum cæruleum minus, ſive Napellus minor.* The ſmall blew Helmet flower.

The ſmall blew Helmet flower riſeth up with a round greene ſtalke, two or three foote high, whereon grow divers darke greene ſhining leaves, cut into five partitions very deepely, each of them ſomewhat cut in on the edges, very like unto the leaves of the greater blew Helmet flower, but that theſe are not ſo finely devided, and the diviſions are ſomewhat broader: the top of the ſtalke is divided into two or three branches, each whereof beareth one flower, and ſeldome two or three, of a very faire deepe blewiſh purple colour, very like in forme unto the other great Helmet flower, but that the flower is ſmaller, and the creſt of the Helmet riſeth higher, then in that; after which come ſmall pods like the other, and ſuch like ſeede: the roote is round like a Bulbous, big below and ſmall above, and encreaſeth thereby, giving ſuch like rootes, with ſmaller fibres thereat, then at the greater rootes.

5. *Aconitum lycoctonon præcox.* The early flowring Woolfes bane.

The early Helmet flower or Woolfes bane, riſeth up very early in the ſpring, with many thicke ſhining darke greene leaves, cut into five diviſions, and they againe ſomewhat devided or cut in on the edges, but not ſo finely as thoſe of the greater Helmet flower, neither whitiſh underneath as they are, but rather of a paler greene on the underſide and ſhining, as well as the upper ſide: the ſhining round greene ſtalke riſeth not fully ſo high as the Helmet flower, being not much above two foote high, having divers leaves thereon, like thoſe below, but ſmaller, and at the top but a few flowers, in compariſon of the other Helmet flowers, but are like unto them both for forme and colour, being of a moſt brave, deepe blewiſh purple colour: after which come three pods, ſtanding together for the moſt part, and no more, wherein lyeth ſuch like round blackiſh ſeede, as are in all the reſt: the rootes are very like thoſe of the greater Helmet flower, and encreaſeth as much, by ſetting of ſundry ſuch like heads.

6. *Aconitum cæruleum Autumnale.* The Harveſt Helmet flower.

This late flowring Helmet flower is very like alſo unto the ſmaller Helmet flower, riſing as high and having ſuch like darke greene leaves ſomewhat ſhining, devided in the ſame manner, but ſomewhat larger: the flowers grow in long ſpikes, of a faire blewiſh purple colour, the pods and ſeede are like, but the roote hath onely divers blackiſh ſtrings or fibres, ſet at the ſeverall tuftes of heads, which are not Turnep like nor bulbous like, as the greater and leſſer Helmet flowers are, which maketh the difference, beſides the time of the flowring which is later then either of the other, that is not flowring untill *Auguſt*.

7. *Aconitum maximum coma nutante.* Great Woolfes bane with a bending top.

This great Woolfes bane hath very long and ſlender ſtalkes, even three or foure foote high, devided at the tops into ſundry branches, with long ſpikie heads, of very large flowers, which for the weakeneſſe of the ſtalkes and the weight of the many flowers growing together, bow downe their heads: for the flowers are greater and larger then in any other Helmet or Woolfes bane flowers, and of a paler blewiſh purple colour, then in the Helmet flower: the leaves alſo are larger, and more devided then in any, except the leſſer Woolfes bane,

Napellus Verus. The true Helmet flower.

Anthora. The counterpoison Monkes hoode.

8. *Aconitum purpureum aliud.*
Another purple Helmet flower.

Aconitum hyemale.
Winter Wolfes bane.

with Larkes heele flowers: the pods are greater and ſtand three or foure together, with larger rough blackiſh ſeede in them: the roote is thicke and long, ſomewhat like unto the rootes of the greater Helmet flower, and encreaſeth ſuch like heads by it in the ſame manner.

8. *Aconitum purpureum aliud.* Another purple Helmet flower.

This other purple Helmet flower hath larger leaves then the other, of a ſadder greene colour and ſhining withall, but inciſed after the ſame manner: the ſtalke likewiſe groweth very high, and often ſpreadeth into ſundry branches, bearing large purple blew flowers in longer ſpikes then the other; the ſeedes and rootes be much like the other Helmet flower.

Aconitum hyemale. Winter Woolfes bane.

This is deſcribed in my former Booke.

Vnto theſe kinds of *Aconites* may be referred the *Anthora* or *Antithora*, ſet forth in my former booke, for that in the outward face and forme of growing, it doth ſo nearely repreſent them, that it made *Cluſius* thinke it muſt alſo be of the ſame deadly quality with them; and although the name doth import it to be the remedy againſt the poyſon of the herbe *Thora*, which ſhall be ſhewed in the next Chapter, and ſo might challenge to be rather inſerted among the *Alexipharmaca*, Counterpoiſons, yet becauſe both it is as I ſaid ſo like unto thoſe former *Aconites* in the flowring, and yet is the remedy againſt the poyſon of theſe *Aconites*, as well as of that *Thora*, I thinke it fitter to mention it here then there, and give you the figure and properties thereof likewiſe, among the vertues, although I have ſaid ſomewhat of them formerly.

The Place.

None of theſe plants grow naturally wilde in our country that ever I could certainly learne, although Doctor *Penny* in his life time, ſeemed to affirme, that he ſaw ſome of their kinds growing on certaine hills in *Northumberland*: they all grow in woods and ſhadowie places in *Italy*, *Germany*, and other places.

The Time.

Some of theſe flower earlier and ſome later then others, according as their tides teſtifie; the reſt flower in the end of *May* or beginning of *Iune*.

The Names.

It is called in Greeke ἀκόνιτον *Aconitum*, *ita dictum* ſaith *Pliny*, *quia in nudis cautibus naſcitur, quas aconas nominant, ubi nullo juxta ne pulvere quidem nutritur*, which *Ovid* expreſſeth in the ſeventh booke of his *Metamorphoſis* in theſe verſes.

Quæ quia naſcuntur dura vivacia cote
Agreſtes Aconita vocant——

Theophraſtus ſaith it tooke the name *ab Aconis ubi plurimum naſcitur, Is autem vicus eſt Peryandinorum, qui ad Heracleam Ponti eſt*, which *Pliny* ſaith againe in his ſixt booke and firſt Chap. *Portus Aconæ veneno Aconito dirus.* But *Pena* miſliking theſe derivations ſaith, *Aptior fuerit Nomenclatura interpretatio, ſi eam ab herbæ ſucco, vel radice, quibus quaſi cote ſpicula a venatoribus affricta & ſubacta, cælerius ſubirent, & perniciem adferrent, quam ſi a cautibus, aut a pagi cognomine deducas*: yet ſaith he *poſſit etiam* ἀπὸ τῦ ἀκοντίζειν *deduci, quemadmodum* τοξικὸν ἀπὸ τοῦ τοξεύειν *& non a taxo.* For even ſo *Xenophon in Cyripædia* ſaith, οὐδὲ γὰρ τοξεύειν, οὐδὲ ἀκοντίζειν αὐθρώπου ἐπιτρέπομεν ὑμῖν. *Neque enim jaculari neque in hominem collimare permittebamus vobis*: it is called *Lycoctonon & Cynoctonum* becauſe it killeth Woolves and Dogs; in Latine *Aconitum & luparia*, for the ſame cauſes: But the name of *Aconitum* was referred to many ſorts of poyſons, and poyſonous herbes, one much differing in face, though not quality from another, as hath beene ſhewed before in the white Ellebor and others, and may be hereafter more as occaſion ſhall ſerve; It is called of the *Arabians Chanach adip* or *adib, id eſt, ſtrangulatorem lupi*, of the *Italians Aconito & Luparia*, of the *Spaniards Yerua matta louo*, of the *French Tue loup*, of the *Germans Wolffs wurtz*, of the *Dutch Woolfwurtel*. The firſt kind here ſet downe is called by *Geſner* in *hort Ger, Aconitum primum flore albo*. *Camerarius in horto* under the name of *Aconitum Lycoctonum flore luteo* diſtinguiſheth both the kinds very well, ſaying the greater hath the largeſt leafe and faireſt greene colour and flowreth later then the other, it is thought to be the ſixt kind of *Aconite*, that *Matthiolus* giveth onely the dumbe figure thereof: The ſecond is called of *Cluſius Aconitum Lycoctonum flore Delphinii* jm. *Sileſiacum*; of *Camerarius Aconitum flore Delphinii*: of *Geſner in hortis Germaniæ Aconitum cæruleum aliud*, of *Bauhinus Aconitum cæruleum hirſutum flore Conſolidæ regalis*: the third is the *Aconitum flore Delphinii* of *Dodonæus* and *Lobel*: of *Dalechampius Aconitum Lycoctonum cæruleum* jm. *flore Delphinii Dodonæi*: it is probable to be the fourth *Aconitum* of *Matthiolus*. *Bauhinus* calleth it *Aconitum cæruleum glabrum flore conſolidæ regalis*: the fourth is called *Aconitum Lycoctonum tertium cæruleum parvum* of *Dodonæus*, of *Lobel Lycoctonum cæruleum parvum facie Napelli*: it is the tenth *Aconitum* of *Cluſius*, who ſaith and ſo doth *Geſner* alſo, that is called in *Italy Thora Italica*, and of the *Chymiſtes* there *herba tora*: of *Bauhinus Aconitum cæruleum minus, ſine Napellus minor*. The fift is called *Aconitum Lycoctonum 4. Tauricum* by *Cluſius*; and by *Bauhinus Aconitum violaceum ſeu Napellus ſecundus*. The ſixt is the *Aconitum Lycoctonum alterum* of *Dodonæus*, and is the ſeventh *Aconitum Lycoctonum* of *Cluſius*, which he ſaith is called alſo *Autumnale*: The ſeventh is the eight *Aconitum Lycoctonum comanutante* of *Cluſius*, *Bauhinus* calleth it *Aconitum inflexa coma maximum*: the laſt is called by *Cluſius Aconitum Neubergenſe* and by *Bauhinus Napellus tertius*. I call all theſe kinds Woolfes banes and Helmet flowers, not onely for a diſtinction from the other ſorts that follow (for all theſe are in face and forme of growing, and in leaves, rootes, flowers and ſeede one, not much differing one from another) but to ſhew you that it is even *Dioſcorides* his diſtinction, who maketh this his *Aconitum alterum*, which he ſaith was called *Lycoctonum* and *Cynoctonum*, although his former *Aconitum* called *Pardalianches* did kill Woolves as well as this, and tha tſuch different herbes ſhould not goe in Engliſh under one common name of Woolfes bane, whereby it ſhould bee hard to underſtand in the naming of them what kind is meant.

The Vertues.

All theſe plants are poiſonous and deadly to mankinde, to be taken inwardly any manner of way, as that feaſt, at Anwerpe ſheweth, where by ignorance the leaves of *Luparia* or *Napellus*, being put as a ſallet herbe with others, many that did eate thereof died, after the violent paſſions they endured for the time: it is alſo as deadly to Dogs, Wolves, and other creatures, who ſhall take thereof, either the juyce of the herbe or roote, or the herbe or roote it ſelfe, put into fleſh, and given them to eate: in the juyce of the rootes eſpecially, the hunters of wilde

beastes, doe use to dippe the heads of their arrowes they shoote, or darts they throw at the wilde beasts, which killeth them that are wounded therewith speedily; yet it is said that the flesh of the beasts so killed, is no whit poysonous but safe, and eateth more tender than of others of the same kinde, not killed in the same manner, so as it abide undressed for a day and a night. The ordinary physicall remedies that is to be used for any that have taken of these herbes, is first to procure vomiting, with all the speede possible, to avoid as much of the evill substance that remaineth in the stomacke as may be; and secondly glisters, both to cleanse the bowells, and to draw the evill quality downewards that way: and thirdly preservatives to defend the heart and vitall spirits from suffocation, or the bloud from putrefaction or congelation; which are effected by taking Mithridate, or rather *Venice* Treakle, which is more appropriate for poysons; as also to drinke the decoction of *Origanum*, Rew, Horehound, Wormewood, or Wormewood wine; as also Southernwood, *Chamæpitys*, or ground Pine, and *Gentiana*: a dramme of the true *Opobalsamum* taken with hony is much commended, and so is Castor, Pepper and Rue, of each a little quantitie taken in wine. Some commend also to drinke that wine, wherein iron, or gold, or silver, made red hot hath beene quenched. *Petrus Aponensis* in his Booke of poisons, commendeth the use of *Terra lemnia*, a dramme or two, thereof to be taken in warme drinke; but above all hee saith that *Aristolochia longa*, or the long rooted Birthwort, is the most especiall antidote or remedy against all Aconites: But behold the wonderfull goodnesse of God; who although he hath given to these plants so deadly faculties, yet hath he endued them also with other properties, very beneficiall to mans health: as that the juice or distilled water of *Aconitum Ponticum* of both sorts, dropped into the eyes, taketh away the inflammation or rednesse in them, as also cleareth them from any haw, or pinne or webbe, growing in or upon them. It is said likewise by *Pliny*, that if any be stung with a Scorpion, or other venemous Serpent, or have taken any other poison, that to take of this in warme wine will expell the other; for finding another enemy already possessing the part that he would worke upon, he striveth to overcome his malignity, and spendeth his force wholely upon it, and thereby freeeth nature from ruine, (but this were a desperate cure for a desperate disease) and that by the touch onely of this Aconite, Scorpions are dulled, and restored againe by white Hellebor; how true this is I leave to every one to judge or trie as he shall thinke best himselfe: but certainely if either the roote or seedes of these Aconites, or of the other Helmet flowers be beaten into pouder, or the juyce of them boyled with oyle, or Hogges fat, and the head and body anointed therewith, it will kill lice and vermine breeding therein: the lye also wherein the leaves, rootes, or seede, hath beene boyled, doth the same, and clenseth the head also from scurfe and dandraffe. *Galen* saith that they are used in foule ulcers and sores, to consume the dead flesh, so as the sores be not in the mouth ot privities, which by reason of their vicinitie, to the spirits and life are not to be dealt with in such sort: and for the Helmet flowers (they are all thought to be of one nature, howsoever it is spoken but of one that is the more common) *Avicen* prescribeth an Antidote or remedy against the poison thereof, to be made with the Mouse that feedeth upon the roote of the *Napellus*, or Helmet flower, saying, that that Mouse is the Treakle thereof, and being taken in the whole substance, resisteth the venome of the *Napellus*, and freeth them from all danger; which Mouse *Matthiolus* saith he hath often found, and saith it is that which *Avicen* calleth *Napellus Moysis*, having the same propertie against the poison of *Napellus*, that the plant it selfe so called hath. *Petrus Aponensis* also saith, that this Muse that feedeth upon the rootes of *Napellus* is the *Bezoar* against the *Napellus*, if it be dryed and two drams of the pouder given in drinke; but *Antonius Guainerius*, a famous Physitian of *Pavia*, in his Treatise of poisons thinketh that it cannot be a Mouse, that *Avicen* maketh mention of to feede upon the roote of *Napellus*, but that they are certaine great Flies that feede upon the flowers, whereof his Antidote is made that expelleth the poison. For hee there reporteth the industry of a certaine student in Physlosophy, desirous to know the truth hereof, who sought diligently for this Mouse, but could neither find or see any, or that any rootes had beene eaten or bitten by any Mouse or the like thing, but found abundance of Flies feeding upon the leaves, which therefore hee tooke, and with them in stead of the Mouse he made an Antidote, which he found to be very effectuall, not onely against other poisons, but chiefely that of the *Napellus* or Helmet flower: *Petrus Pena*, and *Matthiolus de Lobel* confirmeth this opinion, and experience of *Guainerius* his student by their owne triall also, who not finding any Mouse, nor hearing thereof by any the Shepheards, and others living in those mountaines of *Switzerland*, where the *Napellus* groweth in abundance, or that ever they had seene any Mouse to feede thereon, found as they say great store of certaine great Flies, with blewish greene heads and wings, like unto *Canthariaes* feeding upon the flowers, when as they could not finde any other living creature, to touch or eate it; the grasse every where being eaten by the cattle that fed thereby, but not any part thereof once touched. And therefore much suspected that this *μῦς mus*, was mistaken by the *Arabians* for *μῦια musca* the Greeke word as well as the Latine, being so neare in letters the one unto the other; (for the roote of this *Napellus* killeth Mice as the name *Myoctonon* and *Myophonon* doth import:) of which Flies as they say, and not of any Mouse, is made an antidote most prevalent against the poison of the most venemous Spider called *Tarantula*, as also against all other Epidemicall generall, or contagious diseases, and is made after this manner. Take twentie of the Flies that have fed upon *Napellus*, of *Aristolochia* and *Bolearmoricke*, of each a dramme, whereof a dramme is to be taken at a time, *Guainerius* his Antidote is to be made with *Terra lemnia*, Bayberies and Mithridate of each two ounces, xxiiij. of the Flies that have fed upon *Napellus*, of hony and oyle a sufficient quantitie, to make it up into an Electuary: you may see hereby the various opinions and Writings of men, *Matthiolus* and *Aponensis* saying they have found and used the Mouse, that fed on the *Napellus*; and *Guainerius*, *Pena* and *Lobel* denying it, which whether is the truer, and more probable, is in part shewed before, and in this may be confirmed, that *Dioscorides* and others doe write, that the *Aconitum Lycoctanum* (whereof *Napellus* is a kind and as strong) is also called *Myoctonon* or *Myophonon*, that is *Muricida*, because it killeth Mice, as well as Wolves, and therefore they could not live upon it if it would kill them. The *Anthora* or Counterpoison Monkes hood, is said by all Authors that it groweth, with or hard by the *Napellus* or *Thora*, although *Gerard* saith the contrary, and adviseth that it be not planted neare the *Napellus* or Helmet flower, for feare of drawing the venemos qualitie thereof unto it. The roote is said by *Hugo Solerius*, to purge the body very strongly, of watersh and vicious humors, both by vomit and by the stoole, if the quantitie of a beane, be taken in broth or in wine: by reason of the exceeding bitternesse of the roote, it killeth all sorts of wormes in the body: it is also saith *Guainerius*, by mine owne experience and sight, as effectuall as *Dictamnus* unto all the purposes whereunto it serveth: the powder of the rootes taken in wine, is a most speedie and speciall remedie, against the winde collicke, which the *Savoyards* about *Diam*, where it groweth abundantly,

dantly, know very familiarly, and call it *L' herbe du machon*, that is, the wind collicke herbe, and ſuppoſe that it having two round rootes, the one will be full and ſolide one yeare, (as it is in the *Orchides* or *Satyrions*) and the other lanke, whichchangeth to be ſolide the next yeare, when the other that was firme in the former yeare, will then become lanke; that the ſound roote will eaſe the winde chollicke, and the lanke procure it: the ſame rootes alſo uſed inwardly, is not onely the chiefe and principall Antidote or remedie, againſt the poyſon of theſe Wolfes banes, and Helmet flowers, but of the Leopards bane, which ſhall be deſcribed in the next chapter, and all other poyſonous berbes whatſoever: and againſt the venome of all ſerpents and other venemous beaſts or creatures, and is alſo a moſt ſoveraigne remedy againſt the plague or peſtilence, and all other infections, or contagious diſeaſes, which raiſe ſpots, pockes, or markes in the outward skinne; by expelling the poyſon from within, and defending the heart, as a moſt ſoveraigne Cordiall.

CHAP. II.

Aconitum Pardalianches ſive Thora. Leopards bane.

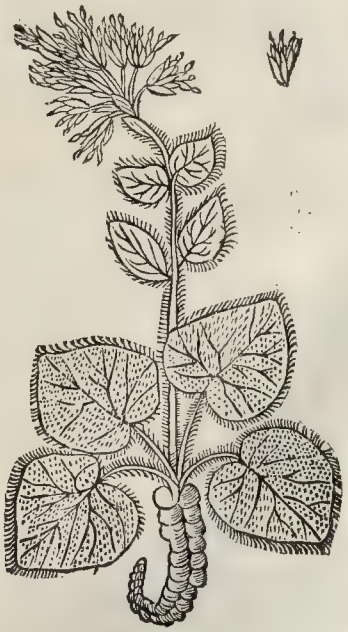
OF this ſort of Leopards bane, there are accounted two ſeverall ſorts, differing in bearing more leaves, one than another, as alſo in the greatneſſe of them, and of the whole plant, which yet might rather be attributed, to the fertility or ſterilitie of the ſoyle, wherein they grow: but as they are remembred by others, ſo I muſt proceede alſo, and ſet them forth here unto you.

1. *Aconitum Pardalianches ſive Thora minor.* The leſſer Leopards bane.

The Leopards bane is a ſmall low herbe, riſing up with a ſmall ſlender round ſtalke, little more than halfe a foote high, bearing about the middle thereof but one ſmall ſtiffe or hard leafe, for the moſt part, but ſometimes two or three one above another, and ſometimes two together, which are round ſomewhat like the leafe of *Aſarum*, but leſſer, ſmooth, and of a blewiſh greene colour full of veines therein, ſomewhat unevenly dented about the edges, not compaſſing the ſtalke, but ſtanding from it, upon ſhort footeſtalkes: the toppe of the ſtalke is divided oftentimes into two or three branches, with a ſmall narrow leafe at the joint, and one ſmooth pale yellow flower at the toppe thereof, ſomewhat like unto thoſe of *Cinquefoile* or five leafed graſſe, conſiſting in many of foure, and in ſome of five round pointed leaves, with a ſmall greeniſh head in the middle, which when their flower is fallen, groweth to be a ſmall head, conſiſting of many ſmall ſeedes ſet together, like unto the heads of diverſe ſorts of *Ranunculi*, or Crowfeete: the roote is compoſed of ſeven eight or tenne, ſmall long round very white ſhining rootes, ſomewhat unevenly as it were branched out like knots or joynts in diverſe places, plainely to be diſcerned in ſome, but in others not, being plaine and ſmooth, ending in a ſmall long fibre, and all of

1. *Aconitum Pardalianches ſeu Thora minor.* The leſſer Leopards bane.

3. *Aconitum Pardalianches Dioſcoridis Matthiolo cum floribus Lugdunenſis. Matthiolus* his fained Leopards bane with flowers added by *Lugdunenſis.*



them fastened at the head thereof, like unto *Asphodill* rootes, of the most poisonfull qualitie, that hath beene found in any other herbe.

2. *Aconitum Pardulianches sive, Thora major.* The greater Leopards bane.

The greater Leopards bane, is in all things like unto the lesser, before described, but that it is greater, and riseth higher, having larger leaves, and finely dented about the edges, and two or three standing together about the middle of the stalke, some smaller than others, and sometimes one above another, and some small long and narrow ones at the joints and brancheth forth into two or three parts or more, bearing every one his small yellow flower, like the former: the seede and roote is also like the other.

3. *Aconitum Pardulianches Matthioli commentitium. Matthiolus* his fained Leopards bane.

I thinke it not amisse to set forth unto your view that figure of *Matthiolus*, which he (as is thought caused to be drawne according to his owne fancie, taking his patterne from this *Thora*, and desirous to expresse it with some nearer resemblance unto *Dioscorides* his description, of *Aconitum Pardulianches*,) hath set forth, with foure round rough leaves, and one long crooked roote, bunched out in diverse places, like unto the taile of a Scorpion, which figure bred a great contention betwixt *Gesner* and him; *Gesner* laying to his charge, that he had but fained it, and that there was no such herbe, *in rerum natura*, because it was made so artificially, and wanted fibres, which all other rootes have, whereby they draw nourishment out of the earth. *Matthiolus* in his defence to that point alledgeth, that *Dentaria* which we call Lungworte, hath no fibres, being a roote consisting onely of scales, as it were set together; as also in that other roote called *Dentaria bulbifera*, which as *Matthiolus* saith, the *Germans* call *Sanicula alba*, and he setteth forth among the *Symphita*; but the Author of the great Herball printed at *Lyons* who was *Ioannes Molineus* and going under the name of *Dalechampius*, but of most writers called *Lugdunensis*, taketh upon him the defense of *Matthiolus* his sinceritie in his appendix to that generall history, and sheweth the same figure of *Matthiolus*, with a stalke of leaves and flowers added to it, which the former wanted, and with all giveth the description thereof in this manner; it riseth up saith he early in the yeare, if the spring be milde, with his stalk, before any of the lower leaves appeare, as the Coltes foot and the Butter burre doe; having foure small round hairy leaves upon the stalke, set by couples at distances; the flowers are many growing in a tuft, or round head together at the toppe thereof, of a pale yellow colour, with many yellowish threds in the middle: when the flowers are past, then commeth up the leaves, which are foure for the most part, and are almost round, hairy and greene on the upperside, and hoary white underneath, full of veines running through them, and full of small spots: the roote consisteth of many knots and joints like unto a Scorpions taile, in the same manner as *Matthiolus* hath set it forth in his figure: this he saith groweth on the Alpes of *Savoy*, not farre from the chiefe Monastery of the *Carthusians*, in a rough rockie place, which they call, *Les Escheles*, that is, the ladder, because the way of the rocke, is cut out into steppes, to get up to the toppe: and saith that this he saw with his owne eyes, and that an Apothecary of *Trevers*, who had diverse plants growing thereof in his garden, and abiding many yeares, from whom he obtained the whole plant to set forth, to end the controversie betweene two such worthy men; and yet this figure is much suspected also to be but counterfeit, by *Columna* in the 44. page of his *minus cognitarium stirpium*, & by *Bauhinus* and many others: but if I might shew mine opinion, I would rather thinke that *Matthiolus* set forth his figure a little artificially from the *Doronicum brachiata radice* which hath round leaves and such a like roote: if I be mistaken let it be accounted my error.

The Place.

The first groweth in shadowie places, on the snowie hils in *Savoye*, where there is scarse any crust of earth for the rootes to grow in, neere unto *Mura*, and in the toppe of *Iura*. The second groweth in the like places, among those Alpes of the *Valdenses*, that respect *Italy*, called *Vnderflumen* and *Engronia*, as also upon the mountaine *Baldus*, which is not farre from *Verona*; the last his place is declared in the description.

The Time.

They all but the last doe flower in Iune, and Iuly, which are the spring Moneths of the Alpes, and their seede is ripe in August.

The Names.

It is called in Greeke by *Dioscorides* ἀκόνιτον παρδαλιάγχες, *Aconitum Pardalianches*, because the herbe killeth Leopards, Wolves, and all other foure footed beasts very speedily. It is called of diverse also *Thora*, from the Greeke word θόρος, that is, *corruptio, venenum aut mors*. *Theophrastus* describeth it in his ninth Booke and ninth Chapter, under the name of *Thelyphonon*, because it is a speedy death to females; or because being put into the secret parts of females, it speedily killeth even within a day. *Gesner* and others take it to be *Limeum* of *Pliny*, in his 17. Booke and 10. Chapter, which he saith is an herbe so called by the *Gaules* wherewith they doe make a medicine, to dippe their arrow heads in, when they hunt wild beasts, which they call *Cervaria*: *Gesner* saith also it was called of some in his countrie, *Lunaria*, because the leaves were round like unto a full Moone, himselfe calleth it *Thora Venenata* and *Toxicum Valdensium*. *Clusius* maketh it to be his third *Ranunculus grumosa radice*, and *Lobel* calleth it *Phthora Valdensium*. *Matthiolus* in contempt of *Gesner* calleth it *Pseudo aconitum Pardalianches*, as though it were but a base kind of *Aconite*, without force or vertues, (which it seemeth he rather uttered in the heate of his contention, and contestation with *Gesner*, who alledged that this was the truer *Aconitum Pardalianches* of *Dioscorides* than in the truth of the matter) it being the neareſt to *Dioscorides* his description in all other parts as well as in the rootes which are shining white like Alablaster, and the strongest and speedyest poison of all manner of herbes. It may be called in *English*, either round leafed Wolfes bane, or Leopards bane to distinguish it from the former.

The Vertues.

Dioscorides giveth no other properties to this kinde of *Aconite*, then death to all foure footed beasts, being given to them in flesh, besides the helpe it giveth to the eyes in easing their paines, being put with other things that are for that purpose: *Theophrastus*, and *Pliny* after him say, that it is a remedy against the Scorpion, being taken in warmed wine, for it killeth nature if it finde not an enemie in nature, whom it may kill, against whom it striveth and spendeth its strength, to overcome it, that it might free nature of danger, thus saith *Pliny*: it was called *Scorpio* because the roote was like a Scorpions taile, it seemeth also it was upon the like occasion called *Theriophonon*, because it killeth Serpents; for they say, that the Scorpion is a stonied, and looseth both strength and motion, being

being onely touched with the Aconite; and receiveth life and ſtrength againe, if it bee touched or rubbed with white Ellebor. It is found by moſt certaine experience, that it is the fierceſt and ſpeedieſt poyſon, ſurpaſſing all other, that groweth on the ground; and that they uſed to ſay in the former times, there was not found any remedie againſt it, although many things had beene tryed, but of later times the induſtry of man, hath found out his *Antigoniſt* or Counterpoyſon, which is the *Anthora* before declared. *Geſner in libro de Lunariis*, reciteth that if a ſword, dart, or arrow, be but touched with the juyce thereof, and therewith either man or beaſt wounded, that any blood be drawne, the malignity thereof ſo quickly pierceth inwardly, that it preſently killeth, corrupting and congealing all the blood, unleſſe that part round about the wound be inſtantly cut away, and that it killeth any wild beaſt ſo wounded, after three or foure leapes or ſpringings; but (that which is more wonderfull in my opinion) he ſaith that the fleſh of that beaſt ſo killed, is not deadly or dangerous to any that ſhall eate thereof: therein peradventure like the baite that is given to fiſh, to make them lye on the toppe of the water, eaſie to be taken with ones hand, and yet not hurtfull to be eaten, and *Plinye* ſaith it killeth fiſh, whereby as hee ſaith it is knowne, that that poyſon is an enemie to the blood. For he ſaith, that if any blood ſhould fall into the pot, where this poyſon is kept, it will preſently looſe its ſtrength. It is ſaid alſo that it is ſo pernicious, that if it be but held in the hand a little time, it will almoſt take away the ſenſes; as alſo, that one but ſmelling thereto, after he had gathered it fell downe as dead, and with much a doe was recovered.

CHAP. III.

Doronicum ſive Aconitum ſuppoſititium. The ſuppoſed Wolfes bane.

I Doe adjoyne this hearbe *Doronicum*, next unto the Wolfes banes, becauſe many doe hold it a kind thereof, which how true or falſe you ſhall heare by and by in his place. Of this kinde there are found diverſe ſorts, differing either in rootes or leaves one from another, and ſome for the likeneſſe, or flowers, or manner of growing, are referred unto them, as ſhall be preſently declared.

1. *Doronicum vulgare.* The moſt common ſuppoſed Wolfes bane.

The moſt common *Doronicum*, (that hath beene longeſt known unto us, and kept in our gardens, many of the reſt being found of later yeares) hath diverſe leaves riſing from the roote, every one ſtanding upon a long foote ſtalk, which are ſomewhat round, greater than the Romane Sowbread leaves, ſoft and gentle in the handlig, ſomewhat hayrie and of a freſh greene colour; from among which riſeth up diverſe greene roundiſh ſtalkes about a yard high or more, parted at the toppe, ſometime into one or two branches, every one carrying a large flower, ſomewhat like the Corne Marigold, but much larger, having many narrow long yellow leaves, as a border ſet about a middle thrumme, ſomewhat yellower, which when it falleth away, turneth into ſmall whitiſh downe;

1. *Doronicum vulgare.*

2. *Doronicum minus.*
The leſſer ſuppoſed Wolfes bane.

with

3. *Doronicum brachiata radice.*
Scorpion rooted ſuppoſed Woolfes bane.

with very ſmall blackiſh ſeede, which is carryed away with the winde: the rootes are ſmall, thicke and ſhort, creeping or lying under the upper cruſt of the earth, with divers ſmall fibres, ſhooting from them downe into the ground and increaſing divers ſuch like tuberous rootes round about it, which are tender and not hard, ſomewhat whitiſh and with ſome joynts therein, and greeniſh on the upper ſide next unto the upper face of the ground: Some would make theſe rootes to reſemble a dead Scorpion, becauſe of the joynts, which are like ſcales therein; the former part next the leaves, being thicke to be the body, and the other part, being ſmall to be the taile, which is ſomewhat ſweete in taſte, and a little bitter, with ſome auſtere clammineſſe joyned therewith.

2. *Doronicum minus.* The leſſer ſuppoſed Woolfes bane.

The leſſer *Doronicum* hath divers leaves, longer and narrower, then the former, ſomewhat like unto Ribwort Plantaine, but hairy and of a yellowiſh greene colour; the ſtalkes are ſlender and riſe nothing ſo high, nor are much branched, but carrying the like yellow flowers as the former, ſomewhat paler: the roote is ſmall not like the former being without thoſe joynts ſo plaine in them.

3. *Doronicum brachiata radice.* Scorpion rooted ſuppoſed Woolfes bane.

This Scorpion rooted *Doronicum* hath large round hairy leaves, like the firſt, ſomewhat waved or unevenly dented about the edges, of a ſadder greene colour and ſomewhat bigger; the ſtalkes have divers narrower leaves thereon, the flowers are yellow and the leaves thereof dented at the ends, the ſeede is like unto the other, but the roote creepeth not ſo much, but is ſomewhat longer thruſt downe into the ground, with joynts growing upwards, branched as it were on each ſide with young rootes, and ending in a ſmall point, with divers long fibres ſet unto them.

4. *Doronicum Auſtriacum anguſtifolium.* Small ſuppoſed Woolfes bane of *Auſtria.*

This ſmall *Doronicum* of *Auſtria* hath fewer leaves then the ſecond, but ſoft, long, narrow and hairy like them, greene and ſomewhat ſhining on the upper ſide, and of a paler greene underneath of a ſharper biting taſte: the ſtalke is ſhorter then it, hairy alſo but ſmooth, and ſtriped all along; whereon are ſet divers narrower leaves, compaſſing it at the bottome, up to the top, where there ſtandeth but one large flower for the moſt part, like unto the other *Doronicum*, but of a deeper yellow colour, which turneth into downe, with ſmall blacke ſeede therein, and carryed away with the winde, in the like manner: the roote is ſmall and joynted ſomewhat like unto it, but not increaſing ſo faſt, with divers long fibres thereat.

5. *Doronicum humile Stiriacum Cluſii.* The low Stirian ſuppoſed Woolfes bane of *Cluſius.*

This low *Doronicum* hath many large and ſomewhat round leaves, dented about the edges like unto the third ſort before expreſſed, ſtanding upon high footeſtalkes: the ſtalke is lower then it, having ſome leaves thereon longer and narrower then thoſe below, and at the top (not having any branches) one flower larger then any of the former, but elſe like unto them, with many long yellow leaves, ſet about a middle browniſh yellow thrum: the roote is ſomewhat long, blackiſh on the outſide and joynted but not plainely to bee diſcerned, the joynts riſing upwards, and not downewards as they doe, in moſt of the reſt, with ſome other rootes growing from it, and having many long white fibres underneath it.

6. *Doronicum Germanicum.* The ſuppoſed Woolfes bane of *Germany.*

The *Doronicum* of *Germany* hath divers broad hairy leaves, of a yellowiſh greene colour on the upper ſide, and whitiſh and ſmooth underneath, lying on the ground ſomewhat like unto broad Plantaine leaves, or rather like unto the Groſſewort *Gentian*, having ſome long ribbes therein: among theſe leaves riſeth up a ſtalke, and ſometimes many, bearing long leaves, at every joynt; at the top it brancheth forth into two or three or more parts ſometimes, bearing every one a faire large flower, ſet as it were in a rough cup, which conſiſteth of many pale yellow leaves, dented at the ends, as a pale or border about the middle, which is made of many ſmall flowers, of foure leaves a peece, of a deepe yellow colour, as it were the thrum; (*Bauhinus* ſaith that there hath a ſort hereof beene found in *Stiria*) with blew flowers, which being paſt, the head turneth into downe, and is carried away with the ſmall blackiſh ſeede therein: the roote is ſmall, yet joynted like the former ſorts, but not ſo plainely to be diſcerned, of a ſweete ſent and a bitter biting taſte, having many fibres underneath it, and giving many of ſets, whereby it is increaſed.

7. *Doronicum maximum Auſtriacum.* The greateſt ſuppoſed Woolfes bane of *Auſtria.*

This great *Doronicum* of *Auſtria* ſhooteth forth many faire greene leaves from the roote, lying round about it, which are broad, hairy, rough and ſomewhat round pointed at the ends, every one ſtanding upon a long footeſtalke: but thoſe which are ſet upon the ſtalkes, which riſe three or foure foote high or more, are larger and longer then thoſe below, ſet without order, and compaſſing it at the bottome like Tobacco leaves, all of them a little unevenly dented about the edges: the flowers upon the toppes of the leaves of the ſeverall branched ſtalkes, are large and yellow like unto the common *Doronicum*, which after they are paſt, the greeniſh ſeedes that lie among the downe, are conveyd both away together with the winde: the roote is thicke and joynted like the reſt, encreaſing as much as any other.

8. *Doro-*

5. *Doronicum humile Stiriacum Cluſii.*
The low Stirian ſuppoſed Woolfes bane, and the *Doronicum* rootes of the Apothecaries ſhops.

6. *Doronicum Germanicum.*

7. *Doronicum maximum Auſtriacum.*
The greateſt ſuppoſed Woolfes bane of *Auſtria*.

10. *Doronicum Americanum.*
Suppoſed Woolfes bane of *America*.

8. *Doronicum Helveticum incanum.* The hoary Helvetian ſuppoſed Woolfes bane.

The hoary *Doronicum* of Helvetia, riſeth up with a round hollow greene ſtalke, a foote high or more, bearing thereon divers leaves ſomewhat longer and more pointed, then thoſe that grow next the ground, ſome whereof are round, and others long and round, yet all dented about the edges, of a pale greene colour on the upper ſide, with a white rib in the middle, and of a mealie hoarineſſe underneath, as the footeſtalke is alſo: the flower is great and yellow that ſtandeth at the top of the ſtalke, with many long narrow leaves, not dented at the edges, but ſmooth compaſſing the middle thrumme: the ſeede is carried away with the downe, like unto others; the roote is ſmall, joynted, and as it were ſcaled like the reſt.

9. *Doronicum Helveticum humile.* The low ſuppoſed Woolfes bane of Helvetia.

This low *Doronicum* of *Helvetia* or *Switzerland*, hath many thicke, darke, greene, hairy leaves, and of a paler greene underneath, lying next the roote being ſomewhat long and round and dented about the edges; from among which riſeth up a ſhort hairy ſtalke, not halfe a foote high, with very long and narrow leaves ſet thereon, parted at the toppe into two or three ſmall branches, bearing yellow flowers, of a meane ſize or bigneſſe like unto the reſt.

10. *Doronicum Americanum.* Suppoſed Woolfes bane of *America.*

This ſtrange *Doronicum* hath divers very large leaves next the ground ſomewhat rough and hairie, divided into five parts, each part being five or ſix inches long, and two inches broad, pointed at the ends, and deepely dented on the edges into three parts: from among which riſeth up ſundry ſmooth round ſtalkes ſet with the like leaves, but ſomewhat leſſer and leſſe divided, and ſome little or not at all: at the top of every ſtalke ſtandeth one large yellow flower like unto the former, the bordering leaves being long and narrow, and the middle thrum browniſh, and made as it were of many flowers ſet thicke together: the roote is great thicke and hard, faſtned with many long ſtrings, I have here given you two figures thereof, the one taken by us, the other by the *French.*

12. *Radices Doronici vulgo officinarum, & Radices Mechini rarioris Lobelii, pro Doronico genuino Arabum a Pona exhibitæ.* The Apothecaries *Doronicum*, and the true one of the *Arabians* as *Pona* thinketh.

I have here likewiſe particularly given you the figures of the rootes of two ſorts of *Doronicum* as they are ſuppoſed to be, the formoſt generally received by all or moſt both Writers & Apothecaries for their medicines, whoſe deſcription is ſet downe before: the other *Pona* in his *Italian Baldus* ſetteth forth ſuppoſing it to be more probably the true *Doronicum* of the *Arabians* then the former, which doth not agree thereunto either in forme or quality, for *Avicen* in the 200. Chap. of his ſecond Booke, and *Serapio* in the 325. Chap. of his Booke of ſimples have deſcribed their *Doronicum* to be a roote of the bigneſſe of ones thumb, of a hard and heavy ſubſtance, of a yellowiſh colour on the outſide and browne within, with ſome white veines, and is hot and dry in the third degree: thus *Serapio*, but ſaith *Pona*, I know no other roote more properly doth repreſent that *Doronicum*, then this ſort of *Mechinus*, which is often found among the *Mechinus* or blacke Ginger, that is brought us chiefly from *Braſſil*, which *Lobell* calleth *Mechini rara varietas*, having divers circular knotted lines as it were like joynts on the out-

Lobel his rare varieties of *Mechinus* and the *Arabians Doronicum* by *Pona.*

ſide,

side, and is firme and heavy full of white veines therein when it is broken: it is also very sharpe, quicke, biting and aromaticall in taste, and therefore saith he, having all the notes of their *Doronicum*, it can be no other then the true and legitimate *Doronicum*, from whom the reasons being so pregnant, I know not well how to dissent, yet leave it to others to judge as they shall finde cause.

The true rootes of the *Doronicum* in the Apothecaries shops are misset, which should have beene in this table, but are expressed in the fift figure.

The Place.

The first groweth on the hills in *Savoy*, beyond the lake *Lemanus*, and in other places, both of *France* and *Germany*: the second groweth not farre from *Burdeaux* in *France*. The third on the wooddy hills about *Trent*, and in *Austria* also as *Clusius* saith: the fourth *Clusius* saith he found on divers hills in *Austria*. The fift likewise about *Newberg* in *Styria*. The sixt is found in many places of *Germany*, in the medowes and elsewhere, and as it is thought, on the hilly grounds in *Northumberland*. The seaventh groweth in many places, both of *Austria* and *Hungary*, as *Clusius* saith: the eight upon the *Alpes* in *Switzerland*: the ninth also on the same hills about *Valesia*, and the last came from the *French* colony about the river of *Canada* and noursed up by *Vespasian Robin* the *French* Kings Herbarist at *Paris*, who gave Mr. *Tradescant* some rootes that hath encreased well with him and thereof hath imparted to me also.

The Time.

They all flower early for the most part, that is in *May*, and some of them in the *Autumne* againe.

The Names.

The name *Doronicum* which is given to all these plants is derived from the *Arabian Doronigi* or *Durungi*, for it is not remembred by any of the ancient Greeke or Latine Authors, except *Actuarius* who calleth it *Carnabadion*; divers have accounted it among the *Aconites*, as *Matthiolus* (calling it *Pardalianches*, and referreth it to *Pliny* and *Theophrastus* their *Aconites*, whose rootes are like Scorpions, as the outward face or forme of these are, which bred the suspition; when as the properties of these are not like their *Aconites*, to kill wilde beasts speedily with their Darts, or Arrowes dipped in the juice thereof; or to be a caustike herbe, able to eate away the flesh of a wound, and cause it to fall away:) who having received it from *Cortusus* of *Padoa*, defameth it to all the world, to be a poyson not fit to be used inwardly in mans body, and that those Physitians that follow the *Arabians* to put it into Cordiall medicines, doe very ill, and little respect the health of man, because both as *Cortusus* writeth unto him, and himselfe upon tryall made as he saith found to be true, that it will kill dogs, the rootes being given them in flesh, which report of theirs how soever be true in dogs, may notwithstanding be not true, being given to other beasts, and may be safely given and without danger to men: for divers things that are wholsome to man, and which we often use without scruple, or doubt of danger, as *Aloes* and bitter Almonds, yet given to a Fox, either of them will quickly kill him, as *Plutarch* reporteth; and the *Camæleon* Thistle as *Fabius Columna* setteth it downe, will kill dogs and swine, &c. and yet is a most soveraigne Antidote against the poyson of Serpents, the roote being drunk in wine, and besides killeth the wormes in children without any further harme, as also even Muske, Saffron, and other things being taken in two great a quantity will kill any man: others hold them to be wholsome, as it hath beene certainly and often found true by good experience, that divers of these sorts are very effectuall to helpe many diseases in men, as you shall heare by and by, and therefore it is not probable, that there lyeth any venemous quality hid underneath those good ones; and besides, *Gesner* saith that he had taken much and often thereof, and had given it to others without any danger or harme; and *Pena* and *Lobel* reporteth that *Iohannes de Vroede* did eate many rootes thereof without any danger, or sense of paine thereby: and therefore doth advise others, not to abdicate the plant wholly from mans use, nor to discredit such famous *Arabian* authors, that have appointed it to be put into *Electuarium de gemmis*, *Electuarium ex Aromatibus*, and *Diamoschum dulce*, and others, as the most Cordiall medicines of all other, and whereof there was never harme taken whosoever did use them, or to say that any that followed their prescriptions, were guilty of the death of any man. *Dodonæus* was also of the same minde with *Matthiolus* for a while, but afterwards found his owne errour and reclaimed it; but it is much doubted, whether this be the *Doronicum* of the *Arabians* or no; for *Franciscus Pona* in his Italian description of *Mont Baldus*, as I said before, refuseth it, accounting it an auncient received errour, and therefore giveth us the figure of *Lobels Mechinus*, for the true *Doronicum*, the faculties of these being quite contrary to their *Doronicum*, for besides a little sweetenesse and clammy taste in the roote; it hath little or no other taste, except that being fresh, some of them have an aromaticall, and some a bitterish sweet taste, like unto juice of Licoris: but the roots of this *Mechinus* are of an aromaticall, sharpe & biting taste: the joynts in the roots of the ordinary *Doronicum*, very likely might cause the later age of the world to erre, in taking it to be the right: but leave we these controversies, and attend the varietie of names and properties of these sorts of *Doronicum*, which may better perswade us of the good to be reaped from them: The first is as I said, the most common, both in the Gardens of our country and others, and is most usually called *Doronicum Romanum* of all writers, or with a sweete roote. The second *Clusius* and others call *Doronicum minus* and *Angustifolium*, *Bauhinus* calleth it *Doronicum plantaginis folio*. The third *Matthiolus* calleth *Aconitum Pardalianches Plinij*, *Dodonæus Pardalianches alterum*, *Pena* and *Lobel*, *Doronicum Brachiata radice*; but *Clusius* setteth out the figure more truely, & calleth it his second *Doronicum Austriacum*. The fourth is *Clusius* his first *Doronicum Austriacum sive minus*, and *Bauhinus Doronicum longifolium hirsutie asperum*. The fift is *Clusius* his fourth *Doronicum*, which he calleth *Stiriacum*, and *Bauhinus Doronicum latifolium flore magno*. The sixt is called diversly, by divers; *Matthiolus* calleth it *Alysma* or *Damasonium*, and thinketh it to be the right *Alysma* of *Dioscorides*, and so doe *Camerarius* and *Gesner*, (who calleth it also *Caltha Alpina*) *Pena* and *Lobel* call it *Nardus Celtica altera*, as *Rondeletius* did take it to be. *Lugdunensis* setteth it forth under the name of *Ptarmica montana*, as divers did call it there abouts, as he saith, and yet setteth it forth againe under the title of *Alysma Matthioli*. *Gerard* likewise hath set it forth in two severall places, under two severall titles, the one under *Calendula Alpina*, the other under *Chrysanthemum latifolium*. *Clusius* calleth it *Doronicum Germanicum*, and saith his *Pannonicum* or *Doronicum sextum*, is the same or very like, for both he and divers others doe set it forth, with smooth, and hairy leaves, also as it is found so growing in divers and sundry places. The seventh is *Clusius* his *Doronicum Austriacum tertium*, which *Bauhinus* calleth *Doronicum maximum foliis caulem amplexantibus*: The eighth and ninth

Bauhinus

Bauhinus setteth forth in his *Prodomus* and *Pinax*, under the same titles they doe here beare: the tenth *Robinus* of *Paris* called *Aconitum Americanum*, and *Cornutus Aconitum Helianthemum Canadense*; but the upper leaves on the stalke, with the flowers and roote, declare it to come nearer to the sorts of *Doronicum*; the last are as the titles declare them. They may all be called in *English*, either *Doronicum* according to the *Latine* name, for so doe both *Italians*, *Spaniards*, *French*, *Germanes*; and *Dutchmen*; or as I have entituled them supposed Wolfes banes, both that the name may differ from the former Wolfes banes, and to give you to understand that they are but supposed to be dangerous; because as I said before the outward forme of the rootes, like unto Shrimpes or Scorpions, and the leaves round like unto the leaves of Sow bread or Cowcumbers, have caused many to thinke them to be the *Aconites* of *Theophrastus* and *Dioscorides*; but *Columna* hath treated very learnedly hereof in the 18. Chapter of his Booke of Plants, whereunto I referre you, for it were too tedious, to relate his sayings in this place.

The Vertues.

The true *Doronicum* is said to be a soveraigne Cordiall, and to resist the poyson both of beasts and other deadly medicines, to clense the breast and to helpe the cough, and to rid those humors, that cause paines in the sides: but our *Doronicum*, although it be not the true of *Serapio* and *Avicen*, yet it is no *Aconite*, as *Matthiolus* and others have supposed; for as is before said, both *Gesner* tooke it often, and a good quantitie at a time, even two drammes in powder, that he might find the operation of it, yet found no harme thereby; and *Vroede*, ss *Lobel* saith tooke of it many times, without any harme; but what especiall good they found by it, is not remembred, for *Gesner* maketh not any mention thereof: yet the juyce thereof is found to be good, for those eyes that be hot and red, and full of paine, by reason of hot and sharpe rheumes, falling into them, to allay the heate, to take away the redneſſe, and to give ease of the paines and prickings in them. *Clusius* saith that the hunters, and shepheards that live in the mountaines of *Austria*, doe no lesse use and commend the rootes of the third and fourth sorts, here set forth, (which grow with them more frequently, than the others, at the least best known unto them,) then they doe the rootes of the yellow *Auricula ursi*. against the swimming or turning in the head, which is a disease subject to those places, rising from the feare and horrour, of such steepe downefalls and dangerous places, which they doe and must continually passe, in seeking for and hunting the wild Goates, and therefore they there call them *Gensswurtz*, that is, *Rupicapraria radix*, as *Clusius* doth interpret it; and there hath beene found in their mawes a certaine stone, called by *Bauhinus*, in his Treatise thereof *Bezoar Germanicum*, in the middest of which stones, some of the rootes have beene found almost whole, which sheweth that they feede thereon willingly, without taking any harme thereby, and that the stones bred thereon are Cordiall, and so used: And I doe not thinke but any of the other sorts (seeing they are all in forme, and places of growing, one so like unto another) if triall were sufficiently made, would performe the same effect. For the sixt sort here expressed (which as I said is called *Caltha Alpina* of some, *Alysma* or *Damasonium* of others, and *Doronicum Geranicum* of others, of the people in the Alpes *Mutterwurtz*, as *Iosius Simlerus* saith, in his Commentarie of the Alpes, that is *Matricaria*, Mother wort, which they have found, and do continually use to procure womens courses, and to ease the paines and diseases of the mother) is very effectuall against the poyson of the fish called *Lapus marinus*, as also the venemous biting of the Shrew, and the poyson of a Toade; and is also profitable for them that have eaten *Opium*, in any dangerous quantitie; it is given with good successe, to them that have the bloudy flixe, or any other paines or gripings in their body or bowells, by reason of sharpe humours gathered therein: it is also helpefull to those that have convulsions or crampes, and ach or paines in the joynts and sinewes, and is very powerfull to be taken with some wilde Carrot seede, to expell gravell, or the stone in the reines or kidnies, if the decoction thereof in wine or water, or the powder of the herbe and rootes be taken: it is applied also outwardly, to ease the paines and inflammations of apostumes and sores: the flowers hereof doe procure neesings.

CHAP. IV.

Ranunculus. Crowfoote.

THere are so many sorts of Crowfeete, some of the Woods, some of the Medowes, some of the Mountaines, some of the Water, some of the Rockes, and some of the Gardens; that to proceede in a methodicall manner, and to ease my selfe and the Reader of too much prolixitie, and intricasie, I thinke it best to distinguish or divide them into severall formes or orders, that so they may be the better apprehended and understood, for otherwise it would be toogreat a confusion, to huddle so many together: and because I have already set forth in my former Booke, many sorts, whose flowers being most beautifull and rare, were fittest to adorne that Garden; I shall not neede to describe any of them againe in this worke, but referre you thereunto to be informed of them: but in shewing you the rest, I will give you the figures of some of them, and of the *Anemones* which are neerest unto them, and so bring every of them into their severall order, and begin first with those of the Woods.

Divisio prima. The first Division.

Ranunculi nemorosi. Wood Crowfeete.

1. *Ranunculus nemorosus albus simplex.* The single white Wood Crowfoote.

THe single white wood or wilde Crowfoote, riseth up with two or three stalkes, about an hand breadth high or better, about the middle whereof, come forth usually three stalkes of leaves, each being somewhat broad, hard and cut in on the edges into three parts, of a sad greene colour, and dented also; the stalke riseth up two or more inches high, bearing at the toppe one single flower, hanging downe the head for the most part, made of five leaves, somewhat broad and almost round pointed, of a light blewish colour on the outside, before it be blowne open, but white afterwards, and more white on the inside, having a few white threds in the middle,

1. *Ranunculus nemoroſus albus ſimplex.*
The ſingle white Wood Crowfoote

5. *Ranunculus nemoroſus flore luteo.*
The yellow Wood Crowfoote.

middle, tipt with yellow, ſtanding about a greene head, which in time growing ripe, is ſomewhat like other heads of Crowfeete, compoſed of many ſmall ſeedes ſet together: the roote is uſually of the bigneſſe of a wheate ſtraw ſtalke, not growing downe deepe, but creeping longwiſe under the upper crúſt of the ground, ſpreading out into diverſe ſmall knobs like branches, of a darke browne colour on the outſide, and white within, and of a ſharpe biting taſte, enflaming the mouth.

2. *Ranunculus nemoroſus minimus albus.* The leaſt white Wood Crowfoote.

This ſmall wood Crowfoote, hath ſuch like leaves as the former ſingle white kind hath devided into three parts, and each of them into other againe, ſtanding upon little long foote ſtalkes, but they are much leſſer, ſo that the whole leafe hereof, is not much bigger than one of the Diviſions, or parts of the other: the ſtalke is verie ſmall with a few leaves thereon, in two places more devided than the lower, little more than two inches high: at the toppe ſtandeth a white flower, conſiſting of ſixe white leaves, with a few yellowiſh threds in the middle: the roote is ſmall and long like unto the other.

3. *Ranunculus nemoroſus flore carneo.* The ſingle bluſh wild Crowfoote.

The ſingle bluſh wilde Crowfoote, is both for forme, of growing, in ſtalkes, leaves, flowers, and rootes, like unto the former, ſo that untill it be in flower, there can hardly be any difference diſcerned, but when the flower appeareth, it ſheweth it ſelfe much more reddiſh on the outſide, and of a faire pale purple, or bluſh colour on the inſide, which maketh it a diſtinct ſpecies of it ſelfe, differing from the reſt.

4. *Ranunculus nemoroſus flore purpureo cæruleo.* The ſingle purple Wood Crowfoote.

This purple kinde is alſo like the other, and differeth from them chiefely in the ſtalke which is ſomewhat browner, and in the flower, which is of a pale purple blewiſh colour, like unto a pale violet flower; none of theſe have any great ſent, but yet a little, and more than the yellow kinde which followeth next.

5. *Ranunculus nemoroſus luteus.* The yellow wood Crowfoote,

The yellow Wood Crowfoote groweth in the ſame manner that the former doe, and with ſuch like ſtalkes of leaves, but they are not ſo broad, nor ſo hard in handling, and are more deepely cut into more long and narrower parts, yet each alſo dented about the edges, eſpecially towards the ends of the leaves, and of a darker greene colour; from betweene theſe ſtalkes of leaves, ſhooteth forth ſometimes but one, and ſometimes two or three ſtalkes, with every one a flower thereon, ſomewhat ſmaller than the former, conſiſting of ſixe uſually or of ſeaven, and ſometimes of eight leaves, which are of a faire pale yellow colour, with many yellow threds in the middle, the ſeede and rootes are like the former: this hath as I ſaid leaſt ſent at all. Vnto theſe belong that ſort of *Anemone* or rather Crowfoote that *Dodoneus* calleth *Trifolia* having the leaves parted into three, ſnipt about the edges with a whitiſh bluſh flower. *Anemone trifolia Dodonæi.*

6. *Ranunculus nemoroſus Moſchatella dictus.* The Muske Wood Crowfoote.

The Muske Crowfoote, hath three or foure ſlender pale greene ſtalkes of leaves, ſomewhat devided at the edges of them, not halfe a foote high, and not of halfe that height in ſome places, very like unto thoſe of the Hol-

Anemone trifolia Dodonæi.
Dodonæus his trefoile Anemone.

6. *Ranunculus nemorosus Muscatella dictus.*
The Muske Wood Crowfoote.

7. *Ranunculus nemorosus dulcis secundus Tragi.*
Sweete Wood Crowfoote.

8. *Ranunculus Virginensis albus.*
The white *Virginia* Crowfoote.

low roote, but ſmaller, and of a paller ſhining greene colour, from among which riſe up one or two ſmall ſtalkes with two ſuch like leaves thereon, but ſmaller, and a little above them, a ſmall round greeniſh yellow head, which ſpreadeth not into leaves, but into foure or five little moſſie heads of threads, and ſo abideth a while, having no other flower, and paſſe away into many ſmall kernelly ſeede; the roote is ſmall and ſomewhat long, compoſed as it were of many ſmall very ſhining white thicke ſcales growing upwards, and having many white fibres at the head of them, of a little ſweetiſh bitter, ſharpe and binding taſte, the leaves have a little ſweete ſent, ſomewhat like unto that kinde of Cranes bill, called Muske, yet more in the naturall places than in Gardens, when it is tranſplanted into them.

7. *Ranunculus nemoroſus dulcis ſecundus Tragi.* Sweete Wood Crowfoote.

The firſt leaves of this kinde of Crowfoote, are round ſomewhat like unto Violet leaves, and not devided at all, but thoſe that riſe next after them, are more devided, ſomewhat like unto the leaves of the laſt, and ſo thoſe that grow after and upon the ſtalkes are more devided than they: the flowers are ſmall, and of a faire ſhining gold yellow colour, ſtanding at the toppes of the ſtalkes, like unto the other common kindes of Crowfeete: after which come the ſeede many ſet together in a head, like a ſmall Strawberry, as diverſe other Crowfeete have; the roote is compoſed of many white ſtrings and fibres, like unto others; neither roote or leafe of this kind, hath any ſharpe or biting taſte in them, but are almoſt inſipide.

8. *Ranunculus Virginenſis albus.* The white *Virginia* Crowfoote.

The white *Virginia* Crowfoot ſhooteth forth from a reddiſh thick tuberous roote with ſome ſmall fibres thereto, three or foure ſomewhat large broad whitiſh greene leaves upon long foote ſtalkes, rent or torne on the edges for the moſt part, among which riſeth up a ſlender round naked ſtalke, five or ſixe inches high, bearing one white flower at the toppe, made of tenne or of twelve ſmall narrow and pointed leaves, with a few yellowiſh threds in the middle, ſet about a greeniſh umbone, which in time groweth to be a long ſlender pod, wherein is contained round whitiſh ſeede.

The Place.

The moſt ſorts of theſe are found growing in Woods, Groves, and Orchards, ſome of them in our owne land in many places, the reſt in many places of *Italy*, *Germany*, *&c.* The fift is found as well by the brooke ſides that paſſe by Medowes, as in Woods, and by hedge ſides.

The Time.

They doe all flower very earely in the Spring, in March oftentimes, or at the furtheſt in Aprill.

The Names.

The firſt foure are diverſly called of diverſe Writers, for ſome call them *Ranunculi nemoreſi*, or *nemorum* and *ſyluarum*, others *Anemones ſylveſtres*, or *nemoroſæ*: but in regard none of theſe do beare any cottony head of ſeede, as all the *Anemones* doe. I rather hold with their judgement, that referre them to the kindes of *Ranunculus* or Crowfoote; yet *Cluſius* thinketh that they may be reckoned as kindes of wild *Anemones*, and ſaith that diverſe did thinke them to be the *Anemone ſylveſtris*, that *Theophraſtus* calleth λειμωνία *Leimonia*; the *Italians* call them *Gengevo ſalvatico*, wild Ginger, either becauſe the rootes of them all, are very ſharpe, hot and biting the tongue like Ginger, or rather as I thinke, becauſe the rootes doe grow a little ſpreading into ſeverall parts, very like unto Ginger. *Tragus* calleth them *Ranunculus ſylveſtris*, whereof there are two ſorts as he ſaith, *candidus* and *luteus*, one that beareth white flowers and an other yellow: *Iohannes Thalius* maketh them his third kinde of Crowfeete: *Geſner* calleth the firſt white one *Ranunculus Phrygmitis*: I have therefore upon more mature advice entituled them Wood Crowfeete, and ſet them in the firſt ranke or diviſion: the ſecond is called by *Bauhinus Ranunculus nemoroſus Anemones flore minor*: the third, fourth and fifth, have their names in their titles: the ſixt is diverſly alſo called, for *Cordus* calleth it *Moſchatella*, and ſome other *Moſchatella pratenſis* that it may differ from the *Moſchatella cærulea* of *Lugdunenſis* called alſo *Ageratum purpureum*; *Lobel* calleth it *Ranunculus minimus Septentrionalium herbido muſcoſo flore*. *Tragus* and *Geſner* make it to be a kinde of *Ariſtolochia*, for ſo they accounted the *Radix Cava* to be, and thereupon as *Camerarius* ſaith, divers did aswell account it a kinde of *Capnos* as ſmall Crowfoote. *Lugdunenſis* calleth it *Denticulata* from the forme of the roote which is made as it were of many teeth ſet together: The ſeventh is *Tragus* his ſecond *Ranunculus ſylveſtris*, and *Lobel* his *Ranunculus auricomus*. The laſt hath not beene ſet forth by any before.

The Vertues.

By reaſon of the hot ſharpe biting taſte of the foure firſt ſorts, they are found no leſſe to exulcerate the skinne being applied, then any of the other ſorts of Crowfeete; yet they may be well uſed to eate away and conſume hard tumours, as alſo to take away ſcarres and other blemiſhes, and wartes upon the hands, &c. and to eate out the core of cornes in the feete, the leaves or roote eſpecially, being bruiſed and bound to for a certaine ſpace: They are ſaid alſo to cleanſe foule ulcers that are much corrupted and ſtinking. The 6. and 7. ſort are not knowne to be uſed. Vnto this Diviſion appertaine thoſe other ſorts of *Anemones ſylveſtres flore pleno*, ſet forth in my former Worke.

Diviſio ſecunda. The ſecond diviſion.

Ranunculi pratenſes & arvenſes. Field Crowfeete.

9. *Ranunculus pratenſis dulcis.* Sweete Meddow Crowfoote.

THis Meddow Crowfoote (which I call ſweet, not as *Gerard* doth becauſe it ſmelleth ſweete, but in regard it hath no ſharpe biting or exulcerating taſte, as moſt of the other Crowfeete have, but is ſo ſweete and pleaſant, that many in *Germany* and other places, doe ſtew the leaves, when they are young among other herbes, that ſerve to eate) hath diverſe great broad, darke greene leaves, ſpread upon the ground, a little hayrie, cut in on the edges into five diviſions, and a little dented alſo about, eſpecially at the ends, and of a paler yellowiſh greene on the underſide, of a ſweete and not unpleaſant taſte, as I ſayd before; among which riſe up diverſe hayrie ſtalkes, with ſome leaves upon them, much more divided and into ſmaller and narrower parts, than the lower: at the toppes whereof ſtand many faire yellow flowers, ſo like unto the next fielde Crowfoote, that is very violent, ſharpe and exulcerating the skinne, that it can hardly

1. *Ranunculus pratensis aulcis simplex & multiplex.*
Single and double meddow Crowfoote.

2. *Ranunculus pratensis acris.*
The common upright field Crowfoote.

3. *Ranunculus repens flore simplici & pleno.*
The common creeping field Crowfoote with single and double flowers.

4. *Ranunculus arvorum.*
Crowfoote of the ploughed fields.

be knowne from it: the ſeed likewiſe that followeth is like thereunto: the roote conſiſteth of many white ſtrings. Of this ſort there is one that beareth double flowers, and is planted in gardens onely for the beauty of the flowers. *Flore multiplici.*

2. *Ranunculus pratenſis erectus acris vulgaris.* The common upright field Crowfoote.

The common field Crowfoote (whoſe branches ſtand upright and bend not downe againe unto the ground, neither creepe thereon, or ſpread, taking roote againe in diverſe places, as the next doth) hath many large darke greene leaves, cut into diverſe parts, ſomewhat like unto the laſt, that many might judge it a kind of the ſame; but the taſte declareth the difference, which is very violent, ſharpe and heating upon the tongue, and bliſtering the skinne, if it be layd thereon, no leſſe than any exulcerating or corroding herbe can doe, and will have ſome blacke ſpots upon them now and then, but not in all, or all places; the flowers are many, and of a gold yellow colour, after which come ſmall heads of ſeedes: the roote is fibrous as other Crowfeete are. Of this kinde alſo there is one with double flowers, which I have ſet forth in my former booke. *Flore pleno.*

3. *Ranunculus pratenſis repens* The common creeping field Crowfoote.

This creeping Crowfoote, that groweth commonly in fields and gardens alſo, is very like unto the laſt deſcribed Crowfoote, both for leafe, flower, ſeede, and roote, but that this is more hayrie and creepeth with his branches upon the ground, taking hold by ſmall white fibres which it ſhooteth forth at the joynts, and ſpreadeth farre thereon, his branches alſo rather leaning then ſtanding upright, or riſing ſo high but the yellow flower, and ſharpe biting taſte of the leaves is almoſt equall with the former. Of this kinde there is alſo one with double flowers nuurſed in gardens. *Flore pleno.*

4. *Ranunculus arvorum.* Crowfoote of the plowed lands.

This Crowfoote hath diverſe ſmaller leaves, than any of the former, divided into many narrower parts, of an overworne greene colour; the ſtalke is about a foote or more high, bearing ſome leaves thereon, more jagged than the lower, and more divided at the toppe into other branches, bearing pale yellow flowers after which come rough pointed ſeedes, ſet in heads many together: the roote is compoſed of many white fibres or ſtrings.

5. *Ranunculus bulboſus ſive tuberoſus.* Knobbed Crowfoote.

The knobbed or round rooted Crowfoote, hath diverſe leaves riſing from the roote, much more cut in and divided than any of the former except the laſt, every one ſtanding on a ſhort footeſtalke, of an overworne greene colour, among which riſe up diverſe ſlender ſtalkes, a foote, or halfe a yard high, with ſome leaves thereon at the joynts, more divided, and into longer and narrower parts than thoſe below; at the toppes whereof, ſtand ſeverall faire gold yellow ſhining flowers, made of five leaves like the former ſorts, with many threds in the middle, ſtanding about a greene head, which after the flowers are paſt, groweth to be more rough or pricking than the former: the roote is white and round, of the bigneſſe ſometime of a Wallnut, and often much leſſe, being no

5. *Ranunculus bulboſus.*
Knobbed Crowfoote.

Ranunculus Anglicus bulboſus.
Batchelours buttons.

bigger than a beane, or sometimes an hasell nut, with some long fibres at the ends especially of it, of a more sharpe biting taste than any of the former.

Bulbosus Anglicus. Of this kinde is that thought to be, that beareth double yellow flowers one out of another, and called *Anglicus*, set forth in my former garden, whose figure is here extant also. As also one whose flower is single and red like an Orange.

Bulbosus flore rubro simplici.

6. *Ranunculus Echinatus Creticus.* Small prickly headed or Crowfoote of *Candye*.

This small Crowfoote hath many stalkes, rising from a threddy roote, round and smooth, full of branches, scarse rising a foote high, at every joynt standeth one broad sad greene crumpled leafe, upon a very long foote stalke: the flowers at the toppes are small, and of a pale yellow colour; and the heades of many small seedes and browne set together, are somewhat sharpe and prickely.

7. *Ranunculus Apuleii quibusdam.* The small early Crowfoote of *Apuleius*.

This small early Crowfoote, which some take to be the *Batrachium* of *Apuleius*, hath diverse small and short leaves, lying upon the ground, not so much divided as the last, but cut into three divisions, for the most part, each of them dented at the ends, and standing upon short foote stalkes, of an inch or two long, compassing one another at the bottomes of them: from among these leaves rise up diverse weake stalkes, bowing and leaning downe to the ground againe; at the joynts whereof grow such like leaves, as grow below, standing each of them upon his short foote stalke, and with them also commeth forth at each joynt, a small short stalke, bearing a flower consisting of five leaves, of a faire pale yellow colour, with diverse yellow threds in the middle; after the flowers are past, there follow five or sixe small cods or hornes, pointed and crooked at the ends, wherein lye small browniſh round seede, somewhat like those of the Winter Wolfes bane: the roote from the head thereof, shooteth forth many white fibres, whereby it taketh fast hold on the ground, encreasing into severall heads: both rootes and leaves are no lesse sharpe and biting than any of the former.

8. *Ranunculus pratensis rotundifolius Bononensis.* Meddow Crowfoote of *Bononia*.

The leaves that rise from this blackish threddy rooted Crowfoote, are round soft and hayrie, dented about the edges of a sad greene colour, and about an inch broad, standing upon very long foote stalkes, but those that grow upon the stalke are larger, and for the most part round also, a little divided into some parts, but not to the middle: the stalke is about a foote high, bending a little downe to the ground, and as it were creeping, divided into smaller branches, with large leaves at the joynts, standing upon long foote stalkes, and small pale yellow flowers set on the toppes of them, with a few yellow threds in the middle about a greene head, which growing to be ripe, hath many sharpe or prickely browne seedes set together.

9. *Ranunculus minimus Apulus.* The small Crowfoote of *Naples*.

This small Crowfoote being the least of all the rest, hath a few small leaves, growing from the roote, divided into three parts somewhat like unto an Ivie leafe, each of them upon a small long hayrie foote stalke, no bigger than the nayle of ones finger: the stalke is about a foote high small and slender, and a little hayrie also, with some leaves thereon, and small yellow flowers at the toppe: the seede is small in heades like the other kindes, and the rootes small and fibrous.

10. *Ranunculus Pannonicus maximus.* The great Crowfoote of *Hungary*.

The great Crowfoote of *Hungary*, is the greatest of all these sorts of Crowfeete, having diverse very large, broad, thicke, sappy, pale, greene, shining leaves, not much lesser than Figge leaves, cut into five parts or divisions, and each of them endented about the edges, being somewhat hayrie withall, a little sharpe and biting upon the tongue, but not so much, as most of the former sharpe sorts are: the stalkes are great, strong, and somewhat hayrie, two foote high, spread at the toppes into diverse branches, whereon stand faire gold yellow flowers, like unto other Crowfeete, and such like heads of seede following them: the rootes are many white fibres or strings, shooting downe from a head into the ground. Very like hereunto is the great Crowfoote of *Candye* set forth in my former booke but that the rootes are composed of long kernelly knots, whose figure I here exhibite unto you.

Creticus latifolius.

11. *Ranunculus Illyricus minor.* The lesser Crowfoote of *Sclavonie*.

The lesser Crowfoote of *Illyria* or *Sclavonie*, hath but three or foure narrow grayish greene leaves, divided into foure or five or more parts, standing upon long foote stalkes, and of a silver white shining colour underneath: the stalkes are firme and round, but small, about a foote high or more, having some such like leaves thereon, about the middle, and spreading into three or foure branches, every one bearing a small shining pale yellow flower, consisting of five leaves, and sometimes two together upon a stalke: the roote is composed of many small round grayish kernels, set very close and hard together in a bunch with some fibres thereat.

12. *Ranunculus Illyricus major.* The greater Crowfoote of *Sclavonie*.

This greater kinde is both in leafe stalke and flower, greater and larger than the former, the leaves being broader and greener on the upperside, and not fully of so silver a white colour underneath, the flowers are of a faire deepe yellow colour, and greater, but the roote hath not so many small graines or kernels set together, in any that I have observed, but shooteth forth white strings, whereby it is nourished and maintained.

Flore albo. Flore variato. Of this kinde some have beene found growing in *Apulia* in the Kingdome of *Naples*, with a white flower, and an other with a reddish flower.

13. *Ranunculus Lusitanicus autumnalis simplex.* The single *Portugall* Crowfoote.

This *Portugall* Crowfoote hath many broade leaves, lying upon the ground, almost round yet pointed, and finely dented about the edges, not divided at all, but somewhat hayrie full of veines, and of a darke greene colour on the upperside, and of a yellowish greene underneath, which continue all the winter, not falling away untill fresh doe spring up: from among these leaves shoote forth two or three small slender hayrie short stalkes, not a foote high, bare without leaves, bearing each of them one small yellow flower, composed of five, and sometime of sixe leaves, with some yellow threds in the middle, which fall away most usually with us, without bearing any seede, in regard it flowreth so late in Autumne, but in the naturall places; and sometimes with us, if the yeare be very hot, and fitting for it; it beareth a small head of such like seede, as the field Crowfoote beareth; the roote is made of small round whitish long kernels or pieces, many set together, somewhat like the *Illyrian*; but greater and longer: This kinde *Clusius* observed in the Olive-yards about *Lisbone*, to grow with larger crumpled

7. *Ranunculus Apuleï quibusdam.*
The small early Crowfoote of *Apuleius.*

8. *Ranunculus pratensis rotundifolius Bononiensis.*
Meddow Crowfoote of *Bononia.*

Ranunculus globosus.
The globe Crowfoote or Locker Goulons.

6. *Ranunculus Cretieus echinatus.*
Small prickly headed Crowfoote of *Candie.*

11. 12. *Ranunculus Illyricus major & minor.*
The greater & leſſer *Slavonian* Crowfoote.

13. *Ranunculus Luſitanicus autumnalis.*
The *Portugall* Crowfoote.

pled or ſwolne leaues, like as it were bliſters upon thē, and bearing the flowēr with eight or ten leaves, ſometimes as if it were double, whereof he giveth a figure, but the ſeede will beare ſuch like plants, as he ſetteth forth the other to be, and therefore giveth no other mention or deſcription thereof.

14. *Ranunculus autumnalis flore multiplici.* Double flowred Autumne Crowfoote.

This is ſo like the laſt in the manner of the growing and flowring, that onely the double yellow flowēs makē the difference.

15. *Ranunculus grumoſa radice Bononienſis.* Meddow Crowfoote of *Bononia* with kernelly rootes.

This Crowfoote hath a roote made of many ſmall long and round white kernels, or graines ſet cloſe togethēr, with diverſe long fibres at them, from whence riſe up ſomewhat round leaves, but deepely cut in on the edges, into three parts, ſomewhat like unto thoſe of the round rooted Crowfoote, ſuſtained by long foote ſtalkes, and ſomewhat hayrie: from among which riſe up the ſtalkes, that are hayrie alſo, and about a foote high, having leaves ſet thereon at two ſeverall diſtances, much more cut in and jagged than thoſe below, not divided into many branches, whoſe flowers at the tops of them are yellow, like unto other field Crowfeete: the ſmall head of rough ſeede that followeth, is ſharpe pointed, and ſhorter than others.

16. *Ranunculus Geranii tuberoſi folio.* Iagged Field Crowfeete of *Padoa*.

The rootes of this Crowfeete conſiſt of long whitiſh ſtrings, ſending forth many darke greenē ſmooth leaves, very much jagged or cut into diverſe parts, ſomewhat like unto the leaves of the knobbed Cranes bill, but larger, each of the cuts being larger and broader than they, which are cut in againe, ſo that the whole leafe being almoſt round, is halfe a foote long, and neere ſo broad alſo, ſet upon a foote ſtalke; an hand breadth long; from among which riſe up, diverſe ſmooth greene creſted ſtalkes, about two foote high, ſpread into branches, having finer cut leaves on them, and ſmall pale yellow flowers at the toppes, with many threds in the middle, like unto others, after which cometh a ſmall round knappe or head of ſeede.

The Place.

All theſe ſorts of Crowfeete, doe grow in fields, meddowes, and arable grounds, many of them in our owne land, eſpecially the firſt five ſorts; the reſt by their titles may bē underſtood from whence they came.

The Time.

The firſt and the great *Candye* ſort are the earlieſt in flower, which is about March and Aprill, and thē 13. and 14. are the lateſt that flower of all the reſt, which is not untill September, all the other in May and June.

The Names.

It is called in Greeke βατράχιον, and there after in *Latine* Ranunculus, *non ſolum quia ranarum colorem folia multa imitantur, ſed potius quia inter folia ranæ ut plurimum degunt:* in *Engliſh* we call them Crowfeete, rather than Frogwort after the *Latine*, from the diviſions of the leaves, as I thinke, and therefore ſome call them *Pedes gallı*, according to *Pliny*, yet ſome writers thought them to be *Coronopus pes corvi* of *Dioſcorides*, and from thence it

14. *Ranunculus autumnalis flore multiplici.*
Double flowred autumne Crowfoote.

Ranunculus Creticus latifolius.
Yellow broade leafed Crowfoote of *Candy*.

it is moſt likely our *Engliſh* name of Crowfeete came, they have alſo diverſe other *Engliſh* names, as King Cups, gold cuppes, Baſinets after the French, Piſſabeds, Bolts, Troll flower, and Locker Goulons, which two laſt are more proper to the eight kinde in my former Booke: of the *Italians* *Ranoncolo* and *Pie Corvino*; of the *Spaniards* *Terva belida*, of the *French* *Grenoilette*, of the *Germanes* *Hanen fuſs*, and of the *Dutch* *Hanen voet*. The firſt is *Tragus* his firſt *Ranunculus dulcis ſive pratenſis* by *Fuchſius* *Chryſanthemum ſimplex*, by *Dodonæus* in his *French* Herball and by *Lugdunenſis* *Polyanthemum ſimplex*, by *Tabermontanus* *Ranunculus dulcis*, & by *Bauhinus* *Ranunculus pratenſis erectus dulcis*: the ſecond is the *Ranunculus luteus of Tragus*, the *Ranunculus pratenſis ſurrectis cauliculis* of *Lobel*, & the ſecond *Ranunculus luteus* of *Dodoneus* & *Lugdunenſis*. *Thalius* calleth it *Ranunculus polyanthemus maculatus*, and *Gerard* *Ranunculus Batrachoides*: the third is called by *Lobel* *Ranunculus pratenſis reptante cauliculo*, by *Thalius* *Ranunculus polyanthemos primus*, by *Dodonæus* and *Lugdunenſis*, *Ranunculus hortenſis primus*, by *Tabermontanus* *Ranunculus vinealis*, and by *Bauhinus* *Ranunculus pratenſis repens hirſutus*: the fourth is called by *Lobel* in his *Icones* *Ranunculus arvorum*, as it is in the title, by *Dodonæus* and *Lobel* in his obſervations *Ranunculus ſylveſtris tertius*; by *Cordus* in his hiſtory of Plants, *Ranunculus ſegetalis*, by *Geſner in hortis Germaniæ* *Ranunculus arvenſis*, and by *Bauhinus* *Ranunculus arvenſis echinatus*: The fift is called by *Tragus* *Ranunculus exiguus & ſceleratiſſimus*, and by *Geſner in hort Germaniæ* *Ranunculus Flammula dictus*, by *Lobel* *Ranunculus bulboſus*, and by *Dodonæus* *tuberoſus*, by *Brunfelſius* *Crus Galli* and *Coronopus parvus*; it is generally taken to be, and ſo called *Batrachium* *Apuleij*, *Bauhinus* calleth it *Ranunculus pratenſis radice verticilli modo rotunda*. The ſixt is called by *Pona* in his *Italian* deſcription of Mount *Baldus*, *Ranunculus echinatus Creticus*, which he ſaith he had from *Signior Contarini* of *Venice*, *Bauhinus* calleth it *Ranunculus ſtellatus echinatus Creticus*: the ſeaventh is called by *Cluſius* *Ranunculus* *Apuleij quibuſdam*, *Pena* and *Lobel* ſet it forth in their *Adverſaria*, under the name of *Ranunculus paluſtris*, *rotundiore folio ſemine echinato*, but as *Bauhinus* ſaith in his *Phytopinax* and *Prodromus*, they confound it with the other *Ranunculus paluſtris rotund. folius lævis*, and therefore he calleth it *Ranunculus paluſtris echinatus*, not that it groweth in mooriſh ground but in wet fields. The eighth is called by *Bauhinus* *Ranunculus rotundifolius repens echinatus*. The ninth is called by *Columna* *Ranunculus minimus Apulus*, as it is in the title, and by *Bauhinus* *Ranunculus arvenſis parvus folio triſido*. The tenth is called by *Cluſius* *Ranunculus Platophyllos*, and is his fift *Montanus*, which *Bauhinus* calleth *Latiſſimo folio hirſutus*. The eleventh is generally called of moſt writers, as alſo with all *Herbariſts*, *Ranunculus Illyricus minor*, and is the fourth *Ranunculus grumoſa radice* of *Cluſius*, and by *Bauhinus* *Ranunculus lanuginoſus anguſtifolius grumoſa radice minor*. The twelfth is called by all *Illyricus major*, being of the ſame kind, which *Bauhinus* therefore calleth, *Ranunculus lanuginoſus anguſtifolius grumoſa radice major*, and remembred by *Cluſius* in the ſame place with the other. The thirteenth is called by *Cluſius* *Ranunculus autumnalis*, and *Luſitanicus*, and is his firſt *Ranunculus grumoſa radice*, whereof he maketh two ſorts, and hath two figures upon the diverſities of the leaves and flowers, it is therefore called *Luſitanicus* by *Lobel*, *Dodonæus*, *Dalechamp* us and all others, except *Bauhinus*, who calleth it *Ranunculus latifolius bullatus Aſphodeli radice*. The foureteenth is remembred by *Iacobus Cornutus* onely in his Booke of Canada plants. The fifteenth is called by *Bauhinus* *Ranunculus grumoſa radice folio Ranunculi bulboſi*. The laſt is called alſo by him *Ranunculus Geranij tuberoſi folio*, as it is in the title.

The

The Vertues.

The first of these kindes, being of no sharpe or biting taste, is held to be harmelesse; for the *Germanes* as *Tragus* saith, use to eate it familiarly among other herbes: but the others are sharpe and doe exulcerate the skinne, especially the fift kinde more than any of the rest, and therefore not to be used inwardly in any case: the second and third sorts here expressed, are oftentimes used to be laid to the wrists of the hands, to drive away agues, the leaves being bruised, with a few cornes of bay salt, and a little glasse of windowes, beaten small and mixed together. *Camerarius* saith that they in *Germany* used to apply the roote of the fift kinde to plague sores, to draw them to maturity and breake them, yet it is no other likely but the other sharpe rootes will doe the like, for they will breake tumours and draw impostumes being wisely applied; and *Tragus* saith, that even those that are not sharpe, doe discusse and dissolve hard tumors in any part of the body, being applied: a peece of the round rooteed Crowfoote put betweene those teeth that doe ake, or into an hollow tooth, taketh away the paine, but many times, it either breaketh those that are hollow, or causeth them to fall out: some write, that applied to the finger, by causing more paine therein, than is felt, by the touthach, it taketh away the paine: the decoction of the leaves of the field Crowfeete, healeth scabs and the itch, but they must not be suffered to abide long upon the places; it is likewise used to stay the falling of the haire, the head being washed therewith, being made warme, but not to rest thereon above two or three houres, and then washed off with fresh warme water: it is also said that if the roote be bruised, and applied unto a foule ulcer, it will clense and take away all the filthy and corrupt matter therein, leaving the sore faire to be healed up with other convenient things, but it must not lie long to the sore lest it worke too forcibly: all these sharpe Crowfeete, have the same operation to take away wartes, or the scabbed ruggednesse of nailes, markes, spots, and blemishes in the skin, and all the other properties attributed to these sorts of Crowfeete, mentioned in the former division: besides being mixed with swines dung, they breake *Scrophulæ*, or the small kernells under the eares, and of the necke called the Kings Evill, and applyed to the *Hæmorrhoides* or piles that swell and bleede not, helpeth to discusse or take them away: but in no hand must it be applyed to those that are open and bleede. The distilled water of the herbe, whilst it is in flower, worketh safely to all the purposes aforesaid, and as some report is given with good successe inwardly, with some Holland pouther, or the *species* called *Lithontribon*, to provoke urine when it is stopped, and to breake the stone; the dryed rootes of most of them made into pouther, and put into the nose procureth neesing.

Divisio tertia. The third Division.

1. *Ranunculi Montani.* Mountaine Crowfoote.

OF some of these Crowfeete I have entreated in my former Booke, by the name of *Ranunculus montanus humilior*, of two sorts, and is the first small figure set here also. *Ranunculus montanus albus minor flore simplici*, which is the second figure here, and the double sort among the other garden sorts hereafter. *Ranunculus Thalictri* and *Rutæ folio* both in one figure, being the third in place: and then *Ranunculus Thalictri folio minor Asphodeli radice* the fourth: and *Ranunculus gramineus flore luteo simplici & duplici* the fift, which are not here againe described: but there are a great many other sorts which I will here bring to your consideration and speake of them.

1. *Ranunculus montanus maximus albus.* The greater white Mountaine Crowfoote.

The great white Mountaine Crowfoote differeth from the lesser single white mountaine Crowfeete that is set forth in my former booke (whose figure I give you here in the second place) chiefly in these things, that the leaves of this Crowfoote, being somewhat hairy and very large, are divided to the stalke into five parts, and each of them somewhat deepelier dented about the edges, resembling the leaves of the Globe Crowfoote, but larger and standing upon footestalkes, that are hairy and a foote long almost: the maine stalke is somewhat great and hairy, bare almost of leaves unto the top, where it brancheth out into flowers, under which stand at the joynt three large leaves, much more divided then those below: the flowers are many, each standing on a long footestalk very large and white, consisting of five leaves so large, that the whole flower seemeth to bee as great as a single purple ringed Daffodill, and very sweete withall, having many yellow threds in the middle, standing about a greene head, whereon being ripe the seede groweth many set together; the roote is somewhat great and long, but as it were bitten off in the halfe, with many long blackish strings hanging thereat.

2. *Ranunculus montanus Pennæi.* The great purple mountaine Crowfoote.

This great Crowfoote hath foure or five or more very large and hairy leaves, rising from the roote, set upon long hairy foote stalkes, each whereof is devided into five or more parts, deepely cut in unto the middle, dented likewise about the edges, and of a darke greene colour on the upper side, and grayish, or as it were hoary underneath, among which riseth up a strong round hollow stalke, hairy also, about a yard high, bearing a leafe onely at the top much divided, and from thence spreadeth into three or foure or more small branches, each sustaining a small leafe or two, about which standeth the flower, consisting of five round leaves of a purplish colour on the under side, and about the edges of the inside, but pure white on the rest of the inside; having many yellow threds in the middle, about a greene head, which beareth many flattish and blackish browne sharpe pointed seede: the roote is composed of many long fibres or strings, and hairy at it were at the head thereof.

3. *Ranunculus Plantaginis folio.* Plantaine leafed Crowfoote.

This *Pyrenean* Crowfoote hath three or foure leaves rising from the roote, set on pretty long footestalkes, being somewhat long and broad like unto Plantaine leaves, with ribs therein, but more pointed at the ends, not devided or dented about the edges, but smooth and plaine with some veines running through the length of them, and pointed at the ends of a whitish or grayish greene colour, circled at it were with a white downe: the stalke is round, firme, and greene, about a foote and a halfe high, bearing two or three longer leaves; broad at the bottome and compassing the stalke, which devideth it selfe at the top, into two or three small branches, having every of them a small long leafe at the foote thereof, and a reasonable large flower at the head without any sent, consisting of five white round pointed leaves, with many yellowish threds in the middle, and a round greene head, which afterwards growing ripe hath many seedes set together, like unto divers other sorts of Crowfeet:

the

Ranunculus Montanus humilior albus ſimplex & duplex.
Single and double cow white mountaine Crowfoote.

Ranunculus Montanus albus minor ſimplex.
The leſſer ſingle white mountaine Crowfoot.

thē roote is compoſed of many white ſtrings or fibres, faſtnēd to a head which is ſomewhat hairy, and abideth many yeares, but the leaves periſh quite in the end of Summer, and are renewed in the ſpring.

4. *Ranunculus Pyreneus albus duplex.* Double white Crowfoote of the *Pyrenean* hills.

This Crowfoote differeth little from the laſt but in the flowers which are not ſo many together, and conſiſt of two rowes of white leaves.

5. *Ranunculus montanus Betonicæ foliis.* Mountaine Crowfoote with Betony like leaves.

This ſmall Crowfoote hath divers leaves riſing from the roote, ſomewhat broad and long, full of ſmall veines which make it ſeeme rugged every one upon a little ſhort footeſtalke, roundly dented about the edges and round at the point or end, very like nnto the leaves of Betony, but that they are ſmaller, of a browniſh greene colour on the upper ſide, and of a ſilver white ſhining colour underneath: the ſlender hayrie ſtalke that riſeth up in the middle of thoſe leaves, doth ſcarſe exceede the length of ones hand, bare or naked without any leaves unto the top, where it beareth one flower onely, like unto the laſt deſcribed ſingle Crowfoote but ſmaller, conſiſting of five ſmall white leaves, pointed at the ends with ſome yellow threds in the middle, having five ſmall greene leaves under it, as a huske wherein it is ſet: the ſeede is conteined in a ſmall rough head like unto other Crowfeete: the roote is a ſmall tuft of white Fibres, ſomewhat like unto the roote of Betony: the whole plant both leaves and rootes are bitter, with an exceeding auſtere or aſtringent binding taſte, whereby it is judged not to be huftfull or offenſive, but rather acceptable to the ſtomacke, and may be profitable for moyſt, and cold diſeaſes thereof.

6. *Ranunculus gramineus bulboſus.* The bulbed graſſeleafed Crowfoote.

This bulbed graſſeleafed Crowfoote hath divers very long and narrow, ſmooth, grayiſh, greene leaves, ſomewhat hairy at the bottome, and with ſome long veines therein; from among which riſeth up a ſlender ſtalke, about a foote high, with two ſmall long leaves thereon, not branched at all, but bearing out of a ſmall huske of five greene parts, one ſmall faire ſhining yellow flower, like unto other Crowfeete, as is the ſeede alſo, being many ſet together on a long head, and every one pointed with a crooked end: the roote is ſomewhat round at the bottome, with a long necke upward, covered with a blackiſh hairy coate or covering, with divers thicke and round Fibres growing underneath, thicker at the ends then at the heads with ſome ſmall hairy fibres at the end of them; within that outer hairy coate is found a round bulbous roote, like unto that of *Gladiolus* or Corne Flagge, the one ſet upon the other which was the elder, and ſeemed as it were ſhrunke.

7. *Ranunculus gramineus perfoliatus.* Thorough leafed graſſe Crowfoote.

This ſmall thorough leafed graſſe Crowfoote ſendeth forth from a ſmall fibrous roote, divers narrow grayiſh greene graſſie leaves, about two inches long, yet ſomewhat broader then the laſt; from the middle of whom riſeth up the ſtalke, ſcarſe higher then the leaves, having two long leaves about the middle thereof, broad at the bottome and compaſſing the ſtalke, like unto that ſmall kind of yellow Centory, that hath his name from that effect, which brancheth it ſelfe at the top, bearing two or three very ſmall greeniſh yellow flowers, conſiſting of five broad leaves, ſomewhat foulded inward, and not layd fully open: the head of ſeede is ſmall, but like unto

Ranunculus nemorosus Thalictri & Rutaceo folio.
Medow Rue and Garden Rue leafed Crowfoote.

Ranunculus Thalictri folio minor Asphodeli radicibus.
Colombine leafed Crowfoot with Asphodill rootes.

Ranunculus gramineus flore luteo simplici & duplici.
Yellow grasse Crowfoot single and double.

Ranunculus montanus maximus albus.
The great white mountaine Crowfoote.

the graſſe Crowfoote deſcribed in my former Booke. Of this kinde there is another whoſe leaves are ſomewhat broader, and the flowers more ſpread open, and with ſharper ends. *Folij latiſ. uſculis.*

8. *Ranunculus pumilus alter anguſtifolius.* Another ſmall narrow leafed Crowfoote.

There is another of this laſt kinde, which groweth a little bigger and higher, and beareth but one yellow flowēt upon the toppe of the ſtalke, larger than in any other of theſe three laſt graſſe Crowfeete.

9. *Ranunculus Aſphodeli radice flore luteo.* Yellow Crowfoote with *Aſphodill* rootes.

I have in my former Booke ſet forth one of this kind, very like hereunto both for forme of flowers and rootēs, whoſe figure you have before: this other differeth from it in the leaves (the former being ſomewhat broader than this, very like unto the ſmall *Thalictrum*) which are very ſmall, narrow, and much divided, very like unto the leaves of the greater *Bulbocaſtanum*, or earth Cheſnut; ſome lying upon the ground, and others ſtanding more upright, each ſtanding upon a reddiſh hairy foote ſtalke, which with the leaves is very nigh halfe a foote long, in the middle of whom appeareth a greene head before the ſtalke is riſen, and beareth it at the toppe thereof, as it riſeth; which when it is ripe ready to blow, ſheweth to be but one faire ſhining yellow flower, (whereas the other hath many white ones) conſiſting of five round pointed leaves; with many yellow threds in the middle, ſtanding about a greene head, which in time groweth ſomewhat longer than in other ſorts of Crowfeete, having many crooked ſeedes ſet together thereon, but much ſmaller than in many of the other: the ſtalke is ſingular, not many, but hairy and reddiſh, ſeldome branched, but bearing two or three divided leaves towards the toppes, ſomewhat broader that thoſe below, upon ſhort footeſtalkes, at ſeverall diſtances one above another, on both ſides thereof: the roote is compoſed of diverſe tuberous, round and ſomewhat long clogs, ending in a very long fibre, very like unto the other.

10. *Ranunculus alter ſaxatilis Aſphodeli radice.* The pale Crowfoote of *Naples*, with *Aſphodill* roote.

This Crowfoote of *Naples*, hath many thicke cloggie rootes, joyned together at the end, greater above and ſmaller downewards, of about a thummes length, with many ſmall fibres among them, from whence the firſt leaves that riſe up are broad, ſomewhat deepely cut in on the edges on both ſides, but thoſe that follow next are much more divided, and into many parts, each part cut in alſo and dented beſides on the edges, and ſtanding upon long foote ſtalkes, which are broader at the bottome than above, and compaſſe one another at the foote, for a little way upward, being ſomewhat hairy alſo, greene on the upperſide and whiter underneath: the ſtalke is round and hairy, about a foote and a halfe high, having diverſe leaves thereon, much more divided than thoſe below; and at the joynts with the leaves, toward the toppes come forth long branches, with ſmall jagged leaves on them, under a ſmall tuft of three or foure large pale flowers, of five broad or round pointed leaves, of the breadth of ones naile, with many yellow threds in the middle: the ſeede is ſmall, round, flat and pointed, many ſet together on a long head.

11. *Ranunculus montanus hirſutus latifolius.* Great hairy Mountaine Crowfootes.

The firſt leaves of this Crowfoote are round, like thoſe of Doves foote, very hairy, of a blackiſh greene colour, and ſoft, divided or cut into three parts, each of them alſo parted into three ſmaller diviſions, ſtanding upon

2. *Ranunculus montanus Pennæi.*
The great purple mountaine Crowfoote.

3. *Ranunculus plantaginis folio.*
Plantaine leafed Crowfoote.

long hairy footeſtalkes, yet thoſe that follow are broader, more divided and hairy, among which riſeth up a ſtraked hollow ſtalke, a cubite and a halfe high, with diverſe leaves ſet thereon, and parted toward the toppe into many branches, having ſmall pale yellow flowers on them, like unto others of this kinde, and ſeede alſo in the like manner; the roote is long made of many fibres.

12. *Ranunculus montanus lanugineſus foliis Ranunculi pratenſis repentis.* Woolly mountaine Crowfoote.

The roote of this Crowfoote hath reddiſh ſtrings or fibres, ſending forth a ſmall ſoft woolly ſtalke, about a cubite high, devided into many branches, with pale greene leaves ſet thereon, being ſoft and woolly, and ſtanding on woolly long footeſtalkes, an hand breadth long, devided into three principall parts, and each of them into others, and dented about the edges, very like unto thoſe of the Medow creeping Crowfoote: the flowers hereof that ſtand at the toppes of the branches are yellow, but larger than the laſt.

13. *Ranunculus ſaxatilis magno flore.* Rocke Crowfoote with large flowers.

This Crowfoote hath many ſmall leaves riſing from a long fibrous roote, ſet upon long foote ſtalkes, ſcarſe ſo broad as the naile of ones hand, parted into three ſmall jagges, and they againe into two or three other, ſomewhat ſoft, and woolly: the ſtalke that riſeth up among theſe, is ſcarſe an hand breadth high, ſomewhat woolly alſo bearing but one large flower at the toppe, of a ſhining gold yellow colour, made of five leaves, with many deeper yellow threds in the middle.

4 *Ranunculus Pyrenæus albus duplex.* Double white Crowfoote of the *Pyrenian* hills.

5 *Ranunculus montanus Betonicæ foliis.* Mountaine Crowfoote with Betony-like leaves.

14. *Ranunculus ſaxatilis foliis ſubrotundis.* Rocke Crowfoote with roundiſh leaves.

This ſmall Rocke Crowfoote, hath a few ſomewhat round leaves ſpread upon the ground, thicke and hairy, ſcarſe a nailes breadth, yet devided into ſmall peeces, which alſo are cut in on the edges, ſtanding upon ſhort footeſtalkes, ſcarce an inch long: the ſlender woolly ſtalke that brancheth it ſelfe from the bottome, riſeth not above halfe a foote high with ſome leaves at the foote of the branches, and many yellow flowers of five ſmall leaves at the toppes: the roote is ſmall and fibrous.

15. *Ranunculus minimus ſaxatilis hirſutus.* The ſmalleſt hairy Rocke Crowfoote.

This ſmalleſt Crowfoote ſpreadeth diverſe verie ſmall, and ſomewhat round hairy leaves, cut into three round parts, and dented about the edges, ſtanding upon ſmall long hairy foote ſtalkes, in the middle of which riſeth up, a ſmall ſlender hairy branched ſtalke, not above two or three inches high, with ſmall yellow flowers, at the toppes, like unto the reſt, and ſo is the ſeede that followeth, the roote likewiſe is ſmall and fibrous.

16. *Ranunculus viloſiſſimus Monſpeliacus.* Small red hairy Crowfoote of *Mompelier.*

This red hairy Crowfoote of Mompelier, hath a ſmall roote made of many reddiſh fibres, from whence ſpring up diverſe thicke ſmall and

7. *Ranunculus gramineus perfoliatus.* Thorough leafed graſſe Crowfoote.

Ranunculus alter non perfoliatus latifolius.

8. *Ranunculus pumilus anguſtifolius.* Another ſmall narrow leafed Crowfoote.

hairy

hairy leaves, at the firſt being devided into diverſe peeces, ſome whereof are round, and other ſharpe pointed; but thoſe that riſe up with the hairy ſtalke, are devided into long and pointed peeces, and as it were prickly at the ends, but of an uneven length, ſome being longer and ſhorter than others; which ſtalke being of an hand breadth high, and branched at the toppe, hath a ſmall devided leafe, at the foote of every of thoſe ſmall branches, that beare yellow flowers of a meane bigneſſe, like unto others of this ſort, the whole plant is covered with reddiſh ſoft haires, that it ſeemeth as if it were reddiſh it ſelfe.

The Place.

All theſe ſorts of Crowfeete grow upon the Mountaines, ſome in *Germany*, ſome on Mount *Iura* by *Savoy*, ſome by *Mompelier*, and others in the Kingdome of *Naples*, or on the *Pyreneian* hills, none of them being knowne to grow wild in our countrie.

The Time.

They doe all of them flower about May and Iune, and their ſeede is ripe quickly after.

The Names.

The firſt kinde which is of two ſorts, *Cluſius* maketh to be his ſecond kinde of Mountaine Crowfoote, of two ſorts, but this is the later of his. *Lobel* calleth it *Aconitum Batrachoides*, and is the fift *Ranunculus montanus* of *Bauhinus* in his *Pinax* which hee calleth *Narciſci flore*: the ſecond is *Cluſius* his third Mountaine Crowfoote, which he ſaith Dr. *Penny* a Phyſition of our *London* Colledge, ſent him the figure and deſcription, finding it on Mount *Iura* nere *Geneva*; and is *Bauhinus* his ſixt *Ranunculus montanus hirſutus purpuraſcente flore*, and ſaith it is the *Aconitum candidum acaulon Dalechampij* that *Lugdunenſis* ſet forth, but how can this with a high ſtalke and a purpliſh flower, be called *Candidum* and *acaulon* without a ſtalke, I know not: the third *Cluſius* nameth *Ranunculus Pyreneus albo flore*, whoſe leaves as he ſaith are like unto thoſe of Plantaine, and therefore with moſt Herbariſts is called now adayes, *Ranunculus plantaginis folio*, and ſo doth *Bauhinus*, who likewiſe ſeemeth to thinke, that it may be the *Ranunculus Phœniceus Myconi*, for the reſemblance of the long leaves, like unto thoſe of the Date tree: but herein, in my opinion he is much miſtaken, for that the roote of that *Ranunculus* is *Bulbous*, and therefore more likely to be another, as I ſhall ſhew you, by and by: the fourth and fift have no other names thanare in their titles, being plants never ſet forth by any before, but growing on one of the Alpes, which the inhabitants call *Mont ſenis*, & ſent the one by *Monnel*, & the other by *Peliterius* unto Dr. *Lobel*: the ſixt *Fabius Columna* finding on the hill *Æquicolo*, in the Kingdome of *Naples*, calleth it *Ranunculus leptomacrophyllon bulboſus*, or *Ranunculus buſboſus gramineus montanus*, which *Bauhinus* thereupon calleth *Ranunculus gramineo folio bulboſus*, and as I think doth more nearely reſemble, the *Ranunculus Phœniceus Myconi*, ſet forth in the great Herball called *Lugdunenſis*, which hee ſaith groweth plentifully at the foote of the hills of *Santa Maria Monteſerato*, and the places there abouts, and as he ſaith there, hath *bulbous* rootes and long narrow leaves, and ſo hath this, but the former hath neither. The ſeventh and eight with the other of the ſame kinde are likewiſe plants never written of by any other before, and therefore their titles muſt ſtand as they doe. The ninth *Fabius Columna* found likewiſe in the hills *Campoclarenſes* and *Æquicoli*, and calleth it *Ranunculus montanus Leptophyllos Alphodeli radice* which is very like unto that with *Aſphodill* rootes, which I have ſet forth in my former Book, having leaves like the ſmall *Thali-Etrum*, and a white flower but this hath yellow, which as I there ſaid, *Lugdunenſis* ſetteth among the *umbelliferous* plants, and calleth it *Oenanthe Miconi*, becauſe he finding it on the rockie or ſtony hills in *Spaine*, referred it unto *Oenanthe*, in regard of the rootes; but the flowers and ſeede demonſtrate it plainely to be no ſuch plant, but a plaine Crowfoote, as both by the compariſon and mine owne inſpection (having had it growing in mine owne Garden many yeares, and ſeene it with others) may truely be teſtified: The tenth *Fabius Columna* found likewiſe on the contrary colder ſide of thoſe hills *Æquicoli*, and called it, as it is in the title: the laſt ſixe ſorts have their names in their titles, as *Bauhinus* calleth them in his *Pinax* and *Prodromus*.

The Vertues.

Moſt of theſe ſorts of Crowfeete being hot and ſharpe in taſte, and exulcerating the skinne, no leſſe than many of the former, cannot be but of the ſame quality with them, and although there hath not ſo many and manifeſt trials, beene made of theſe being moſt of them but of late invention, yet no doubt but they may be applied, for the ſame purpoſes; according to their degree, in being more or leſſe ſharpe than others; onely the fourth ſort that hath leaves like Betony, for the forme ſake of the flowers, being joyned to this family, as is ſaid in the deſcription, hath no ſuch hot ſharpe or exulcerating propertie, but as is there ſaid being ſomewhat bitter, and exceeding aſtringent in taſte, is held aſſuredly to be friendly to the ſtomacke, as other things that are of the ſame qualitie of bitterneſſe and aſtriction; which helpe to ſtay and drie up the defluxions of humors, be they cold or hot that fall from the head upon the ſtomacke and lungs, and to preſerve them from putrefaction cauſed thereby.

Ranunculi hortenſis. Garden Crowfeete.

THoſe Crowfeete that are chiefefly nourſed up in Gardens, ſhould follow next, but that I have already ſhewed them in my former Booke, ſelecting all thoſe that beare flowers of any beautie, out of all the reſt of the Tribes or Families, to ſtore that Garden with all as was moſt fit and proper: whoſoever therefore are deſirous to ſee their diſcriptions or know farther of them, I muſt referre them to that Booke wherein they may ſee and reade the varieties there expreſſed, The *Anemones* alſo or Wind flowers and *Pulſatillas* as being kindes of Crowfeete their ſharpe taſte and exulcerating qualitie declaring the ſame, ſhuold beare a place here with the reſt, but that they are all likewiſe deſcribed aforehand, yet I thinke it not a miſſe to give you ſome figures of them, to beautifie this worke and to pleaſe your eyes.

Ranunculus albus multiplex.
The double white Crowfoote.

Ranunculus Asiaticus flore rubro amplo simplici, vel versicolor.
The larger red or the party coloured Crowfoote of *Asia*.

Ranunculus Creticus vel Asiaticus flore argenteo.
The silver like Crowfoote of *Candy* or *Asia*.

Ranunculus Asiaticus vel Creticus flore albo.
Single white Crowfoote of *Asia* or *Candy*.

Ranunculus Asiaticus flore pleno & prolifero.
Double red Crowfoote of *Turkie.*

Pulsatilla rubra.
Red Pasque flower.

Pulsatilla vulgaris.
Ordinary Pasque flower.

Pulsatilla alba.
White Pasque flower.

Anemone latifolia prima Clusij.
Clusius his first broad leafed Wind flower.

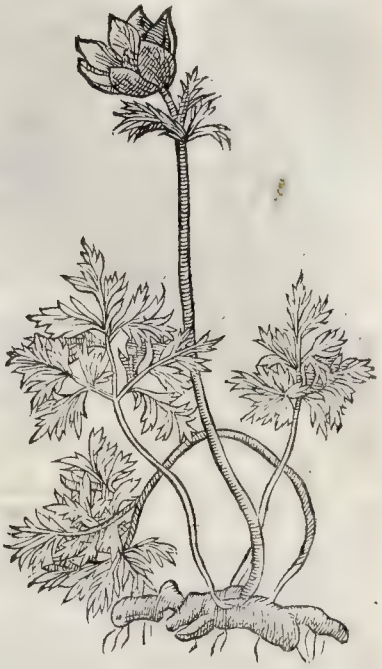
Anemone latifolia cherneſina.
The double crimſon broad leafed Wind flower.

Anemone latifolia flore purpureo.
Broad leafed Wind flower with purple flowers.

Anemone maxima Chalcedonica.
The great Wind flower of *Conſtantinople.*

Anemones maximæ Chalcedonicæ flos.
The flower of the great Windflower of *Conſtantinople.*

Anemone tenuifolia flore ſimplici violaceo.
The thinne leafed Wind flower with a ſingle purple flower.



Ranunculi paluſtres & Aquatiles. Marſh and Water Crowfoote.

Such ſorts of Crowfeete likewiſe ſhould follow, and be joyned to the reſt, as grow in Moriſh grounds or Watery places, if I had not ſet and propounded to my ſelfe an other manner of method to follow in this Worke; I muſt referre therefore all thoſe that are deſirous, to be ſatisfied with the knowledge of them unto their proper place, where they ſhall be intreated of all together, with all other ſorts of herbes, naturally growing in ſuch places, which is the Claſſis of Moriſh and Watery plants.

CHAP V.

Mandragoras Mandrake.

ALthough I have declared in my former Booke the diverſities of Mandrake, both male and female, yet I thinke it not a miſſe to remember them here againe, being a plant both of that worth and rarietie, and dangerous and profitable qualities therein, eſpecially *ſoporiferous* whereof ſome enſuing plants doe partake.

1. *Mandragoras mas vulgatior.* The more ordinary male Mandrake.

This male Mandrake thruſteth forth from the roote (which groweth ſomewhat great and downe right, in ſome but with one, in others with two, three or foure twines or branches, devided a little below the head or toppe, and diverſe ſmall fibers beſides, blackiſh on the out ſide, & whitiſh within, without other ſhape of mans or womans parts, whatſoever cunning knaves may forme other rootes by Art to be like what they pleaſe) many large leaves lying on the ground greater than any Beete leaves, whereunto *Dioſcorides* compareth them: from the middle of whom riſe up ſundry pale greene flowers, made of five round leaves apeece, each ſtanding on a ſmall ſlender foote ſtalke within a greene five leafed huske wherein afterwards is the fruit ſet, being of the bigneſſe of a reaſonable Pippin, and as yellow as gold when it is thorough ripe with divers round whitiſh flat ſeedes within it, and of an heady or ſtrong ſtuffing ſent, this is the true deſcription of the plant, and therefore thoſe idle formes of the Mandrakes and Womandrakes, as they are fooliſhly ſo called, which have beene expoſed to publike view, both in ours and other lands and countries, are utterly deceitfull being the work of cunning knaves, onely to get mony by their forgery: doe not miſdoubt of this relation no more than you would of any other plant ſet downe in this booke, for it is the plaine truth whereon every one may relie.

2. *Mandragoras mas alter.* Another male Mandrake.

I ſaw in my Lord *Wootton* his Garden at *Canterbury*, whereof Mr. *John Tradeſcant* had then the keeping an other

other sort of male Mandrake whose leaves were of a more grayish greene colour and somewhat foulded together differing herein from the forerecited kinde which grew there hard by this also, but what fruit it bore could not be assured having never borne any as they said.

3. *Mandragoras fœmineus.* The female Mandrake.

The female Mandrake hath likewise many leaves lying on the ground, but smaller, narrower, more crumpled and of a darker greene colour, resembling those of *Lettice* as *Dioscorides* compareth them: the flowers also rise from among the leaves, each on his slender footestalke as in the former, but of a blewish purple colour: the fruit that followeth is much smaller than those of the male, but round like them, and not peare fashion as some have thought, (for *Clusius* who saw diverse of them, growing naturally in sundry places in *Spaine* denieth it) of a paler yellow colour when they are ripe, and of a more pleasing, or rather of a lesse heady sent, than the apples of the male, wherein are contained such like seede but smaller and blacker, the roote also is like the former, blackish without and white within, neere unto the same forme, parted into more or fewer branches, as nature listeth.

Mandragoras mas & fœmineus.
The male and female Mandrake.

The Place.

They grow in woods and shadowie places, and the female by rivers sides, in diverse countries beyound the Alpes, but not on this side naturally, as in *Græcia*, the Iles of *Candy*, and others in the Mediterranean sea, *Italy* also and *Spaine*: withus they are noursed up as rarieties in Gardens, the male in sundry places: but the female onely with the curious, as being both farre more rare to get, and more tender to keepe.

The Time.

The male flowreth in March and the fruit is ripe in July the female as *Clusius* saith, he found in some places in *Spaine* in flower in February, and in the same moneth in other places of *Spaine* it had ripe fruit, but with us where it is best preserved, it flowreth not untill August or September, and the fruit seldome or never ripeneth.

The Names.

It is called in Greek μανδραγόρας and *Mandragoras* also in Latine, *quod ad mandras pecorum aliasque speluncas proveniat*; some also as *Dioscorides* saith in his time called it ἀνθρώπιον, and *Circæa*, because *Circe* the great enchantresse used it as is thought in love matters; *Pythagoras* called it ἀνθρωπόμορφος *a forma humana*, because the roote hath some likenesse of a mans body with two legges, but without armes; they are called also *Mala canina & terrestria*. *Dioscorides* saith the female was called τριδάκνας *tridacias* of the Letice like leaves, and *niger*, as the male was called *Candidus*, the fruit of both is round, but of the female as *Dioscorides* saith, like ὄις *forbis*, and not ὠὸν *ovis*, as *Ruellius* his Translation hath it, which caused some to figure it peare fashion, especially seeing *Oribasius* who followed *Dioscorides* most nearely compareth the fruit as well to *acradibus* as Wild peares; but you here before *Clusius* his deniall thereof, as an *oculatus testis* of all those that he saw, so that if any fall out otherwise, it might be rather accounted *lusus naturæ*, than the ordinary propertie in nature. *Dioscorides* his third sort called *Morion*, is not *Theophrastus* his *Mandragoras* as *Cordus* thought, which *lib. 6. cap. 2.* hee saith hath a stalke as *Elleborus*, *Cicuta* and *Albucum*, but is much controverted by diverse, being not certainely knowne what herbe it is, and peradventure also not to *Dioscorides* himselfe, for he relateth it but by heare say, as he doth many other things which were not of his owne knowledge. *Matthiolus* defendeth *Hermolaus Barbarus* against *Brasavolus* and *Fuchsius*, who judged that *Hermolaus* thought the *Melongena* or *Mala insana* to be *Dioscorides* his *Morion*, which he describeth, *ut ferunt* or *tradunt*, to grow nigh unto caves in sundry woods, with lesser white leaves than those of the white Mandrake, a spanne long lying about the roote, which is tender and white, longer then ones hand, and of the thicknesse of ones thumbe: *tradunt* againe saith he, that if a dramme of the roote be given any man in bread or broath, it will take away the use of reason and sense, causing him to sleepe for three or foure houres, after the same manner of disposition as when he tooke it: Phy tians use this when there is cause to burne or cut off any member, (that is, to cast him into a deepe or dead sleepe, that the paines may not be so sensible:) by these words of *Dioscorides*, it doth plainely appeare to me, that his *Morion* is but another species of the former which hath no stalkes, for the leaves he saith (and peradventure the fruite also) lie on the ground about the head of the roote: but *Pliny* hath faulted foulely in describing the Mandrakes, making those of *Theophrastus* and *Dioscorides* to be one, and transferring that which is proper to the one unto the other. The sundry fables hereof reported in *Matthiolus* and others are not fit here to be related; who so are desirous to know them, may reade them in thir Authors or Relators. The *Arabians* call it *Iabora* and *Yabrohach*; the *Italians Mandragora*; the *Spaniards Mandracola*; the *French Mandragore* and *Mandagloire*; the *Germans Alraun*; the *Dutch Mandragora*; and we in *English* Mandrake:

The Vertues.

The Mandrake as *Galen* saith is of an exceeding cold qualitie even in the third degree, yet hath in it some heate, in the barke of the roote is some drinesse, and in the apple some moisture, whereby it is of a soporiferous propertie causing sleepinesse or drowsinesse, as *Levinus Lemnius* in his Herball to the Bible maketh mention of

an

an experiment of his owne, that upon a ſuddaine became drowſie, ſitting at his booke in his ſtudy, and muſing what ſhould be the cauſe, found that it proceeded from the ſent of one of theſe apples, which he had laid on a ſhelfe therein, which being removed he found no further inconvenience: the barke or the juice taken therefro, is given to thoſe that in their ſickeneſſe cannot ſleepe, the decoction of the roote in wine alſo doth the ſame, and is exhibited to thoſe (as is aforeſaid) that are to be ſeared, or a limbe or member to be cut off, to induce the leſſe ſence of paine: the condenſate juice taken to the waight of one ſcruple in ſweete wine, purgeth flegme and melancholy by vomit like unto Hellebor, but taken in a greater quantity it killeth: it is uſed alſo in peſſaries, either of it ſelfe, or with other emollient thinges to take away the hardneſſe of the matrix, to procure their courſes, and to expell the dead birth. But ſee that not above halfe a ſcruple be uſed at a time: the ſaid juice is alſo uſed with thoſe ocular medicines that coole inflammations in the eyes: the leaves are likewiſe uſed for the ſame purpoſe, as alſo impoſtumes, and diſcuſſe, all hardneſſe, knots and kernels in the fleſh, and take away the ſcars of burning, being often rubbed therewith: the roote beaten with vinegar and applyed to thoſe inflammations, called Saint *Anthonies* fire, doth heale them, and applyed with honey or oyle, taketh away the ſting of Serpents. It is ſaid that if Ivory be boild with the roote hereof ſix houres together, it will ſo mollifye it, that it will take what forme or impreſſion you will give it; the apples and eſpecially the ſeeds in them, doe purge and coole the hot matrix, as *Serapio Avicen*, and *Paulus Ægineta* after *Dioſcorides* have ſet downe, which peradventure *Rachel* knowing to be availeable for her hot and dry body, which was the cauſe of her barenneſſe, (and her beauty argueth a probability of ſuch a conſtitution) deſired the more earneſtly the Mandrake apples that *Ruben Leahs* ſonne had brought his mother, as it is *Geneſis* 30.*v*.14. the ſtrong ſent of theſe apples is remembred alſo *Cant*.7.13, although ſome would divert the ſignification of the Hebrew word דודאים, (which is the ſame in both places) unto Violets or ſome other ſweete flowers, that *Rachel*, deſired and the fruite of *Muſa* or *Adams* apples to that in the *Canticles*: *Hamilcar* the *Carthaginian* Captaine is ſaid to have obtained a famous victory, over the *Libians* by infecting their wines with the apples of Mandrake, whereby being made drowſie they left their wals unmand.

CHAP. VI.

Solanum. Nightſhade.

THere are diverſe ſorts of Nightſhades, properly ſo to be called, and there be ſome other that are referred thereunto, for the likeneſſe of the leaves, flowers, or fruite, or for the properties in the operation. Of thoſe that are referred unto the Nightſhade, I have already ſpoken of diverſe in my former booke, whereunto I referre them, that would be enformed of them, not meaning to repeate their deſcriptions, but denominations in this place, which are *Mirabilia Peruana*, the Mervaile of *Peruor* of the world. *Pomum amoris fructu majore*, Apples of love the greater ſort. *Stramonium ſive Pomum ſpinoſum majus flore ſimpli albo, & purpureo, & Datura Turcarum flore albo ſimplici & flore duplici purpureo*, Thorne apples the greater, with a ſingle white, or ſingle purple flower, and the leſſer with a ſingle white flower, or a double purple flower. *Solanum arboreſcens* or *frutcoſum*, called alſo *Pſeudocapſicum Dodonæi*, or *Amomum Plinij*, *Solanum Americanum, & Ceraſa Indiana*, Tree Nightſhade, the Mumme tree, or Winter Cherry tree: *& Solanum veſicarium* or *Alkekengi*, Winter Cherries, *Potatoes* of *Virginia* called of many, apples of youth, and of *Bauhinus* in his *Matthiolus Solanum tuberoſum eſculentum*, and thought by *Cluſius*, that it did in many things reſemble the *Pycnocomon* of *Dioſcorides*, moved chiefely thereunto from the likeneſſe of the figure thereof, which he ſaw in a written copy of *Dioſcorides*, that had figures; as alſo that it might be *Arachidna* of *Theophraſtus*; but ſetteth it downe in his Hiſtory of Plantes, by the name of *Papas Peruvianorum*, and called by the *Indians*, or *Spaniards Papas*, as *Gomara* and others ſay: and although the common wild Nightſhade, is not dangerous, as divers others are, nor planted in Gardens with us as it was in former times, to be as a potherbe or ſallecherbe uſually eaten, (but now adayes utterly refuſed,) and therefore called Garden Nightſhade, yet let me ſet it with the reſt of the familye and not disjoine it from them.

1. *Solanum vulgare.* Common Nightſhade.

The Common Nightſhade, hath an upright round greene hollow ſtalke, about a foote, or halfe a yard high, buſhing forth into many branches, whereon grow many darke greene leaves, ſomewhat broad and pointed at the ends, ſoft and full of juice, larger than the leaves of Baſſill, elſe ſomewhat like, and a little unevenly dented about the edges, at the toppes of the ſtalkes and branches, come forth three or foure or more white flowers, made of five ſmall pointed leaves a peece, ſtanding on a ſtalke together, one by or above another, with yellow pointels in the middle, compoſed of foure or five yellow threds ſet together, which afterwards turne into ſo many pendulous greene berries, of the bigneſſe of ſmall peaſe, full of greene juice, and ſmall whitiſh round flat ſeede, lying within it: the roote is white and a little wooddy, when it hath given flower and fruite, with many ſmall fibres at it: the whole plant is of a wateriſh inſipide taſte, but the juice within the berryes, is ſomewhat viſcous, like unto a thin mucilage, and is of a cooling and binding quality.

2. *Solanum vulgare baccis rubris.* Red berryed common Nightſhade.

I call this common Nightſhade, becauſe it is in all things like the former common Nightſhade, except that the leaves hereof are ſomewhat harder and rougher, and the berries when they are ripe, are either of a yellow, or of a yellowiſh red colour, the whole plant growing alſo little bigger then the other: this ſort we have had out of *Spaine*, but endured not a winter with us, being more tender as comming out of a hotter Country, where it abideth many yeares, and it may be, that it is but a degeneration by reaſon of the climate, as it hapeneth in ſweete Fenell ſeede and divers other things which change by tranſplantation.

3. *Solanum Somniferum.* Sleepy Nightſhade.

Sleepy Nightſhade riſeth up, with divers thicke round ſoft woolly ſtalkes, divided into other branches, whereon grow many ſoft woolly, but greene broad round leaves, very like unto Quince leaves, two alwayes ſet at a joynt one againſt another, of ſomewhat a hot taſte as *Cluſius* ſaith: the flowers come forth at the joynts with the

1. *Solanum vulgare.*
Common Nightshade.

3. *Solanum Somniferum.*
Sleepy Nightshade.

5. *Solanum Venerarum alterum.*
Sleepy Nightshade of another sort.

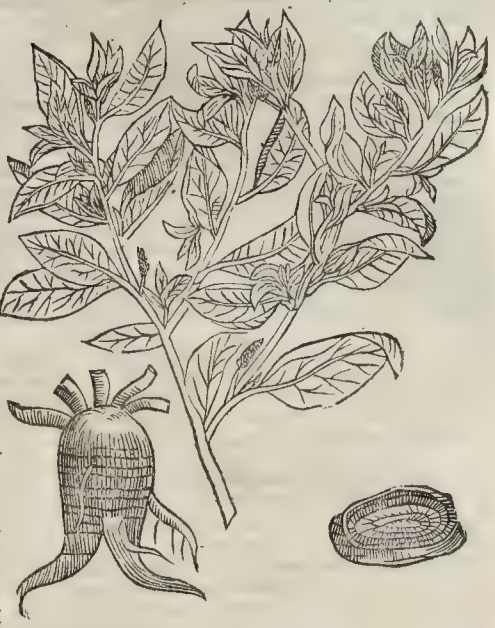
6. *Solanum Lethale.*
Deadly or deadly Nightshade.

the leaves, all along the ſtalkes and branches, three or foure together round about them, which are long and hollow, ending in foure ſomewhat long and pointed leaves, of a pale white colour, which being paſt, there riſe up in their places ſmall yellowiſh red berries, yet bigger then thoſe of the former, ſet in woolly huskes: the roote is thicke long and hard, and of a browniſh colour on the outſide.

4. *Solanum ſomniferum antiquorum verum.* The true ſleepy Nightſhade of the ancient writers.

This Nightſhade riſeth up with three or foure or more thicke round ſtraight whitiſh ſtalkes about a yard high or more, parted into ſome other branches, hard to breake, ſet with ſomewhat broad leaves very like unto Quince leaves with ſmall footeſtalkes under them not alwayes two at a joynt, but many ſtanding ſingly at the joints with the leaves; from the middle of the ſtalkes upwards, come forth diverſe reddiſh flowers together, conſiſting of foure leaves apeece after which follow, ſmall ſtriped and pointed greeniſh huskes; but red when they are ripe, very like unto the bladders of the Winter Cherries, but much leſſe, with a red berry within it, in like manner; the roote is ſomewhat great and wooddy, covered with a whitiſh barke, not very thicke, of a foule ſent and inſipide taſte. Becauſe that kinde of *Solanum*, which *Matthiolus* firſt, and *Cluſius* after him, ſet forth for the true *Somniferum* of the ancients, doth not beare bladder like huskes or fruite, as *Theophraſtus* ſaith, *lib. 9. c. 12.* it hath, it cannot be the right, but this onely which hath ſuch.

8. *Solanum magnum Virginianum rubrum.*
The great *Virginia* Red Nightſhade.



5. *Solanum Somniferum alterum.* Sleepie Nightſhade of another ſort.

The other ſleepy Nightſhade, hath an upright creſted or cornered ſtalke, with many leaves thereon, being longer and narrower than the laſt, and more inclining downeward to the ground, full of veines running long wiſe and traverſe therein: at the joynts of the ſtalke, from the middle part upward, come forth ſeverall pendulous flowers, hanging by very long ſtalkes, being long and hollow like unto a Bell-flower, of a purpliſh colour, each of them ſet in a large greene huske, dented or cut into five parts at the edges, but not very deepe; wherein after the flower is paſt, ſtandeth a round berry, of a deepe blackiſh purple colour, encloſed therein to the middle, and having like a Crowne, at the head of the berry; which is full of a winelike juice, and many ſmall white ſeeds within it: the roote is great and ſpreadeth many great branches with ſmall fibres alſo, under the ground.

6. *Solanum lethale.* Dwale or deadly Nightſhade.

Deadly Nightſhade groweth ſometimes to the height of a man, but uſually it riſeth not up above three or foure foote high, having round green ſtalkes, ſet with divers large leaves, much greater than any of thoſe before, ſmooth and of a darke greene colour, ſet upon very ſhort footeſtalkes; among which at the joynts with the leaves come forth ſeverall long hollow flowers, dented at the brims, of a faint deadiſh purple colour, ſtanding in a greene huske; which after the flower is fallen, containeth a great round berry, greene at the firſt, but of a ſhining blacke colour, like ſhining or poliſhed jet; when it is ripe, full of a purpliſh juice, and many whitiſh ſeeds lying therein: the roote is great, growing downe deepe into the ground, and ſpreading great branches therein, and beſides creepeth under ground, riſing up in ſeverall places diſtant, quickely ſpreading over a ground: the plant hath no good ſent, nor taſte, but unſavory and bitter and very pernicious.

Of this kinde there is another ſort, whoſe leaves are leſſer, and of a darker greene colour, ſtanding upon longer footeſtalkes, and the flowers are not ſo great and large as the other.

7. *Solanum Indicum umbelliferum hirſutum.* Hoary Indian Nightſhade.

Cluſius in his fourth booke of *Exotickes*, declareth that one Dr. *Cole*, or *Coolmans*, going with *Dutch* Merchant Ships to *Bantam*, and other places, in the *Eaſt Indies* (but dying by the way in comming home) had gathered ſome herbes, and put them up into a booke of papers, which being viewed by *Cluſius*, hee found among many others, this dryed plant without leaves, which yet he referreth to the kinds of Nightſhade; the ſlender ſtalkes, being about five inches long, and hoary white, bearing many ſhrivelled berryes, hanging downe out of five pointed huskes or cuppes, of a browniſh red colour, of the bigneſſe of pepper cornes, ſtanding in a tuft or umbell, wherein were white ſeedes, like to thoſe of Nightſhade, but not ripe.

8. *Solanum magnum rubrum Virginianum.* Red Nightſhade or Red weed of *Virginia*.

This great *Virginian* plant, which from the likenes of the leaves we have called a *Solanum*, and referred thereunto, riſeth up with a great thick round reddiſh ſtalke, of the thicknes of ones thumbe at the leaſt, & 4. or 5. foote high or more, ſet without order with many very large freſh greene leaves full of veines, ſome greater and ſome ſmaller and ſometimes turning reddiſh: from the joynts where the leaves ſtand from the middle of the ſtalke upwards, come forth ſeverall ſmal ſtalkes bearing the flowers which are very ſmall conſiſting of foure leaves a peece of a pale red or bluſh colour, divers ſtanding together as it were in a ſmall long cluſter, which after bring forth ſmall blackiſh

blackish round seede, foure usually set in one huske: yet it seldome commeth to ripenesse in our country: the roote is white and groweth great with us, but perisheth if it be not defended from the frosts in winter, which usually rot it, but in the naturall places it groweth as big as a mans legge, (for such hath beene sent me, with many circles to be seene in the middle when it was cut like unto a *Bryonye* roote) and above a foote long.

8. *Solanum Mexicanum parvo flore, sive Mirabilis Peruana minor.* The small Mervaile of *Peru*.

This small Mervaile of the world, or of *Peru*, groweth in the same manner, that the greater kinde, shewed you in my former booke doth, but nothing so great or high, having such like leaves set on the stalkes, but much lesser and rounder: the flowers likewise being of a red colour for the most part, and made of one leafe, opening into five parts at the brimes, like the other, are so small, that the whole flower of this is scarce so bigge as the one part, or division of the greater flower, the seed that followeth, and the roote likewise are answerable in proportion to the rest of the plant.

The Place.

The first groweth wild with us, under old walles, and in rubbish, the common paths and sides of hedges and fieldes as well as in other countryes, either hot or cold, as also both in their and our gardens, without any planting. The second groweth onely wild in the hotter countries of *Spaine*, *Italy*, &c. The third *Clusius* saith he found not farre from *Malaga* in *Spaine*, and *Matthiolus* saith in *Italy* also. The fourth *Alpinus* saith, groweth in *Candye*. The fifth as *Matthiolus* saith, groweth on the hill *Salvatino* in the County of *Goritio* in *Italy*, hard by *Trent*, and as some thinke in *Syria*, and the East Countries thereabouts. The sixth groweth wilde not onely in many, and divers woods of *Germany*, but in divers places of our owne Land, as in the Castle yard of *Framingham* in *Suffolke*, under *Iesus Colledge* wall in *Cambridge*, and in many places of that Country: also at *Ilford* in *Essex*, at *Croydon* among the Elmes, at the end of the Towne: in Moore Parke in the Parke of Sir *Percivall Hart* at *Lelling stone* in *Kent*, on the Conny burries, in *Burling* Parke likewise, as also in the way that leadeth from S. *Mary* Cray to Footes Cray over against the gate of a great field called *Wenaell*. The seventh is declared in the description. The eighth groweth in *Virginia*, *New England*, &c. from whence the seed and Plants, were first brought to us. The last came as the greater sort did from the *West-Indies*.

The Time.

They doe all dye downe to the ground in winter, although some doe shoote a fresh in the spring, as the 3. 4. 5. 7. 8. 9. doe, yet the third being more tender as comming out of a warmer Country, doth hardly endure, but perisheth utterly, by the extremities of our winters, especially if it be not housed or well defended, and even the two first that dye every yeare, and rise of their owne sowing, doe not spring out of the ground, untill it be late in the yeare, as not untill the latter end of *Aprill* at the soonest.

The Names.

It is called in Greeke of some τρύχνον & τρυκνόν, but more usually Στρύχνον *quod viteum, capreolum, vitem vel acinum, vel tale quiddam signet, ait Pena, in Solanorum classe, quibus cunctis proprium acinos plures vel pauciores habere, nisi quis στρύχνον e. Theophrasto suspicari malit, aut* Βατίχιον *in* στρύχνον *mutatum.* In Latine *Solanum & Solatrum. Uua lupina & Uua vulpis. Pliny* saith it was called also *Strumum* and *Cucubalus*, but they are thought to be rather bastard names, and not to be proper to this plant, the *Arabians* call it *Hameb alhomaleb*, *Hameb alchaich*, and *Hameb althaleb*, the *Spaniard*, *Yerva Mora*, and *Morella*, the *Italians Solatro*. The *French* Morelle. The *Germans Nachtschadt*, and the *Dutch Nascaye*, and *Natchscade*. In *English Nightshade*, *Morrell*, *Petty Morrell*, and in some places *Hounds berries*. *Dioscorides* reckoneth up foure sorts, Κύπρια *& hortense*, ἀλικακάβος *vesicarium*, ὑπνοποιὸς *somniferum*, and μανικὸς *furiosum* or *manicum*. *Theophrastus* in his 7 booke and 14. chapter, maketh but three sorts, *Solanum edule, fructum veluti mitem, vel acinosum ferens. Sunt alia duo quorum alterum somnium, alterum insaniam adfert.* The first is generally called by all writers *Solanum simply*, or *vulgare*, or *hortense*, because it is most usuall, and generally every where to be had, and was planted in gardens as other herbes for foode, but now is no where used, but Physically: the second is called of *Cordus* in his History of Plants *Solanum puniceum*, and of *Gesner in hortis Germania Solanum rubrum & luteum*, and is remembred by others also. The third is generally taken to be the true *Solanum somniferum* of *Dioscorides*, for so *Matthiolus*, *Gesner*, *Guilandinus*, *Lacuna*, *Clusius*, *Dodonæus*, *Lobel*, *Cæsalpinus*, *Castor Durantes*, *Camerarius*, and *Lugdunensis* doe set it downe. Prosper *Alpinus* only contesteth against it, and sheweth that the fourth here set downe, which in his booke *de plantis exoticis*, he saith hath red bladders, and small red berryes in them is the right sort, as *Dioscorides*, *Theophrastus* and *Pliny* doe describe their *Solanum somniferum* to be. The fifth *Matthiolus* calleth *Solanum somniferum alterum*, and so doe *Camerarius*; *Gesner*, and *Lugdunensis*, *Dodonæus* calleth it *Solani lethali alind genus*. The sixth is generally by the *Italians* called *Bella Donna*, either *per Antiphrasin*, because it is blacke, or as the *Moores* doe account them fairest, that have the finest blacke skinne, or as some have reported, because the *Italian* Dames, use the juice or distilled water thereof for a *fucus*, peradventure by the excessive cold quality, to take away their high colour, and make them looke paler. *Matthiolus* calleth it *Solanum majus*, and so doe *Cæsalpinus*, and *Camerarius*: *Tragus Solanum hortense nigrum*: *Fuchsius*, *Lobel*, and *Lugdunensis*, *Solanum somniferum*, *Dodonæus*, and *Clusius Solanum lethale*, and so doth *Thalius*; *Gesner Solanum sylvaticum*; *Anguillara*, *Guillandinus*, *Dodonæus*. *Fuchsius*, *Cordus* and others, doe take it to be *Mandragoras morion* of *Theophrastus*, but not of *Dioscorides*, for they are so much differing one from another, as though they had lived in two severall worlds, to give names to herbes, the one not knowing of the other. The *Germanes* call it *Schlaffbeere* and *Dolwurtz*; it is called in *English*, *Dwale*, or deadly *Nightshade*. The seaventh *Clusius* maketh mention of, in the fourth booke of his *Exotickes*, by the name of *Solani Indici genus*, and *Bauhinus* thereupon calleth it as I doe in the title, *Solanum Indicum hirsutum corymbiferum*. The eighth we have referred as I said before, to the kindes of *Solanum*, for the likenesse of the leaves, although much larger, and call it *rubrum*, both for the colour of the stalke, and from the colour that it giveth, for the *Indians* therewith doe both colour their skinnes, and the barkes of trees wherewith they make their baskets, and such like things, as we are informed: the *Indians* themselves call it and our *English* people that live in *Virginia*, call it *Red weede*, but we according to the Latine name, red *Nightshade* of *Virginia*. The last *Bauhinus* setteth fort in his *Prodomus* and *Pinax*, under the title here expressed, not being mentioned by any other Writer.

The

The Vertues.

The ordinary or common Nightſhade is wholly uſed to coole all hot inflammations, either inwardly or outwardly, being no way dangerous to any that ſhall uſe it, as moſt of the reſt are; yet it muſt be uſed moderately, for being cold and binding in the ſecond degree, the diſtilled water onely of the whole herbe is fitteſt and ſafeſt to be taken inwardly: the juyce alſo clarified and mingled with a little vinegar, is good to waſh the mouth and throate that is inflamed: but outwardly the juyce of the herbe or berries, with oyle of Roſes, and a little vinegar and ceruſſe, laboured together in a leaden Morter, is very good to anoint all hot inflammations, Saint *Anthonies* fire, and all other grieved places, that are moleſted with heate, as the head ache and frenzies, anointing the temples and forehead therewith, as alſo the heate and inflammation in the eyes: it doth alſo much good for the ſhingles, ringwormes, and in all running, fretting & corroding ulcers, and in weeping or moiſt Fiſtulaes, if the juice be made up with ſome hens dung, and applied thereunto: a peſſary dipped in the juyce, and put up into the matrixe ſtayeth the immoderate fluxe of womens courſes; a cloth wet therein and applied to the teſticles or cods, upon any ſwelling therein giveth much eaſe: as alſo to the goute, that commeth of hot and ſharpe humours; the juyce dropped into the eares, eaſeth thoſe paines that ariſe of heat or inflammation; *Pliny* ſaith moreover, that it is good for hot ſwellings under the throate: the ſleepie Nightſhade of both ſorts, are of one and the ſame qualitie, being cold in the third degree, and drie in the ſecond, comming neere unto the propertie of *Opium* to procure ſleepe, but ſomewhat weaker, if a dramme of the barke of the roote be taken in wine, but not to exceede that proportion for feare of danger: the ſeede drunke doth powerfully expell urine, and is alſo good for the dropſie; but the often taking thereof in too great a quantite, procureth frenzie; the remedy whereof is, to take good ſtore of warme honied water: the roote boyled in wine, and a little thereof held in the mouth, eaſeth the paines of the tooth ache: *Pliny* ſaith it is good to faſten looſe teeth: the juyce of the roote mingled with hony, is good for the eyes that are weake of ſight: It is more effectuall in all hot ſwellings and inflammations than the former, in regard it is colder in qualitie, the juyce of the herbe or rootes, or the diſtilled water of the whole plant being applied: the deadly Nightſhade is held more dangerous than any of the other, for it is thought to be cold in the fourth degree: the juyce of the leaves, and a little vinegar mixed together, procureth reſt and ſleepe, (when upon great diſtemperature, either in long ſickneſſe, or in the tedious hot fits of agues, reſt and ſleepe is much hindered) if the temples and forehead be a little bathed therewith: as alſo taketh away the violent paine of the head, proceeding of a hot cauſe: the leaves bruiſed or their juyce may be applied to ſuch hot inflammations, as Saint *Anthonies* fire, the ſhingles, and all other fiery or running cankers, to coole and ſtay the ſpreading: the danger is very great, and more in the uſe of this inwardly, than in any of the former, and therefore there had neede of the more heed and care, that children and others doe not eate of the berries hereof, leaſt you ſee the lamentable effects it worketh upon the takers thereof as it hath done, both in our owne land, upon ſundry children killed by eating the broth wherein the leaves were boiled, or the berries, and beyond the ſea in the ſame manner: yet ſome doe hold that two ounces of the diſtilled water hereof is effectuall to be taken inwardly without any danger, againſt the heart burning, and other inflammations of the bowells, and againſt all other hot inflammations of the skinne or eyes, giving eaſe to the paines. It hath beene often proved, that one ſcruple of the dried roote hereof infuſed in a little wine ſixe or ſeven houres; and then ſtrained hard through a cloth, that if this wine be put into a draught of other wine, whoſoever ſhall drinke that wine, ſhall not be able to eate any meate for that meale, nor untill they drinke ſome vinegar, which will preſently diſpell that qualitie, and cauſe them fall to their viands, with as good a ſtomacke, as they had before: this is a good jeſt, for a bold unwelcome gueſt. The *Virginia* Nightſhade is a familiar purger with them in *Virginia*, *New England*, &c. where they take a ſpoonefull or two of the juyce of the roote which worketh ſtrongly; but we having tried to give the dried roote in powder have not found that effect.

CHAP. VII.

1. *Solanum ligneſum ſive Dulcamara.* Wood Nightſhade or Bitter ſweete.

ALthough this plant hath no dangerous quality therein, nor yet is properly any Nightſhade, more than the outward conformitie in ſome ſort, yet becauſe many learned Authours have reckoned it as a ſort thereof, and called it by that name, let me alſo place it with them, and ſhew it you in this place, thus: it groweth up with many ſlender winding brittle wooddy ſtalkes, five or ſixe foote high, without any claſpers, but foulding it ſelfe about hedges, or any other thing that ſtandeth next unto it, covered with a whitiſh rough barke, and having a pith in the middle, ſhooting out many branches on all ſides, which are greene while they are young; whereon grow many leaves without order, ſomewhat like unto the leaves of Nightſhade, but that they are ſomewhat broad, long, and pointed at the ends, with two ſmall leaves, or rather peeces of leaves, at the bottome of moſt of them, ſomewhat like the Sage with eares, and many of them likewiſe, but with one peece on the oneſide, ſometimes alſo thoſe peeces are cloſe unto the leaves, making them ſeeme as it were jagged, or cut in on the edges into ſo many parts, and ſometimes ſeparate there from, making the leaves ſeeme winged or made of many leaves. and are of a pale greene colour: at the toppes and ſides of the branches come forth many flowers, ſtanding in faſhion of a long umbell, upon ſhort foote ſtalkes, one above another, which conſiſt of five narrow, and long violet purple coloured leaves, not ſpread like a ſtarre, or very ſeldome, but turning themſelves backwards to the ſtalkes againe whereon they ſtand, with a long gold-yellow pointell in the middle ſticking forth, which afterwards turne into round and ſomewhat long berries greene at the firſt, and very red, ſoft and full of juyce when they are ripe, of an unpleaſant bitter taſte, although ſweete at the firſt; wherein are contained many flat white ſeedes: the roote ſpreadeth it ſelfe into many ſtrings under ground, and not growing into any great body: the barke alſo of the branches, being chewed, taſteth bitter at the firſt, but ſweeter afterwards.

2. *Dulcamara flore albo.* Wood Nightſhade with white flowers.

Of this kinde there is another that differeth not from the former, more than in the flowers, whoſe outer

leaves are white, and the pointell yellow.

The place.

This groweth usually by ditches sides, and hedges, where they may climbe up upon them, the first almost every where: the second is very rare and seldome to be met with, yet it groweth by Saint *Margates* Church in *Rumney* Marsh, and neere unto *Bermonsie* house on *Southwarke* side, when *Gerard* wrote thereof, but now is not there to be found. *The Time.*

The branches abide dispoiled of leaves all the Winter, yet perish not, but shooteth forth new leaves in the Spring, and flowreth about July, the berries are ripe in August. *The names.*

This hath not beene remembred, by any of the ancient Greeke Authours, although some of the moderne Writers, have imposed Greeke names upon it, calling it σεμχοδένδρον. *Strychnodendron*, which is *Solanum arborescens*; and γλυκυπικρον *Glycypicron*, that is, *Dulcamara* or *Amaradulcis*; diverse doe thinke it to be *Melothron* of *Theophrastus*. *Matthiolus* tooke it to be *Vitis sylvestris* of *Dioscorides*, *lib.* 4. *cap.* 183. Others in referring it to the Nightshades, call it *Solanum lignosum* or *fruticosum* or *rubrum*. It is called of the *Germans Ielenger ie lieber* and *Hynschkraut*, because the shepheards use it for their cattell, when they are troubled with that disease they call *Hynsch*, of the *Dutchmen Alfrank*; of the *French Morelle du bois*; and we in *English* Bitter sweete, wood Nightshade, and Fellonworte of some. *Tragus* would referre it to the *Hedera Cilicia*, or *Smilax* of *Theophrastus* in his third Booke and last Chapter; or unto the *Smilax laevis* of *Dioscorides*, set forth in his fourth Book and 140. Chapter; *Dodonæus* thinketh, that that kinde that beareth white flowers, may be *Cyclaminus altera of Dioscorides*. *Guillandinus* tooke it to be *Salicastrum* of *Pliny*, *lib.* 22. *cap.* 1. but all erroniously: the learned of *Mompelior* as *Pena* and *Camerarius* say called it *Circæa*; whereuntoit as little agreeth, asthe *Circæa* set forth inthe next Chapter, as you shall there understand. *Bauhinus* calleth it *Solanum scandens*, *seu Dulcamara*.

Dulcamara seu Solanum lignosum.
Wood Night shade.

The Vertues.

Both leaves and fruit are hot and drie, astringent and clensing. *Tragus* sheweth the manner of making a medicine for the yellow saundise, (and for the dropsie saith *Dodonæus*) although it be inveterate, by driving it forth gently, both by urine and the stoole, in this wise: Take saith he, a pound of the wood of wood Nightshade, cut it small, and put it into a new earthen pot, whose cover hath an hole in the toppe, with three pints of white wine, close the joynts of the pot with paste, and set it on the fire to boyle gently, untill a third part be consumed: which afterwards being strained forth, take a draft thereof morning and evening: The juyce of the leaves and berries is thought to be good for them that have beene bruised by blowes or falls, to dissolve and avoid the congealed bloud, and heale the part affected afterwards: it is held also effectuall to open the obstructions of the liver and spleene, but so often as I have given it by appointment I have knowne it to purge very churlishly. Some also use the drinke before prescribed against putride feavers or agues. The countrie shepheards of *Germany* as *Tragus* reporteth, doth use to hang it about their cattells neckes, when they are troubled with the disease they call *Die Hynsch*, which is a swimming in the head, causing them to turne round: diverse countrie people doe use the berries bruised and laid to the finger that hath a Felon thereon to cure it.

CHAP. VIII.

1, *Circæa Lutetiana major.* The greater Inchanters Nightshade.

THE likenesse also of this plant in some part thereof, hath caused it to be referred unto the Nightshades by diverse, and so must I untill a fitter place may be knowne, the description whereof is thus. It riseth up with diverse small round pointed stalkes, most usually standing upright, yet sometimes leaning downe to the ground, and taking roote at the jointes, about a foote or more high, especially if it grow in a moist shadowie place, with two leaves set at every joynt, each of them set upon a prettie long foote stalke, which are broad and round almost at the bottome, and very long pointed at the end, somewhat dented about the edges: some compare them unto the leaves of Nightshade; others unto those of Pellitory of the wall, being of a shining greene colour on the upperside, and tender, soft, or gentle in the handling, although it be a little hairy, and of a darke grayish colour underneath: from the middle of the stalke almost upwards, doe the flowers grow Spike fashion, many set together one above another, which shew to be of a darke browniish colour, while they abide buddes unblowne open, but being blowne are small white five leafed starre flowers, dasht over especially at the brimmes or edges, with a light shew of blush, with many browniish yellow threds in the middle, where after they are past, came small rough round heads, like unto small burres, sticking unto garments in the like manner, wherein are included small shining blacke round seede, somewhat like unto the seede

ſeed, of *Pellitorye* of the wall, but leſſer: the roote is ſmall, very white, and full of joynts, from whence it ſhooteth forth and creepeth every way under ground, quickly ſpreading a great compaſſe: the taſte hereof is ſomewhat ſweetiſh and wateriſh withall.

2. *Circæa lutetiana minor.* Small Inchanters Nightſhade.

This ſmall Nightſhade is in all things like the former, but that it groweth much ſmaller in every part, although it grow in the ſame places with it.

The Place.

They grow in moiſt and ſhadowye places, and ſometimes at the rootes of old rotten trees in woods, and ſometimes by the hedge ſides or borders of fields.

1. *Circæa lutetiana major.*
The greater Inchanters Nightſhade.

The Time.

They ſpring up in *Aprill*, are in flower in *Iune*, give their ſeede in *Auguſt*, and periſh downe to the ground afterwards, the rootes abiding ſafe in the ground.

The Names.

Theſe were not knowne to any of thē ancient writers, that we can finde, but are uſually in theſe dayes, called by all Herbariſts *Circæa*, becauſe in the outward forme, it is like the *Circæa* of *Dioſcorides*: *Lobel* and *Pena*, call the greater *Circæa Lutetiana*, not knowing the leſſer, we adde *major* for a diſtinction between them, the former is called alſo *Circæa Monſpelienſium*. *Tragus* calleth it *Lappa ſylveſtris*, becauſe the ſmall heads of ſeed, are rough like ſmall burres, for he judgeth the *Amaranthus minor purpureus* to be the *Circæa* of *Dioſcorides* and *Pliny*. *Iohannes Thalius* in *Hercynia ſylva* (which is joyned with *Camerarius* his *hortus Medicus*) calleth them *Helxine ſylveſtris, ſive fluviatilis major & minor*, and ſaith that they are like in leaves, unto the *Helxine*, that is called *Parietaria*. *Geſner* in *hortis Germaniæ*, calleth it *Ocimaſtrum verrucarium* (not being before knowne by any name) becauſe the leaves as he ſaith, are like *Baſſill*, and the rough heades, like unto rugged warts; *Tabermontanus* calleth it *herba* Di. *Stephani*: *Bauhinus* calleth the greater *Solanifolia Circæa dicta major*, as hee doth the leſſer *Solanifolia Circæa Alpina*, which *Fabius Columna* calleth *Circæa minima*. Many alſo have taken the *Mandrake* of *Theophraſtus* to be *Circæa* of the ancients, becauſe he ſaith, it was ſo called by ſome in his dayes: and ſome the *Mandragoras* of *Theophraſtus*, to be this *Circæa*, and have attributed the vertues thereof unto it: but aſſuredly none of theſe herbes, nor that in the former Chapter, is anſwerable unto the deſcription of *Dioſcorides* his *Circæa*, for although he ſaith the leaves of *Circæa* are like *Nightſhade*, yet the flowers are many and blacke, and the ſeede like unto *Millet*, growing in ſmall hornes: the roote alſo he ſaith is almoſt a foote long, three or foure together, being white, ſweete in ſmell, and of an heating or warming property: ſo that as I ſaid, none of theſe anſwer unto this deſcription in all things, for the ſeede of none of them is contained in hornes or crooked cods, although *Tragus* ſaith the *Amaranthus* is; yet the rootes are not ſweete nor heating, nor of any uſe, when as the chiefeſt property of *Dioſcorides* his *Circæa*, conſiſted in the roote applyed for many purpoſes. It is called in *Engliſh* of *Gerard*, *Inchanters Nightſhade*, derived from *Circes* the great Enchantreſſe, mentioned by the ancient writers, but why he ſhould call it alſo *Bindweede Nightſhade*, (and his corrector letteth it ſo paſſe) I ſee no cauſe; for that name doth better agree, unto the wood *Nightſhade*, ſet forth in the former Chapter, becauſe it doth climbe like a *Bindweed*.

The Vertues.

There hath not beene any of the moderne writers, either *Tragus*, *Geſner*, *Thalius*, *Lobel* and *Pena*, or *Tabermontanus*, that have ſet downe any property, wherewith any inward or outward diſeaſes may be helped thereby, but have overpaſſed them, as though none of all the Country people where they grow, made any uſe thereof: but aſſuredly by the temperate qualityes, of cold and moiſture therein, they may not unfitly, nor peradventure without good effect be applyed in hot griefes, as the Nightſhade is, although it be moiſt and not aſtringent as it is: I doe not here ſet downe any of the vertues of *Dioſcorides* his *Circæa*, becauſe this is not it, neither doe we know what it is.

CHAP. IX.

Solana Pomifera. Applebearing Nightshades.

VNto thē kindes of Nightshade I must, as divers other good authors doe, joyne some other plantes, which for their qualities, either more or lesse dangerous, or for their outward forme and proportion, doe somewhat agree with the former set done.

1. *Solanum pomiferum herbariorum Lobelij.* *Lobels* red berried Nightshade.

It groweth like common Nightshade but greater, the leaves are like small Tobacco leaves, the flowers are white, like the ordinary sort, the berryes are small and round, of an orient reddish colour, with white seedes within them of an insipide taste, almost without any heate or sharpenesse, and perisheth every yeare as Nightshade doth, this differeth from *Mala Æthiopica*, although *Bauhinus* make them to be one, for this hath no prickes, or thornes, on stalkes, or leaves, nor is the fruite hard or crested.

Solanum fruticosum Americanum dictum Amomum Plinij. The Winter Cherry Tree.

This is described in my former Booke.

2. *Mala Insana Syriaca.* Madde Apples of *Syria.*

This raging or madde Apple, riseth up with a great hard round purplish or browniſh greene stalke, two foote high, divided from the bottome into divers branches, whereon are set many hairy broad rough leaves somewhat unevenly cut in on the edges, and somewhat like the Thorne apple leaves; at the joynts with the leaves, come forth severall large flowers, consisting of six large pointed leaves, in some plants white, in others of a pale, but deadish purple colour, with yellow threds in the middle; which being past there succeedeth large, somewhat long and round fruite, in the warme countries, as bigge as a Cowcumber, but in others, seldome bigger then a large great egge set in the same cup or huske, that contained the flower before, whose colour on the outside, is usually according to the flower it bore, either of a whitish greene, more yellowish, or of a grayish ash colour, or of a pale or wanne purplish colour, with a very thinne skinne or barke, and full of a whitish pulpe, and juice within, having many small flat whitish seedes within it, somewhat greater then those of the Apples of love, the roote is composed of many strings, some great, others small, not thrusting downe deepe into the ground, nor abiding but perishing with the first frosts.

3. *Mala Æthiopica.* Madde Apples of *Æthiopia.*

The Madde apples of *Æthiopia*, are somewhat like the former, but that it groweth not so high, nor spreadeth so much, but having one upright stalke, about halfe a yeard high, set here and there, with divers small prickes, not very hard or long, and at severall joynts with jagged leaves, both lesser, and lesse cut in on the edges, then the former, especially the lowermost, having some prickes also in the middle rib, on the backeside, but those leaves that grow higher, toward the toppes of the stalkes and branches, are much lesser, divided on the edges: the flowers stand dispersed on the branches at the joynts, consisting of sixe white white short leaves, with a yellow pointell in the middle, of divers threds joyned together, after which commeth the fruite which is round and a little pointed at the end, smaller and harder then the greater kinde of Love apples, and straked, and furrowed withall in divers places, of an excellent red colour, and turning more deepe when it is ripe, having sometimes small bunches on them, like unto other small apples, growing unto them; and containing a juicye pulpe within it, somewhat more sharpe then the former, but nothing so moist as the love apples, with such like flat yellowish white seede within it: the roote is a tuft of threds, perishing likewise every yeare, and seldome in these colder countryes commeth to maturity, to shew his beautifull colour or give good seede.

1. *Solanum pomiferum herbariorum Lobelij.*
Lobels red berried Nightshade.

4. *Mala Insana Europea.* Madde apples of *Europe.*

This kinde of madde Apples, groweth with an upright round stalke, to the bignesse of ones finger, a foote and a halfe high, from whence spring forth at severall joynts, sometimes on the one side, and sometimes on the other, divers long and somewhat broad greene leaves, unevenly cut in on the edges; and ending in a long point, three for the most part comming together, each of them upon a short footestalke: at the tops of the stalke grow the fruite, which are round reddish berryes or apples of the bignesse of a Plum, full of seede within them.

5. *Poma amoris majora media & minora.*

Apples of Love, of a greater, lesser, and middle sizē.

These sorts of Love Apples, doe in all things so neerely resemble one another, both in the long trayling branches, the winged and divided leaves, the yellow flowers, and the red berries or fruite, as I have shewed in my former booke, that I can adde no more thereunto.

The Place.

The first was brought out of *Spaine*, the second groweth plentifully wild in *Egypt*, as divers doe report, as also in

Syria,

Solanum fruticosum Americanum dictum Amomum Plinij.
The Winter Cherry tree.

2 *Mala insana Syriaca.*
Madde apples of *Syria.*

3 *Mala Ethiopica.*
Madde Apples of *Ethiopia.*

5. *Pomum amoris maius.*
The greater love Apples.

Syria, and these Easterne countryes: the third is thought to come out of *Æthiopia*, and the backe parts of *Barbarye*: the fourth *Lugdunenſis* ſaith, groweth in ſhadowie places, upon the *Apennine* Mountaines: the laſt likewiſe groweth in thoſe Eaſterly Countryes of *Egypt*, *Syria*, *Arabia*, &c.

The Time.

The three firſt doe flower late in the yeare, that is, not untill *Auguſt*, ſo that their fruite, hardly commeth to be any thing ripe with us, but the ſorts of the laſt, doe uſually ripen well, if the Sommer be not too cold.

The Names.

The firſt is called by *Lobel*, *Solanum pomiferum herbariorum*, but is not *Mala Æthiopica* of *Dodonæus* and others as *Bauhinus* ſetteth it downe. The ſecond is called in Latine *Mala Inſana* of moſt writers, that is *Madde Apples* in *Engliſh*, (but many doe much marveile, why they ſhould be ſo called, ſeeing none have beene knowne, to receive any harme by the eating of them:) in *Italian Melanzana* and *Melongena*, and of the *Florentines*, as *Matthiolus* ſaith *Petranciani*, of the *Spaniards Verengenas*, of the *French Pommes d'amour*, but why they ſhould ſo call it, *Ruellius* doth not know as he ſaith, when as there is another more fitly to be called by that name; of the *Germanes Melantzan* and *Dollopffell*: divers doe take this to be *Strychnon* of *Dioſcorides*, and *vrbanum* of *Theophraſtus*, as alſo the third kinde of *Pliny*, whereupon *Cæſalpinus* as I thinke, calleth it *Solanum hortenſe*, and *Pyra inſana*, of *Bauhinus Solamum pomiferum fructu oblongo*. *Hermolaus* is thought by *Fuſchius*, and *Braſavolus*, to take this to be the *Mandragoras Morion* of *Dioſcorides*, but *Matthiolus* defendeth him, and reprooveth them, for laying that imputation upon him, which he did not avouch. The third is called by *Dodonæus*, and others, *Mala Æthiopica*: *Lugdunenſis* calleth it *Capſicum rotundum Dalechampij*, but very erroniouſly, for this hath no ſuch fiery heating quality therein as the *Capſica Ginney Peppers* have; of *Bauhinus*, *Solanum pomiferum fructu rotundo ſtriato duro*: The fourth is called by *Lugdunenſis*, *Hyoſciamus peregrinus Dalechampij*, and of *Bauhinus Solanum peregrinum fructu rotundo*, I have called it *Mala Inſana Europea*, becauſe that growing naturally in theſe parts, it is ſo like unto the laſt, which is a kinde of *Mala Inſana*: the laſt is called, *Pomum amoris*, and *Pomum* or *Malum aureum*, which *Anguillara* tooke to be *Lycoperſicum*, or *Lycoperſion* as ſome have it of *Galen* and others, and to be *Glaucium* of *Dioſcorides*, which it cannot be, for that hath a yellow juice and bitter, which this hath not: *Guilandinus* ſaith it is called *Tumatle* by the *Americans*, and ſome others alſo would referre it to *Solanum furioſum*, whereunto it hath no quality correſpondent, *Bauhinus* calleth it *Solanum Pomiferum fructu rotundo ſtriato molli*.

The Vertues.

Madde apples are eaten being firſt boyled in fat broth, with vinegar or ſalt, oyle and pepper, as a continuall juncket with the Genveſes and others, as *Scaliger* ſaith, and neither breed frenſyes nor any other harme, and therefore he ſaith, *minus ſano judicio inſana dicuntur*. Yet *Avicen lib. 2. cap. 455.* condemneth them, ſaying that thoſe that are old are very noiſome and hurtfull, although the freſh ones be better: for by their bitterneſſe and acrimony it is gathered, that they are hot and dry in the ſecond degree, and that therefore they engender Melancholly, the Leproſie, Cancers, the Piles, Impoſtumes, the Headache, and a ſtincking breath, breed obſtructions in the Liver and Spleene, and change the complection into a foule blacke and yellow colour, unleſſe they be boyled in Vinegar; ſo that it is to be admired, that *Averrhoes* ſhould commend them, being dreſt in ſome faſhion. *Fuſchius* ſaith that there is a ſuperaboundant coldneſſe, and moiſture, in the Madde apples, as there is in Cowcumbers and Muſhroomes: yet the beauty of the fruite worketh in ſome, and the inſatiable deſire of delight to the palate in others, and the inciting to Venery in the moſt, (which theſe are thought to procure) doe ſo farre tranſport a great many, that in *Italy* and other hot countries, where they come to their full maturity, and proper reliſh, they doe eate them with more deſire and pleaſure then we doe Cowcumbers, or the like, and therefore prepare and dreſſe them in divers manners; as ſome doe eate them raw, as Cowcumbers, ſome doe roaſt them under the Embers, and others doe firſt boyle them, pare them and ſlice them: and having ſtrowed flower over them, doe frye them with oyle or butter, and with a little pepper and ſalt, ſerve them to the table. Some alſo doe keepe them in pickle, to ſerve for to ſpend in the Winter and Spring: but it is certainely found true, that they doe hardly digeſt in the ſtomacke, whereby they breed much windineſſe, and thereby peradventure bodily luſt; that they engender bad blood and Melancholicke humours, and give little nouriſhment at all unto the body, and that not good: the Apples of *Ethiopia*, are of the ſame quality, although of a firmer ſubſtance, not yeelding any good nouriſhment, but rather offenſive to the body, for theſe two are *congeneres* in forme, and therefore moſt likely in quality. The golden apples or apples of love, are cold and moiſt, more then any of the former, and therefore leſſe offenſive, theſe are eaten with great delight and pleaſure in the hotter Countries, but not in ours, becauſe their moiſture is flaſhy and inſipide, for want of the ſufficient heate of the Sunne in their ripening.

CHAP. X.

Solana pomifera ſpinoſa. Thornye applebearing Nightſhades.

THere are one or two more to be ſpoken of, to finiſh this family of the Nightſhades, one whoſe fruite is neereſt in likeneſſe unto theſe Madde apples, the other to the Nightſhades, after which the Thorne apples ſhould next follow, as being by all authors referred unto the Nightſhades, but becauſe I have already ſet forth all their deſcriptions, I ſhall not neede to repeate them againe.

1. *Solanum ſpinoſum fructu rotundo, ſive Pomum Hiericonticum Imperato.*

Thorny Nightſhade of *Hiericho* with round apples.

The leaves hereof are very like unto thoſe of the former madde apples of *Europe*, but whiter and ſofter, having many ſmall thornes on the middle ribbe of every leafe on the under ſide: on the ſtalke likewiſe and branches are ſparſedly ſet divers thornes, and purpliſh flowers at the toppes of them being ſmaller then the former, after which come ſmaller apples alſo, greene before they be ripe, changing yellow and browniſh afterwards, being round and ſomewhat ſweete in ſmell, but as unſavoury, or without taſte as the former.

Datura

Datura sive Pomum spinosum majus flore albo & purpureo.
Datura sive Stramonium minus flore albo simplici & flore purpureo simplici & duplici.

These are described in my former Booke, and the figures of the lesser sorts here exhibited.

2. *Solanum poniferum Indicum folio rotundo.*
Indian Applebearing Nightshade with round leaves.

Stramonicum minus sive peregrinum simplex & duplex.
Single and double small Thorny Apples.

This plant being onely mentioned by *Monardus*, in his history of those simple medicines, that come from the West *Indies*, is referred by *Bauhinus* unto his Classis of Thorne Apples in his *Pinax*, but should more properly in my judgement, be placed with the fruits, in the last Chapter going before, called Madde Apples, but that it hath farre more excellent properties. The plant groweth in manner of a shrubbe or hedge bush as he saith, of an excellent greenenesse, having leaves that are small, thinne and round, bearing long fruit, round at the lower end, and flat toward the stalke, like unto the *Malum insanum* or Madde Apple, of a grayish or ashcolour on the out side, and of a pleasant and gratefull taste, without any acrimony therein, having many very small seedes within it.

The Place.

The first groweth in *Syria* and *Palestina*, and other the countries neare there unto; the other groweth in the Mountaines of *Peru* onely, a Province in the *West Indies*, and the seede sent unto *Monardus* into *Spaine*, who sowed the seede, to make triall of the effects, were declared to be in it.

The Time.

It is not mentioned at what time either of them floureth or beareth ripe fruite, but it is probable they varie not much from the season, of the other Thorne and Madde Apples, unto which they are so like in forme.

The Names.

The first *Bauhinus* calleth *Solanum spinosum fructu rotundo*, which *Ferrantes Imperatus* of *Naples*, calleth *Pomum Hiericonticum*: the other *Monardus* saith came to him under the name of *Cachos*, as the *Indians* it is likely doe call it.

The Vertues.

There hath not any Phisicall use beene remembred of the first; whereunto it serveth: but *Monardus* saith of the other, that was sent him out of the *Indies*, that it is of great estimation there, both with the *Spaniards* and *Indians* themselves, in that it provoketh urine, expelleth gravell and the stone in the kidnies and bladder, for which it is most commended; it breaketh the stone in the bladder, if it be not too hard and inveterate, or may by any medecines be dissolved, whereof there were many proofes (as *Monardus* saith) declared to his great wonderment: for as he saith, he did not thinke that the stone in the bladder could be dissolved, and expelled by any medicines, and that the cure thereof consisted onely, in the cutting of it out by a cunning hand: but it was said of this, that the seede taken in any fit and convenient water, for that purpose, will by little and little dissolve the stone into small gravell, which after it is expelled forth, will againe be gathered and grow into a hard stone.

CHAP. XI.

Capsicum. Ginny Pepper.

THe *Ginny* Pepper in mine opinion is fittest to follow next after the family of the Nightshades, being in outward forme likest thereunto, as also being no lesse dangerous, although in a quite contrary nature. for this is as farre exceeding in heate, as the other in cold: hereof there are found out, or at least brought to knowledge many sorts in these dayes, which were not knowne in former times, or neglected and not so heedefully regarded at least, as they have beene of later time, especially by *Gregorius de Reggio*, a Capuchine Fryer, who hath observed a dozen severall varieties at the least in the fruite or cods, although very little differing in any thing else. All which I thinke it not amisse to shew you in this Chapter, with some others also not observed by him, but by *Clusius* and others.

1. *Capsicum majus vulgatius oblongis siliquis.* The most ordinary *Ginny* Pepper with long huskes.

I propound this *Ginny* Pepper as a patterne, by which yee may frame the descriptions of all the rest, the chiefest difference consisting in the forme of the fruite whether you will call them huskes or cods, as shall bee shewed every one in their order. The plant it selfe riseth up with an upright firme round stalke, with a certaine pith within them, about two foote high in our Country, and not above three foote in the hotter, spreading into many branches; on all sides, even from the very bottome, which divide themselves againe into other smaller branches; at each joynt whereof come forth two long leaves upon short footestalkes, somewhat bigger then those of Nightshade, else very like, with divers veines in them, not dented about the edges at all, and of a very sad greene colour: the flowers stand severally at the joynts with the leaves, very like unto the flowers of Nightshade, consisting of five most usually, yet sometimes of six white small pointed leaves, standing

open

open like a ſtarre, with a few yellow threds in the middle; after which come the fruite (either great or ſmall, either long or ſhort, either round or ſquare, as the kinde is, either ſtanding upright or hanging downe, as their flowers ſhew themſelves, either of this or that forme, as ſhall be ſhewed hereafter,) in this ſomewhat great and long, about three inches in length, thicke and round at the ſtalke, and ſmaller toward the end, which is not ſharpe but round pointed, greene at the firſt, but being full ripe, of a very deepe, crimſon, ſhining red colour on the outſide, which is like a thicke skinne, and white on the inſide, ſmelling reaſonable well, and ſweete, having many flat yellowiſh white ſeedes therein, cleaving to certaine thinne skinnes within it, which are broader at the upper end, and ſmaller at the lower, leaving the end or point empty within not reaching ſo farre, the whole huske but eſpecially the ſeede, being of ſo hot and fiery a taſte, that it enflameth and burneth the mouth and throate, for a long time after it is chewed, almoſt ready to choake one, that careleſly taketh much at a time thereof: the roote is compoſed of a great tuft, or buſh of threds, ſpreading plentifully in the ground, and periſheth even in the hot Countryes, after it hath ripened all his fruite, and with us, upon the firſt ſharpe froſt it feeleth.

2. *Capſicum minus Braſilianum.* Small round *Ginny* Pepper.

This *Ginny* Pepper groweth in the ſame manner that the former doth, not differing therefrom in any thing, but in the leaves, which being of the ſame forme, are not ſo great and large, and in the fruite which is ſmall and round (ſtanding ſome forthright, and ſome upright, but none pendulous or hanging downe, each of them upon a long footeſtalke) about the bigneſſe of a Barbery, but round and nothing ſo red, but of a darke or blackiſh yellow colour, enclining to red, and in another ſort almoſt blacke, having ſuch like ſeede within them, but ſomewhat ſmaller, no leſſe hot and fiery then the former, and abideth the winter colds, no otherwiſe then the former, and indeede ſeldome beareth ripe fruite in our Country. Thoſe which we have had from the *Bermoudas* where they are naturall, are of a yellowiſh red.

3. *Capſicum rotundum majus ſurrectum.* The greater round upright *Ginny* Pepper.

The chiefeſt difference in this ſort of *Ginny* Pepper, conſiſteth moſt in the forme of the fruite, which ſtandeth upright, as the flowers doe, being great and round like an apple, even the greateſt of all the ſorts that beare round fruite, of an exellent red colour when it is ripe, like unto a polliſhed Corrall.

4. *Capſicum erectum pyramidale majus.* The great upright ſpire faſhioned *Ginny* Pepper.

This is much alike or very little differing from the firſt, the difference of the fruite is that this ſtandeth upright, great below, and ſmaller, and ſmaller to the point, which is ſharper then in the firſt, elſe it might ſeeme the ſame being inverted, that is, either that turned upward, or this turned downewards, of as brave an orient Corall like colour as the laſt.

Capſicum Longum.

1. *Capſicum majus vulgatius oblongis ſiliquis, & alia duo genera nempe quartum & quintum.* The moſt ordinary *Ginney* Pepper with great long huskes, and the fourth and fifth.

5. *Capſicum*

2. *Capſicum minus Braſilianum & 7. alia genera.* Small round *Ginny* Pepper, and 7. other ſorts.

Capſici ſpecies quatuor nempe. 15. 16. 17. & 18.

5. *Capſicum erectum pyramidale minus.* The leſſer upright ſpyre faſhioned *Ginny* Pepper.

As the fruite of this ſort is leſſer, by the halfe than the laſt, and not ſo ſharpe or ſmall at the end, but ſomewhat round, ſo the greene leaves alſo are ſmaller and narrower, and the ſtalke ſmaller and not growing ſo high: the flowers of this, as of all the reſt, that beare their fruit upright, doe ſtand upright alſo, which is a certaine rule to know what fruit will be pendulous and what will be upright. The figures of both theſe laſt ſorts are ſet on the ſides of the former table.

6. *Capſicum exiguum erectum pyramidale.* The leaſt Spyrefaſhioned *Ginny* Pepper.

The forme of this ſmall Spyrefaſhioned *Ginny* Pepper, commeth ſo neare unto the ſecond ſort, that many may ſoone be deceived, in thinking them both one, that doe not heede them more preciſely; for although they both agree in growing upright, and being ſmall, yet thoſe (of the ſecond ſort I meane) are ſhort and round like unto a wild Olive, and theſe are ſmaller and longer, of an inch long at the leaſt, and of a blackiſh red before they be thorough ripe, but then are as red as the reſt: this groweth taller, fuller of branches, and more ſtored both with flowers and fruite, which make the goodlier proſpect: the leaves alſo are no ſmaller, than in any other ſort going before, and of the ſame darke greene colour with the reſt.

7. *Capſicum Cordatum erectum majus.* The greater upright heart faſhioned *Ginny* Pepper.

This ſort of *Ginny* Pepper groweth to be but of a meane height, that is, not ſo high as moſt of the former, having large leaves, but not ſo ſmall at the ends: the fruit is not pendulous or hanging downewards, with his foote ſtalke, but ſtanding upright, being ſomewhat great flattiſh, and as it were bunched out at the upper end next unto the ſtalke, and ſmaller below, ſhort and round pointed, ſomewhat reſembling the forme of a mans heart, as it is intituled.

8. *Capſicum Cordatum erectum minus.* The leſſer upright heart faſhioned *Ginny* Pepper.

This differeth not from the laſt, but in the ſmallneſſe of the fruit, ſtanding alſo upright, and being ſmaller by a third part, or neare an halfe, and ſhorter alſo: the figure of this is omitted, becauſe it is the ſame with the next, but that this is upright and the other pendulous.

9. *Capſicum Cordatum propendens.* Pendulous heartfaſhioned *Ginny* Pepper.

The faſhion of this ſort of Pepper, is ſomewhat like the greater upright heartfaſhioned Pepper, being neare of the ſame bigneſſe, but a little more uneven and not ſo round, but is as red being ripe, and is pendulous hanging downewards not ſtanding upright as the other. There is another of this ſort of pendulous Peppers differing in nothing from the greater but in being ſmaller. *Alterum minus.*

10. *Capſicum ſiliqua Olivaria propendens.* Pendulous Olivefaſhioned *Ginny* Pepper.

This Pepper hath ſmall long and round cods, ſmaller below than above, being very like unto an Olive berry, as red being ripe as any of the reſt, and with the ſtalke hanging downeward.

11. *Capſicum ſiliqua Olivaria erecta.* Vpright Olivefaſhioned *Ginny* Pepper.

This differeth from the laſt but in being greater than it, and ſtanding upright and not in any thing elſe. The figure of this is not ſet in any of the tables; but this figure with eleven is next under the number twelve.

12. *Capſicum*

12. *Capsicum siliqua rotunda Ceraſorum.* Cherry faſhioned *Ginny* Pepper.

There are two ſorts of this Pepper, one which is fully round, like unto an *Engliſh* or *Flanders* Cherry, the other that hath a little point at the end thereof, this being a little bigger then the other, and both of them hanging downe.

13. *Capsicum siliqua lata & rugoſa.* Broad and Crumpled *Ginny* Pepper.

The cods of this Pepper are ſomewhat large, greater above and ſmaller below, ſomwhat flat alſoand not round, but crumpled as it were or ſhrunke halfe together, and ſmelleth pretty ſweete.

14. *Capsicum erectum majus longum.* Long and upright *Ginny* Pepper.

This Pepper is long and round, yet not like that, that carryeth the forme of an Olive berry, but much longer, and of an equall bigneſſe all the length thereof, and ſtandeth upright.

15. *Capsicum oblongum majus recurvis siliquis.* The greater crooked or horned *Ginny* Pepper.

The greater horned *Ginny* Pepper, hath great large cods, about five inches long, ſometimes little or nothing crooked at the lower end, which is long and ſmall, ſometimes a little crooked or bended upwards, and ſometimes very much.

16. *Capsicum oblongum minus recurvis siliquis.* The leſſer horned *Ginny* Pepper.

This differeth from the laſt, in not being halfe ſo thicke or long, and keeping his end bowed or crooked conſtantly, not varying as it doth: both this and the laſt hang downe their cods toward the ground: the whole plant alſo groweth leſſe then the other.

17. *Capsicum bifurcata siliqua.* Double pointed *Ginny* Pepper.

This Pepper is very like the long upright Pepper, and much about the ſame forme and bigneſſe, being of an equall ſize almoſt, all the length thereof, but differeth from it in this, the lower end is parted as it were, into two ſhort round points, and is alſo a little ſmaller there then upwards, neither in colour nor any thing elſe differing from the reſt.

18. *Capsicum siliqua flava breviore.* The ſhorter gold yellow *Ginny* Pepper.

It might be thought by divers, that onely ſee the cods of this Pepper, that it differeth from all the reſt, in the manner of growing, as well as in the colour of the fruite, but it is not ſo; for it hath like leaves, ſtalkes and flowers in every part, and onely differeth in that it beareth cods, very like unto the firſt ſort here ſet downe, which is the moſt common, but that they are ſhorter, and ending in a ſmaller or ſharper point, and of a faire gold yellow colour, not red as all the other before are.

19. *Capsicum siliqua flava longiore.* The longer gold yellow *Ginny* Pepper.

This gold yellow Pepper differeth in nothing from the laſt, but in the cods, which are not ſo thicke as they, but a little ſmaller, from the middle thereof being longer, or leſſening very finely unto the pointed end, of as faire a gold yellow colour as the other.

20. *Capsicum caule piloſo. Ginny* Pepper with hairy ſtalkes.

This *Ginny* Pepper groweth with round greene ſtalkes; ſet full of white haires thereon, contrary to all the former ſorts: at the joynts with the branches come forth two ſuch leaves, as the firſt ſort here ſet forth hath, but larger then they; the flowers are white, conſiſting of five leaves like the reſt, but larger alſo then any of them; after which come the cods, greene at the firſt, as all the other are, but as red as the reſt, when they are ripe, which are ſomewhat great and long, ending in a very long point, in the reſt, as in the ſeede and rootes, not differing from the former ſorts.

The Place.

All theſe ſorts of Pepper, came firſt from the *Weſt Indies*, called *America*, and the ſeverall parts thereof, *Braſſile* being reckoned as a parcell thereof, and our Sommer Ilands alſo, although we in *Engliſh* from others falſe relation, give it the name of *Ginny* Pepper, as though it originally came from thence: they are nurſed up in gardens, in all the Provinces of *Europe*, and groweth in many places of *Italy*, *Spaine*, *&c.* Set in pots about the windowes of their houſes, either for the pleaſure of the beautifull greene leaves and fruite or cods, when they are ripe, or for the uſe it ſerveth, or both. *Cluſius* ſaith it is not onely planted in *Spaine*, and *Portugall* in divers places, but in *Moravia* alſo as he ſaith, for the profits ſake they make of the fruite, which ſerveth them in thoſe parts, in the ſtead of the *Eaſt-Indian* Pepper.

The Time.

They uſe not to ſow them untill the end of *March*, or beginning of *Aprill*, no not in the warme Countries: they flower uſually not before the beginning of *Auguſt*, at the ſooneſt; and their brave red cods ripen not thorowly, untill the beginning of Winter, and ſo will abide both with flowers and fruite, moſt of the Winter with them; but if they take any froſts with us, they preſently periſh, and therefore muſt be houſed if any will preſerve them.

The Names.

It is generally held to be *Siliquaſtrum* of *Pliny*, *a ſiliquis quas producit*, and *Piperitis* of him alſo, *quia fructus Piperis ſapore & acrimonia ſit*, and Καψικον Κάπτω *mordeo*, *Capsicum* of *Actuarius*, *Pena* thinketh it to be *Zingiber Caninum* of *Avicen*: it is in theſe dayes diverſely called, for ſome call it *Piper Indicum*, *Piper Americanum*, *Piper Braſilicum*, or *Braſilianum*, ſome *Calecuthium*, ſome *Hiſpanicum*, and ſome *Piper de Guinea*. *Fragoſus* ſaith that the *Indians* call it *Axi*, and beſides the ſorts here mentioned, he ſpeaketh of one in the laſt Chapter of *Spices*, of a blackiſh blew colour, familiar in *Spaine*. Of the *Italians Pepe Cornuto*, and *Pepe d'India*. Of the *Spaniards Pepe Indiano*. Of the *French Poiure d'Inde*, and *Poiure d'Eſpagne*. Of the *Germanes Pfeffer Indianiſch*, and ſo likewiſe of the *Dutchmen*, we in *Engliſh* generally call it *Ginny Pepper*, and ſome *Indian* Pepper. The firſt as being beſt knowne, and firſt obtained in theſe Chriſtian parts of the world, is mentioned by moſt of the later writers: *Fuſchius* calleth the firſt two, *Capsicum rubrum & nigrum*, and *Siliquaſtrum majus & minus*, *Matthiolus* calleth them *Piper Indicum*, and mentioneth three ſorts, this firſt kinde, the ſixth ſort, and the ſeventh, which the figure in *Bauhinus*, his addition unto him doth demonſtrate. *Lugdunenſis* calleth them, *Capsicum majus & minus*, *Cæſalpinus* tooke it to be *Circea* of *Dioſcorides*. *Lobel* calleth them *Capsicum, vel Piper Indicum longioribus ſiliquis*: the thirteenth is likewiſe remembred by *Fuſchius*, by the name of *Capsicum latum*, and *Siliquaſtrum quartum*, and ſo doth *Dodonæus* alſo, and *Lugdunenſis* from him, call it *Capsicum latum*, ſome alſo doe call that ſort

ſort *Capſicum Cordatum*: the laſt is mentioned by *Camerarius* in his *Hortus Medicus*, by the name of *Piper Indicum piloſo caule*: the moſt of the reſt are remembred by the foreſaid *Gregorio de Reggio*, and ſome by *Bauhinus*.

The Vertues.

The *Ginny* Pepper of all ſorts (for herein they are all like) are hot and dry in the fourth degree, and beyond it if there be any beyond it, and are ſo fiery hot and ſharpe biting in taſt, that they burne and enflame the mouth and throate ſo extreamely that it is hardly to be endured; for if any ſhall eate thereof unadviſedly, it will bee almoſt ſufficient to choake them, and if it be outwardly applyed to the skin in any place of the body, it will exulcerate it, and raiſe bliſters in the ſame manner, as if they had beene burnt with fire or ſcalding water: yea the fierce vapours that ariſe from the huskes or cods, while one doth but open them, to take out the ſeede, to uſe or ſowe, (eſpecially if they doe mince or beate them into pouder) will ſo pierce the ſenſes by flying up into the head by the noſtrills, that it will procure aboundance of neeſings, and draw downe ſuch aboundance of thin rheume, that it is to be admired, forcing teares very plentifully: and paſſing likewiſe into the throate, it will provoke a ſharpe coughing, and even cauſe a vomiting in that vehemencie, that all the bowells as well as the ſtomack, will be much perplexed therewith, and if any ſhall with their hands touch their face or eyes, it will raiſe ſo great an inflammation, both in the face and eyes, that they will thinke themſelves utterly ſpoyled, which will not bee remedyed in a long time, by all the bathing of them with wine or cold water that may be uſed, but yet will paſſe away without further harme: if ſome hereof be caſt into the fire, it raiſeth greevous ſtrong and noyſome vapours, procuring ſneezings very fiercely and coughing, and even vomiting or caſting very ſtrongly, to all that be in the roome any thing neare thereunto: yet marke and obſerve the goodneſſe of our good God, that hath notwithſtanding all theſe evill and noyſome qualities, given unto man the knowledge how to tame and maiſter them, and cauſe them to be ſerviceable and profitable for their health: for whereas if it ſhould be taken ſimply of it ſelfe, either in pouder or decoction, it were ſcarſe to be endured, although in a ſmall quantitie, and by often taking would prove very dangerous to life, the way here ſet downe is found to be the ſafeſt, both to be taken familiarly and often without offence in meate as well as medicine, as alſo to worke thoſe good effects in Phyſick whereunto it is conducible: It is *Gregorio de Reggio* his receipt, for take ſaith he, of the ripe cods of any ſort of *Ginny* Pepper (for as I ſayd before, they are all in propertie alike) and dry them well, firſt of themſelves, and then in an oven, after the bread is taken out, put into a pot or pipkin, with ſome flower that they may be thoroghly dryed, cleanſe them from the flower, and their ſtalkes if they have any, cut them or clip them very ſmall, both huskes and ſeedes within them, and to every ounce of them, put a pound of fine wheate flower (theſame yee dryed them withall in the oven, may be part if yee will) make them up together into cakes or ſmall loaves with ſo much leaven, as yee thinke may be convenient for the quantitie you make; bake theſe as you doe bread of that ſiſe, and being baked cut it againe into ſmaller parts, and bake it againe, that it may be as dry and hard as biſket, which beaten into fine pouder and ſifted, may be kept for any the uſes hereafter ſpecified, or may ſerve in ſtead of ordinary Pepper, to ſeaſon meate or broth, or for ſauce, or any other purpoſe the *Eaſt Indian* Pepper doth ſerve: for it not onely giveth as good, but rather a better taſte or relliſh to the meate or ſauce (yea and your wine and other drinke) but it is found to be ſingular good, to breake and diſcuſſe the winde, both in the ſtomacke and the collicke in the body: it is ſingular good to be uſed with ſuch meates as are flatulent or windy, and ſuch as breed much moyſture and crudities (whereof fiſh is reckoned one ſpeciall:) one ſcruple of the ſaid pouder, taken in a little broth of Veale, or of a Chicken, doth wonderfully comfort a cold ſtomacke, cauſing flegme, and ſuch groſſe or viſcous humours as lye low in the bottome thereof to be avoided, helpeth diſgeſtion, for it provoketh an appetite to meate, provoketh urine, and taken with Saxifrage water expelleth the ſtone in the kidneyes, and the flegme that breedeth them, and taketh away the dimnes or miſtineſſe of the ſight uſed in meates; taken with *Pillulæ Æleophangine* doth helpe the dropſie: the pouder taken for three dayes together in the decoction of Peny-royall, expelleth the dead birth, but if a peece of the cod or huske, either greene or dry be put into the mother after delivery, it will make them barren for ever after: but the pouder taken for foure or five dayes faſting, with as much Fennell ſeede, will eaſe all paines of the mother: the ſame alſo made up with a little pouder of Gentian, and oyle of bayes into a peſſarie, with ſome cotten wooll, doth bring downe their courſes if they have beene ſtayed: the ſame mixed with a Lohoc or Electuary for the cough, helpeth an old inveterate cough; being mixed with hony and applyed to the throate, troubled with the ſquinſie, helpeth it in a ſhort ſpace, and made up with a little pitch or Turpentine, and layd upon any hard knots or kernells in any part of the body, it will reſolve them, and not ſuffer any more to grow there: mixed with ſome niter and uſed, it taketh away the morphew and all other freckles, ſpots or markes, and diſcoulourings of the skin; applyed with Hens greaſe diſſolveth all cold impoſtumes and carbuncles, and mixed with ſharpe Vinegar, diſſolveth the hardneſſe of the ſpleene: if ſome thereof bee mixed with *unguentum de alablaſtro*, and the raines of the backe anointed therewith, it will take away the ſhaking fits of Agues: a plaiſter made thereof, and the leaves of Tobacco, will heale the ſting or biting of any venemous beaſt: the decoction of the huskes themſelves made with water, and the mouth gargled therewith eaſeth the toothach, and preſerveth them from rottenneſſe: the aſhes of them being rubbed on the teeth, will cleanſe them and make them grow white that were blacke: the decoction of them with wine helpeth the Rupture that commeth of water, if it be applyed warme morning and evening: if they put it to ſteepe for three dayes together in *aqua vitæ*, and the place affected with the palſie bathed therewith, will give a great deale of eaſe; and ſteeped for a day in wine, and two ſpoonefull thereof drunke every day faſting, will helpe a ſtinking breath, although it hath continued long; and ſnuft up into the noſtrills, will correct and helpe the ſtinch of them, which is procured of flegme corrupted therein.

CHAP.

CHAP. XII.

Dorycnium. The ſuppoſed venemous plant *Dorycnium.*

THere are diverſe plants ſet forth for the true *Dorycnium* of *Dioſcorides* by diverſe Writers, not any one whereof agreeth with all the notes that he giveth of it; ſo that yet to this day, the true *Dorycnium*, is not knowne to any that we can heare of: I will therefore here ſet forth unto you ſome of thoſe plants, that the moſt judicious moderne Writers, doe ſuppoſe may be referred thereunto, as agreeing therewith in many things, and ſhew whereunto elſe they may moſt properly be referred.

1. *Dorycnium ſuppoſititium Monſpelienſe & Hiſpanicum.*
The white ſhrubbe Trefoile of Mompelier and *Spaine.*

The ſhrubbe Trefoile, which *Rondeletius* and other the learned of Mompelier, (as *Pena* ſaith) called *Dorycnium*, ſhooteth forth many wooddy branches, browne at the bottome, and whiter towards the toppes, ſomewhat flexible, to the height of three or foure foote (as I have obſerved in mine owne Garden) whereon at ſeverall diſtances, come forth diverſe ſmal whitiſh leaves, three or five or more together at a joynt, round about the ſtalke: at the toppes of the branches ſtand many ſmall whitiſh flowers in tuftes, like unto the flowers of other Trefoiles but ſmaller, which turne into ſmall long cods with ſmall round blackiſh gray ſeedes within them: the roote is great, wooddy, very long, and branched into many parts under ground, of a pale reddiſh or fleſh colour on the inſide, covered with a darke browniſh barke: which abideth diverſe yeares, although the branches dye downe to the ground, if there be care taken to defend it from the extremities of the froſts in Winter, for want whereof mine periſhed: it hath little or no taſte at all.

2. *Dorycnio congener Cluſij.* Another Trefoile like unto the former.

This other as *Cluſius* ſaith is very like the former, but more white or hoary, having ſhorter and broader leaves ſet in the ſame manner, three or five together, upon the ſmall bending branches, which are whiter and ſlenderer than they: the flowers are greeniſh and larger than the former, ſtanding many together on a ſlender bare twigge; *Anguillara* and *Camerarius* ſay the flowers are purple, or of a whitiſh purple colour, this hath a ſaltiſh taſte with ſome acrimony in it alſo.

3. *Dorycnium Dioſcoridis fortè Pone. Pona* his ſuppoſed true *Dorycnium* of *Dioſcorides.*

This ſtrange plant ſaith *Pona*, that was encreaſed from the ſeede ſent out of *Candy*, to *Signor Contarino*, and grew in his garden, roſe to the height of a foote and a halfe, ſpreading forth into many branches, whereon did grow many ſmall long and narrow rugged leaves full of veines, leſſer then the leaves of the Olive tree, ſet without order upon them: the flowers were faſhioned like unto the bloſſomes of Pulſe or Peaſe ſometimes of a white colour, and ſometimes of a more yellowiſh colour: the ſeed he ſaith he did not ſee, (but ſurely it muſt give ſeede in cods or huskes: for there are very few plants that beare peaſe or pulſe like flowers, but they beare their ſeede in cods or the like) the rootes are many ſmall ſtringe and fibres ſhooting from a head, which whether it die every yeare or abide, wee have not yet learned: but *Dioſcorides* ſaith that his *Dorycnium* hath a roote of the length of a cubit and of the thickeneſſe of a finger when it is growne old, which this as you heare hath not, and therefore if for nothing elſe, it agreeth not with the right *Dorycnium* of *Dioſcorides*, and yet *Pona* ſaith, he hath not ſeene any plant that doth ſo neerely reſemble the true *Dorycnium* as this doth.

1. 2. *Dorycnium ſuppoſititium Monſpelienſe & Hiſpanicum.*
The white ſhrubbe trefoile of *Mompelier* and *Spaine.*
Et Dorycnio congener Cluſij. Another like it.

4. *Dorycnium Creticum Alpini.*
The ſuppoſed true *Dorycnium* of *Candy.*

This plant doth ſo differ from others, that every one is ready to apply it to a ſeverall plant, as his judgement and affection to ſome particular part thereof doth draw him, becauſe it doth partake with divers plants, as you ſhall heare: it riſeth with divers ſtraight upright wooddy ſtalkes, yet very flexible, divided into many branches from the bottome, all white or hoary; whereon grow many long thicke, and ſomewhat narrow white ſilver like leaves, ſet without order, at the toppes of the ſtalkes and branches, come forth many flowers together in a tuft or umbell, with ſome ſmall leaves with them, every one whereof is broad, open at the brims, and round, conſiſting of one whole leafe, like unto a Bell-flower, or bindweed, which open by degrees, one after another, and not all together, whereby it doth continue the longer in flowring: after the flowers are fallen, come ſmall rough huskes, wherein is contained blacke ſeed, like unto thoſe of the Bindweedes, ſomewhat thicke and great: the roote is ſomewhat great and thicke not growing downe deepe into the ground, with many fibres thereat, which abideth many yeares in the warme countryes, yet the branches loſe their

leaves

3. *Dorycnium Dioscoridis sorte Pona.*
Pona his supposed true *Dorycnium* of *Dioscorides.*

4. *Dorycnium creticum Alpini.*
The supposed true *Dorycnium* of *Candy* by *Alpinus.*

leaves in winter, themselves yeelding new, and budding fresh in the spring but hardly endureth a winter with us, unlesse especiall care be had to preserve it, by keeping it in a large pot or, such like, and housing it untill the spring.

The Place.

The two first grow in divers provinces of *Spaine*, as *Clusius* setteth it downe, and the foremost about *Mompelier* also. The third and the last growboth in rocky or stony places neare the Sea, in *Candy*, from whence the seede or plants were first brought into *Italy*, and from thence to severall friends elsewhere.

The Time.

They doe all flower very late in these parts, whereby their seede seldome commeth to perfection, and in their naturall not untill the Autumne.

The Names.

It is called in Greeke Δρύκνιον *Dorycnium*, and of *Cratevas* as *Dioscorides* saith, ἁλικάκαβος & καλέα *Halicacabus*, and *Calea*, some write it is called δοῦκνιον *Dorycnium quasi toxicum, quo spicula cuspidata ave tela inficiebant ut celeriorem molirentur perniciem* saith *Pena*, but we cannot heare, that any of these plants have any *soporiferous*, much lesse venemous or mortall quality in them, as *Dioscorides* attributeth to his, and therefore the more suspitious that none of them are the right, although in the outward face, they may all of them, in some things resemble it. There are other plants also referred thereunto, as the *Phyllirea*, which *Gesner* in *hortis Germaniæ*, taketh to be a shrubbe like unto the *Vitis Idæa*, as also *Pisum cordatum*, or *Vesicaria nigra, sive peregrinna cordis effigie*, by *Cordus* upon *Dirscorides*. The first is called *Dorycnium verum*, by the learned of *Mompelier*, as *Pena* and *Lobel* say, and *Anguillara*, and *Clusius* say the same also, yet *Clusius* calleth it *Dorycnicum Hispanicum*, which was also sent him as he saith, by *Ulisses Aldroandus*, by the name of *Trifolium album*, but by *Cordus* in the place before recited, it is accounted false. *Bauhinus* in his *Pinax* reckoneth it among the spiked Trefoiles, calling it *Trifolium album angustifolium floribus, velut in capitulum congestis*. *Clusius* saith that the *Spaniards* about *Salamanca*, where he found it, call it *Myedierga*. *Gerard* calleth it venemous Trefoile of *Mompelier*, and of *Spaine*, making them to be two severall plants, expressed by two figures, and Mr *Johnson* his corrector letteth them so passe likewise, but I had rather give it the denomination of *Dorycnium*, from the Latine, as most other nations doe, and call it *Dorycnium supposititicium*, supposed *Dorycnium*, because it is but supposed to be right, or else from the forme, and call it shrubbe Trefoile onely, because it is not dangerous. The second is so called by *Clusius*, as it is in the title, but *Bauhinus* calleth it *Lotos pentaphyllos incanus*. The third is called by *Pona* in his *Italian* booke, *Dorycnium Dioscoridis sorte*, but by *Bauhinus* in his *Pinax*, *Iaceæ olæ folio affinis*, and saith hee had the seede from *Honorius Bellus*, out of *Candy*, by the name of *Lago Chymica*, which grew with him, but if the flowers be *leoninous*, as *Pona* describeth them to be, it cannot possibly come nere to any *Iaceæ*, and yet againe in his *Pinax*, *fol.* 465. he maketh it also to be *Cneoro albo affinis*, which how likely it is, let others judge. The last *Clusius* setteth forth in the *Appendix*, to his History of Plants, by the name of *Dorycnium Plateau*, because *Iacobus Plateau*, had it growing with him, from the seede received from *Candy*, and sent both the figure and description thereof

unto *Cluſius*, *Imperatus* alſo it is likely had it from thence, by the ſame name of *Dorycnium*, for ſo *Bauhinus* ſaith, he called it, and *Alpinus* in his booke *de plantis exoticis*, ſaith that they of *Candy* doe call it *Dorycnium*. Yet *Pona* doth not account it to be the right, but rather thinketh it to be a *Convolvus*, and calleth it *Convolvulus rectus Creticus*. *Lugdunenſis* calleth it *Cneorum album Dalechampij*, and *Bauhinus* in his *Pinax* calleth it, *Cneorum album folio oleæ argenteo molli*.

The Vertues.

There hath not beene any experience made of any of theſe plantes, ſo farre as I can underſtand, that they be effectuall to any Phyſicall uſe, and therefore I can ſay no more of them; for ſeeing none of them are *ſoporiferous*, as *Dioſcorides* his *Dorycnium*, or venemous, and was accounted as ſtrong a *Toxicum*, to dippe their arrowes heads in, to kill wild beaſts, as any other; I cannot appropriate the vertues of *Dorychnum*, to any of theſe plants. Yet *Galen* accounted it onely like unto Mandrake and Poppy, for the cooling property, and only dangerous if too much were taken thereof, in provoking too much ſleepe.

CHAP. XIII.

Hyoſcyamus. Henbanē.

THe ancient writers hath made mention, but of three kindes of Henbane, the one blacke, the other white, and the third yellow; which denominations are not taken from the colour of the herbe or flower, but of the ſeede: but there hath beene ſome other ſorts found out of later times; all which I thinke meete to ſet downe in this Chapter together.

1. *Hyoſcyamus vulgaris.* Common Henbane.

Our common Henbane, hath very large, thicke, ſoft, woolly leaves, lying upon the ground, much cut in or torne on the edges, of a darke or evill grayiſh greene colour, among which riſe up divers thicke and ſoft ſtalkes, two or three foote high, ſpread into divers ſmaller branches, with ſome leſſer leaves on them, and many hollow flowers, ſcarſe appearing above the huskes, and uſually torne on the one ſide, ending in five round points, growing one above another, of a deadiſh yellow colour, ſomewhat paler towards the edges, with many purpliſh veines therein, and of a darke yellowiſh purple in the bottome of the flower, with a ſmall pointell of the ſame colour in the middle, each of them ſtanding in a hard cloſe huske, which after the flower is paſt, groweth very like (the huske of the Pomgranet flower, but that is not ſo well knowne unto us) the flower or huske of *Aſara bacca*, and ſomewhat ſharpe at the toppe points, wherein is contained much ſmall ſeed, very like unto Poppy ſeede, but of a duskye grayiſh colour, the roote is great white, and thicke, branching forth divers wayes under ground, ſo like unto a Parſnep roote, but that it is not ſo white, that it hath deceived divers, as you ſhall heare by and by; the whole plant more then the roote, hath an heavie evill ſoporiferous ſmell ſomewhat offenſive.

1. *Hyoſcyamus niger vel vulgaris.*
Common or white Henbane.

3. *Hyoſcyamus Creticus.*
Henbane of *Candy*.

2. *Hyoſcyamus*

2. *Hyoscyamus albus.* White Henbane.

The white Henbane hath divers large leaves, but not so great as the former, yet more soft and woolly and not so much jagged or torne on the edges, rounder also, and of a paler greene colour; the stalkes grow higher, and with fewer branches on them, the flowers are in forme like the other, but smaller and of a pale colour, enclining to a whitish yellow: the seed likewise groweth in such like hard huskes, but lesse prickely, and is whiter: the roote also is not much unlike, but lesser and perisheth every yeare that it giveth seede, the smell of this is nothing so heady and offensive as the other.

3. *Hyoscyamus Creticus.* Henbane of *Candy*.

This Henbane of *Candy*, hath lesser and thinner leaves then the last, more white and woolly, and more cut in on the edges, dented also, and standing upon longer footestalkes, the stalkes are more slender and short, having such like flowers, ending in full round leaves, standing higher above the huskes, of a faire yellow and sometime of a pale yellow colour, and purple at the bottome: after which come seede like the common kinde, but somewhat yellower in rounder heades or huskes: the roote is somewhat thicke and short, like a Navew roote, dying every yeare with us.

4 *Hyoscianus Ægyptius.* Henbane of *Egypt*.

4. *Hyoscyamus Ægyptius.* Henbane of *Egypt*.

The *Egyptian* Henbane riseth up with a strong woolly stalke, about two foote high, wheron are set lesser leaves, then those of the common kinde, and almost as much torne on the edges, especially those towards the bottome, but those that grow up higher toward the toppe, are little or nothing cut on the edges at all, all of them being very white and hoary: the flowers stand every one of them at the joynts with the leaves, and at the tops likewise, in such like huskes as the common doth, and of the same pale yellow colour, with purple veines therein, at the first blowing of them, but afterwards as they grow larger, so the colour changeth to be of a darke reddish colour, with veines of a deeper colour, and a whitish bottome, with a purple pointell, encompast with yellowish threds in the middle, after which commeth such like prickely heads, as the common kinde hath, and such like seed also: the roote is small and perisheth every yeare.

The Place.

The first is commonly growing by the way sides, and under hedge sides, and walles: the second groweth by the Sea sides, in *Narbone* in *France*, neare where the River *Rhodanus* runneth into the Sea. The third groweth in *Candye*, and in *Spaine* also, from whence the seed being sent, hath growne with me and divers others also. The last is naturall both in *Egypt* and *Syria*, and in our Gardens.

The Time.

They doe all flower in Iuly, yet the strange kindes somewhat later, and from their seed growing ripe, and suffered to shed, it springeth up againe every yeare, but the two last doe scarse perfect their seede with us.

The Names.

It is called in Greeke ὑοσκύαμος, *quasi faba porcina, quod Æliano authore, pastu hujus herbæ convellantur sues aprive, presenti mortis periculo, nisi copia aquæ statim se foris & intus proluerint: adeuntes aquas, non ut proluant se tantum, verum etiam ut cancros venentur, eos enim nulli protinus sanitati restituuntur*; in Latine also *Hyoscyamus*, and corruptly *Iusquiamus*, and *Apollinaris, ab Apolline medecinæ inventore, vel quia opplet cerebrum vitioso & fœtido halitu, eoque mentem percellit, quasi Apollinis æstro. Pliny* saith that the *Arabians* call it *Altercum*, or *Altercangenum*, but *Scribonius* saith the Latines call it *Altercum, ab altercando, quia cum verborum altercatione rixaque se torquent Hyoscianso dementati*; *Camerarius* saith, it is also called *Priapeia, quia Itali semine utuntur ad priapismum sedandum*. It is called by the *Arabian* Phisitions *Bengi* (which name differeth but little from *Bangue* of *Garcias ab Orta*, and *Christophorus Acosta*, so called of the *Persians* and *Indians* also of divers places, and peradventure may be the same, for they say the plant is insipide, or without taste, and the seede both smaller then Hempe whereunto it is compared, and not so white: (and which hath a great affinity as *Clusius* saith, with the *Maslac* of the *Turkes*: yet *Bauhinus* saith, that their *Maslac*, is made of the great *Stramonium* or *Pomum spinosum*) which procureth a kinde of sleepy drunkennesse, or alienation of the minde, as this doth, with some other effects tending to venery, as may be seene in their workes, whereunto I referre those that would be further informed:) of the *Italians Iusquiamo*, of the *Spaniards Velenho*, of the *French Iusquiame*, and *Hanne bane*, of the *Germanes Biilsenkraut*, of the *Dutchmen Bilsen cruidt*. The first is called by all authors *Hyoscyamus vulgaris*, or *niger*, onely *Fuschius* calleth it *flavus*. The second is likewise called *Hyoscyamus albus* of all, and is but of one kinde, although *Bauhinus* seemeth to make two. The third is called by *Clusius*, *Hyoscyamus Creticus*, and although he make two sorts as *Bauhinus* doth, that followeth him, yet assuredly I thinke that they are both but one plant, as the descriptions doe declare. The last likewise is by *Bauhinus* divided into two or three sorts, because *Camerarius* in *horto*, setteth forth two figures, the one he nameth *Syriacus*, the other *peculiaris*; when in his descriptions he saith they differ onely in the broadnesse of the leaves, the one from the other, which may happen rather by the fertility of the soile, wherein they grow, then of any other specificall difference. *Bauhinus* nameth

it *rubello flore*, and maketh it tobe another sort from the *Egyptiacus* of *Clusius*, when as both *Clusius* and *Camerarius* agree in this, that *Paludanus* brought the seede from *Egypt*, and *Rauwolfius* saith he found it growing about *Aleppo*: so that the seven sorts of *Hyoscyamus* set forth by *Bauhinus*, are but these foure here recited, for his two sorts of white, are but one; his two sorts of *Candy* are but one; and his two sorts, the one *rubello flore*, and the other *spinosi simis caulibus Ægyptiacus* are but one, even that which *Camerarius* calleth *Syriacus*, and *peculiaris*, and *Clusius Ægyptiacus rubello flore*: but *Dioscorides* his third sort, wich is the yellow, is not declared, which of these it should be, the first being called *niger*, blacke, and the second white, are peculiarly set downe, and agreed upon by all, but the yellow, as I said is not so plainely determined, some taking the *English* Tobacco to be it or the *Indian* kinde, being quite differing in effect, this being hot and stupefactive, the other cold and soporiferous: but if I might be allowed my verdit, I should say that the *Candy* Henbane is most probable to be the yellow, and the *Egyptian* kinde the blacke, or a species thereof differing onely by the climate.

The Vertues.

The blacke or common Henbane, and the yellow, are both accounted to be more dangerous than the white, and therefore to be as much avoyded in inward medicines as may be, and that but in case of necessitie, when the white cannot be had, for the white is cold in the third degree, and the other in the fourth, procuring drowsinesse and a senslessnesse of the spirits, stupefied by the benumming qualitie; the white is fit onely to be used in inward Phisicke, which is most availeable to many good purposes, if it be wisely and conveniently applied; but the leaves of them all doe coole all hot inflammations, either in the eyes or any other part of the body; and are good to asswage all manner of swellings, whether of the cods, or womens breasts, or else where, if they be boyled in wine, and either applied themselves or the fomentation warme: the same also applied to the goute, asswageth the paines thereof, and of the Sciatica, and all other paines in the joynts, and other parts, which rise from an hot cause; it helpeth likewise the headach, and want of sleepe in hot fevers, applying it with vinegar to the forehead and temples: the juyce of the herbe or seede, or the oyle drawne from the seede doth the like, and so doth the decoction of the huskes, to wash the feete or the head, but see that you doe not use it too often for feare of danger: *Dioscorides* saith that the seede is profitable against the defluxions, of hot and sharpe salt rheumes upon the lungs causing a cough, as also against the strangling and other paines of the mother, and to stay the over-great fluxes of their courses, and all other fluxes of bloud: the oyle of the seede is helpefull for the deafenesse and noise and wormes in the eares, being dropped therein: the juice of the herbe or roote doth also the same: it helpeth the tooth-ach, if the roote be boyled in vinegar, and a little of the decoction be held on that side the paine is: some have also affirmed, that the fume of the seede being burned, taken into the mouth, will not onely ease the paines, but cause the wormes to fall out from the teeth, but diverse cunning knaves to deceive those they would get money from, having caused such to hold their mouthes over warme water, have cunningly conveyed small peeces of Lute strings into the water, to cause them to beleeve they voyded so many live wormes, as there are peeces in the water: for the property of those Lute strings is, that feeling the heate of the water, they will seeme to stirre, and move as though they were alive: but *Pena* sheweth that hee knew a young woman that used the foresaid fomentation for her teeth, that after shee had ease of them, was for three dayes so troubled in her senses, that she seemed as if shee had beene drunke, being very merry and pleasant all that time, which passed away without further danger: but I know a friend of mine, that having digged up some Parsneppe rootes that grew in his Garden, by chance some rootes of Henbane which grew among them (which as I had before is somewhat like thereunto) were boyled with them, and he eating thereof at supper, was very shortly after first troubled with a drought, that nothing that he could take would quench it, then his taste, or relish of any thing was taken away, suddenly also his sight was troubled that he could not discerne things as they were, but as if they were 3. or 4. fold, his urine also was quite stopped, so that notwithstanding he had great desire to make water, yet he could not possibly: in this perplexitie he continued most of the night, neither could he rest, or sleepe being in bed, but his urine by the stopping thereof grew so hot within him, and not able to passe it from him, caused him to bethinke himselfe of a pouder, himselfe had caused to be made, availeable against the stone, which he caused to be given him, which suddenly caused him to make water and thereby hee presently felt incredible ease in his whole body, for all the things that he had taken before did doe him no good, but by this meanes he quickly recovered his sight, and the other symptomes vanished, and before morning, hee was as well as before the taking of that roote: the servants also that did eate of the good Parsneps that were boyled with these malignant rootes were somewhat distempered, some more some lesse, each somewhat, according to their feeding, and their owne dispositions working together: this I have related that you may know also the danger of this herbe, and of every part thereof; the seede is usually mixed with *Coculus Indus* to take fish, causing them that take it to turne up their bellies, and lie above the water as if they were dead for a while; but they doe not long abide in this manner, but returne to their senses againe and swimme away: Hens also or other birds, that take of this seede will die, and the fume of the herbe being burned, and brought into their rousting place, will cause them to fall downe as if they were dead: the decoction also of the herbe or seede or both, will kill lice and vermine whether in man or beast, which you shall plainely perceive in a dogge troubled with lice, being washed therewith, the lice will be soone found dead upon him, and some fall from him: the fume of the dried herbe, stalkes, and seede burned, and the hands held over the fume thereof, that are troubled with swellings and chilblanes in the Winter, or their heeles that have kibes, will quickly heale them. The distilled water of the herbe is effectuall for all the purposes aforesaid. The remedy to helpe those that have taken Henbane, is to drinke Goates milke, much mede or honied water, Pine kernells with sweete wine; or if these be not at hand or will do no good. Fennell seede, Nettle seede, the seede of Cresses, Mustard or Raddish, as also Onions or Garlicke taken in wine, doe all helpe to free them from danger, and restore them to their due temper againe. The white Henbane is as I said, the fittest and most effectuall in all inward medicines for the griefes afore specified: the other sorts are of the qualitie of the ordinary, that is, more dangerous than the white.

CHAP. XIV.

Papaver. Poppie.

THere are diverſe ſorts of Poppies, ſome tame and of the garden, others wild and of the fieldes; of the Garden kinde ſome have ſingle and ſome have double flowers: of the wilde there are diverſe kindes, ſome of the corne fields moſt properly and plentifully, and therefore called Corne Roſe, or Corne Poppie, others whoſe heads of ſeede are ſmall & long, bending or bowing like an horne, and therefore called Horned Poppy, of which kinde one ſort groweth moſt uſually by the ſea ſide: others by the pathes, hedges and bankes in fields: then that kinde called Spatling Poppie, differing from them all, as *Papaver Heracleum* doth, although called Poppy: and laſtly, there is a baſtard kind of wild Poppie, called in Latine *Argemone*, which although *Dioſcorides* reckoneth it not among the Poppies, yet he maketh it like unto the wild corne Poppie, both in heads and flowers, and like the *Anemones* in leaves, and as he ſaith with a round roote, wherein it differeth from ours. Of ſome of theſe kindes I have already ſpoken, and therefore neede not to diſcribe them againe: the Garden kindes, with double flowers I have ſet forth in my former Booke of the Garden of flowers; as alſo a kinde of that wild Corne Poppie, that beareth double flowers: and in the Claſſis of purging plants, here before in this Booke, I have ſet downe all the ſorts of Horned Poppie; as alſo that kind of Spatling Poppie, that is ſo accounted with us: the reſt of the ſorts and kindes not ſet forth, are now to be entreated off: but I thinke it moſt fit to give you ſome of the figures before expreſſed, and to ſpeake of the ſorts of *Argemone*, in the next Chapter, and not in this.

1. *Papaver ſimplex ſativum album*, Single Garden white Poppie.

The Garden Poppie hath at the firſt, foure or five whitiſh greene leaves, lying upon the ground, which riſe with the ſtalke, compaſſing it at the bottome of them and are very large both broad and long, much rent or torne in on the edges, and dented alſo beſides: the ſtalke (for every roote for the moſt part hath but one, of the height of foure or five foote (hath ſometimes no branches at the toppe, and uſually but two or three at the moſt, bearing every one but one head, wrapped or folded in a thinne filme or skinne, which boweth downe, before it be ready to blow, and then riſing and being broken, the flower which was foulded within it, ſpreadeth it ſelfe open, and conſiſteth of foure very large white round leaves, with many whitiſh round threds in the middle, ſet about a ſmall round greene head, having a crowne or ſtarre-like cover at the head thereof, which growing ripe becommeth to be as large as the greateſt apple; (*Bellonius* ſaith the heades are in *Natolia* (where they make *Opium*) ſo great, that they will containe halfe a pint) wherein are contained a great number of white ſmall round ſeede, in ſeverall partitions or diviſions, next unto the ſhell the middle thereof remaining hollow,

1. *Papaver ſimplex album ſativum.*
Garden white Poppie.

Papaver multiplici flore.
Double Garden Poppies.

and emptie: this head abideth close, and openeth not at the toppe under the crowne, as all the blacke kindes for the most part doe: all the whole plant, both leaves stalkes and heads, while they are fresh, young and greene, yeeld a milke when they are broken, of an unpleasant bitter taste, almost ready to provoke casting, and of a strong heady smell, which being condensate, is called either *Opium* or *Meconium*, as you shall heare by and by: the roote is white and wooddy, perishing as soone as it hath given ripe seede: Of this white kinde, there is another in all things like unto it, but that the flowers, but especially the head of seede is not so great by the halfe, and for the most part hath more branches upon the stalkes; the seede is as white as the other, and as large or great. The varieties of the double garden Poppies are set forth in my former Booke.

Alter.

Papaver sativum multoplici flore.

2. *Papaver sativum simplex nigrum.*
Single garden blacke Poppie.

There is little difference to be discerned betweene this and the last mentioned, untill it beareth his flower, which in this is somewhat lesse, and of a blacke purplish colour, without any purple spots in the bottome of the leafe as in the next; the head of seede is usually not so bigge as the second sort of white ones, and openeth it selfe a little round about the toppe under the crowne, so that the seede which is very blacke, will fall out if one turne the head thereof downewards.

3. *Papaver sativum simplex flore rubro rubente, &c.*
Single garden red Poppie of diverse colours.

There be some other sorts of this garden Poppie, which differ not onely somewhat in the leaves from the former, being lesser, and in some crumpled and cut in on the edges, but in the jagged edges also of some of the flowers, and specially in the colour of the flower and seede, for the flower of some will be very red, of others paler, some of a Rose colour, others of a murry colour, either deeper or paler, yet all of them have a deeper spot somewhat large in the bottome of every leafe: and as the flower varieth so doth the seede also, for the Rose and pale coloured flower bringeth gray or ashcoloured seed, the Reddish and deepemurrey, not so pale seede, but more enclining to the blacke: the seedes of all these kindes, the white as well as the blacke or gray, if they be suffered to shed will spring up againe the next yeare, and beare every kinde

2. *Papaver sativum simplex nigrum.*
Single garden blacke Poppie.

4. *Papaver Rhœas.*
Wild Poppie or corne Rose.

5. *Papaver spinosum Americanum.*
Thorny Poppie of *America*.

his owne colour of flower and ſeed, and doe not degenerate or vary, for ought that ever I could obſerve.

4. *Papaver erraticum, Rhœas ſive ſilveſtre.* Wilde red Poppy or Corne Roſe.

The leaves of the wild Poppy, are long and narrow, very much cut in on the edges into many diviſions, of a light greene colour, but not whitiſh, and ſometimes hairye withall: the ſtalke is blackiſh and hairy alſo, but riſeth not up ſo high as the Garden kindes, having ſome ſuch like leaves thereon as grow below, parted into three or foure branches ſometimes, whereon grow ſmall hairy heads bowing downe, before the skinne breake, wherein the flower is encloſed, which when it is full blowne open, is of a faire yellowiſh red or crimſon colour, and in ſome much paler, without any ſpot in the bottome of the leaves, having many blacke ſoft threds in the middle, compaſſing a ſmall greene head, which when it is ripe, is not bigger then ones little fingers end, wherein is contained much blacke ſeede, ſmaller by halfe then that of the Garden: the roote periſheth every yeare, and the ſeed ſpringeth every yeare of its owne ſowing. Of this kinde there is one that is leſſer in all the parts thereof, and differeth in nothing elſe. *Bauhinus* maketh mention of one of this kinde, that bore a great yellow flower, and peradventure might be the *Argemone flore luteo* in the next Chapter, but the plant was onely brought dry unto him, gathered as he ſaith in divers wet places, on the *Pyrenean* hils. The double wild Poppy is deſcribed alſo in my former Booke. *Minus. Flore pleno.*

5. *Papaver ſpinoſum.* Thorny Poppy.

Vnto the ſorts of Poppye I thinke meete to adjoyne this Thornye Poppy, not finding a fitter place; which hath at the firſt, three or more whitiſh greene leaves lying upon the ground, ſtraked with white veines, which growing greater, are long, ſmooth, and not hairy, ſomewhat long and broad, rent or torne diverſly on the edges, but not to the middle ribbe, having many corners or dentes as it were about them, whereat ſtand many ſmall ſharpe prickes or thornes, not having any white ſtrakes or veines on the underſide, but in the white milkye veines are like to that wilde *Carduus* or Thiſtle, called our Ladies Thiſtle, and on the underſide are more whitiſh, with ſome ſmall prickes, along the middle ribbe and veines, compaſſing the ſtalke at the bottome of them, which riſeth to be two or three foote high, ſpreading forth into diverſe branches, with the like, but leſſer leaves on them, and bearing at every of the toppes, one ſmall head, encloſed in a rough skinne or filme, like as the Poppies have, from whence I thinke roſe the name of a Poppy, given unto it, which being open ſheweth forth a ſmall yellow flower, conſiſting of five leaves uſually, yet ſometimes it will have but foure, and ſometimes ſixe, with a ſmall long greene prickely head in the middle, tipped at the top with a red ſpot, which quickly weareth away, and with many yellow threds ſtanding about it; after the flower is paſt, for it continueth but a while, the head groweth ripe, having five or ſixe ribbes from the toppe to the bottome, and ſo likewiſe betweene the ribbes, armed with very ſmall, but cruell ſharpe and ſhort prickes, or thornes, wherein is encloſed round rough blacke ſeed, twice as bigge as any Poppye ſeed: the roote is ſmall and ſpreading, dying every yeare; every part of the plant yeeldeth a yellow juice.

The Place.

The Garden kindes doe not naturally grow wild in any place, I thinke, although *Dioſcorides*, *Galen*, and others ſay, that the blacke kinde that ſheddeth his ſeede, groweth wilde, for I rather ſuppoſe that ſome ſeed happening there by chance, ſhed it ſelfe, and ſo was thought to grow naturally wilde, and being ſuffered to ſhed, will grow plentifully, though ſmaller, but in all Countries, at the leaſt in all Chriſtian Countries, they are all ſowen, and not found wild, ſo farre as I can learne, onely the firſt wilde kinde is plentifull enough, and many times too much, in the corne fields of all Countries, and alſo upon ditch banckes, and hedge ſides: the leſſer alſo is found in corne fieldes, but more rarely, as alſo in ſome other places. The thornye Poppy groweth in the *Weſt-Indies*, from whence the ſeede was firſt brought to us.

The Time.

The Garden kindes are uſually ſowen in the ſpring, which then flower about the end of May, and ſomewhat earlier, if they ſpring of their owne ſowing: the wilde kindes flower uſuall from May untill July, and the ſeed of them all is ſoone ripe after the flowring. The Thorny kinde flowreth ſeldome before Midſomer, and the ſeede is ripe in Auguſt, but is to be ſowen in Autumne, or elſe it hardly ſpringeth.

The Names.

It is called in Greeke μήκων a μὴ κονεῖν *non miniſtrando, quod veſcentes ſuis muniis fungi non poſſunt*; or as ſome thinke a μὴ κινεῖν, *quod ejus uſus nimium infrigidet, & hominibus tandem motum auferat*, the Garden white kinde is called ἡμερ& καὶ κηπευτὰ (and of *Dioſcorides* Συλαμὶς *thylacitis* and the blacke ſeede is called πθῖτις *pithitis*) *hortenſe* or *ſativum*: the wild kinde is called ῥοιὰς *Rhœas*, that is *fluidum, quia flores protinus decidunt*; in Latine *Papaver Rhœas, erraticum, rubrum*, or *ſilveſtre*; *Dioſcorides Galen*, and others, make onely the firſt great white kinde, to be the Garden kinde, and the blacke to be the wilde ſort, the Garden kinde is called by the *Arabians* Caxcax, by the *Italians Papavero domeſtico*, by the *Spaniards Dormideras* and *Caſcall*, by the *French Pavot*, by the *Germans Magſamen* and *Olſamen*, of the *Dutchmen Huell* and *Mancup*; of us in *Engliſh* Poppy, or Garden Poppye for the moſt part, yet in ſome Countries with us, lone ſilver pinne, *ſubauditur* faire without and foule within, and in many other places Cheeſeboules: the wild Poppy is called in *Italian*, *Papavero ſilvatico*, in *Spaniſh Amapolas roſella*, and *Papoulas*; in *French Coquelicoc*, *Pavot ſauvage* and *Confanons*, in the high *Dutch* tongue *Clapper roſen*, and *korn roſen*, in the low *Dutch* tongue *Rooden huel*, *wilden huel*, and *Colbloemen*, in *Engliſh* Wild Poppy, Corne Roſe, redweede, and Canckers, *Tragus* calleth it *Argemone*. The Thorny Poppy is called generally by all now adayes, *Papaver ſpinoſum*, but of *Gerard Carduus Ceryſanthemus Peruanus*; by the *Spaniards* in the *Indes*, from whom the *Italians* had it *Figo del Inferno*, that is *Ficus Infernalis*, the Figge of hell, becauſe the prickely head is long and round, ſomewhat like a figge, and that whoſoever ſhould have one of them ſticke in his throate, it would ſurely ſend him to heaven or hell. The milkye juice gathered from the heades onely of the great white Poppye, growing in the Eaſt Countryes of *Aſia major*, towards *India*, and in divers other countries of thoſe *Indies*, (for it is there a great merchandiſe of much uſe and expence, as alſo in *Paphlagonia*, *Cappadocia*, *Galatia*, *Cilicia* and *Natolia*, which is the leſſer *Aſia*, as I ſaid before,) is that true and beſt *Opium*, that is or ſhould be uſed in *Narcotickę* medicines, and is an ingredient of much reſpect, in thoſe great compoſitions of *Theriacę* and *Mithridatium*, *&c.* whereof a ſmall quantity, hath beene gathered in ſome Chriſtian Countryes: and my ſelfe and others in our owne land, have gathered a little from the greene heads, as they ſtand, and are but halfe

growne

growne ripe, slit or cut with a knife in two or three places, that the milke issuing forth, may be gathered into some convenient thing, and hardned afterwards in the Sunne, but not at the fire, which will not be so blacke as that *Opium*, that commeth usually to us, which is rather *Meconium* as *Dioscorides* setteth it downe, which is made of the juice of both leaves and heades pressed forth, of the white as well as of the blacke Poppy, for the true best *Opium* is somewhat of a whitish yellow or browniſh colour, and giveth no such yellow tincture, as that which is sophisticate andmade with *Glaucium*, (which is the yellow juice of an herbe, with leaves like unto horned Poppy, but divers have thought *Glaucium*, to be the juice of *Chelidonius majus*, others of *Pomum amoris majus*, and lastly *Bauhinus* and some others, thinke it to be of this thorny Poppy, because it giveth a yellow juice) but as *Bellonius* writeth, that to have any quantity of true *Opium*, it rather consisteth in the multitude of gatherers (for it must be both speedily gathered, and in the heat of the day) then in the great quantity of ground sowen therewith, it being a tedious worke; for a very small quantity can be but gathered by any one in a day, in that every head yeeldeth but little, and must be attended to be taken from them, before it be dryed too much upon them.

The Vertues.

All the sorts of Poppyes are cold in the fourth degree, but especially *Opium* or the condensate juice, as *Galen* and divers other authours doe affirme, yet *Matthiolus* sticketh thereat, thinking it rather to be hot, by the sharpenesse and bitternesse thereof, and is *Anodinum medicamentum*, that is such a medicine, that by procuring sleepe, easeth many paines for the present, which indeede it doth but palliate or cause to be quiet for a time; the continuall use whereof, bringeth very often more harme, and a more dangerous disease then it hath allayed, that is an insensibleneſse or stupefaction of a part or member, which commeth to be the dead palsie, for although *Dioscorides*, *Galen*, and others write, that the white seed is familiarly taken in bread, and made into cakes and eaten with pleasure, and *Matthiolus* and divers others have observed that in our dayes, the white Poppy seede, is sowen in *Italy* and other places, and much used, yea and the blacke seede also, although as they all agree, it is stronger in operation, and onely medicineable, or onely to be used in Physicke to helpe diseases; for *Matthiolus* writeth that the inhabitants about *Trent*, doe sow the blacke seede in their fields and grounds, among Beanes and other pulse, which they familiarly eate, being made into cakes, that are made of many foldes, the seede being cast in betweene the folds, and so kneaded together, and yet hee saith, they are no whit more sleepy or drowsie, then those that eate none of them: as also that in *Stiria* and the upper *Austria*, the inhabitants doe eate the oyle pressed out of the blacke seede in their meates familiarly, in the stead of Sallet oyle, and finde no inconveniency of drowsineſse at all thereby; which made him as he saith, venture to give the creame of the seede made up with Barly water oftentimes, and in great quantity, in the hot fits of agues, and burning feavers, both to aswade thirst, and to procure rest, and hereby as he saith, he shooke of that feare of Poppy, that his wise Masters had by their grave admonitions, seasoned him withall in former times: the Garden Poppy heads with seedes made into a Syrupe, is both frequently used in our dayes, and to very good effect to procure rest and sleepe in the sicke and weake, and to stay catarrhes, and defluxions of hot and thinne rheume, from the head into the stomacke, and upon the lungs, causing a continuall cough, the forerunner of a consumption; but hath not halfe that force in those that are stronger, for the strength or debility of nature worketh divers effects, as you see, as well in this, as in all or most other things; the same also helpeth the hoarseneſse of the throate, and when one hath lost their voyce, which the oyle of the seede doth likewise: the blacke seed boyled in wine and drunke, is said also to stay the fluxe of the belly, and the immoderate course of womens sickeneſse: the empty shels of the Poppy heades, are usually boyled in water, and given to procure rest and sleepe; so doe the leaves in the same manner, as also if the head and temples be bathed with the decoction warme, or with the oyle of Poppyes, the greene leaves or heads bruised, and applyed with a little vinegar, or made into a pultis with Barly meale and *Axungia*, cooleth and tempereth all inflammations, as also that disease called Saint *Anthonyes* fire. The *Opium*, but I may rather say the *Meconium*, (which is the juice of the Poppy thickned) that is commonly used in the Apothecaries shops, and is much weaker by the judgement of all, both moderne and ancients, then the true *Opium*,) is much colder, and stronger in effect, than any other part of the plant, but if we may know the temperature and qualities of things, by their taste and effect, we may rather judge *Opium* to be hot then cold, or at the least, to have very hot parts in it, witneſse the bitternesse thereof, the heate and sharpeneſse that is felt in the mouth, upon the tasting, and keeping it in the mouth a while, that it is ready to blister both tongue and pallate; as also the grievous or heady heavy smell, as well in it, as in the whole plant: but it may be saith *Matthiolus*, the bitternesse, heate, and sharpeneſse in *Opium*, or *Meconium*, is rather accessory then innate, and is therein by the mixture and adulterating of it with *Glaucium*, and to give a yellow juice, for our *Opium* if it be dissolved doth shew a browniſh yellowneſse; yet by his leave I may say, that even the fresh milke with us, is bitter and strong in smell like the *Meconium* or *Opium*, but because our ancients, who have found out the qualities of things and left them for our knowledge, have so found and judged of *Opium*, I must as *Matthiolus* saith, leave it for others to descant theron, as reason and experience shall direct them: It is generally used as I said before in *Treakle* and *Mithridatum*, and in all other medicines that are made to procure rest and sleepe, and to ease paines in the head, as well as in other parts, as I said before, or rather to palliate them, it is used also, both to coole inflammations, agues, or frensies, and to stay desluctions, which cause a cough or consumption, as also other fluxes of the belly, or womens courses, and generally for all the properties that the seede or any other part of the plant is used: it is also put into hollow teeth to ease the paine: it is used both in *ocular* and *auricular* medicines with some, and to stay fluxes and to ease paines, but *Galen*, and divers others in the former as well as in our times, have forbidden such medicines, as too dangerous for the eyes, and even any other wayes used inwardly, it is not to be taken, but with good correction and great caution, yet divers have found that applyed to the gout, it hath given much ease of paine: The wild or red Poppy that groweth in the corne, while it is young, is a Sallet herbe in *Italy*, in many places, and in the territory of *Trent* especially, as *Matthiolus* saith, as also to prevent the falling sickneſse, which *Theophrastus* also saith in his 9. booke and 13. Chapter, was common in his time: the Syrupe made of the flowers is with good effect, given to those that have a Plurisie, and the dryed flowers also, either boyled in water or made into powder and drunke, either in the distilled water of them, or in some other drinke, worketh the like effect; the same also is availeable, in all other cephalicall or pectorall griefes: the distilled

water

water of the flowers of the wilde red Poppyes, is held to be of much good uſe againſt ſurfets, to drinke it evening and morning: it is alſo more cooling in quality then any other Poppy, and therefore cannot but be as effectuall in hot agues, frenſies, and other inflammations, either inward or outward, the Syrupe or water to be uſed therein, or the greene leaves uſed outwardly, either in an ointment as it is in *Populeon*, a cooling ointment, or any other wayes applyed, *Galen* in 7. *facultatum ſimplicium medicamentorum*, ſaith the ſeede is dangerous to be uſed inwardly. *Gerard* was much miſtaken, to thinke that this wilde Poppy ſhould be that, which ſhould be uſed in the compoſition called *Diacodium*, and citeth *Galen* for his authour, as if he had taught him that opinion, not underſtanding what kinde of Poppy *Galen* doth meane by wild Poppy, for he according as *Dioſcorides* afore him hath done, accounteth onely the great white Poppy, whoſe heads are ſomewhat long, to be the garden or manured kinde, and the other blacke kind to be wild, and doth not meane this red Poppy, becauſe it is onely wild with us, and not ſowen, as whoſoever ſhall obſerve the places throughly ſhall finde. The thorny Poppy being but of late invention, hath not beene applyed to any diſeaſe by any, that I can heare of.

CHAP. XV.

Argemone. Baſtard wilde Poppy.

THere is of the kindes of wilde Poppy divers other ſorts, ſome deſcribed by others, and ſome not ſet forth by any before that I know, which being found in our owne land, ſhall be ſpoken of with the reſt.

1. *Argemone capitulo rotundiore.* Round headed baſtard Wild Poppy.

This kind of wilde Poppy, hath divers hairy greene leaves lying on the ground, ſomewhat longer and more divided into parts, then thoſe of the former wild Poppy, ſomewhat like unto the leaves of the thinne leafed *Anemone* or wind flower, as *Lobel* ſaith, but is ſeldome ſo found with us, from among which riſe up diverſe rough hairy ſtalkes, more then two foote high ſometimes, bearing ſuch like leaves here and there on them, leſſer then thoſe below, all yeelding a yellow juice or milke being broken, and on the top of each branch one flower leſſer then the other wilde Poppy, yet conſiſting of foure round pointed leaves, of a more delayed red colour, ſometimes having each of them a blackiſh ſpot in the bottome, and ſometimes without, with divers blackiſh threds ſtanding about a ſmall greene head, which when it is ripe, is ſomewhat ſhort, rough and round, with ſome creſts thereon, and a little round head, but not a Crowne or ſtarre, like the Pop-

1. *Argemone capitulo rotundiore.*
Round headed baſtard wilde Poppy.

4. *Argemone lutea Cambro Britanica.*
Yellow wild baſtard Poppy of *Wales*.

pies at the top, wherein is conteined ſuch like ſmall blackiſh ſeed, as the former wild kind hath, but bigger, the roote is ſmall and long, with many fibres thereat, and periſheth in the like manner after ſeede time.

2. *Argemone capitulo longiore.* Long headed Baſtard wild Poppy.

This is in all things like the laſt, both for leaves, flowers, and ſeede, the chiefeſt difference in this from the former conſiſteth in the head with ſeede, which is longer then the other, ſmaller below then above, yet having a little round head at the top, but no crowne, and is rough and hard like it.

3. *Argemone Alpina lutea.* Yellow mountaine baſtard wilde Poppy.

The yellow outlandiſh mountaine baſtard wilde Poppy, hath many ſmooth greene leaves, ſet on ſomewhat hairy long footeſtalkes, an handbredth long, which leaves are very much and finely cut on the edges, very like unto thoſe of the *Coriander* leafed Crowfoote, from among which riſe up divers bare or naked ſtalkes, yet hairy withall, of halfe a foote high, at the toppes whereof ſtand one flower a peece, of a meane ſize, conſiſting of foure yellow leaves, with many whitiſh threds in the middle tipt with yellow, ſtanding about a ſmall round and rough head, like the former kinde, wherein is contained ſmall blackiſh ſeede: the roote is ſmall and long, and threddy at the end.

4. *Argemone Cambro-Britanica lutea.* Yellow wild Baſtard Poppy of *Wales.*

This yellow Poppy, hath many winged large ſpreade leaves, lying upon the ground, that is, many leaves ſet together on each ſide of a middle rib, each divided leafe being ſomewhat deepely cut in, in ſome places of the edges, more then others, of a deep e, but faire greene colour: among theſe leaves riſe up, divers branched ſtalkes two foote high, having ſome ſuch leaves thereon, but ſmaller, at ſeverall diſtances, and at the tops of the ſtalkes and branches, a faire yellow ſomewhat large flower, conſiſting of foure round leaves, with many yellow threds in the middle, ſtanding about a long greene head in the middle, which when the flower is fallen, and the head ripe, is then larger then the former long headed wilde Poppy, but in the like manner ſmaller at the bottome and bigger at the toppe, with a ſmall head thereon, containing much ſmall blacke ſeed, lying within ſeverall cels, in the ſame faſhion that the other Poppies doe: the roote is long, and browniſh on the outſide, ſpreading into ſome branches, and divers ſmall fibres thereat, which periſheth not every yeare, as the other ſorts before ſpecified doe.

The Place.

The two firſt are often found as well in Corne fields, in *Summerſetſhire*, *Kent*, and other Countries of this land, as in the corners and borders of fieldes, and by the way ſides. The third was found upon *Sneberg* a hill in *Auſtria*, as alſo on ſome hils in *Italy*. The laſt groweth in many places of *Wales*, in the valleyes and fields, at the foote of the hils, and by the water ſides, about a mile from a ſmall village called *Abbar*, and in the midway from *Denbigh* to *Guider*, the houſe of a worthy Gentleman Sir *John Guin*, as alſo neere a woodden bridge, that giveth paſſage ouer the River *Dee*, to a ſmall village called *Balam*, which is in *North-Wales*, and in going up the hill that leades to *Banghor*, as alſo nere *Angleſey* in the way to the ſaid Sir *John Guin* his houſe.

The Time.

All of them doe flower about the end of *Iune*, and in *July*, and the ſeed is ripe in *Auguſt*, in ſome places earlier, and in others later.

The Names.

It is called in Greeke Ἀργεμώνη, *quia argemas, id eſt, oculorum nubeculas tollit*, in Latine alſo *Argemone*, after the Greeke word, *Pliny* in his 25. booke, and 9. Chapter calleth it *Argemonia*, and ſaith that they in his time made three ſorts hereof, whereof the beſt was that, whoſe roote did ſmell like *Francumſence*, but in ſome places he maketh mention of foure ſorts, as in his 21. book, & 23. chap. he ſaith, that *Anemone* is called *Argemone*, in his 24. book, & 19. chap. he ſaith that *Lappa Canaria*, whoſe roote ſmelleth of *Francumſence*, was called *Argemone*, and in his 26. book, & 6. chap. he ſaith *Inguinaria* was called *Argemone*: in former times our ordinary *Agrimony* was taken for *Argemone*, but now a dates all our moderne writers do agree, that our *Argemone* is the ſame that *Dioſcorides* wrote of, notwithſtanding that he giveth to it, a round roote which ours hath not; ſome copies have another ſort of *Argemone*, which moſt doe not hold right: the firſt of theſe is called by *Lobel*, *Argemone capitulo torulis canulato*, *Bauhinus* calleth it *Argemone capitulo breviore*, and thinketh it to be the ſame, that *Lobel* and *Pena* in their *Adverſaria*, call *Anemone minor Coriandri folio, flore Pulſatillæ capitulis hirſutis, nec ut Papaver corolla donatis*: The ſecond is called by *Lobel Argemone capitulo longiore*, as *Bauhinus* doth alſo, but he maketh it alſo to be the *Anemone Narbonenſis major corniculata* of *Lobel* and *Pena*, in their *Adverſaria*, when by the judgement of the beſt, that *Anemone* of theirs, is *papaver corniculatum violaceum* of *Cluſius*, *Dodonæus* and others, and doth much differ from this *Argemone*, both in bigneſſe and colour of the flower, and in the head of ſeede, that being much longer and ſmaller then this: *Cordus* in his Hiſtory of Plants, and 46. Chapter, ſetteth this forth by the name of *Argemone*, which *Geſner* who ſet him forth knew not, becauſe *Cordus* ſaith, it giveth a yellow juice like *Celondine*: The third is ſet forth by *Pona* in his *Italian Baldus*, and by *Bauhinus*, in his *Prodromus* and *Pinax*, under two titles as two ſorts, when as aſſuredly they are both but one: The laſt was found as I ſhewed you before in many places of *Wales*, by *Lobel* in his life time, and therefore entituled juſtly according to the Country.

The Vertues.

Dioſcorides and *Galen* give unto this kinde of Poppie, a cleanſing qualitie and ſharpe, that it is able to cleare the ſpots that happen in the eyes, and ſuch miſtes, filmes and cloudes, that grow in them to hinder the ſight, as alſo to aſſwage any inflammations; but others ſay, that it helpeth the bloudy fluxe, the decoction thereof being made in water and drunke, as alſo if it be boyled in wine and drunke, is a preſent remedy againſt the ſtinging or biting of any venemous beaſt, and that two drammes thereof taken in wine, waſteth the ſpleene that is ſwollen: being beaten while it is freſh, and applied to cuttes and wounds healeth them ſpeedily: applied alſo to any member vexed with crampes or convulſions, to any ſores, cankers, or fiſtulas, to any blacke and blew ſpots in the face, or on the eyes, by ſtrokes or falles, doth helpe and heale them all: being bruiſed and applied with vineger to the throat, healeth the quinſie, and applied to the place grieved with the gout taketh away the paine thereof quickly: being rubbed upon Wartes, it doth in a ſhort time conſume them, and take them away. There is no propertie remembred belonging to any of the two laſt ſorts.

CHAP.

CHAP. XVI.

Hypecoum. The herbe *Hypecoum* of *Dioscorides.*

ALthough *Camerarius*, *Dodonæus*, *Lobel*, and others doe reckon this ſmall plant as a ſpecies, or ſort of wild Cumin, and have referred it to with them, yet I dare not ſo call it, becauſe I doe not finde either the face, or outward reſemblance there of, nor yet the temperature and qualities, to be any way anſwerable thereunto, but rather unto the Poppies, I have therefore thought it fitteſt to joyne it next unto them, and doe rather incline to the judgement of *Cluſius*, to account this plant to be the true *Hypecoum* of *Dioſcorides*: unto which I will alſo adjoyne another ſmall plant, reckoned alſo by *Lobel* to be of the kindes of wild Cumin, which I muſt call another *Hypecoum*, in that it is ſo like unto the other: And let me crave leave with all to inſert here, as in an extravagant place, that kinde of wild Cumin, which is ſo accounted of moſt Writers, as not having a fit place to ſet it alone, in regard it may not be joyned with the true Cumin, which muſt be intreated of among the umbellifers, and becauſe this is in other Authors joyned with the former.

1. *Hypecoum legitimum Cluſij.* The true *Hypecoum* of *Dioſcorides* according to *Cluſius.*

This ſmall plant hath diverſe long leaves lying on the ground, very much divided, and cut into many parts, of a pale or whitiſh greene colour, ſo like unto *Fumiterry* in the colour of the leaves, as alſo ſomewhat neere in the many diviſions and parts thereof, that it will ſoone deceive one that doth but ſlightly regard it, but is ſmaller and thinner and more gentle in handling, yet is larger in *Spaine* than with us as *Cluſius* recordeth; in the middle of them riſeth up a ſtalke or two, with ſome leaves thereon, and divided towards the toppe into diverſe branches; at the toppes whereof ſtand ſmall yellow flowers, conſiſting of ſixe leaves, two whereof are larger than the reſt, and ſtand one oppoſite unto another, the reſt being very ſmall and ſcarſe diſcerned, but when the flower is blowen open: after which doe ariſe long crooked flat huskes or cods full of joints, ſomewhat like unto the huskes of the *Scorpioides* of *Matthiolus*, but greater and longer: in the ſeverall joints whereof lye ſeverall ſquare yellowiſh ſeede, very hardly to be taken forth, and ſeparated from the huskes or skinnes: the roote is ſmall, and a little ſtringy, dying every yeare at the firſt approach of Winter, and is very hardly made to ſpring, but by an Autumne ſowing: the taſte of the plant is unpleaſant.

2. *Hypecoum alterum.* Another *Hypecoum.*

This other ſort (for ſo I make it) is very like unto the former, but that the leaves hereof are not ſo broad and long, being more finely divided, ſomewhat like unto the Seſeli or Hartwort of *Marſeilles* or wild Chervill; the ſtalkes are ſmooth, full of leaves and branches, whereat come forth yellow flowers made of five pointed leaves, and after them long pods, which hang downe and ſtand not upright: nor are crooked like the former, but joynted and with greater and yellow ſeedes within them, like unto thoſe of *Galega* or Goates Rue.

3. *Cuminum ſylveſtre.* Wild Cumin.

Wild Cumin ſhooteth forth diverſe long rough, or ſomewhat hard winged leaves, each whereof is finely dented about the edges; from among which riſeth up a ſlender weake bending ſtalke, divided at the toppe into many parts, each whereof hath a round whitiſh ſoft gentle, and woolly head or ball upon a ſmall foote ſtalke, like unto thoſe of the Plane tree heads or balls, wherein is contained ſmall ſeedes: the roote is ſmall and white and quickly periſheth, with the leaſt blaſtes or dewes of cold nights, and ſeldome commeth to maturitie in our countrey, as I have often ſeene the experience my ſelfe.

1. *Hypecoum legitimum Cluſij.*
The true *Hypecoum* of *Cluſius.*

The Place.

The two firſt groweth as well in Province, in the way to *Arles*, *Mompelier*, and other places in *France*, as in diverſe Provinces of *Spaine* as *Cluſius* ſaith: the other as *Lobel* ſaith, groweth in the ſame places in *France*, that the former doth: the laſt he ſaith likewiſe groweth plentifully in *Narbone* about *Aquas Sextias*, and other places of *France.*

The Time.

All theſe flower with us, not untill the midſt of Sommer, and give their ſeede late, but the laſt worſt as I ſaid, and ſeldome good although late.

The Names.

Dioſcorides calleth an herbe in Greeke ὑπήκοον and ὑπόφοιον *Hypecoum* and *Hypopheum*, for which the Latines have no other name *Hypecoum*, after the Greeke; yet there is great doubt amongſt many, what plant ſhould be the right, ſome thinking the *Thalictrum minus* to be it, others thinking the *Argemone minor* of *Tragus* (which is the leſſer *Papaver Rhœas*) to be it: *Matthiolus* (according to his manner, that whatſoever was obtruded unto him, and was not manifeſtly contradictory, was preſently preſented for right; no markes there of wanting) maketh the *Alcea veſicaria* or *Veneta*, which *Lobel* calleth *Peregrina Soliſequa* to be it, which I have ſet forth in my former Booke: And laſtly *Cluſius*, and from him *Dodonæus* propound this firſt plant, for the true *Hypecoum* of *Dioſcorides*; *Cluſius* affirming that of all the plants that he knew, there was not any that came nearer thereunto than this, unto whom I muſt alſo conſent, for that neither the face nor the qualitie, as I

ſaid

2 *Hypecoum alterum.*
Another *Hypecoum.*

3. *Cuminum ſylveſtre.*
Wild Cumin.

ſaid before doth gainesay it. It is also by *Matthiolus*, and *Caſtor Durantes* who taketh it from him, as also by *Camerarius*, *Lugdunenſis*, *Tabermontanus* and *Lobel* called *Cuminum ſylveſtre alterum* or *ſiliquoſum*, and *Gerard Corniculatum*; *Cluſius*, as I ſaid before, and after him *Dodonens* and *Camerarius*, call it *Hypecoum & legitimum*, and ſo doth *Bauhinus* alſo, who quoteth *Matthiolus* in two places to call *Caminum ſylveſtre alterum* both *Delphinum* and this, but he quoteth *Geſner in hortis Germaniæ* to call it ſo likewiſe; when in that place *Geſner* his *Hypeconm*, is that of *Matthiolus*, which is the *Aleea veſicaria*, and not this. *Cluſius* ſaith that the *Spaniards* in the kingdome of *Granado* and *Murciano* doe call it *Cadoriya*. The ſecond is called *Cuminum ſiliquoſum alterum*, *Dioſcoridis* of *Lobel* and *Pena*, whom *Lugdunenſis* doth imitate; of *Tabermontanus Cuminum ſylveſtre* 3. and *ſiliquoſum minus*. *Bauhinus* calleth it *Hypecoi altera ſpecies*, and ſo doe I, the face thereof ſo nearely agreeing unto the firſt. The laſt is called *Cuminum ſylveſtre*, and *Dioſcoridis primum* of *Matthiolus*, and ſo of moſt Writers, but *Globoſum* of *Camerarius*, and *Capitulis globoſis* of *Bauhinus*. *Bellonius* in his obſervations ſaith, that in the Ile of *Lemnos*, they call it *Lago'Chimeni*, that is *leporum cubile*, which the inhabitants of *Lemnos* called at this day *Stalimene*, doe uſe in their meate in ſtead of *Origanum* which they want, for as he there ſaith, it hath both the ſmell and taſte of *Origanum*; and for the likeneſſe, he there compareth the leaves with thoſe of Yarrow, and the round heads to thoſe of the *Romane* Nettle.

The Vertues.

The taſte of the two firſt is as I ſaid before unpleaſant as that of the Poppies, and therefore of a temperature inclining to the propertie of Poppie, whereunto *Dioſcorides* and *Galen* make *Hypecoum* to be like, there hath not beene any further experience made of either of the former plants, and therefore I can relate no more unto you of them: the laſt if it be the right wild Cumin of *Dioſcorides*, as by *Bellonius* his relation here before ſet downe it may very well be, the ſeede is effectuall againſt the windineſſe, either of the ſtomacke, or of the belly and bowells, which bringeth tormenting paines and ſwellings with it, being taken in wine, and expelleth the poyſon of any venemous beaſtes: it is good for moiſt ſtomackes, that are troubled with raw crude humors: taken with vinegar, it ſtayeth the hickocke; and if it be applied with hony and rayſins to the face, or any other place that is blacke or blew by ſtroakes and beatings, it will quickely take them away, and applied in the ſame manner to the cods when they are ſwollen, allayeth the ſwelling and taketh away the paine.

CHAP. XVII.

Arum. Wake *Robin* or Cuckow-pintē.

UNto this common *Arum* or Wake-Robin (which groweth wilde in many ditchēs and drie bankes throughout all this kingdome, I muſt adde divers other ſorts, which in moſt things are like thereunto, as alſo another much differing from all the reſt, accounted the true *Colocaſio* or *Faba Ægyptiaca*.

1. *Arum vulgare non maculatum.* Common Wake Robin without ſpots.

This Wake Robin ſhooteth forth three or foure or five leaves at the moſt from one roote, every one whereof is ſomewhat large, and long, broad at the botome next unto the ſtalke, and forked like unto a ſorrell leafe,

leafe, but ending in a point, without dent or cut on the edges, of a ſad or full greene colour, each ſtanding upon a thicke round ſtalke, of an handbreadth long or more; among which after they have beene up two or three moneths and begin to wither, riſeth up a bare naked round whitiſh greene ſtalke, ſomewhat ſpotted and ſtraked with purple, like the ſtalke of Dragons, ſomewhat higher than the leaves; at the toppe whereof, ſtandeth a long hollow hoſe or huske, cloſe at the bottome, but open from the middle upwards, ending in a point; in the middle whereof ſtandeth a ſmall long peſtle or clapper, ſmaller at the bottome than at the toppe, of a darke purbliſh colour as the hoſe or huske is on the inſide, though greene without, which after it hath ſo abiden for ſome time, the hoſe or huske decaieth, with the peſtell or clapper, and the foote or bottome thereof groweth to be a ſmall long bunch of berries, greene at the firſt, and each of them when they are ripe, of a yellowiſh red colour, of the bigneſſe of an Haſell-nut kernell, which abide thereon almoſt untill Winter: the roote is round and ſomewhat long, not growing downe right, but for the moſt part lying along, the leaves ſhooting forth at the bigger end, which when it beareth his berries is ſomewhat wrinckled and looſe, another being growen under it, which is ſolid and firme, with many fibres or ſmall threds hanging thereat, which in the beginning of the yeare, when the leaves beginne to ſpring yeeldeth a milky ſappe being broken or cut: the whole plant is of a very ſharpe and biting taſte, pricking the tongue upon the taſting, no leſſe than Netles doe the hands, and ſo abideth for a great while without alteration; the roote with the ſharpeneſſe hath a very ſtrange clammineſſe in it, ſtiffening linnen, or any other thing whereon it is laid, no leſſe than ſtarch: and in former dayes, when the making of our ordinary ſtarch (which is made of the branne of wheate) was not knowen, or frequent in uſe, the fineſt dames uſed the rootes hereof, to ſtarch their linnen, which would ſo ſting, exaſperate and choppe the skinne of their ſervants hands that uſed it, that they could ſcarſe get them ſmooth and whole with all the nointing they could doe, before they ſhould uſe it againe.

2. *Arum vulgare maculatum.* Spotted wake *Robin.*

This *Arum* is in all things like the former, but that the leaves hereof are ſomewhat harder in handling, ſmaller pointed and have ſome blackiſh ſpots thereon, like the ſpotted Arſemart, which for the moſt part abide in the Sommer longer greene then the former, and both leaves and rootes, are more ſharpe and fierce then it.

3. *Arum magnum rotundiore folio.* Round leafed wake *Robin.*

This kinde hath ſomewhat larger leaves, then either of the former, and more round pointed, both at the end and at the bottome next to the ſtalke, having ſome white veines appearing in the leaves, and abiding greene longer in the Sommer, even almoſt untill Autumne, the hoſe or huske, with the peſtell or clapper, are both of a pale whitiſh yellow colour, in which things this differeth from the other and in nothing elſe: *Proſper Alpinus* ſetteth forth an other ſort found at the bottome of ſome of the *Alpine* hills, whoſe leaves and flowers differ little from the ſecond ſort, but the roote is round like unto the rootes of the rouud rooted Culcas: *Alterum rotunda radice.*

4. *Arum Byzantinum.* Wake Robin of *Conſtantinople.*

This *Arum* of *Conſtantinople*, hath a reaſonable great thicke roote, of an hand breaddth long, or there abouts, having many ſmall round heades, breaking forth on all ſides thereof, from whence come forth many freſh greene leaves, very like unto the two firſt ſorts of *Arum*, ſome whereof will be ſpotted with ſmall blacke ſpots, others not having any at all; from among which riſeth up a ſtalke, having ſuch a like hoſe or hood, as the *Arum* hath, and a peſtle therein which are of a purpliſh colour in thoſe that have ſpotted leaves, and white in thoſe

1. 2. *Arum vulgare maculatum & non maculatum.* Spotted and unſpotted Wake Robin.

4. *Arum Byzantinum.* Wake Robin of *Conſtantinople.*

5. *Arisarum latifolium.*
Broad leafed Fryers coule.

6. *Arisarum longifolium.*
Long or narrow leafed Fryers coule.

7. *Arum Ægyptium rotunda & longa radice vulgo Colocasia dicta.*
The *Egyptian Culcas* or wake Robin with a rounder and longer roote.

Fabæ Ægyptiæ fructus.
The fruite of the *Egyptian* Beane.

that have no spots, the leaves likewise of those that have spots, spring up for the most part before Winter, and the other not untill the Spring, there hath not any fruite beene observed in this, by any that I can understand.

5. *Arisarum latifolium.* Broad leafed Fryers Coule.

The Broad leafed *Arisarum* groweth in all things like unto the *Arum*, having divers faire greene leaves, whose middle rib on the upperside, as also some other of the veines are white sometimes, and somewhat thicker and rounder pointed then the *Arum*, the middle stalke bearing the flower (which is a crooked or bending hose at the top, with a small crooked whitish pestell in the middle, rinsing out of it,) is spotted with red spots, not rising fully so high as the leaves, which are nothing so sharpe in taste, as those of the Wake Robin, and doe alwayes spring up in the end of Autumne, abiding greene all the Winter: after the huske or flower is past, and the greene leaves withered and gone, which will be in the Summer, then the berryes doe appeare on the toppes of the stalkes, greene at the first, and of a yellowish red when they are ripe, which abide untill the frosts cause them to wither; and the greene leaves begin to appeare: the roote is white and somewhat round, encreasing much by of sets.

6. *Arisarum longifolium.* Long or narrow leafed Fryers Coule.

The leaves of this *Arisarum*, are very narrow and long, not rising so high as the former, but rather lying on the ground, and doth more seldome beare any hose, which is whitish small and long, with a very long and small reddish pestell in the middle, like unto a long worme, scarse rising above the ground, the berryes that follow are white and not red, the roote is white and round, smaller then the former, encreasing by of sets, but not in so plentifull a manner.

7. *Arum Ægyptium vulgo dictum Colocasia rotundiore & oblongiore radice.*
The *Egyptian Culcas* or Wake Robin with a rounder and longer roote.

This *Egyptian* plant, hath beene the subject of much controversie, among many worthy and learned writers, both of our and of former times, some applying it to the *Faba Ægyptia* of *Dioscorides*, whose huske conteining the fruite was called *Cibarion*, and whose roote was called *Colocasia*, and others refusing that opinion, call it simply *Arum* and *Ægyptium*, because it was a species or kinde of *Arum*, that is thought to bee naturall to *Egypt*, as also to other places, as you shall heare by and by, the description whereof is in this manner: It shooteth forth divers very large and whitish greene leaves, of the fashion of *Arum*, or Wake Robin leaves, pointed at the ends, but somewhat rounder, each of them two foote long, and a foote and a halfe broad, not so thicke and sappy as they, but thinner and harder, like unto a thinne hard skinne full of veines, running every way, and refusing moisture, though they be laid in water, standing every one, on a very thicke stalke, nere five foote long in the said places, which is not set at the very division of the leafe into two parts, as the wake Robin is, but more toward the middle, somewhat like unto the water Lillies, the division of each leafe at the bottome, being somewhat rounder then those of Wake Robin: betweene these leaves after many yeares continuance in a place unstirred, there riseth up sometime but one stalke of flowers, and sometimes two or three, according to the age and encrease of the plant, the standing and keeping (for all these helpe to the fructifying thereof, for else it would not beare any shew of hose, or pestell, or flower, as many that not having seene any, have confidently set downe that it never beareth any) thereof in a large pot, or other such thing, and in a warme place and climate: each of these stalkes are much shorter, then those of the leaves, and beareth an open long huske at the top, in the middle whereof, riseth up for the most part three severall narrow huskes or hoses (and never one alone, as the *Arum* or *Arisarum* do) with every one their pestell or clapper in the middle of them, which is small, whitish and halfe a foote long, from the middle downwards bigger, and set round about with small whitish flowers, smelling very sweete, the lowermost first flowring, and so by degrees upwards, which last not above three dayes, and from the middle upward bare or naked, ending in a small long point, after the flowers are all past, that lower part abideth, and beareth many berryes, like as the *Arum* and *Arisarum* doe, but much paler and smaller, the roote is great and bulbous, or rather tuberous, in some more round then in others, which are smaller and long with the roundnesse, as great as the roote of a great Squill or Sea Onion, (which I judge more properly, speaking thereof in my former booke to be a Sea *Hyacinth*) and one which *Alpinus* setteth forth in his *Historia Ægyptiaca*, with great long creeping rootes like the Reede, reddish on the outside, and whitish within, having many bulbous or tuberous heads, shooting from all sides thereof, whereby it is encreased, and with many great fibres shooting therefrom into the ground.

8. *Faba Ægyptia Dioscoridis & Theophrasti cujus radix Colocasia dicebatur.*
Dioscorides and *Theophrastus* their *Egyptian* Beane, whose roote was called *Colocasia*.

Because the *Egyptian Arum*, hath beene so much mistaken by many writers that have called it the true *Colocasia* of *Dioscorides* and *Theophrastus*; let me here shew you in this place, the description of the true *Colocasia*, that is the roote of the *Egyptian* Beane, as *Dioscorides* and *Theophrastus* have set it downe; to affront the false figure of *Matthiolus* his *Egyptian* Beane, as he set it forth in his comentaries upon *Dioscorides*, moulded from his owne imagination, and not from the sight of any plant growing in *rerum natura*, to make it answer the description, but hath failed chiefely in the fruite, which is not expressed like to the combe that waspes doe make, but farre differing as many have observed, and objected against him, although as he saith, *Odoardus* did shew it him at *Trent*, with many other rare plants, which he brought out of *Syria* and *Egypt*; the figure of the true fruite, *Clusius* hath set forth, in the 32. *folio* of his booke of *exotickes* or strange things, which was brought by *Dutch* Marriners from forraine parts unto *Amsterdam*, but was not then knowne where it grew (but since is knowne to be the Kingdome of *Iava* in the *East-Indies*) who was perswaded it might be the true fruite of their *Egyptian* Beane, unto whose judgement therein, both *Bauhinus* and *Columna* doe encline, and so doe I as you shall heare by and by more at large, but for brevities sake, I will draw both the descriptions thereof by *Theophrastus* and *Dioscorides* into one. The Beane of *Egypt*, which some call the Beane of *Pontus* saith *Dioscorides*, (but *Theophrastus* mentioneth neither *Egypt* nor *Pontus*, but onely calleth it a Beane) groweth in Lakes and standing waters (plentifully in *Egypt* saith *Dioscorides*, which *Theophrastus* speaketh not of,) in *Asia*, that is in *Syria* and *Cilicia*, but there saith *Theophrastus*, it doth hardly perfect his fruite, but about *Torona*, in a Lake, in the Country of *Calcidicum*, it commeth to perfection, and beareth very large leaves (like those of the butter-burre saith *Dioscorides*) the

ſtalke ſaith *Dioſcorides*, is a cubite long, *Theophraſtus* ſaith the longeſt is foure cubits high, of the bigneſſe of ones finger, like unto a ſoft reede, but without joynts, it beareth a flower, twiſe as large as that of the Poppy (with double flowers, for ſo I enterpret in *plenum caput*, the words of *Theophraſtus*) of the colour of the Roſe, after which is paſt commeth a round head called *Ciborion*, or *Cibotion*, that is a ſmall caske, (yet *Athenæus* ſaith that a kinde of drinking cup was ſo called alſo, whoſe forme peradventure was like this fruite here expreſſed) not unlike to the comb which waspes do make, wherin is contained thirty cels at the moſt, and in every cel or diviſion thereof, groweth a Beane, whoſe toppe riſeth higher then the cell wherein it is encloſed, whoſe kernell is bitter; which ſay they, the inhabitants thereabouts put into clay, and thruſt downe to the bottome of the water, with long poales, that it may abide therein and thereby make their encreaſe: the roote is very thicke and great, like unto that of the Reede, but (*Theophraſtus* addeth, which *Dioſcorides* hath not) full of cruell prickes or thornes, and therefore ſaith he, the Crocodile refuſeth to come nere it, leaſt he ſhould runne againſt the prickes thereof with his eyes, wherewith he cannot ſee well, and is called *Colocaſia* as *Dioſcorides* maketh mention, but not *Theophraſtus*, which is uſed to be eaten either raw or otherwayes dreſſed, that is ſodden or roaſted, the Beanes ſaith *Dioſcorides* are eaten while they are freſh and greene, but grow hard and blacke when they are old, being ſomewhat bigger then an ordinary Beane, which ſaith *Dioſcorides* (*Theophraſtus* making no mention of any qualities, or vertues of them) have an aſtringent or binding faculty, and thereby profitable to the ſtomacke, and helpeth thoſe that have the fluxe of the ſtomacke and belly, and the bloody flux, the meale or flower of them ſtrawed upon meate &c. or taken in broth: the huskes whereof ſaith he doth more good, being boyled in ſweete wine, the middle part of the beane which is greene and bitter, being bruiſed and boyled in Roſewater, and dropped into the eares, eaſeth the paines of them. Thus farre *Theophraſtus* and *Dioſcorides*. Now the deſcription of *Cluſius* his ſtrange fruite is thus, as he ſetteth it downe, This fruite did reſemble a very large Poppy head, cut off at the toppe: and conſiſted of a rough or wrinckled skinny ſubſtance; of a browniſh colour ſomewhat light, whoſe circumference at the top was nine inches, and growing leſſer and leſſer by degrees, unto the ſtalkes, which as it ſeemed, did ſuſtaine the flower, after which came this fruite, for there appeared certaine markes of the flower, where it did abide: the upper part hereof was ſmooth and plaine, having 24 holes or cells therein, placed in a certaine order, like unto the combe of waſpes; in every one whereof was one nut, like unto a ſmall akorne, almoſt an inch long, and an inch thicke in compaſſe, whoſe toppe was browne, ending in a point, like as an akorne doth, the lower part having an hole or hollow place, where it ſhould ſeeme the footeſtalke upheld it, while it was in its place, whoſe kernell was rancide or mouldy, thus farre *Cluſius*. Let me here alſo bring in an eye witneſſe or two, of this plants growing in the Ile of *Iava*, Dr. *Iuſtus Heurnius*, both Divine and Phyſition, for the *Ducth* factory in the Kingdome or Ile of *Iava*, ſent into *Holland* a ſmall booke or collection of certaine herbes, &c. growing in that country, with the vertues and uſes, whereunto the naturals did apply them (which booke, as I underſtand by my good friends, Dr. *Daniel Heringhooke*, and Dr. *William Parkins* both *Engliſh*, is kept in the Vniverſity Library at *Leyden* in a cloſe cupbord having a glaſſe window before it, thorough which any one may reade ſo much thereof as lyeth open) at the end whereof is one by him ſet downe, under the name of *Nymphæa glandifera* thus deſcribed: the huske or cup (ſaith he) is rugged or full of wrinkles yet ſoft looſe and ſpungye, like a Muſhroome, and of a greene colour divided into twelve or fourteene cels (*Cluſius* his figure here exhibited hath 24) or places, in every one whereof is contained one fruite like unto an akorne of a blackiſh purple colour on the outſide and very white within, the taſte whereof is aſtringent and ſomewhat bitter withall, like akornes but rough and ſpongie: it groweth in Mooriſh places, and by rivers banckes: the leaves are wondrous great and like unto thoſe of the Water Lilly, and ſo is the flower alſo of a very ſtrong ſmell like unto the oyle of Aneſeedes: thus farre Dr. *Heurnius*; whoſe deſcription in my judgement is ſo punctuall to thoſe of *Dioſcorides* and *Theophraſtus* aforeſaid, the deſcription of the roote onely wanting, that I ſhall not neede further to comment upon it, every ones judgement though meane, I ſuppoſe being able by comparing to agree the parts: it is probable that *Cluſius* having ſeene this booke and the figure hereof annexed to the deſcription might ſoone pronounce it (as I doe here) to be the true *Faba Ægyptia* of the ancients: there is no mention made in that booke of *Heurnius* by what name the *Iavaneſes* or *Malayos* doe call it. The other eye witneſſe hereof is M. *William Fincham* an *Engliſh* Merchant, as he is recorded in Mr. *Purchas* his fourth booke of Pilgrimes, the 4. ch. *Sect.* 5. *p.* 429. that ſaith he often did eate of the fruite of a certaine herbe growing in a great Brooke or Lake, two or three courſes or miles long on the *North-Weſt* ſide of *Fetipore*, which is about twelve courſes from *Agra*, in the dominions of the great *Mogoll* called *Surrat* or *Guzurrat* in the *Eaſt-Indies*, which the people call *Camolachachery*, deſcribing it to be like a goblet, flat at the head conteining divers Nuts or akornes within it. I have here ſet downe theſe things, as well to ſhow you mine owne obſervations after *Cluſius* and others, that aſſuredly this is the true *Faba Ægyptia* of the ancients, as to provoke ſome of our nation to be as induſtrious, as the *Hollanders* by whoſe care in their travels, this was firſt made knowne to us, to ſearch out ſuch rare fruites as grow in the parts of their abode, and either communicate them to ſuch as are experienced, or having penned them to publiſh their labours in Print, if it may be, which I hold the better, according to Mr. *Finchams* example, whoſe obſervations have given ſo great an illuſtration in this matter, as well as in other things, by me alſo remembred elſewhere in this worke.

The Place.

The two firſt are frequent enough in our owne Country. The third is found in ſome place of *Germany*. The fourth *Cluſius* ſaith came among other rootes from *Conſtantinople*. The fift he alſo ſaith he found in *Spaine* and *Portugall*. The ſixt in *Italy*, in divers places. The ſeaventh is not naturall to *Egypt* as I ſuppoſe, becauſe it is not found to flower there, being planted for their onely uſe in meates which they ſeldome take without it, but groweth in *Candy* naturally as *Bellonius* ſaith, and *Portugall* as *Cluſius* reporteth, and in *Italy* alſo in many places, and in the Country of *Salerne* in the Kingdome of *Naples* as *Columna* reporteth it, as alſo in the Iland of *Iava*, where they uſe it as familiarly as in *Egypt*, and ſo recorded in the *Hollanders* Navigation thither, in *Anno.* 1595. The laſt as I ſaid before in *Iava* and *Surrat*, and no doubt in ſundry other places as *Theophraſtus* remembreth, who therefore would not call it *Ægyptia* as *Dioſcorides* doth, being not proper to *Egypt*, where for many ages paſt it hath not beene known to grow now at all, but aſſuredly if it were a naturall of *Egypt*, it cannot be quite extirpate, and might by good ſearch be there found againe, if men induſtrious and of knowledg were employed thereabouts.

The

The Time.

The foure first sorts shoote forth leaves, in the Spring, and continue but untill the middle of Sommer, or somewhat latter, their hoses or huskes appearing before they fall away, and their fruit shewing in August. The fifth and sixt as I said, doe shoote forth their greene leaves in Autumne, presentlyy after the first frosts have pulled downe the stalkes with fruits, and abide greene all the Winter withering in Sommer, before which their huskes appeare: The seventh flowreth with his hose and clappers very late, even in the warme countries, seldome before October or November, and the fruit doth there seldome come to perfection: the last (as may be gathered by the relation thereof) flowreth and beareth fruit in the Sommer time as other herbes doe.

The Names.

It is called in Greeke ἄρον, and in Latine *Arum*, and some *Pes vituli*, because the leafe doth somewhat resemble a Calves foote; some also *Dracontea minor*, and *Serpentaria minor*: others againe from the figure of the pestle or clapper in the middle of the hose, call it *Sacerdotis penes*, and *canis priapus*. *Simon Ianuensis* calleth it *Aron* and *Barba Aron*; the *Syrians* as *Dioscorides* saith call it *Lupha*: it is called of the *Arabians Iarus* and *Sara*, and after them diverse Apothecaries beyond the seas in their shops: In *Italian Aro*, *Giaro*, *Gigaro* and *Balaazon* as *Durantes* saith; In *Spanish Taro*, in *French Pied de veau*, & *vid* or *vit de prestre*, & *vit de chien*, in high *Dutch Pfaffenpint*: in *Low Dutch calfs voet*; in *English* Wake Robin, Cuckowes pintle, Priests pintle, Rampe, Buckrams, and of some Starch-wort. *Cæsalpinus* calleth it with spotted leaves, *Gicherum* or *Gigarum* after the *Italian* name, when as all others agree in the name of *Arum*, with the distinction of *maculis albis* and *nigris*, as the kind or sort is; yet the third is called by *Lobel Arum majus Veronense*, and by *Bauhinus Arum veris albis*, and by *Dalechampius* upon *Pliny Calle primum genus Plinij*. *Cordus in historia plantarũ* calleth it *Dracunculus henicophyllos*, and as he saith is the same that *Matthiolus* calleth *Dracunculus major*. *Clusius* calleth the fourth *Byzantium*, & it is most probable, it is the same with *Matthiolus* his *Arum aliud minus* with many small rootes, which he saith he received from *Calzolarius* of *Verona*, and thought it grew upon Mount *Baldus*, because he had sent him many plants that grew there: but because this is not mentioned in all the description of Mount *Baldus*, it is more likely that *Calzolarius*, had it from *Constantinople*, or some other place in *Turkie*, and sent it him as a raritie. The fift & sixt are called *Arisarum* or *Aris* as *Pliny* saith, and distinguished by the titles of *latifolium* and *angustifolium*. The *Spaniards* call it *Frailillos*, that is little Friers, because the hose doth represent the forme of a Friers Cowle: the *latifolium Dalechampius* upon *Pliny* calleth *Calle alterũ genus Plinij*, yet *Tragus* thinketh that this *Arisarũ*, should be more properly the *Arum* of *Dioscorides*, which is usually eaten, for our *Arum* is so hot and sharpe, that it is not to be endured, whereunto some others doe reply and say, that the *Arum* of the hotter countries is more mild, and yet the same in *specie*: The seventh is called by the *Spaniards Manta de nuestra senora* from the largenesse of the leaves, and diversely by divers late Latine Writers, some as I said contesting earnestly, that it is the *Faba Egyptia*, and *Colocasia* of *Dioscorides*, or *Colocasion* of *Nicandar*, others flatly denying it and calling it *Arum Ægyptium*, which terme *Pliny* useth, but it is not knowne from whom he had it: those that hold and maintaine the former opinion, are *Bellonius*, *Alpinus*, *Camerarius*, *Lugdunensis*, and lastly *Clusius*, who doe all conclude, that this plant which the *Egyptians* call *Culcas*, can be no other plant then the *Faba Egyptia* of *Dioscorides* and *Theophrastus*, although it beare neither flower nor fruit, and thereupon doe much suspect the truth of their descriptions, because there was never heard or found (as they say) any other that did answer in all things unto their descriptions, and that this did most nearely approach thereunto, both for that the name of *Culcas*, so nearely drawing to the Greeke name *Colocasia*, and was so antiently continued among those Nations of *Egypt*, *Syria*, *Arabia* and *Affricke*, and that the daily use of the roote to be dressed or eaten raw, for their food and meate as they said their *Faba* was; but the fruit or nuts was their foode and not the rootes, time having inverted both name and use: it is also called *Talusse* by the inhabitants of *Iava* (but *Lalade* in the *Malaia* tongue) which soundeth somewhat neere *Culcas* as it is recorded in the *Dutch* Navigation thither in *Anno* 1595. before spoken of, where it is said also to beare neither flower nor fruit; but those that hold the contrary opinion that it is but *Arum Ægyptium*, and not the true *Colocasia*, although commonly so called, are *Anguillara*, *Guillandinus*, *Maranta*, *Cansabonus*, *Matthiolus*, *Gesner in hortis Germaniæ*, *Dodonæus*, *Lobel*, and *Columna*, who have all of them in their times testified it, most of them having seene the flower or fruit, or both, that it beareth: which plainely declareth it to be a kind of *Arum*, and that it is not the *Faba Ægyptia*, whose roote was called *Colocasia*: but *Fabius Columna* lastly and most fully to the purpose, doth shew the truth, setting forth the description of this *Arum Ægyptium*, amply in every part, to beare leaves, flowers, hose or huske, with a pestle or clapper therein, and berries afterwards, agreeing in all those parts to the vulgar *Arum* and *Arisarum*, although somewhat in a different manner, as every species of a *Genus* doth; and with all doth defend the veritie of *Dioscorides* and *Theophrastus* descriptions thereof, against all gainesayers, wondering that so many learned men should not discerne the truth, but be led away so grossely into errour, against so plaine declarations, that they make of the plant and every part thereof, that is of roote, stalke, leafe, flowers and fruit: the roote to be like the roote of the Reede, but greater and not *bulbous* like the *Arum*, to be armed with prickles or thornes, when as the roote of this *Arum*, or supposed *Colocasia* is not so, then that it beareth a stalke a cubite or more high, which this doth not, and that it carrieth a flower thereon, bigger than that of the Poppie, and of a Rose colour, which this hath no resemblance thereunto; and lastly that it beareth a head like a Waspes combe, with many cells or divisions therein, in every one wherof groweth a fruit ornut, begger than an ordinary Beane, whereunto this *Arum* hath no likenes; I might adde also the name of the head called *Ciborion*, or *Cibotion*, which as I said signifieth a small casket, from the similitude of the places, wherein the fruit standeth, as also from the forme of the head with the fruit, like unto a drinking cuppe, used among the ancient *Grecians*; as also the fruite or Beane it selfe, so notably knowne to all the Nations, both Greekes and others, that it was as a standard for a certaine weight, whose true proportion was certainely knowne, and constantly maintained: the place also of the growing, being in the waters, is differing from that of *Arum*, the vertues and qualities as different from it, all which I have therefore shewed you, that every one may plainely see the truth, and hereafter be better perswaded, if they have erred in their opinion and judgement: And to shew the originall of this errour, as it is most probable: first I may say that the revolution of time, which bringeth on with it many slippes and errours, hath beene the cause thereof, which therefore wise men and judicious, must still be carefull to finde out and reforme: *Bellonius* in the 28. Chapter of his second Booke of Observations, thinketh that *Herodotus* was the first, that was the

cauſe of that errour, but I verily ſuppoſe it to be more antient, for *Dioſcorides* ſaith in his Chapter of *Arum*, among the diverſe names thereof, that thoſe of *Cyprus* did call *Arum* by the name of *Colocaſion*, and therefore it is moſt probable that diverſe Nations, eating the rootes of this *Arum*, as well as the reſt, which were not hot and ſharpe in taſte, in thoſe countries, as they are in theſe colder, did from the *Cyprians* call it *Colocaſia*, becauſe the roote of the *Egyptian* Beane, being alſo called *Colocaſia*, was boyled and eaten as thoſe of *Arum* were: and thus this errour ſpreading, and the uſe of them encreaſing by being peradventure, both more plentifull, to be had by encreaſe, and more acceptable to the taſte, than the fruite of the *Egyptian* Beane, it became of leſſe eſteeme, and in time to be ſo much neglected, that it was no more looked after and planted, whereby it became to be utterly unknowne at the laſt, and the name *Culcas*, was ſtill maintained and impoſed on thoſe rootes of *Arum*, as if they had beene the rootes of the *Egyptian* Beane. Thus much I thought good out of my ſimple judgement to declare, which if it doe not agree with truth and reaſon, I ſubmit it to thoſe that can bring better.

The Vertues.

Tragus reporteth that a dramme weight, or more if neede be, of the roote of that Wake Robin, that hath ſpotted leaves, whether it be freſh and greene, or dried it mattereth not; being bruiſed or beaten and taken, is a moſt preſent remedy never failing againſt both poyſon and plague: ſome he ſaith, take as much *Andromachus* Treakle with it, for the more certaintie: the juyce of the herbe taken, to the quantitie of a ſpoonefull or more, worketh the ſame effect: but if there be a little vinegar added thereunto, as well as to the roote before ſpoken of, it will ſomewhat allay that ſharpe biting taſte upon the tongue, which it cauſeth; the greene leaves likewiſe being bruiſed and laid upon any boyle or plague ſore, doth wonderfully helpe to draw forth the poyſon: the pouder of the dried roote of Wake Robin, to the weight of a dramme, taken with twiſe as much Sugar, in the forme of a Lohoc or licking Electuary, or the greene roote, doth wonderfully helpe thoſe that are purſie or ſhort-winded, as alſo thoſe that have the cough, having their ſtomacke, cheſt, and longs, ſtuffed with much flegme, for it breaketh and digeſteth it in them, and cauſeth it to be eaſily avoided and ſpit forth: the milke wherein the roote hath beene boyled, is effectuall alſo for the ſame purpoſe: the ſaid pouder taken in wine or drinke, or the juyce of the berries, or the pouder of them, or the wine wherein they have beene boyled provoketh urine, and bringeth downe womens courſes when they are ſtayed, and purgeth them effectually after child bearing, to bring away the afterbirth; it is ſaid that it expelleth drunkenneſſe alſo; taken with ſheepes milke, it healeth the inward ulcers of the bowells; the diſtilled water hereof likewiſe is effectuall, to all the purpoſes aforeſaid; and moreover a ſpoonefull taken at a time, healeth the itch; and an ounce or more taken at a time for ſome dayes together, doth helpe the rupture: the leaves either greene or drie or the juyce of them, doth cleanſe all manner of rotten and filthy ulcers, of what part of the body ſoever they be, and the ſtinking ſores in the noſe called *Polypus* and healeth them alſo: the water wherein the roote hath beene boyled, dropped into the eyes, cleanſeth them from any filme or skinne beginning to grow over them, or clouds or miſtes that may hinder the ſight, and helpeth alſo the watering and redneſſe of them, and when by chance they become blacke and blew: the roote mixed with Beane flower, and applied to the throat or jawes that are inflamed, helpeth them: the juice of the berries boyled in oyle of Roſes, or the berries themſelves made into pouder, and mixed with the oyle and dropped into the eares, eaſeth the paines in them: the berries or the rootes beaten with hot oxe dung, and applied to the gout, eaſeth the paines thereof: the leaves and rootes alſo boyled in wine with a little oyle, and applied to the piles, or the falling downe of the fundament eaſeth them, and ſo doth the ſitting over the hot fumes thereof: the freſh rootes bruiſed and diſtilled with a little milke, yeeldeth a moſt ſoveraigne water to cleanſe the skinne from ſcurfe, freckles, ſpots, or blemiſhes whatſoever therein: yet ſome uſe the rootes themſelves bruiſed and mixed with vinegar, but that is too ſharpe, and not to be uſed but when there is great neede, and with good caution, and not to abide long upon any place: there is a *fecula* made by art from the freſh rootes, called *Gerſa ſerpentaria*, which is as white as Starch or *Ceruſe*, and being diſſolved in milke, or in the diſtilled water, of the rootes and milke aforeſaid, doth wonderfully blanch the skinne, hiding many deformities: the freſh rootes cut ſmall and mixed with a ſallet of white Endive or Lettice, &c. is an excellent diſh to entertaine a ſmell-feaſt, or unbidden unwelcome gueſt to a mans table, to make ſport with him, and drive him from his too much boldneſſe; or the pouder of the dried roote, ſtrawed upon any daintie bit of meate, that may be given him to eate; for either way, within a while after the taking of it, it will ſo burne and pricke his mouth and throate, that he ſhall not be able either to eate a bit more, or ſcarſe to ſpeake for paine, and will ſo abide untill there be ſome new milke or freſh butter given, which by little and little, will take away the heate and pricking, and reſtore him againe. Some uſe to lay the greene leaves of Wake Robin among their Cheeſes, both to keepe them from breeding wormes, and to ridde them alſo being in them. The *Ariſarum* or Friers Coule, as *Dioſcorides* and *Galen* affirme, is farre hotter, and ſharpe or biting in taſte, than *Arum* or Wake Robin, which is not ſo found in any part of Europe, whether *Italy* or *Spaine*, *France*, *Germany* or *England*, that I know, both hot and cold countries, but in all of them much milder and weaker than the *Arum* (which cauſed *Tragus* as I ſaid before, to ſuſpect that our *Arum*, was the *Ariſarum* of the antients) and therefore they appoint it, to be laid to eating, fretting, and running ſores, to ſtay their ſpreading, and abate their malignitie, as alſo to be put into fiſtulas and hollow ulcers, to helpe to cleanſe and heale them up: a peece of the roote, put into the ſecret parts of any femall creature, killeth them, cauſing them to die quickly; which thing is contradicted by ſome, and ſaid to be utterly untrue. *Amatus Luſitanus* writeth, that in the *Low Countries* it was uſed againſt the plague, whereof *Cluſius* ſaith, it was not knowne unto his countrie men, untill he had travelled into *Spaine* and *Portugall*, and from thence gave them the knowledge thereof, by ſending it unto them: but it may be hee miſtooke *Ariſarum*, for *Arum*, which as you may ſee before, is found effectuall for that purpoſe. The *Arum* of *Egypt* as it is milder in taſte, although ſomewhat ſharpe and bitter and ſlimie in eating, ſo it is leſſe effectuall in medicine, becauſe it is more uſuall in meate. All the Eaſt countries which the *Italians* call the *Levant*, as *Aſia*, *Syria*, *Arabia*, *Egypt*, *&c.* and *Iava* alſo, and other places in the *Indies* as you heard before doe moſt frequently eate the rootes hereof boiled in the broth of fleſh, and many other wayes dreſſed, not onely as a daily foode, but as they thinke, to encreaſe naturall ſperme or ſeede, and to cauſe a validitie alſo, and more powerfull abilitie in the act of generation.

CHAP.

CHAP. XVIII.

Chriſtophoriana. Herbe Chriſtopher.

BEſides the uſuall ſort of herbe *Chriſtophor*, which hath beene knowne of a long time to us, we have lately gained an other ſort as we ſuppoſe, the neare reſemblance in face cauſing us ſo to imagine.

1. *Chriſtophoriana vulgaris.* Ordinary herbe *Chriſtopher.*

Herbe *Chriſtopher* ſhooteth forth diverſe greene ſtalkes of leaves, halfe a foote long, which are made into three parts, yet ſome times into five, the lower parts ſtanding for the moſt part one againſt another, or not much diſtant, and the other at the end of the ſtalke, each of theſe parts conſiſt of three leaves ſeparate a ſunder, with ſmall foote ſtalkes unto them, which are ſomewhat broad, and ending in a point, ſome of them cut in on the edges more deepely, and all of them dented about the edges, of a ſad greene colour; among theſe leaves riſe up diverſe ſomewhat weake, ſmooth, round ſtalkes, halfe a yard or two foote high, yet not bending but ſtanding upright, having three or foure ſuch like leaves thereon, as grew below, but with ſhorter ſtalkes: at the toppes of the ſtalkes ſtand a tuft or buſh of white flowers, every one conſiſting of five ſmall leaves, with many whitiſh threds in the middle; and after they are fallen come ſmall round berries, greene at the firſt, and blacke when they are ripe: the roote is blacke without, and a little yellowiſh within, and ſomewhat thicke with diverſe blackiſh ſtrings, or great fibres annexed thereunto, which periſheth not, although the ſtalkes and leaves doe die downe every yeare, freſh ſpringing up againe.

2. *Chriſtophoriana Americana baccis niveis & rubris.* Herbe *Chriſtopher* of *America.*

This ſtranger ſhooteth forth in the Spring many reddiſh ſtalkes about a foote high with diverſe leaves thereon, divided into many parts ſomewhat reſembling the former, but larger, rougher, and of a ſadder greene colour, at the toppes, whereof ſtandeth a large tuft of white flowers compoſed in a manner wholly of threds, yet if they be more neerely vewed, there will appeare for every flower ſixe ſmall white leaves with their threds in the middle, compaſſing a round greene button, which comming to maturitie is either white with a purple tippe and foote ſtalke, or reddiſh wholly: the roote is blacke, thicke, ſhort and crooked, not growing downewards nor creeping: but with many fibres thereat.

The Place.

The firſt groweth generally in the woods of mountaines, that are ſomewhat open and not too much ſhadowed, and other like places, as well in our owne as other countries. The other both in our Plantations, and the *French* in *America.*

The Time.

They flower after Midſomer, and the berries are ripe in Auguſt.

Chriſtophoriana vulgaris.
Ordinary herbe *Chriſtopher.*

Chriſtophoriana Americana.
Herbe *Chriſtopher* of *America.*

The

The Names.

It hath no Greeke, or ſcarſe any good Latin name, although commonly with moſt, it be called *Chriſtophoriana* or *herba ſancti Chriſtophori*, but for what cauſe and reſpect I cannot learne, and many do doubt of the Saints name thinking it but compoſed as relative, bearing Chriſt according to the morall of the ſtory, and not eſſentiall and indeede: Some call it as *Lugdunenſis* ſaith *Napellus leucanthemos*, and ſome *Aconitum bacciferum*. *Lugdunenſis* ſaith, it is called with them *Napellus racemoſus*, and ſo with *Marantha* as *Camerarius* ſaith, ſome againe call it *Coſtus niger*, *Pena* and *Lobel* make a doubt whether it be nor *Actæa* of *Pliny*, in his 27. Booke and 7. Chapter, becauſe his *Actæa* beareth blacke berries like Ivie: but diverſe good and judicious Herbariſts, doe rather take *Actæa* to be *Ebulus*, for this hath no rough ſtalke as *Actæa* hath, but a ſmooth; and *Paulus Ægineta* interpreteth the roote of *Actæa*, to be the roote of *Sambucus*; *Bauhinus* calleth it *Aconitum racemoſum*, and ſeemeth to leane to *Lobel* his opinion, whether it be not *Pliny* his *Actæa* or no. Some alſo doe call *Scrophularia* by this name of herbe *Chriſtopher*. *Camerarius* ſaith it is called in high *Dutch* Wolfs worts, when as *Tragus* and others ſay, the *Aconitum Lycoctonum*, that is *Luparia* or *Lupicida* is ſo called alſo with them. *Camerarius* ſaith alſo it is called with them *Chriſtoffels kraut*, But *Tragus* ſaith that a kind of Vetch or Pulſe, which he thinketh is the *Aracus* of *Dioſcorides*, is called with them Sant *Chriſtoffels kraut*: The other is called by *Iacobus Coruntus* in his *Canadenſium plantarum hiſtoria Panaces χάμαι μοι ſive racemoſum Canadenſe*: but why *Panax* being no wound herbe, I ſee no cauſe unleſſe it were for want of a better name: but I thinke I have entituled it more truely, I am ſure more nearely reſembling this herbe, than any *Panax* that I know.

The Vertues.

The Inhabitans of all the mountaines and places, whereſoever the firſt groweth as ſome Writers ſay, doe generally hold it to be a moſt dangerous and deadly poiſon, both to men and beaſt, and that they uſe to kill Wolves herewith very ſpeedily; it muſt therefore be cautelouſly uſed, or rather utterly refuſed: but I much doubt whether thoſe Mountainers meane not rather that *Aconitum Lycoctonum* called *Lupicida*; and although many good Authours hold it dangerous, yet cannot I in my judgement ſo thinke, not finding herein by the taſte any pernitious qualitie; but I cannot learne what helpe this hath procured to any: *Cornutus* ſaith of his *Panuces Carpimon*, that it is eaten familiarly both with the naturalls, and *French* inhabitants with them as a ſallet herbe.

CHAP. XIX.

Clematites. Climers or Clamberers.

THere are diverſe ſorts of Climers or Clamberers, moſt of which are ſharpe hot and cauſticke, or exulcerating the skinne, if they lie any little time thereon, and thereby dangerous, although not deadly; diverſe of them have beene declared in my former Booke, whereunto I referre them that would be enformed of them, yet I thinke it not amiſſe to let you ſee ſome of their figures, the deſcriptions of the reſt ſhall follow.

1. *Clematis ſylveſtris latifolia ſive Viorna.* The great wild Climer or *Gerards* Travellers Joy.

This wild Climer or Travellers joy, as ſome call it, hath in ſome places (eſpecially if it have ſtood long in a place) a thicke and ſtrong ragged wooddie ſtemme or trunke, with diverſe chops or riftes in the barke, which is of a grayiſh colour, from whence ſhoote forth many long pliant grayiſh greene branches, more ſtrong and woodie, than any of the other Climers, (ſo that their branches doe in many places ſerve as withes, to winde about garden and field gates, or to bind eany burdle together,) theſe branches ſpread upon the hedges or trees, whatſoever it ſtandeth next unto, dividing it ſelfe into many other twigges, whereon are ſet at the ſeverall joynts, two long ſtalkes of winged leaves, conſiſting of five leaves, two and two together, and one at the end, each dented on the ſides, with ſmall notches, of a pale greene colour, and taſting ſharpe and hot, biting upon the tongue, but not ſo much as the burning Climer or Virgins bower; theſe branches winde themſelves about any thing, ſtandeth neare unto them for a great way, but have no claſping tendrells, like the Vine, to take hold and winde it ſelfe thereby, as *Gerard* ſaith it hath, ſo farre as ever I could obſerve: at the joynts where the leaves ſtand, come forth likewiſe towards the toppes of the branches, diverſe bunches or tufts of white flowers, ſet together upon ſmall long foote ſtalkes, with diverſe yellow threds in the middle, ſmelling very ſweete; and after they are paſt, there ariſe in their places ſeverall heads of many long hoary ſilver like plumes, as if they were feathers ſet together, with a browniſh flat ſeede at the bottome of every of them, which abide a great while, even to the Winter, before they fall off, or are blowen away with the winde: The roote ir great thicke, and ſomewhat woddy, diſperſing it ſelfe into diverſe long branches under ground: the leaves fall away in the Winter, and recover againe in the Spring.

2. *Clamatis ſylveſtris altera Bœtica.* The great *Spaniſh* wild Climer.

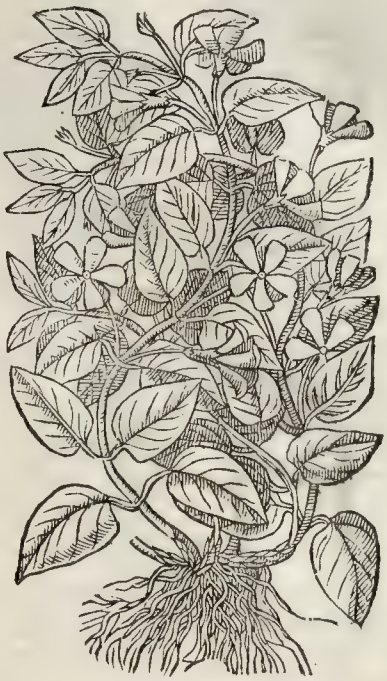
This other wilde Climer hath ſuch like running or climing branches, but ſpreading farther with many joynts all the length thereof, whereat ſtand round about it diverſe hard and ſomewhat broad leave, each by it ſelfe upon a ſmall footeſtalke, and dented round about the edges, of as ſharpe and hot taſte as the former, where alſo come forth two claſpers on each ſide, whereby it catcheth faſt hold of any thing ſtandeth in the way neare unto it: from the joynts likewiſe where the leaves ſtand, come forth (the flowers were not obſerved) long tufts or heads, in the ſame manner that the former hath, with the like plumed feathers, of a hoary white colour, with ſmaller ſeede below them, then the other.

3. *Clematis Cruciata Alpina.* The croſſe Climer of the Alpes.

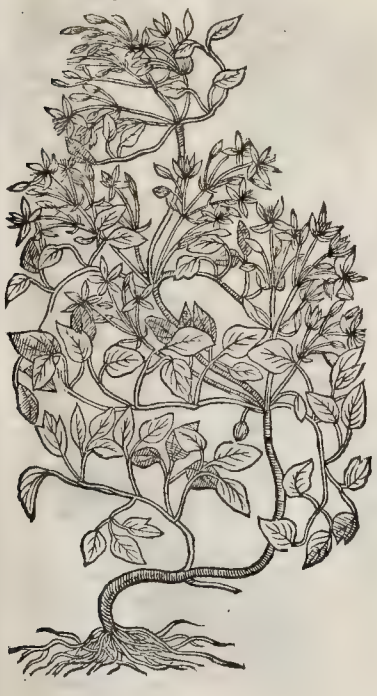
This Croſſewort Climer hath many ſlender and more ſquare branches, than any of the other Climers, ſomewhat hard and wooddy, riſing to be foure or five foote high, ſtanding for the moſt part upright, or but leaning a little downewards, from whence ſhoote forth many ſmall twigges, not paſt foure inches long, whereon are ſet at equall diſtances, two ſmall ſtakes of leaves, all the length of the twigges, three joyned alwayes together at the ends of them, each whereof is hard rough and full of vaines, of a ſad greene colour, of the bigneſſe of a large Mirtle leafe, or bigger, dented thicke round about the edges; the flowers come forth ſingle, every one upon a ſlender

Vinca pervinca vulgaris.
Common Periwincle.

Cematis Daphnoides latifolia seu Vinca pervinca major.
The greater Periwinkle.



Clematis urens flore albo.
The burning Climer or Virgins Bower.



Clematis peregrina flore rubro vel purpureo simplex.
Single Ladies bower red or purple.

Clematis peregrina flore pleno.
Double purple Ladyes Bower.

Flammula Iovis erecta.
Vpright *Vrgenia* Bower.

Clematis Panonica minor.
The lesser *Hungarian* Climer.

Clematis Panonica Clusij major.
The greater *Hungarian* Climer.

a ſlender long foote ſtalke, conſiſting of foure woolly and pointed leaves, laid open like unto a croſſe, of a bluſh white colour, having in the middle thereof, many ſmall whiter leaves foulded together: the roote ſpreadeth very much under ground, which hath but very ſmall acrimonie therein, or none at all, but the leaves are ſomewhat ſharpe and hot in taſte.

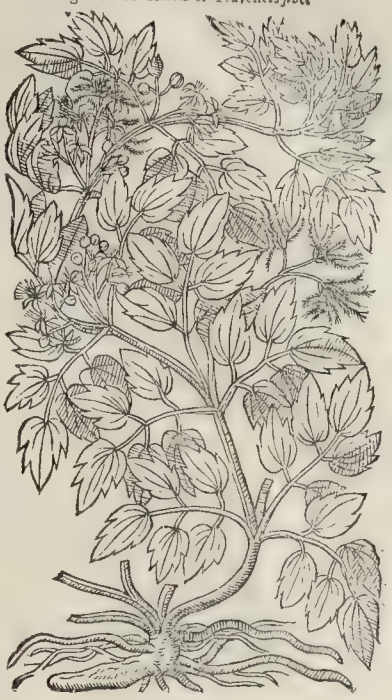
4. *Clematis maritima repens.*
The creeping fiery Sea Climer.

This creeping Sea *Clematis*, ſpreadeth abroad many creeping pliant, joynted and creſted branches, about two foote long, covered with a very darke greene barke, from whence ſhoote forth many winged leaves, a little dented about the edges, very like unto the *Clematis erecta*, or *Flamula Iovis*, the upright Virgins Bower, conſiſting of five leaves, but moſt commonly of three upon a ſtalke, being narrower, harder and longer pointed: at the ends whereof commeth forth, a ſmall claſping tendrell, but thoſe that grow up higher upon the ſtalkes, and nearer unto the toppes, where the flowers doe ſtand, are much ſmaller and narrower: the flowers come forth many together, as in the other, ſet upon long foote ſtalkes, which are white with many hairy threds in the middle of them: and after they are paſt, ariſe many round flat reddiſh ſeede, ſmaller than the other, three or foure upon a ſtalke together, plumed with a white feather, at the head of every of them: the whole plant is ſharpe and hot like unto the other.

The Place.

The firſt groweth in many places of our owne land, in the hedges of fields, & by the high wayes ſide, in *Buckinghamſhire*, *Bedfordſhire*, and *Eſſex*, but eſpecially in *Kent*, where from beyond *Woolwich* to *Graveſend*, and from *Graveſend* along to *Canterbury*, you may ſee it in many

1. *Clematis ſylveſtris latifolia ſive Viorna.*
The great wild Climer or Travellers *ſive*.



2. *Clematis ſylveſtris altera Bætica.*
The great Spaniſh wild Climer.

3. *Clematis Cruciata Alpina.*
The leſſer Climer of the Alpes.

places

places. The second *Clusius* onely found in Spaine, betweene *Medina Sidonia* and *Calpe*, and in divers place thereof. The third was found upon mount *Baldus*, by *Iungermannus* as *Bauhinus* saith, but is set downe b *Iohannes Pona*, an Apothecarie of *Verona*, in his description thereof which he sent unto *Clusius*, that first pub lished and set it forth at the end of his history of plants, and was augmented afterwards by *Pona* himselfe, an setforth first in Latine, and after that againe enlarged with many additions and set forth in *Italian* by his sonne yet *Bauhinus* saith it was found also very plentifully, both fairer and greater by Doctor *Burserus*, upon the hill of *Austria*: The last *Bauhinus* saith, groweth in many places of the *Adriaticke* sea shore, and in those Ilands o the *Venetians* there, called *Lio*, and *Litzefusina*.

The Time.

They doe all flower about *July*, and the feather like toppes of the crested ones, appeare in some places all the winter.

The Names.

They are called *Clematides* of their climing and spreading branches. The first *Bauhinus* calleth *Clematitis syl-Vestris latifolia*, and so doe I also. *Lobel* and *Gerard* call it *Viorna*, *quasi vias ornans*, which Latine word I thinke was but derived from the French *Vierne*, or the French from the Latine: *Bellonius* saith, it is *Viburnum Gallorum*, (and *Ruellius* I thinke tooke it from him *ore converso*.) as if the French *Viorne* were derived from *Viburnum* whereof *Virgil* speaketh in these words.

Verum hoc tantum alias inter caput extulit urbes,
Quantum lenta solent inter Viburna Cupressus.

Wherein he compareth the statelines of *Rome* to the Cypresse tree, and the meanesse of other Cities to the low shrubbe *Viburnum*: but so it is not likely to bee, seing this *Viorna* will rise to the top of the tallest Cypresse it selfe, if it be planted nigh it whereon it may clime; that *Virgil* his comparison therefore may hold good we must find *Viburnum* to be a low shrub much differing from this, as you shall heare in his place: *Fuschius* thought it to be *Vitis nigra*, *Dodonæus* calleth it *Vitalba*. *Anguillara* judged it to be *Atragene Theophrasti*, whereof he maketh mention in *lib.* 5. *c.* 10. whereunto *Clusius* doth consent as being the most likely of any other plant, and *Pena* and *Lobel* doe not dissent therefrom, neither doe I for the reasons there shewed: it is also the *Vitis sylvestris* of *Pliny* whereof he speaketh in his 16. Booke and fourth Chapter, and the *Clematis tertia* of *Matthiolus*, the *Vitis sylvestris caustica*, of *Gesner* in *hortis Gemaniæ* the *Vitis sylvestris Dioscoridis* of *Anguillara*, and the *Clematis altera prima* of *Cordus* upon *Dioscorides*: the *Italians* call it *Vitalba*, the *Germans Linen* and *Lijnen*, the *Dutch Lyner*, and in English of most country people where it groweth Honestie; and the Gentlewomen call it Love, but *Gerard* coyned that name of the Travelours joy. The second *Clusius* calleth *Clematis altera Bætica*, and *Bauhinus* that he might vary therefrom, *Clematis peregrina foliis pyri incisis*: The third is set forth by *Pona* under the title of *Clematis Cruciata Alpina*, but *Bauhinus* to alter the title, calleth it *Clematis Alpina Gerani folia*: the last *Bauhinus* calleth *Clematis maritima repens*, as it is in my title and describing it in his Pinax, referreth it to *Anguillara* his *Clematites*.

The Vertues.

None of these here described are used in Physicke, by any that I know, for although they are all hot and sharpe in tast, some more or lesse then others, yet are they not applyed to the purposes that the other sorts are, which *Dioscorides* and *Galen* speak of: both these and the other Climers whose figure I give you here, and their description in my former booke may very well serve to make Arbours, in Gardens, Orchards, or other places for pleasure, for thereunto they are most fit, if any will so respect as to plant them. The other Climers serve to take away the scurfe, lepry, or other deformities of the skinne: but may not safely be used inwardly, although *Dioscorides*, *Galen*, *Pliny*, and others say it was used to purge the waters in the Dropsie: *Matthiolus* saith the water of the upright Virgins Bower is effectuall in any cold greefes, and that some gave the leaves prepared to helpe the quartane Ague: an oyle made thereof is used to heale those that have aches, crampes, and other paines that come by cold, as also to helpe the stone and to provoke urine: the Periwincle is a great binder staying bleeding, both at the nose and mouth if some of the leaves be chewed, the French doe use it to stay the menstruall courses. *Dioscorides*, *Galen*, and *Ægineta* commend it against the laske and fluxes of the belly to bee drunke with wine: it is a tradition received with many, that a wreath made hereof and worne about the legs defendeth them from the crampe. The *Maracoc* or *Virginia* Climer, although I have placed it among them for the manner of growing, yet is it of a farre differing quality, the liquor within the fruite is very pleasant to the taste, as if Muske or Amber were mixed with it, or as others say, having a little aciditie with it, so that it cloyeth not the stomack although one take much thereof, nor giveth any bad symptome, but is held rather to move the belly downewards and make it soluble. *Aldinus* in his Farnesian Garden hath set downe many vertues thereof rather in an *hyperbole* I think then in verity, which I thinke were rather others fantasies then of his owne approbation: for in his owne judgement and tryall he saith the leaves are of a sleepie property, smelling like unto Nightshade, having withall peradventure some deleteriall or deadly quality in them also, because (as he observed) that flies resting on them were extinguished or kild.

CHAP. XX.

Apocynum sive Periploca. Dogs bane.

HEre are three sorts of this *Apocynum* or Dogs bane differing chiefely in the climing, and in the forme of their leaves, and are dangerous to man and beast, but there are some other plants referred unto them, as well for their face and forme of growing and giving of milke, as for their violent and dangerous qualities, I have spoken of that kind that came out of *Virginia* in my former booke, whereunto I must refer them for the description that are desirous to see it.

1. *Apocinum latifolium non repens.* Broad leafed or upright Dogs bane.

This broad leafed or upright Dogs bane, a wooddy stemme of the bignesse of ones finger, covered with a grayish

iſh barke, from whence ariſe divers wooddy, but flexible greeniſh branches, eaſie to winde, but very tough & hard to breake, ſtanding for the moſt part upright, and ſeldome trayling or laying hold of any thing that groweth neare it, having two broad darke greene leaves, but ſharpe and not round at the points, ſet at every joynt all along, but not very neare one unto another, full of veynes, ſomewhat ſofter then Ivie leaves, ſomewhat thicke alſo, whoſe ſtalkes and branches being broken yeeld a pale yellow coloured milke; but as *Dioſcorides* and other writers ſay, of a much deeper yellow, that is, in the warmer Countries; the flowers come forth at the joynts with the leaves, and at the tops three or foure or more ſometimes ſtanding together, which conſiſt of five ſmall pointed leaves, of a whitiſh colour, yet larger then thoſe of *Aſclepias* or Swallowewort; after which (in the hotter Climats, but never in ours that could be obſerved) grow long crooked and pointed cods, ſomewhat more hard and wooddy then thoſe of *Aſclepias*, although nothing ſo much as thoſe of the Roſe bay tree, called *Oleander*, moſt uſually two ſtanding together upon one ſtalke, but ſevered at the ſetting to the ſtalke, and are full of a ſilken white downe, wherein lye diſperſed many flat blackiſh browne ſeedes: the roote groweth downe into the ground ſpreading into ſundry branches, with divers ſmall fibres thereat, this looſeth not his branches, but leaves every yeare, new ſhooting forth every ſpring.

2. *Apocynum anguſtifolium ſive repens.* Climing Dogs bane.

The climing Dogs bane ſendeth forth from the roote divers wooddy branches, yet tough and flexible, of a darke grayiſh greene colour, and ſometimes browniſh eſpecially neare the ground, where it beareth no leaves after it is growne of any bigneſſe or height, which winde themſelves from the Sun ward (as in all that I have ſeene I have obſerved) to a very great height, twenty foote or more ſometimes, if it finde whereon it may climbe higher, or elſe falling downe againe with his top, whereon ſtand at ſeverall good diſtances, ſaving at the tops where they ſtand thicker ſet together, two leaves longer and narrower then the former, and pointed at the ends, ſomewhat thicke, and of a deepe greene colour almoſt ſhining: the flowers ſtand in the ſame manner that the others doe, conſiſting of five thicke leaves, each of them pointed and ſomewhat bending backwards, ſeeming to have two leaves a peece, one lying upon another, like unto thoſe of *Epimedium* or Barrenwort, the undermoſt being greeniſh and larger then the upper leaves, which lye upon them, and are not ſo large to cover them wholly, but leave the greene brims, or edges of the lower leaves to bee ſeene round about them, which upper leaves are of a darke purple or reddiſh colour, and cleave ſo faſt to the lower, that it is very hard to ſeparate them: in the middle of each flower ſtandeth a greene pointell, incompaſſed with five darke yellow chives, each of them turning inwards: after the flowers are fallen, appeare (in the warme countries, but not in ours) ſmall long cods, two alwayes joyned together, but more ſtrictly then the other, bowing ſomewhat more outwards in the middle, and meeting almoſt together at the points, wherein lie ſuch like flat ſeedes, wrapped in the like ſilken downe: the roote ſpreadeth in the ground like the other, and ſometimes ſendeth forth ſuckers, whereby it is encreaſed: this likewiſe looſeth his leaves but not his ſtalkes in the winter, and gaineth freſh in the ſpring.

1. *Apocynum latifolium non repens.*
Broad leafed or upright Dogs bane.

3. *Apocynum anguſto ſalicis folio.* Willow leafed Dogs bane.

This other narrow leafed Dogs bane groweth up in the ſame manner, that the laſt doth, having two leaves ſet at every joynt of the climing twigs, but they are not ſo thicke, but ſomewhat thinner, and much narrower then they, almoſt reſembling the forme of a willow leafe, the flowers are like the other, and blow as late, looſing his leaves in the winter, in the ſame manner.

4. 5. *Apocynum rectum latifolium & anguſtifolium Americanum, ſive majus & minus.*
The great and leſſer upright *American* Dogs bane.

Although I have in my former booke given you both the deſcription and figure of the greater ſort of theſe Dogs banes by the name of *Periploca Virginiana, Virginian* ſilke, yet I think it not amiſſe to mention it here againe, & give you the full figure thereof, referring you to ſee the deſcription, &c. there, and with it to joyne a leſſer ſort which creepeth not with the rootes in the ground like it, but from many long fibres ſhooteth forth a round browne ſtalke about halfe a yard high, having at each joynt a paire of long narrow leaves, and ſuch a large tuft of flowers at the top, but of a deeper purple colour, which have a certaine clammineſſe on them that will detaine flies or other light things that happen to fall thereon, after which come long and ſtraight cods (not crooked like the greater ſort hereof) with flat browne ſeede therein lying in a white kind of downe, like unto *Aſclepias* Swallowewort: this yeeldeth a milky ſap like the other, and thought to be both dangerous, although no true tryall hath beene made thereof.

6. *Pſeudo apocynum Virginianum, alijs Geſſeminum Americanum maximum flore phœniceo.* Virginian Iaſmine.

Let me I pray you make bold to inſert in this place to the reſt this Indian, I intitle him with baſtardy for the reaſons hereafter ſpecified, whoſe deſcription I give you in this manner. It ſhooteth forth ſundry weake whitiſh wooddy ſtemmes not able to ſuſtaine themſelves without helpe of ſtakes or faſtening to ſome wall but ſpreading exceeding high or farre, branching forth on all ſides into many ſmall ones, at whoſe joynts come forth long winged leaves ſeaven or nine ſet on a middle ſtalke, each whereof is ſomewhat broad and long pointed

2. *Apocynum angustifolium sive repens.* Climing Dogs bane.

Apocynum rectum latifolium & angustifolium Americanum sive majus & minus. The greater and lesser American Dogs bane.

ted and dented somewhat deepely about the edges, and of a sad greene colour full of veines, very neare resembling the leaves of the great Germane Burnet Saxifrage. This never bore flower with mee, nor any other that hath it in our country that I could heare of: but in the naturall place, as also beyond sea, at *Rome*, and other warme countries, it beareth a great tuft of flowers together hanging downewards, each whereof is large and somewhat long, somewhat like to the Foxglove, but rather Bell fashion, small at the bottome big in the belly, and wide open at the mouth, cut in on the brims into five or six lips as it were or divisions, of a sad Orenge or yellowish red colour, with some yellow threds, & a whitish stile in the middle: after the flowers are past, arise hard, wooddy, long & flattish double edged crooked and pointed cods, containing within them a double row of flat, thin, transparant, browne skinny and winged seedes, with a thinne wooddy filme separating them in the middle all the length of the cod: the roote groweth not very deepe but spreadeth, yet runneth not under ground, the leaves all falling away from the branches every winter, and are renewed every spring. By this that hath beene sayd you may perceive the reason why I place it among these dangerous climers, although it have no obnoxious or hurtfull quality therein for any thing I can learne, and doe not call it a Iasmine as many others do, nor a Honysuckle as our English Colonie at *Virginia* first did, nor a Bell flower as since they have done, nor yet place it with the other Climers in the last Chapter, because of the pods with seede, neither yet doe I entitle it *Gelsemium hederaceum Indicum*, as that good French goose doth, whose horned name is prefixed to his worke of great judgement no doubt, to make it beare an Ivy title that hath so little resemblance thereto.

The Place.

The first groweth in *Syria* and those Easterne countries, the other groweth in *Italy*, in *Apulia* and *Calabria* in the kingdome of *Naples*: the third likely groweth in *Italy*, the seede being sent from thence, as also in *Egypt*, the three last sorts came all from our English plantations in *America*.

The Time.

They flower very late in the yeare, if they flower at all, that is, not untill the end of *August*, and to the middle of *September*.

The Names.

It is called in Greeke Ἀπόκυνον and κυνόμετρον, *Apocynum* and *Cynomeron*, *quia canis interficit*: *Dioscorides* saith it was also called of divers in his time *Cynocrambe*, *Brassica canina*, but it is an extravagant name not fit, and περίπλοκη, *Periploca* of divers; which is as well a word, common to all sorts of herbes, that clime up and wind themselves about trees, and other things as peculiar to these called *Periploca*, whose *Alexipharmacum* or counterpoyson is the *Vincetoxicum* or *Asclepias*, as the *Anthora* is unto the *Thora*, and *Herba Paris* unto *Pardalianches*. *Fabius Columna* seemeth to doubt, that the Herbarists and Apothecaries in *Italy* did take the *Apocynum* of *Dioscorides*, in their Medicines, which is deadly, in stead of *Asclepias*, and that they did not know the true *Ascepias* of *Dioscorides*, unto whose description that which is called *Asclepias* with them and us doth not agree, for although it hath a number of rootes, yet they doe not smell well, (as *Dioscorides* saith the rootes of his *Asclepias* should doe) nor yet hath it seeds like unto *Securidaca* Hatchet Teeth, but hath leaves, flowers, cods, with silken downe, and seede

seede in them, like unto the *Apocynum* of *Dioscorides*, and differing in nothing but in the milkye juice it yeeldeth; which as he saith, in that, is white like milke (but *Dioscorides* saith, that his *Apocynum* giveth a yellow juice or milke) and in this, is of a pale yellow colour like unto the poyson of the viper, that sticketh in the gums of his teeth; which he saith he hath often shewed to his friends, to shew them the likelihood of danger to be in their *Asclepias*, which yeeldeth such a likely poyson, or at the least to cause them to be more cautelous in the use of it: but assuredly if their *Asclepias* (which is the same with ours called also *Vincetoxicum* as I thinke) doe give a yellowish milke, yet doth it not in our Country, neither the white nor black: he saith also, that the latter writers have set forth divers sorts of *Apocynum* under the name of *Asclepias* of *Dioscorides*, for that they doe not know, nor have seene the true *Asclepias* of *Dioscorides*, unlesse his *Apocynum* and *Asclepias* be all one, set forth in divers places, and by divers names: thus farre *Fabius Columna*, led away onely by the sight of that yellowish milke in their *Asclepias*; which as you heare he acknowledgeth not to be the right (how soever the use thereof was frequent with them, and might be as he acknowledgeth also, a counterpoison as the true *Asclepias* is accounted) but rather an *Apocynum*: but I thinke he did not thorowly consider that the true kindes of *Apocynum*, have all of them wooddy, yet pliant branches, as *Dioscorides* giveth to his *Apocynum*, fit to binde any thing, which abide and dye not downe to the ground, as all the sorts of *Asclepias* doe, which is the true note to distinguish the *Apocynum* from *Asclepias*. The names of them all, as they are in their titles here set downe, doe little or nothing vary, from those that all other writers give them, some calling them *Apocynum*, and some *Periploca*, and therefore I neede not I thinke, make any further repetition of their divers appellations, onely the fourth *Bauhinus* calleth as I doe, and taketh it to be also the *Secamone Ægyptiorum* of *Alpinus*, and the second sort of the second kinde of *Apocynum* of *Clusius*: the last, because of the wooddy pods with the manner of the climing, mooveth me rather to joyne it to these, although I know not of any evill quality therein, and therefore give it a bastard name.

The Vertues.

There is no property herein fit for the use of mans body, appropriated by any, either ancient or moderne writers, for the place in *Pliny, lib. 24. c. 11.* is mistaken or scarse to be beleeved, where he saith the seede of *Apocynum* taken in water, helpeth the pleurisye, and all paines of the sides, (unlesse he thought it to be like the hangman that can doe as much,) and yet afterwards saith it killeth dogges, and all foure footed beasts, being given them in their meate, for *Galen* saith it is a poyson to man, and being of a strong sent it is hot, and that not in a meane degree, although it is not drying in the same, and is not to be used but outwardly, to discusse humours. *Clusius* saith, that the most illustrous Prince, *William Landtsgrave* of *Hessen*, in appointing his Physitions to make tryall of the *Terra Silesiaca*, which was taken at *Strega*, whether it had those properties to expell poysons, as they that brought it to sell reported of it, caused divers poysons to be given to dogs, as *Arsnicke*, *Napellus*, or Helmet flower, and *Oleander* or the Rose bay, and this Dogs bane also; which soever of those dogges, had that earth given to him in drinke, did after some fits or passions recover, but those that had none thereof given them dyed all, but none so speedily as those that had this Dogs bane given unto them, yet *Pena* and *Lobel* in their *Adversaria*, speaking of that kind of Dogs bane, say thus; If it be death to a dogge that hath eaten it, it is probable that it is *Apocynum* (for in their title, they make a doubt thereof) of *Dioscorides*: but say they, wee have it for certaine, and of long time found true by experience and tryall, that this is a counterpoyson against other sorts of poyson given to dogges, thus you see the reports of these two are flat contrary, the one unto another, so that which of them to beleeve, I leave to every one as they thinke good: peradventure, this their *Periploca Græca foliis latioribus hederaceis*, (for so they call it) is the same vulgar or common *Asclepias*, that *Fabius Columna* saith, was used in *Italy*, as is before said, and not that *Apocynum rectum* of *Clusius*.

CHAP. XXI.

Asclepias sive Vincetoxicum. *Asclepias* or Swallow-wort.

HAving now shewed you all the Venemous Plants, as also those that procure sleepe, and those that are hurtfull and dangerous: let me now shew you also those that are accounted Counterpoysons, to those deadly or dangerous herbes, as also to other sorts of Venome or poyson, and yet not all, for some are dispersed in this worke, in the severall Classes thereof, and some are spoken of in my former booke, as you may there find. The first of them that I shall set forth unto you is the Swallow-wort, because it is so like unto the Dogs-bane in the last Chapter, and is his Antidote, whereof there are three sorts as followeth.

1. *Asclepias flore albo.* Swallow-wort with white flowers.

This Swallow-wort riseth up with divers slender weake stalkes; to be two or three foote long not easie to breake, scarse able to stand upright, and therefore for the most part, leane or lye downe upon the ground, if it find not any thing to sustaine it, and sometimes will twine themselves about it, whereon are set two leaves at the joynts, being somewhat broad and long pointed at the end, of a darke greene colour, and smooth at the edges: at the joynts with the leaves towards the toppes of the stalkes, and at the toppes themselves, come forth divers small white flowers, consisting of five pointed leaves apeece, of an heavy sweet sent; after which come small long pods, thicke above and growing lesse and lesse to the point, wherein lye small flat browne seede, wrapped in a great deale of white silken downe, which when the pod is ripe, openeth of it selfe, and sheddeth both seed and cotten upon the ground, if it be not carefully gathered: this yeeldeth no milke either white or yellow in our Country as the Dogs bane doth, in any that I have observed, but a thinne watery juice; the rootes are a great bush, of many white strings fastened together at the head, smelling somewhat strong while they are fresh and greene, but more pleasant when they are dryed: both leaves and stalkes, dye downe every yeare to the ground, and rise a new in the Spring of the yeare, when the stalkes at their first springing are blackish browne.

2. *Asclepias flore nigro.* Swallow-wort with blacke flowers.

The blacke Swallow-wort groweth in the same manner that the former doth, having his long slender rough branches, rise to a greater height then the other, and twining themselves about whatsoever standeth next unto them,

1. *Asclepias flore albo.*
Swallow-wort with white flowers.

2. *Asclepias flore nigro.*
Swallow-wort with blacke flowers.

them, having ſuch like darke greene leaves ſet by couples, but ſomewhat ſmaller then they: the flowers likewiſe ſtand in the ſame faſhion, but ſomewhat ſmaller alſo and of ſo darke a purpliſh colour, that it ſeemeth to be a blacke, and are ſcarſe diſcerned unleſſe one looke very earneſtly upon them: after which come more plentifully then in the former, ſuch like cods, with a white ſilver downe, and ſeedes in them as in the former: the rootes hereof are not ſo buſhye as in the other, neither ſmell ſo ſtrong, nor doth it give any milkie but a watery juice when it is broken, ſo farre as ever I could obſerve.

3. *Aſclepias Cretica.* Swallow-wort of *Candy.*

This *Candy* Swallow-wort, riſeth up in the ſame faſhion that the former doe, with many ſlender flexible greene branches, with leaves ſet at the joynts, on either ſide, as the white kinde hath, and are very like unto them, but ſomewhat of a paler greene colour; the flowers ſtand in the ſame manner, three or foure together upon a ſtalke, but are ſomewhat of a paler white colour, not ſo white as they, to whom ſucceede ſometimes but one, but moſt uſually two pods together, which are thicker and ſhorter then thoſe of the white kinde, ſtraked all along, and double forked at the ends, wherein lye ſeedes and ſilke as in the former: the rootes have not ſo many ſtrings as the laſt, and have as well as the reſt of the Plant, a ſtrong ſmell reſembling Boxe leaves.

The Place.

The two firſt grow in rough untilled places, and in mountaines in divers places, both in *France* about *Narbone*, *Marſeilles* and *Mompelier*, and in *Italy* alſo, and in other places. The laſt grew in *Candy* from whence the ſeed came.

The Time.

They all flower in the moneths of Iune and Iuly, and ſometimes not untill Auguſt, if the yeare be backeward, and their cods with ſeede is ripe about a moneth after: the empty huskes abiding on the dry branches, when the ſeed and ſilke is ſhed out, and fallen on the ground, or blowne away with the wind.

The Names.

It is called in Greeke *δολαπιὰς Aſclepiai, ab Æſculapio, qui δολαπιὰς Græcis dicitur antiquo medicinæ doctore*: ſome baſtard names it hath alſo, as *κισσὸν quaſi hederula*, and *κισσοειδὲς hederefolium*: and thereupon or from the forme of the leaves like unto Ivy: *Ruellius* calleth it *Hederalis*, in Latine it is called uſually *Aſclepias* and *Vincetoxicum*, which is as a generall word to denominate any Counterpoiſon, for *Vincetoxicum quaſi Alexipharmacum dictum, & quod illis inſignis adverſus venena vis inſit*, it was anciently called *Hirundinaria*, (although both the kindes of *Chelidonium majus* and *minus*, be alſo called *Hirundinaria*) of ſome, *quia acutæ & apertæ ejus ſiliquæ, cum candida lanugine volanti hirundini fere ſimilis eſt, alij vero a ſemine lanugine pinnato, ita dici aiunt*: that is, it is called Swallow-wort of ſome, becauſe the pointed cods when they are open; and the ſilke appeareth out of them, doe ſomewhat reſemble a Swallow flying; others ſay from the likeneſſe of the ſeed, fethered as it were with the downe about it: it is called in *Italian Venci taſſico & Aſclepiade*, in high *Dutch Schwalben wurtz*, in low *Dutch*

Dutch Swalwe wortel, and in *Englifh* Swallow-wort, and of ſome ſilken Cicely: It is generally by the moſt writers, and moſt judicious Herbariſts now a dayes, acknowledged to be the true *Aſclepias* of *Dioſcorides*, although *Anguillara* doubteth of it; and *Matthiolus* denieth it and conteſteth againſt *Fuchſius* that ſaid it was *Vincetoxicum*. For firſt concerning the leaves, to be like Ivye, as *Dioſcorides* ſaith and long as it is in ſome copyes, but *Oribaſius* as he ſaith hath it not ſo; and *Marcellus* doth thereunto agree, led peradventure as he ſaith, by the ſight of ſome ancient copies, the leaves being like unto Bay leaves, but ſharper pointed; ſecondly that the flowers had no ſtrong or evill ſent; thirdly that the leaves and rootes did not ſmell ſweet; and laſtly, the ſeede was not like thoſe of *Pelecinum Securidaca*, the Hatchet Fetch; all which *Dodonæus* retorteth ſaying, all his exceptions and reaſons are nothing worth, but I may ſay all *Dioſcorides* his compariſons are not ſo ſtrictly to be ſtucke unto; for in the deſcription of the cods of *Apocynum*, he ſaith, they are like Beane cods, when as all know they are more like the cods of *Oleander*: and in the deſcription of the leaves of *Periclymenum* he ſaith they are like thoſe of Ivy, unto whom they are in all mens judgement very little like, and ſo in a number of other things: Concerning the rootes, *Matthiolus* ſaith, that an ancient Manuſcript hath not the word πολλας *multas*, but λεπτας *tenues*, but which of them both is taken doth not much alter the matter: but that they are not ſweete, no man that hath his ſence of ſmelling perfect, can ſay ſo, if he feele their ſent, as they grow naturally in the Mountaines; and for the evill ſmell of the flowers, the word Καρδιακὸν *virus redolens*, is not in all things of one equality: and for the ſeede although it be not as ſquare as the *Securidaca*, yet is flat, and in colour and bigneſſe like it. *Fabius Columna* as it is ſet downe in the Chapter before, tooke the *Italian Aſclepias*, to be rather *Apocynum* of *Dioſcorides*: and *Lobel* alſo calleth the blacke Swallow-wort *Periploca minor*, belike becauſe it riſeth higher, and clambereth like a *Periploca*, or more then the white: or peradventure becauſe of the blacke flowers, but I ſhewed you before the chiefeſt note, to know *Aſclepias* from *Periploca* or *Apocynum*. There is little variation in the denominations of theſe plants by any writers, more then is here expreſſed, ſome calling them by the one, and ſome by the other name, and therefore not worthy further trouble.

The Vertues.

The rootes have a moſt ſoveraine quality againſt all poyſons, but in particular as is ſaid before, againſt the *Apocynum* or Dogs bane; It is effectually given to any that are bitten by any venemous beaſt, or ſtunge by any Serpent or other Creature; as alſo againſt the biting of a mad dogge, a dramme and a halfe thereof taken in *Cardus Benedictus* water, for divers dayes together: It is taken alſo in wine every day againſt the Plague or Peſtilence: a dramme thereof taken in Sorrell or Bugloſſe water is very effectuall againſt all the paſſions of the heart, if a few Citron ſeedes be taken therewith, taken in the ſame manner and meaſure, it eaſeth all the griping paines in the belly: the decoction of the rootes, made with white wine, taken for divers dayes together, a good draught at a time, and ſweating preſently thereupon cureth the dropſie: the ſame alſo helpeth the jaundiſe, provoketh urine, and eaſeth the cough and all defects of the cheſt and lunges: the powder of the rootes taken with Peony ſeede, is good againſt the falling ſickeneſſe, or with Baſſill ſeede or the rinde of Pomecitrons is good againſt Melancholly: and taken with the rootes of *Dictamnus albus* or *Fraxinella*, baſtard *Dittany*, will kill and expell the wormes of the maw or belly: the rootes are very effectually uſed with other things, made for bathes for women to ſit in, or over, to eaſe all paines of the mother, and to bring downe their courſes: the decoction likewiſe of the rootes hereof, and of Cumfrye made with wine, is much commended to helpe thoſe that are burſten or have a rupture, alſo for them that have beene bruiſed by a fall, or otherwiſe: the powder of the rootes or leaves, is no leſſe effectuall to clenſe all putride rotten and filthy ulcers and ſores whereſoever, then the rootes of *Ariſtolochia* or Birthwort, and may ſafely be uſed in all ſalves, *Unguents* and *lotions*, made for ſuch purpoſes, in the ſtead thereof, the one for the other: the leaves and flowers boyled and made into a pultis, and applyed to the hard tumours or ſwellings of womens breaſts, cureth them ſpeedily, as alſo ſuch evill ſores as happen in the matrix, although they be inveterate or hard to be cured: the downe that is found in the cods of theſe herbes, as well as in the Dogs bane, doe make a farre ſofter ſtuffing for cuſhions or pillowes or the like, then Thiſtle downe, which is much uſed in ſome places for the like purpoſes.

CHAP. XXII.

Herba Paris. Herbe True love or one berry.

BEſides the uſuall and knowne *Herba Paris*, I have two other herbes like thereunto, to bring to your conſideration, which I thinke is fit to take up the roome here.

The ordinary *Herba Paris*, or Herbe true love hath a ſmall creeping roote, of a little binding, but unpleaſant loathſome taſte, running here and there, under the upper cruſt of the ground, ſomewhat like a Couch graſſe roote, but not ſo white, and not much leſſer then the roote of the white wild *Anemone*, and almoſt of as darke a colour, but much like thereunto in creeping: ſhooting forth ſtalkes with leaves, ſome whereof carry no berries, and others doe, every ſtalke being ſmooth without joynts, and blackiſh greene, riſing to the height of halfe a foote at the moſt, if it beare berries (for moſt commonly thoſe that beare none, doe not riſe fully ſo high) bearing at the toppe foure leaves, ſet directly one againſt another in manner of a croſſe, or a lace, or ribben, tyed as it is called, in a true Loves knot, which are each of them a part ſomewhat like unto a Nightſhade leafe, but ſomewhat broader (yea in ſome places twice as broad as in others, for it will much vary,) ſometimes having but three leaves, ſometimes five, and ſometimes ſixe, and ſometimes ſmaller and ſometimes larger, either by a quarter or halfe, or as I ſaid before, twiſe as great: I have ſeene it alſo degenerate, that the foure leaves being twiſe as large as the ordinary, have beene dented in, both at the edges and points, which have beene parted or forked, (and have borne greater berries then the ordinary) all which are of a freſh greene colour, not dented about the edges: in the middle of thoſe foure leaves, there riſeth up a ſmall ſlender ſtalke about an inch high, bearing at the toppe thereof one flower ſpread open like a ſtarre, conſiſting of foure ſmall and narrow long pointed leaves, of a yellowiſh greene colour, and foure other lying between

Herba Paris.
Herbe true love or one berry.

2. *Herba Paris Canadensis rotunda radice.*
Herbe true love of *Canada* with a round roote.

them leſſer then they; in the middle whereof ſtandeth a round darkē purpliſh button or head, compaſſed about with eight ſmall yellow mealy chives or threds, which three colours make it the more conſpicuous, and lovely to behold: this button or head in the middle, when the other leaves are withered, becommeth a blackiſh purple berry full of juice, of no hot nor evill, nor yet of any ſweetiſh taſte, of the bigneſſe of a reaſonable grape, having within it many white ſeedes: the whole plant is almoſt inſipide, without any manifeſt taſte, and by the effects, in repreſſing humours and inflammations is accounted as cold as the Nightſhade.

2. *Herba Paris triphyllos Braſiliano.* Herbe true love of *Braſill.*

The roote of this herbe is ſmall and creepeth like the other, ſending forth a ſlender ſtalkē of fourē or fivē inches high, having three broader and longer leaves ſet thereon, then are in the former, the ſtalke riſeth about three inches above them, bearing at the top three muchnarrower leaves, as it were the huske to the flower, ſtanding in the middle, conſiſting of three white leaves having ſome veines in them, and are about three inches long, and one broad.

3. *Herba Paris Canadenſis rotunda radice.* Herbe true love of *Canada* with a round roote.

This herbe groweth with three large leaves like the laſt, and at the toppe of the upper ſtalke one flower, conſiſting of ſixe leaves, three whereof are greene and ſmall, which are as it were the huske to the other three leaves which are larger and longer, of a darke purple colour, and in ſome white, in the middle whereof groweth a ſmall round blackiſh berry, full of ſmall ſeedes like Nightſhade ſeede: the roote hereof creepeth not as the formēr, but groweth into a ſmall round tuber.

The Place.

The firſt groweth in our woods and copſes, as alſo ſometimes in the cornērs and borders of fields, and waſtē grounds, in very many places of this land, for beſides thoſe places which *Gerard* hath ſet downe, which are almoſt all waſted and conſumed, every one running thereunto, that is next him, and gathering it: it is found in *Hinbury* wood, three mile from *Maideſtone* in *Kent*, in a wood alſo called *Harwarſh*, neere to *Pinnenden* heath, one mile from the ſaid *Maideſtone*, in a wood by *Chiſſelhurſt* in *Kent*, called Long wood, and in the next wood thereunto called *Iſeets* wood, eſpecially about the skirts of a hoppe garden bordering thereon, in a wood alſo over againſt *Boxly* Abbay a mile from *Maideſtone* in great abundance, not farre from the hedge ſide of that Meddow, through which runnes a rivelet, related by Mr. *George Bowles* a young Gentleman, of excellent knowledge in theſe things. The ſecond was found as *Bauhinus* ſaith in the woods of *Braſil*, but I had the knowledge thereof given me from *Mounſier Loumeau* of *Rochell* Preacher, who had it out of *Canada*. The laſt was brought out of *Canada*, and mentioned by *Coruntus* in his booke of *Canada* plants.

The Time,

They ſpring up in the middle of Aprill, or May, and are in flower ſoone afterē, the berries arē ripe in the end of May, and in ſome places in Iune.

The

The Names.

This herbe *Paris* hath not beene knowne, to either antient Greeke or Latine Writers, that wee can finde by their writings. It hath found therefore divers names, by divers of the moderne Authours, every one according as his opinion and judgement led him: for although *Matthiolus*, *Cæsalpinus*, *Anguillara*, *Camerarius*, *Dodonæus*, and *Lugdunenſis* following them, doe call it *Herba Paris*, as it is now generally termed of all Herbariſts; yet in the former times, *Fuſchius* tooke it to be *Aconitum Pardalianches*, and to be deadly or at leaſt dangerous, whom *Matthiolas* contradicteth, and *Cordus* in his Hiſtory of plants, ſeemeth to be of *Fuſchius* opinion, calling it *Aconitum ſive Pardalianches monococcon*, but becauſe it was found by good experience not to be hurtfull, but helpefull, *Tabermontanus* calleth it *Aconitum ſalutiferum*. Some called it *Uva verſa*. *Tragus* not knowing any Latine name, that others called it by, giveth it the name of *Aſter*, from his owne countrie people, who called it *Sternkraut*, but he addeth thereunto, *ſed non Atticus*, becauſe it might be knowne, he did not account it the *Aſter Atticus* of *Dioſcorides*, and others: he alſo calleth it *Uva lupina*, after the *Germane* word *Wolffsbeer*, whereby they in other places uſually call it; as alſo *einbeer*: the *Italians* call it *Herba Paris*; the *Spaniards Centelha*; the *French Raiſin de Reinard*; the *Dutch Wolfebeſien*, and *Spinne coppen*. *Geſner in hortis Germaniæ*, and *Lobel* and *Pena* in their *Adverſaria*, call it *Solanum tetraphyllon*, from the forme of the leaves and berries, or both, and *Bauhinus* as leaning unto their judgement, calleth it *Solanum quadrifolium Bacciferum*. The ſecond *Bauhinus* calleth *Solanum triphyllum Braſilianum*; and I *Herba Paris triphyllos Braſiliana*, becauſe I doe not account the *Herba Paris* to be any kinde of *Solanum*. The laſt *Cornutus* calleth *Solanum triphyllum Canadenſe*.

The Vertues.

Although ſome formerly did account this herbe to be dangerous, if not deadly, as by the name of *Aconitum*, it may be gathered, becauſe the forme thereof bred in them ſuch aſuſpition, yet have not ſet downe any evill Symtomes that it wrought, and therefore *Pena* and *Lobel* ſay, they made much triall thereof upon dogs, & other creatures, to finde out whether it would worke any dangerous effects unto them, but did not ſee any harme come to them that had eaten it, and therefore upon report of the contrary effect it would worke, they made triall likewiſe thereof upon two dogs, to whom was given of *Arſenicke* and *Sublimatum*, of each halfe a dramme in meate, unto one of them, about an houre after their taking of it, when their furious & foming fits were over, that they become more quiet, as if they were ready to die, there was given one of them, two drammes of the pouder called *Pulvis Saxonicus*, (the receipt whereof hereafter followeth) in red wine, who preſently thereupon grew well, the other dying without helpe: the receipt of the pouder is thus. Ref. *Radicum Angelicæ ſativæ & ſylveſtris, Vincetoxici, Thu ſive Valerianæ majoris, Polypodij quercini, Altheæ & Urticæ ana unciam dimidiam, Corticis Meſerei Germanici, drachmas duas, granorum herbæ Paridis numero 24. Foliorum ejuſdem cum toto numero 36. ex radicibus & cortice in aceto maceratis, ſiccatis ut cæteris & mixtis fiat omnium pulvis*: the leaves or berries alone are alſo effectuall, to expell poiſons of all ſorts, but eſpecially that of the *Aconites*, as alſo the plague and other infectious diſeaſes: it hath beene obſerved ſaith *Matthiolus*, as well from my owne experience, as from *Baptiſta Sardus*, the Author that enlarged the *Pandects*, that ſome have beene holpen hereby, that have lyen long in a lingring ſickneſſe, and others that by Witchcraft (as it was thought) were become halfe fooliſh, as wanting their wits and ſences, by the taking a dramme of the ſeedes, or the berries hereof in pouder, every day for twenty dayes together, were perfectly reſtored to their former good eſtate, and health: the leaves dried and given in pouder, have the like operation, yet in a weaker manner; it is thought alſo that the berries procure ſleepe, being taken at night in drink: the rootes in pouder eaſe the paines of the collicke incontinently, being taken in wine: the leaves are very effectuall, as well for greene wounds, as to clenſe and heale up old filthy ulcers and ſores, and is very powerfull to diſcuſſe all tumours and ſwellings, and to allay all inflammations very ſpeedily, as alſo thoſe tumours that happen in the cods, privy parts, or in the groine: the juyce or diſtilled water of the leaves, taketh away all heate and inflammation in the eyes: the ſame leaves alſo or their juyce applied to fellons, or thoſe nailes of the hands or toes, that have empoſtumes or ſores gathered together at the rootes of them, healeth them in a ſhort ſpace.

CHAP. XXIII.

Biſtorta. Biſtort or Snakeweede.

THere be diverſe ſorts of Biſtorts, ſome being of late, others of elder account.

1. *Biſtorta major vulgaris.* Common Biſtorte or Snakeweeke.

This common Biſtort hath a thicke ſhort knobbed roote, blackiſh without, and ſomewhat reddiſh within, a little crooked or turned together, of an harſh or aſtringent taſte, with divers blackiſh fibres growing thereat, from whence ſpring up every yeare divers leaves ſtanding upon long foote ſtalkes, being ſomewhat long and broad, very like unto a Docke leafe, and a little pointed at the ends, but that it is of a blewiſh greene colour on the upperſide, and of an Aſh colour gray, and a little purpliſh underneath, having divers veines therein; from among which riſe up diverſe ſmall and ſlender ſtalkes, two foote high, almoſt naked and without leaves, or with very few, and narrower, bearing a ſpikie buſh of pale fleſh coloured flowers, which being paſt, there abideth ſmall ſeede ſomewhat like unto Sorrell ſeede but greater.

2. *Biſtorta magis intorta radice.* Biſtort with more crooked rootes.

This Biſtort differeth not much from the former, being a little leſſe, both in leafe and roote, which are more writhed and crooked than the former; the Spikie flowers, &c. are equall alſo, almoſt unto them, and ſo is the three ſquare ſeede.

3. *Biſtorta Alpina major.* Great Mountaine Biſtort

The great Biſtort hath many very long and pointed leaves, of the ſame colour with the firſt, both above and underneath, ſome of a cubite or a foote and a halfe long, and but narrow in compariſon of the length, being about three inches broad, theſe ſtalkes riſe almoſt twiſe as high as the firſt, almoſt bare without leaves thereon, which are much ſmaller, bearing a ſpike of bluſh flowers, foure inches long at the toppes: the roote is foure times bigger than the common ſort, blacke without, with many blacke fibres at them, but not ſo red within as the firſt, but rather whitiſh.

4. *Biſtorta*

4. *Bistorta minor nostras.* Small Bistort of our owne Countrie.

This small Bristorte sendeth forth three or foure small narrow leaves, scarse an inch broad, and almost foure inches long, greene above, and gray underneath; the stalkes are slender, and but with one or two leaves set thereon, at the toppes whereof stand small long round spikie heads of white flowers, with diverse small greene leaves among them; after which come a reddish seede almost round, which being drie, become blackish, and are bigger than those of the first: the roote is small in proportion, but somewhat crooked or turned like the common kinde, being of a blackish colour without, and somewhat whitish within, of the same auster binding taste, that the rest hath.

5. *Bistorta minor Alpina.* Small Bistort of the Alpes.

This small Bistort hath broader leaves, and not so long as the last, the tuft of flowers likewise at the toppe is closer set together, in other things not differing.

6. *Bistorta Alpina pumila varia.* Variable leased small Bistort.

This Bistort hath not onely two or three broad and short almost round leaves pointed at the ends, but two or three very narrow and long leaves also with them comming from the roote, the stalke is scarse an hand breadth high, with many such whitish flowers thereon as are in the other small ones.

The Place.

The two first grow at the foote of hills, and in the shadowie moist woods neare unto them, in many places of *Germany*; and in our countrie likewise in the like places, but chiefely is nourished up in gardens. The third groweth on the high hills in *Silesia*, and other places: the fourth groweth especially in the North, as in *Lancashire*, *Yorkeshire*, and *Cumberland* in diverse places. The two last are found likewise on the Alpes in diverse places, but the last among the *Switzers*.

The Time.

They all flower about the end of May, and the seede is ripe about the beginning of Iuly.

The Names.

It is called generally *Bistorta, quod radice in se serpentis modo contorta, & convoluta constet*, of *Trdgus*, *Lonicerus*, and others *Colubrina*, from the *Germane* title of *Schlangenwurtzel* and *Natterwurtzel*; of *Fuschius Serpentaria, quod venenosorum serpentium ictibus succurrit*: of *Gesner in hortis Germaniæ Limonium*. *Fracastorius* calleth it *Bulapathum*, as well as *Bistorta*. *Lobel* and *Clusius* thinke it may be *Britannica* of *Dioscorides* and *Pliny*. *Bauhinus* calleth the first, *Bistorta major radice minus intorta*. Some call it *Behen rubrum*, others take it to be *Molybdæna* of *Pliny*. Some also doe take it to be the second *Dracunculus* of *Pliny lib. 4. cap. 16.* the second is called by *Tragus Colubrina minor*. *Bauhinus* calleth it *Bistorta major radice magis intorta*. The third *Bauhinus*, that hath first set it forth as I thinke, calleth it *Bistorta Alpina maxima*: the fourth I take to be differing from the next, and therefore call it *Nostras*: the fifth is called by *Camerarius*, *Clusius*, *Lobel*, *Bauhinus*, and all others that have written

1. 4. *Bistorta major vulgaris & minor.*
Great and small Bistorte or Snakeweede.

5. 6. *Bistorta minor Alpina & Alpina pumila varia.*
Small Bistorte of the Alpes and rabbe leafed Bristorte.

threrof

hereof *Bistorta minor*, or *Alpina minor*; onely *Gesner in hortis Germaniæ*, reckoneth it to be a small sort of *Limonium*. But in that *Bistorta* cannot be *Britanica* this sheweth: in the description thereof that the leaves are rough or hairy, when these are smooth, and that the rootes of *Britanica* are small and short, when these are not small although short; and *Galen* in his sixt Booke of Simples, saith that although the leaves of *Britanica* be somewhat like unto Docke leaves, yet they are blacker and more hairy. And that it cannot be *Behen rubrum*, the faculties doe easily declare, for the rootes of the true *Behen rubrum & album*, are both sweete in smell, and are of an hot qualitie, that they are effectuall to procure venery, or bodily lust which these cannot: the last is not remembred by any Author before this time. The *Italians*, *Spaniards* and *French* doe follow the Latine, as we doe also, the *Low Dutch* the *Germanes* in their appellations, which is *Natterwortele*.

The Vertues.

Both the leaves and rootes of Bistort, have a powerfull faculty to resist all poyson, a dramme of the roote in pouder taken in drinke, expelleth the venome of the plague or Pestilence, the small Pocks, Measells, Purples, or any other infectious disease, driving it forth by sweating: the same roote in pouder, or the decoction thereof in wine being drunke staieth all manner of inward bleeding, or spitting of bloud, as also any fluxes of the body in man or woman; as also when one is troubled with vomiting: the pouder also of the roote, or the decoction thereof being drunke, is very availeable against ruptures or burstings, or all bruises or falls whatsoever dissolving the congealed bloud, and easing the paines that happen thereupon: the same also helpeth the laundise: the water distilled from both leaves and rootes, is a singular remedy to wash any place, bitten or stung by any venemous creature, as Spiders, Toades, Adders, or the like, as also for any the purposes before spoken of; and is very good to wash any running sores or ulcers: the decoction of the roote in wine being drunke, hindereth abortion, that is, when women are apt to miscarrie in child bearing, the leaves also killeth the wormes in children, and is a great helpe to them that cannot keepe their water, if they put thereto some juyce of Plantaine; and applied outwardly doth give much helpe in the *gonorrhæa* or running of the reines: a dramme of the pouder of the roote, taken in the water thereof, wherein some iron or steele being red hot hath beene quenched, is an admirable helpe thereunto, so as the body be first prepared and purged from the offensive humours: the leaves or seedes, or rootes, are all very good to be put into decoctions, or drinkes, or lotions, for either inward or outward wounds, or other sores; and the pouder strowed upon any cut or wound in a veine, &c. that is apt to bleede much, staieth the immoderate fluxe thereof: the decoction of the rootes in water, whereunto some Pomgranet Pills, and flowers are added, serveth for an incection into the matrice, as well to stay the accesse of humours to the ulcers thereof, as also to bring it to the place being fallen downe, and to helpe to stay the abundance of their courses: the roote of Bistort and Pellitory of *Spaine*, and burnt Allome of each alike quantitie, beaten small & made into a paste with some hony, a little peece hereof put into an hollow tooth, or holden betweene the teeth, if there be no hollownesse in them, staieth the desluxions of rheume upon them, when it is the cause of paine in them, and helpeth to cleanse the head, and avoide much offensive matter: the distilled water is very effectuall to wash those sores or cankers that happen in the nose or any other part, if the powder of the roote be applied thereto afterwards: it is good also to fasten the gummes, and to take away the heate and inflammation, that happen as well in the jawes, almonds of the throat ot mouth, if the decoction of the rootes leaves, or seedes, be used, or the juyce of them: the rootes are more effectuall to all the purposes aforesaid, than either leaves or seede.

CHAP. XXIV.

Tormentilla. Tormentill or Setfoile.

ALthough formerly there hath but one kind of Tormentill or Setfoile beene knowne to our *English* Writers, yet now there is found out and made knowne to us two other sorts, which shall be all declared in this Chapter.

1. *Tormentilla vulgaris.* Common Tormentill.

The common Tormentill (is so like unto *Cinquefoile*, that many doe mistake it, for it may well be reckoned as one of them) hath many reddish slender, weake branches, rising from the roote, lying upon the ground, or rather leaning, than standing upright, with many short leaves that stand closer to the stalkes, than the other *Cinkefoiles* doe, with the foote stalke encompassing the branches at severall places, but those that grow next to the ground are set upon long foote stalkes, each whereof are like unto the leaves of *Cinkefoile*, or five leafed grasse, but somewhat longer and lesser, and dented about the edges, many of them divided but into five leaves, but most of them into seaven, whereof it tooke the name Setfoile, and standing round with the divisions like a starre, and therefore called *Stellaria*) yet some may have sixe and some eight, as the fertilitie of the soile and nature list to worke: at the toppes of the branches stand divers small yellow flowers, consisting of five leaves, like unto those of *Cinkefoile*, but smaller: the roote is smaller than Bistort, somewhat thicke but blacker without, and not so red within, yet sometimes a little crooked, having many blackish fibres thereat.

2. *Tormentilla Alpina major.* The greater Tormentill.

This Tormentill differeth not from the former, but in the largenesse of the leaves and rootes, which are much greater and redder, and of a better sent, in all things else agreeing with the former.

3. *Tormentilla argentea.* Silver leafed Tormentill.

This white Tormentill, hath many short, low and thicke spread reddish stalkes, with leaves like unto a Cinkefoile, but much smaller than the first, and consisting of five leaves in many of them, and sixe and seaven in most of them, & sometimes more being somewhat longer, & each of them set upon very long foote stalkes, greene on the upperside, and of a silver shining white colour underneath, smooth and not snipt at all about the edges: the flowers are smaller than in the first by the halfe, and of a white colour, set about the stalkes at the toppes, at severall distances, and standing in small huskes, wherein afterwards is contained small yellowish seede: the roote

2. *Tormentilla vulgaris.*
Tormentill or Setfoile.

3. *Tormentilla argentea.*
Silver leafed Tormentill.

roote is thicke and somewhat long, joynted or knotted, blackish on the outside and somewhat reddish within, with many fibres thereat.

The Place.

The common sort groweth as well in woods and shadowie places, as in the open champion countrie, about the borders of fields in many places of this land. The second groweth among the *Helvetians* or *Switsers*, as also in the county of *Tirol*: the last groweth upon the Alpes in divers rockie or stony places, as also upon the *Pyrenaan* Mountaines, and among the *Savoyards* likewise.

The Time.

They doe all flower in the Sommer, from the beginning to the end, but the last is latest.

The Names.

It hath beene not set forth, by any of the antient Greeke or Latine Writers, yet it hath obtained a Greeke name from the forme ἑπτάφυλλον *Heptaphyllum*, or *Septifolium*, Setfoile, or Seven leaves, but not properly, for they are not seaven leaves, but the number is seven of the divisions of every leafe; for to speake properly, it is but one leafe, cut into five or seven divisions, and not seven leaves: for this is a generall rule in all leaves, whether of herbes or of trees, that what leafe falleth away wholly together with his stalke and not in partes, and at severall times, is but one leafe, whether winged as we call it, as the leaves of the Ash tree, the Elder, the Wallnut tree, Horse Chesnut, *Virginia Sumacke*, &c. the great Centory, Agrimony, Danewort, Parsnep, *Valerian*, the Trefoiles, Cinkefoiles, and this Setfoile, in herbes: for in all these and the like, the whole stalke, with the leaves falleth away together, and not any part of those leaves at one time, and part at another, as in all other trees and herbes that have not winged divided leaves. Although this narration be somewhat prolixe and extravagant, yet I hope to some good purpose, in regard the use thereof, may be profitable to young Herbarists, that know not or regarded not so much before: the first is called *Tormentilla vulgaris*, and of some *Stellaria*, from the forme of the leaves, and yet there are divers other herbes called *Stellaria*, as shall be shewed in their places, and some *Consolida rubra*, from the efficacie and colour of the root. The Second *Camerarius in horto*, calleth *Tormentilla Alpina* and *Bauhinus Tormentilla Alpina vulgaris major*. The last is very variably entituled by divers, as *Pentaphyllum argenteum* of *Anguillara*, *Pentaphyllum Alpinum petrosum & minimum* by *Lobel*. *Pentaphyllum petræum & Alpinum* of *Tabermontanus*. *Cæsalpinus* taketh it to be *Alchimillæ alterum genus*; and *Clusius* somewhat leaneth to that opinion, yet calleth it *Heptaphyllon*. *Tragus* taketh it to be the true *Pentaphyllum* of *Dioscorides* and *Theophrastus*, because it is found as often almost to have but five leaves as seaven; and *Gesner in hortis Germaniæ Argentarea petræa*; of *Camerarius Stellaria argentea*, and *Argentea Heptaphyllos montana*; and of *Lugdunensis Tormentilla candida Dalechampij*: it is very likely to be the *Pentapyllum lupini folium* of *Thalius in Hercynia sylva*. *Bauhinus* calleth it, *Tormentilla Alpina flore sericeo*. Some also doe thinke it is *Chrysogonum* of *Dioscorides*, but thereof he hath but a very short description, saying *Crysogonon* bushеth thickely with Oaken leaves, whose flower is very like unto *Verbascum Coronarium*, the roote whereof is like a Turneppe, very red within and blacke without; but this herbe hath not leaves like an Oake, neither is the flower of any such beauty, or respect, that it might be put into garlands: as the *Verbascum Coronarium* (which is thought to be the *Lychnis Coronaria* Rosecampion with the red flower, a

fit

fit and usuall flower for garlands, for no other *Verbascum* is knowne to be put to that use) neither is the roote like a Turneppe, whereby you may see what great difference there is, betweene this and that: But the true *Chrysogonum* of *Dioscorides*, *Ranwolfius* found among the corne fields, not farre from *Aleppo* in *Syria*, as *Lugdunensis* setteth it forth, in his Appendix to the generall History of Plants; and *Fona* also, sheweth in his *Italian* description of Mount *Baldus*, as you shall have it more fully in his proper place: the *Germans* call it *Blutwurtzell* and *Rotwortzell*, that is, *radix Sanguinaria*, and *radix rubra*; and some after the Latine *Tormentill*, as most of the other Nations doe.

The Vertues.

Tormentill is of the same temperature and qualitie, that Bistort is, which hath caused divers to account it a kinde thereof, being cold in the second, and drie in the third degree, and therefore most excellent to stay all kindes of fluxes of bloud or humors, in man or woman, whether at the nose, mouth, belly, or any wound in the veines, or any where else; the juyce of the herbe or roote taken in drinke, not only resisteth all poyson or venome of any creature, but of the plague and pestilence it selfe, and pestilentiall feavers, and infectious diseases, as the pockes, measells, purples, &c. by expelling the venome and infection from the heart by sweating: if the greene roote, is not at hand, or not to be had readily, the powder of the drie roote is as effectuall, to the purposes aforesaid, to take a dramme thereof every morning: the decoction likewise of the herbes and rootes made in wine, and drinke, worketh the same effect, and so doth also the distilled water of the herbe and roote, rightly made and prepared, which is to steepe them in wine for a night, and then distilled in *Balneo mariæ*; this water in this manner prepared taken with some *Venice* Treakle, and thereupon being presently laid to sweate, will certainely by Gods helpe expell any venome or poyson, or the plague, or any fever or horror, or the shaking fit that happeneth, for it is an ingredient of especiall respect in all antidotes or counterpoysons, never to be forgotten out of them, it is so effectuall in the operation against the plague; yea it is said that good shepheards doe carefully preserve this herbe, and give it their Sheepe for the rot, and many other diseases in them: for there is not found any roote, more effectuall to helpe any fluxe of the belly, stomacke, spleene, or bloud than this, prepared after what manner one will, to be taken inwardly or applied outwardly: the juyce taken doth wonderfully open the obstructions of the liver and lungs, and thereby certainely helpeth the yellow jaundise in a short space. Some there be that use to make cakes hereof, as well to stay all fluxes, as to restraine all chollericke belchings, and much vomitings with loathings in the stomacke; in this manner, take the powder of the roote, and of a peece of a Nutmeg beaten, made up with the white of an egge and as much meale of Oates, as all of them come unto, which being baked, is to be taken every morning one, untill you finde helpe: or the powder of the roote onely, made up with the white of an egge, and baked upon an hot tile and so taken. *Andreas Valesius de radice Chinæ, pag.* 84. holdeth this opinion thereof, that the decoction of the roote is no lesse effectuall to cure the *French* poxe, then *Guaiacum* or *China*: because it so mightily resisteth putrefaction: *Lobel* saith that *Rondeletius* used it in the stead or after in the same manner, that he used *Hermodactiles* for joint aches: the powder also, or the decoction to be drunke, or to sit therein as in a bath, is an assured remedy against abortion in women, that is, when they use to miscarrie often in childbearing, if it proceede from the over fluxibilitie or weakenesse of the inward retentive faculties, as also a plaister made therewith and vinegar, applied to the reines of the backe doth much helpe; it doth much helpe likewise those that cannot hold their water, the powder taken in the juice of Plantane, and is commended also against the wormes in children: it is very powerfull in ruptures and burstings, as also for bruses and falls, to be used as well outwardly as inwardly: the roote hereof made up with pellitorie of *Spaine* and Allome, and put into an hollow tooth doth not onely asswage the paine, but staieth the fluxe of humors thereunto, which was the cause thereof: the juice hereof also being drunke, is found effectuall to open the obstructions of the liver and gall. Tormentill likewise is no lesse effectuall and powerfull a remedy, for outward wounds, sores and hurts, than for inward, and therefore it ought to be a speciall ingredient in all wound drinkes, lotions and injections, for foule and corrupt rotten sores, and ulcers of the mouth, or secret parts, or any other part of the body; and to put either the juice, or powder of the roote into such ointments, plaisters, and such things that are to be applied to wounds and sores, as cause shall require: it doth also dissolve all knots, kernells, and hardnesse gathered about the eares, the throate and jawes, and the Kings evill, if the leaves and rootes be bruised and applied thereunto: the same also easeth the paines of the *Sciatica*, or Hippegout, by restraining the sharpe humours that flow thereunto: the juice of the leaves and rootes used with a little vinegar, is also a speciall remedy against the running sores in the head, or other parts, scabbes also, and the itch, or any such eruptions in the skinne, proceeding of salt and sharpe humours: the same also is effectuall for the hemorrhoides or piles in the fundament, if they be washed and bathed therewith, or with the distilled water of the herbe and rootes: it is found also helpefull to drie up any sharpe rheume that distilleth from the head into the eyes, causing rednes, paine, waterings, itchings or the like, if a little prepared *Tutia* or white Amber, be used with the distilled water hereof: many women also use this water as a secret to helpe themselves and others, when they are troubled with the abundance of the whites or reds, as they call them, both to be drunke, and injected by a Syring.

CHAP. XXV.

Pentaphyllum sive Quinquefolium. Cinkefoile or five leafed Grasse.

THe next unto the Tormentill must come the Cinkefoile to be intreated of, not onely for the likenesse of the outward face, or forme of the plant, but of the properties also, as you shall heare hereafter. Hereof there are many more sorts found out, and now made knowne, than formerly there was, and therefore I thinke it fit to expresse them in some method and order, that is in three rankes; the first shall be of those sorts, that beare white or whitish flowers; the second shall be of those that beare yellow flowers, and lie downe with their leaves upon the ground, or runne with their rootes; the third shall be of those that stand more upright bearing yellow flowers.

Primus

Primus Ordo. The first Ranke.

1. *Pentaphyllum majus luteo flore vel albo.* Great white or yellow Cinkefoile.

THis first and greateſt upright Cinkefoile, hath many leaves riſing from the roote, each upon his owne foote ſtalke, divided in five parts, as if they were five ſeverall leaves, dented about the edges, and ſome times round pointed, very like the great common yellow Cinkefoile, but larger and a little hairy; from among which riſe up ſtraight or upright ſtalkes, and not much leaning downe to the ground, as the next that followeth doth; a little hairy alſo, and divided at the toppes into two or three branches, and they againe into other ſmaller: upon every one whereof ſtandeth one flower, of a white colour and larger than in others, but conſiſting of five leaves, as all others doe; in the middle whereof ſtandeth a ſmall downy head, encompaſſed with many reddiſh yellow threds: the roote is ſomewhat thicke and long, and reddiſh with all.

2. *Pentaphyllum majus alterum album.* Common great white Cinkefoile.

This other white Cinkefoile, which is more common with all Herbariſts, have many leaves growing from the roote, divided into five parts, each of them ſomewhat longer, a little dented, and pointed alſo at the ends, greene on the upper ſide and hoary white underneath, betweene theſe leaves grow weake branches, leaning downe to the ground, ſcarſe a foote long, with many ſuch like leaves upon them, but leſſer than thoſe below: the flowers of theſe, are almoſt as large, as thoſe before, and of a white colour, conſiſting of five more round pointed leaves, than the greater before, yet with a nicke in the middle, with many ſmall yellow threds in the middle, ſet about a woolly head, having many ſmall ſeedes ſet together, like unto a Crowfoote heade of ſeede; the roote is ſomewhat thicke and long, blackiſh on the outſide, but reddiſh within, with many fibres thereat.

Aliud haud crenatis foliis. Of this ſort there is an other whoſe greene leaves are not dented about the edges, little differing in any thing elſe.

3. *Pentaphyllum ſiliquoſum Arabicum albidum.* Codded Cinkefoile of *Arabia*.

This Cinkefoile of *Arabia* riſeth up with a tender tranſparant browne ſtalke about a ſpanne or halfe a foote high, and afterwards groweth to be a foote high or more, having ſome leaves at the ground, and others upon the ſtalke, each of them ſet at the end of pretty long footeſtalkes, ſtanding upright, bowing a little downewards in the middle, and raiſed at the ends, which leaves are ſoft, and of a ſad greene colour, divided into five parts, whereof thoſe two that are on both ſides next the ſtalke, at the firſt are very ſmall, the next two are twiſe as bigge as they, and the fifth in the middle, bigger by halfe then either of the laſt: but after they have ſtood a good while, the two lower leaves onely grow ſomewhat larger: the ſtalke divideth it ſelfe from the ground up to the middle thereof, into divers reddiſh branches; ſet at every joynt with the like leaves: at the toppe

1. *Pentaphyllum majus luteo flore vel albo.* Great white or yellow Cinkefoile.

2. *Pentaphyllum majus alterum album.* Common great white Cinkefoile.

whereof

3. *Pentaphyllum siliquosum Arabicum albidum.*
Codded Cinkefoile of *Arabia.*

7. *Pentaphyllum fragiferum.*
Strawberry Cinkefoile.

whereof grow a long ſpiky buſh of flowers, one ſet above another, flowring one after another, thereby enduring very long with flowers on them, which before they are blowne reſemble ſmall cups, ſet in ſmall greene huskes, with pointels in the middle, but being blowen open, conſiſt of foure little long and narrow hard leaves, of no pure but a ſullen white colour with me, but bluſh with others, not ſtanding as other Cinkefoiles doe, but upright all of them together almoſt, on the one ſide of a button, which is in the middle of the huske, and the pointell below then on the other ſide, ſtanding forth an inch long, ſmall at the bottome, and bigger at the further end, of a very darke or browne colour, having foure ſmall purpliſh threds, with yellow chives hanging at the ends about it: at the joynts all along the ſtalkes, where they beginne to flower, come forth much ſmaller greene leaves, divided onely into three parts: the ſeede did not come to perfection in my Garden, but withered by ſome earely cold blaſtes, pulling downe all the heades, that were full of flowers and cods, to have ſeeded, but *Alpinus lib. de exoticis*, ſaith it beareth long and ſlender round and pointed pods, containing ſmall round blacke ſeed, the roote neither ſpreadeth deepe nor wide, but periſheth with the firſt froſts.

4. *Pentaphyllum album minus.* Small white Cinkefoile.

This ſmall Cinkefoile, hath many buſhy upright ſtalkes, growing thicke together, with many hoary white leaves, in forme like the common white Cinkefole, and at the toppes of them many white flowers, like unto others, compoſed of five round pointed leaves, with a nicke in the middle: the roote is blackiſh and threddy, more then the former, and the whole plant, both ſtalkes, leaves, and flowers, are both lower and leſſer, in other things little differing.

5. *Pentaphyllum album minimum.* The leaſt white Cinkefoile.

This leaſt Cinkefoile, hath his low ſtalkes ſomewhat hairy, but not hoary, being little more then one handbreadth high; whereon grow upon ſhort footeſtalkes, ſmall leaves conſiſting of five parts, dented onely at the ends: the toppes of the ſtalkes are divided, into many branches, whereon ſtand many white flowers like the laſt, but ſmaller, the roote is ſmall and blackiſh.

6. *Pentaphyllum minus argenteum.* Small ſilver leafed Cinkefoile.

This other ſmall Cinkefoile ſpreadeth on the ground, with very many whitiſh branches, covered next unto the roote, with many ſhort browniſh threds or haires, more like then leaves; above which come forth the leaves, made of five parts, as ſmall as the laſt, but round pointed, and not dented at the end, of a ſad greene colour on the upperſide, & of a moſt fine ſhining ſilver colour underneath: at the tops of the branches ſtand a confuſed number of greeniſh heads or huskes, ſet round about long branches, much differing from the other ſorts, out of which appeare very ſmall whitiſh flowers, ſcarſe to be diſcerned, which turne into a very ſmall yellowiſh ſeed, ſomewhat brown, the

roote is small, long hard and threddy, abiding diverse yeares, and busheth thereat so thicke, that it doth spread a great deale of ground.

7. *Pentaphyllum fragiferum Clusij.* Strawberry Cinkefoile.

This Cinkefoile hath divers long hairy stalkes of leaves, rising from the roote, not set close together as other Cinkefoiles are, but parted or divided more like unto a winged leafe, sometimes into five, and sometimes into seaven leaves, rough and hairy also, dented about the edges, greene above and gray underneath, two set one against another, with a little space betweene, but those three at the ends, standing somewhat closer together: the stalke that riseth up among these leaves, is about a foote high or more, reddish and hairy, and divideth it selfe at the toppe into lesser branches, with divers leaves thereon, divided into three parts, on the toppes whereof stand large white flowers, very like unto Strawberry flowers, but somewhat lesse, with many yellow threds in the middle; which being fallen there succeede small round heads, very like unto Strawberryes, but smaller and without any juice therein, having small reddish seeds within them: the roote is somewhat thicke, long, hard, and wooddy, reddish within and blackish without, with divers small long fibres thereat.

The Place.

The first *Bauhinus* saith, was found on the walls of *Wallstat*, a City of the *Switzers*. The second as *Clusius* saith, groweth in many of the woods, upon the mountaines in *Austria*, extending to the *Alpes*, as also in *Moravia*, *Hungary*, in *Italy* also, and divers other places: the other sort of that kinde, *Tragus* saith, he found not farre from *Lutha*, a City of the Empire; the third was brought out of *Egypt*, or out of *Arabia*, as the title declareth. The fourth grew in stony places, about *Curia* of the *Switzers*. The fifth grew saith *Clusius*, in the stony and rocky places of the *Alpes* in *Austria* and *Stiria*. The sixth is a Plant raised from the seede that came among other sorts of seedes, sent me from beyond sea: the last groweth in divers places of *Hungaria*, and *Austria*.

The Time.

They doe all flower in the Sommer moneths of Iune and Iuly, and the third in August.

The Names.

It is called in Greek Πεντάφυλλον, and in Latine *Pentaphyllum* and *Quinquefolium*, *a numero foliorum*. *Gasa* translating *Theophrastus* calleth it *Quinque petum*. *Tragus* sheweth his mind and opinion concerning the *Pentaphyllum* of *Dioscorides*, and *Theophrastus*, that our Tormentill is their best and most noble *Pentaphyllum*, and is thereunto led as he saith, by the text of *Theophrastus*, in his tenth booke and fourth Chapter, (which yet contrarieth his judgement in my mind) for he there saith, that all the leaves are five parted, and his roote reddish when it is fresh, and blackish and square when it is dryed; but Tormentill hath more leaves of seaven divisions, then five, and hath alwayes yellow flowers, when as *Dioscorides* saith his hath whitish. The first *Bauhinus* calleth *Quinque folium album majus caulescens*. The second is his *Quinque folium album majus alterum*, and by all other Authors, *Pentaphyllum* or *Quinquefolium album*, the other of that kind *Tragus* calleth his owne, that is, *Pentaphyllum Tragi & nobile*. Vnto the third I have given the name as *Alpinus* doth, from the forme of his leaves and fruite, and from the place of his naturall abiding, but *Pona* in his *Italian Baldus* calleth it, *Lupinus Arabicus sive Pentaphyllum peregrinum*. The fourth *Bauhinus* calleth *Quinquefolium album minus*. The fifth is *Clusius* his second, which he calleth *Quinquefolium minus flore albo*, and as he saith is the same that *Lobel* calleth *Pentaphyllum minimum & petræum*, but that as *Clusius* saith, his kinde hath as large flowers as the Strawberry, which *Lobels* hath not, but *Clusius* is therein much deceived, for *Lobels Pentaphyllum petræum* or *petrosum*, is declared before to be the *Stellaria argentea* of *Camerarius*, and with *Bauhinus*, *Quinquefolium album minus alterum*. The sixth came to me by the name of *Pentaphyllum argenteum*, and because it is none of the great ones, I have added thereto *minus*. The last *Clusius* calleth, *Pentaphyllum fragiferum*, and is the *Fragaria quarta Tragi*. The *Italians* call it *Cinquefolio*, the *Spaniards Cinco Yramas*, the *French Quintefueille*, the *Germanes Funff finger kraut*, the *Dutch men Viif vinger czuyt*, we in *English* Cinkefoile and Cinkefield, and five finger grasse, or five leafed grasse.

Secundus Ordo. The second Ranke.

1. *Pentaphyllum vulgatissimum.* The most common Cinkefoile.

THe common small Cinkefoile spreadeth and creepeth farre upon the ground, with long slender stringes like Strawberries which take roote againe, and shooteth forth many leaves, made of five parts, and some times of seven, dented about the edges, and somewhat hard, the stalkes are slender, leaning downewards, and beare many small yellow flowers thereon, with some yellow threds in the middle, standing about a smooth green head, which when it is ripe, is a little rough, and containeth small browniish seede: the roote is of a blackish browne colour, seldome so bigge as ones little finger, but growing long with some threds or fibres thereat, and by the small strings it quickly spreadeth over the ground.

2. *Pentaphyllum incanum repens Alpinum.* Creeping Mountaine Cinkefoile.

The creeping Mountaine Cinkefoile, shooteth forth many leaves from the roote like unto the former, and dented about the edges, but softer in handling; and somewhat of a grayish greene or hairy shining colour: the stalkes are slender and trayle almost upon the ground, with some lesser and lesser divided leaves on them, then below, bearing many gold yellow large flowers, with yellow threds in the middle, and such like seede: the roote is smaller and more fibrous then the former, but spreadeth in the like manner.

3. *Pentaphyllum repens minus.* Small creeping Cinkefoile.

This small Cinkefoile, creepeth and spreadeth upon the ground like the last, and is in stalkes and flowers alike also, saving that the leaves are somewhat larger and nothing hoary or shining, but greene, and have a little soft hairy downe on them, and the flowers are not of so gold a yellow colour, in other things not much differing.

4. *Pentaphyllum minus repens lanuginosum.* Small woolly creeping Cinkefoile.

This woolly Cinkefoile is very like the last for growing, both of stalkes, leaves and flowers, but the stalkes are a little

1. *Pentaphyllum vulgatiſsimum.*
The moſt common Cinkefoile.

4. *Pentaphyllum minus repens tanugnoſum.*
Small hoary creeping Cinkefoile.

a little ſlender, not greene but rēddiſh, the leaves are morē woolly, and the edges deepelier dented in, the flowers alſo are of a deeper gold yellow colour then the laſt.

5. *Pentaphyllum minimum repens.*
The ſmalleſt creeping Cinkefoile.

This ſmalleſt Cinkefoile, is leſſe creeping then any of the former, having many ſmall leaves of five parts, as others have, but a little whitiſh hoary underneath, this ſcarſe beareth any ſtalke, with ſmall pale yellow flowers, having a purpliſh head in the middle, which growing ripe is hard, and like a ſmall Strawberry head as all the reſt have, the roote is ſmall, but ſomewhat ſharper in taſte then the others, but yet aſtringent withall.

6. *Pentaphyllum ſupinum Potentillæ facie.*
Low Cinkefoile with wild Tanſy leaves.

This ſmall Cinkefoile creepeth not, nor yet ſtandeth upright, but leaneth downe with his weake ſtalkes to the ground ward, having very long ſtalkes of leaves on them, divided into many parts next the ground, ſet on each ſide thereof two at a ſpace one againſt another, and an odde one at the end, all of them dented about the edges, very like unto wild Tanſy leaves, but not hoary or ſilver like as they, but greene: the flowers come at the joynts with the leaves towards the toppes of the ſtalkes, which are there, leſſer and leſſe divided then thoſe below, every one by it ſelfe, which are ſmall and of a pale yellow colour, with a head in the middle, which after it is ripe, is like unto the other Cinkefoile heads of ſeede, that is, like unto a ſmall hard dry Strawberry: the roote is ſmall long and blackiſh, like the ordinary Cinkefoile.

6. *Pentaphyllum ſupinum Potentillæ facie.*
Low Cinkefoile with wild Tanſie leaves.

7. *Alterum eidem ſimile Enneaphyllon.*
Another ſmall one like thereunto.

There is another low one of this kind, that *Bauhinus* hath ſet forth in his *Prodromus*, whoſe ſmall ſlender ſtalkes, three or foure inches long are many, lying round about the roote upon the ground, divided into many branches, whereon are

long ſtalkes of leaves like unto the laſt, but divided into nine parts, each of them much narrower than they, very hairy and dented about the edges: the flowers are ſmall and more yellow, ſtanding in the ſame manner, and yeel ing the like heade of ſeede: the roote is ſomewhat thicker and blacke ending in long fibres.

The Place.

The firſt groweth by woods ſides, hedge ſides, the pathwayes in fields, and in the borders and corners of them, almoſt through all the land: the ſecond groweth on the higheſt toppes of the Alpes, that are nigheſt unto *Auſtria*; the other *Pentaphyllum* of *Cluſius* groweth in the graſſie fields of the Alpes neare *Auſtria*: the third groweth the moſt common of all others, by the wayes ſides, in dry grounds in *Hungary*, the lower *Auſtria*, *Moravia* and *Bohemia*: the fourth groweth in the ſame places with the third, but more rare to be met with; the fift *Tragus* ſaith, in many ſandie grounds of *Germany*, and in the graſſie fields that are by the woods ſides: the ſixt *Cluſius* ſaith he found in the borders of fields, that are by the woods ſides about *Vienna*, and is cheriſhed in gardens with many; the laſt groweth on the Alpes among the *Switſers*.

The Time.

They doe all flower in Sommer for the moſt part, yet the leaſt, is often in flower thē earlieſt, which is ſometimes in Aprill, and the ſecond in May.

The Names.

The firſt is generally called by all, either *Pentaphyllum* or *Quinquefolium vulgare*; of *Bauhinus*, *Quinquefolium majus repens*: the ſecond is the third *Pentaphyllum* of *Cluſius*; called by him, *Pentaphyllum Alpinum flore aureo*, and by *Bauhinus*, *Quinquefolium minus repens Alpinum aureum*: the third is *Cluſius* his firſt ſort, of the fourth kinde of *Pentaphyllum*, which *Bauhinus* calleth *Quinquefolium minus repens lanuginoſum luteum*: the fourth is the other ſort, of *Cluſius* his fourth kinde, and called by *Bauhinus*, *Quinquefolium minus repens aureum*. The fift is the firſt kinde of *Tragus*, called by him *Quinquefolium minimum*, and by *Lobel* in his *Adverſaria*, *Pentaphyllum minus luteum*: the ſixt is called by *Lobel* in his obſervations and *Icones*, *Pentaphyllum ſupinum Tormentillæ facie*, but by *Cluſius* more properly, *Potentillæ facie*; by *Dodonæus* according to his figure, but not the deſcription *Quinquefolium tertium repens*, which is M^r. *Gerards Fragaria veſca ſive ſterilis*: *Bauhinus* calleth it *Quinquefolio fragifero affinis*; and calleth the laſt (which if it be not the ſame and growing leſſe in his naturall or wilde place, yet is very like it) *Quinquefolio affinis Enneaphyllon*.

Ordo tertius. The third Ranke.

1. *Pentaphyllum majus erectum.* The greater upright Cinkefoile.

THe greater upright Cinkefoile, hath ſomewhat longer and larger greene leaves, than any of the former ſorts, cut into five parts, and often alſo into ſeven, and but with three leaves towards the toppes, and dented about the edges: the ſtalkes are ſtrong and upright, not much above halfe a yard high, branched divers wayes, with large pale yellow flowers at the toppes of them, which turne into ſeede like as the other ſorts doe, the roote is blackiſh and ſtringie. Of this kinde, there is ſome that doth ſometimes beare white flowers, and others purpliſh, whereof their flowers make the difference.

1. *Pentaphyllum majus erectum.*
The greater upright Cinkefoile.

2. *Pentaphyllum rectum minus.*
The leſſer upright Cinkefoile.

The leſſer upright Cinkefoile, hath ſmaller and rounder leaves than the other, of a ſad greene colour on the upper-ſide, and gray or hoary underneath: the ſtalkes are tenderer and lower, and the flowers at the toppes of them, are ſomewhat ſmaller and of a more gold yellow colour, and herein conſiſteth the chiefeſt differences the one from the other.

3. *Pentaphyllum montanum erectum.*
The Mountaine upright Cinkefoile.

The Mountaine upright Cinkefoile, hath divers upright but ſlender hoary ſtalkes, ſcarſe halfe a yard high, divided at the toppes into ſundry branches, whereon grow divers leaves, cut into five deeper parts, and deeper dented about the edges, ſomewhat hairy alſo, and a little hoary underneath but not ſhining, whoſe foote ſtalkes are ſome ſhorter and ſome longer than others: but thoſe leaves that grow below, at the foote of the ſtalkes ſtand upon very long foote ſtalkes, and are for the moſt part divided into ſeven parts or leaves: at the toppes of the ſtalkes grow gold yellow flowers, like the former but ſmaller, the ſeede that followeth, is not unlike the reſt, neither is the roote which is blackiſh.

The Place.

The firſt groweth in many places in *Germany*, *France*, and in *Savena* of *Narbone* where it beareth white flowers ſay *Pena* and *Lobel*, and in *Italy* purpliſh: the ſecond groweth in *Germany* in divers places, for *Fuſchius* and *Iohannes Thalius* make mention of it: the third *Bauhinus* ſaith was found on the hill *Crentzenis*, in the aſcending to the toppe.

The Time.

Theſe flower for the moſt part all the Sommer long.

The Names.

The first is called *Pentaphyllum majus* by *Brunfelsius* and *Lobel* in his Observations; and *rectum majus* by *Camerarius*: yet unto *Lobels* figure in his *Icones*, and unto *Gerards* figure, the title is *Pentaphyllum vulgare*: in the *Adversaria* the title is hereof, (because of the variation of their flowers in the colour as I said before) *Pentaphyllum aliud album & purpureum*: with many Herbarists in these dayes it is called *Pentaphyllum Heptaphylli facie*, because it hath so usually seven divisions or leaves upon a stalke. *Bauhinus* termeth it *Quinquefolium rectum luteum*. The second is called by *Matthiolus* in some editions *Pentaphyllum album*, and by *Tragus Pentaphyllum exiguum*, by *Iohannes Thalius* in *Harcynia sylva Pentaphyllum canum*, by *Camerarius Pentaphyllum rectum minus*: by *Dodonæus*, *Fuschius* and *Lugdunensis*, *Pentaphyllum* or *Quinquefolium luteum minus*: by *Gerard Quinquefolium Tormentille facie*, by *Tabermontanus Quinquefolium petræum majus*, and by *Bauhinus Quinquefolium folio argenteo*. The third *Bauhinus* in his *Pinax*, and *Prodromus* setteth downe under the title of *Quinquefolium montanum erectum hirsutum luteum*.

The Vertues.

Having declared unto you all the severall sorts of this kinde of herbe, called Cinkefoile, in their Orders and Rankes, I must now declare unto you the chiefe properties of them altogether, and yet shew which is the most effectuall in speciall: all these sorts for the most part, having one qualitie of cooling and binding, yet the binding is more incident, and naturall unto them all, then the cooling, in that some of them are a little sharpe or bitter in taste, which argueth some more heate, yet I may ghesse the sharpenesse or bitternesse therein, is no more any signe of heate than it is in Cichory, or Poppy or *Opium*: our common wilde creeping Cinkefoile, the greater upright one and the white Cinkefoile, are the chiefest for use, and strongest in effect of all the rest. These three sorts are much alike for their operation, and are held to be as effectuall for all the purposes, whereunto the Tormentill is used, as well for preserving against venemous and infectious creatures, and diseases in each respect, as in keeping from putrefaction, for binding and restraining fluxes, either of bloud or humors, or any the other effects, whereunto Tormentill is applied; so that in stead thereof, and where it is wanting Cinkefoile may be used to as good purpose, I might referre you therefore to the properties of the Tormentill, to be enformed thereby, for the severall helpes, that this doth give; but I will shew you some particular remedies, it worketh upon especiall griefes and diseases: as first, it is an especiall herbe, used in all inflammations and feavers, whether infectious and pestilentiall or topicall among other herbes, to coole and temper the bloud and humours in the body, as also for all lotions, gargles, injections and the like, for sore mouthes, ulcers, cankers, fistulaes, and other corrupt and foule or running sores: yet some are so foolish to thinke, that the decoction of one branch of leaves thereof, taken with a little Pepper, doth helpe a quotidian or daily ague, that three branches helpeth a tertian, and foure a quartane ague; but this set number of leaves and branches, is rather an idle conceit, as it is also to were it in their shooes, for the same purpose, then any certainety fit for a wise man or Christian to leane and trust unto: the juice hereof drunke about foure ounces at a time for certaine dayes together, cureth the quinsie and the yellow jaundise, and to be taken for thirtie dayes together cureth the falling sickneſse, and for all fluxes in man or woman, whither the whites or the reds, as also the bloudy flixe, the rootes boyled in milke, and drunke is held most effectuall of any other remedy: the rootes boiled in vinegar, and the decoction thereof held in the mouth, easeth the paines of the toothach: the juice or the decoction is good to helpe the hoarsenesse of the throate taken with a little hony; as also is good for the cough of the lunges: The distilled water of both rootes and leaves, is effectuall to all the purposes aforesaid, and if the hands be washed often therein, and suffered at every time to drie in of it selfe without wiping it will in a short time helpe the palsie, or the shaking in them: the roote boyled in vinegar helpeth all knots, kernells, hard swellings and lumpes growing in the flesh in any part applied thereunto; as also all inflammations and S. *Anthonies* fire, all empostumes and painefull sores, with heate and putrefaction, the shingles also and all other sores of running and foule scabbs, sores, and itches: the same also boiled in wine, and applied to any joynts full of paine and ache, the gout also in any of the joynts of the hands or feete, and that also of the hippes called *Sciatica*: and if the decoction thereof be also drunke, it helpeth forward the cure much the sooner, and easeth also much paines in the bowells: the rootes are likewise effectuall to helpe ruptures or burstings to be used with other things availeable therefore, either inwardly or outwardly or both, as also for bruises, or hurts by blowes, falls, or the like, and to stay the bleeding of wounds, in any part inward or outward.

CHAP. XXVI.

Gentiana. Gentian or Fellwort.

ALthough I have set forth in my former Booke divers sorts of Gentians or Fellwort, yet there remaine divers others to be intreated of, which shall be here remembred; and because I was there somewhat briefe in declaring the vertues as was fit for that worke, being but an abstract of choise plants, that beare beautifull flowers to store a garden of pleasure, and not a generall worke wherein all things are to be comprised, and all that may be said of every one also, I will here therefore amplifie my selfe the more in their vertues, that have beene spoken of, which are the most effectuall, and of these also, for they are to be referred unto them: yet I thinke good to give you here some of the figures extant before. But that I may use such a methodicall course, as I have formerly held, in setting forth other plants which have divers sorts of one kinde, I will divide this family of Gentians into a greater and lesser sort, and of the lesser sort which admitteth a subdivision, and not the greater; I will divide them againe into *perennes*, everliving or abiding, that is, that perish not in the Winter; and into *annuas* annuall, that is, such as spring up and perish the same yeare that they flower, abiding onely the Sommer and not the Winter: I might also divide the lesser sort againe into *Vernall*, *Æstivall* and *Autumnall* flowring plants, whereof every one in their order.

Gentianæ majores. The greater Gentians.

1. *Gentiana major flore purpureo.* Great purple Gentian.

THe great purple Gentian, is very like the great yellow Gentian in moſt things, having a great thicke browniſh yellow roote, parted into two or three great branches; with great fibres at them but a little more hard and woody of as bitter a taſte as the other, which ſendeth forth at the ſeverall heads thereof, many faire broad three ribbed darke greene ſhining leaves, ſo like unto the other, that it is ſomewhat hard to diſtinguiſh them, many of theſe heads from among the leaves, ſhoote forth thicke and ſtrong ſtalkes, three or foure foote high, with divers joynts on them, and two leaves at them, one againſt another: towards the toppes whereof come forth the flowers compaſſing the ſtalkes, at two or three of the uppermoſt joints, with two leaves apeece under them, like as in the other, which are not laid open, ſtarre faſhion, like the other, but abide cloſe and hollow, the brimmes onely divided into ſixe or more round parts, of a purple colour, but paler at the bottome of them, where they are ſpotted with purple ſpots on the inſide, having ſo many yellowiſh threds in the middle, as the flower hath corners, ſtanding about a long greene byforked head, which growing ripe is the ſeede veſſell, and containeth there in ſuch like flat browniſh ſeedes as the other, but ſomewhat leſſe.

2. *Gentiana major flore albo.* Great Gentian with white flowers.

This white flowred Gentian is very like the former, and the great yellow kinde, not much leſſer and lower in any part than the former, whoſe flowers are not purple but pure white, and hollow like the other, without any ſpots in them, this making the whole difference betweene them.

3. *Gentiana major flore pallido punctato.* Great pale yellow ſpotted Gentian.

This ſpotted great Gentian, is in all things alſo like the firſt, but in the flowers, which are of a duskiſh pale yellow colour, ſpotted both within and without with very many blacke ſpots.

4. *Gentiana major flore cæruleo.* Great Gentian with blew flowers.

And this alſo differeth neither in greatneſſe of ſtalkes, leaves and flowers, nor in the manner of growing, but in the colour of the flower, which is of a blew colour.

5. *Gentiana Aſclepiadis folia.* Swallowort Gentian.

This is diſcribed in my former Booke.

The Place.

All theſe ſorts grow in many places on the Mountaines of *Germany*, and in other places, but are not to be found ſo uſually as the great yellow.

The Time.

Theſe doe all flower in Iune or there abouts.

The Names.

It is called in Greek Γεντιάνη in Latine, and ſo likewiſe *Gentiana*, *a Gentio Illyriorum rege primũ inventore*, as *Di-*

1. *Gentiana major cujuſque coloris.*
The greater Gentian of any of the colours.

Gentiana Cruciata.
Croſſeworte Gentian.

oſcorides

ſcorides & Pliny ſet it down: *Serapio* ſaith it was called *Baſilica*: of ſome it was called as ſome copies of *Dioſcorides* hath it *Centauria radix*, of ſome *Aloes Gallica Narce sChronion*, and as *Pliny* ſaith, ſome *Romanes* called it *Cnendia*, and ſome *Ciminalis*. The *Italians* and *Spaniards* follow the Latine name *Gentiana*, the *French* alſo *Gentiane*, the *Germanes Gentian*, *Enzian*, and *Bitterwurtz*; but the *Gentiana Conciata*, they call *Modelgheer*; we call it in *Engliſh* either Gentian or Fellworte, mixed as I take of *Latine* and *Engliſh* together, or Bitterwort, and of ſome Baldmony: all Authors doe generally call them all Gentians, and diſtinguiſhed according to the colour of the flowers, as they are in their titles.

Gentiane minores vernales perennes. The leſſer Gentians of the ſpring, abiding.

1. *Gentianella major ſive Gentianella Alpina latifolia magno flore.* The greateſt ſmall Gentian of the Spring.

THis greateſt of the ſmall Gentians is very like unto the Gentian of the Spring, that I have already ſet forth, yet it is not the ſame, having larger greene leaves, of two inches long and one broad, ſomewhat round pointed, with three ribbes or veines running through them, as the others have, the ſtalke riſing from the middle of theſe leaves, groweth about foure inches high, with a ſmall leafe or two thereon, bearing at the end thereof a large huske, ſuſtained by two ſmall and long leaves, from the middle whereof ſhooteth forth a very large and great hollow blew flower, ending in five ſmall points: the roote is ſmall yellowiſh and fibrous.

2. *Gentianella anguſtifolia verna.* Small narrow leafed Gentian of the Spring.

This ſmall Gentian of the Spring, ſhooteth from the roote, which is long ſlender much ſpread under the ground and yellowiſh, many heads of divers ſmall long and narrow leaves ſet together, ſomewhat longer then the next that followeth; from ſome of theſe heads, (for all flower not in one and the ſame yeare, thoſe flowring the yeare following, which flowred not the yeare before, and thoſe that did flower, not flowring againe the next yeare after,) riſeth up a ſmall ſlender ſtalke, ſomewhat higher then the former, bearing thereon, two ſuch like ſmall leaves at a joynt, and at the toppe one flower for the moſt part, (ſeldome more or the ſtalke branched) much ſmaller then the laſt, narrow long and hollow like a hoſe or huske of one entire leafe at the lower part, but ending above into five corners or ſmall pointed leaves, laid open like a ſtarre, having ſmall peeces of leaves like as it were eares, ſet at the bottome of the diviſions of them, both of them of a perfect blew colour, but not ſo deepe as the former, having a white line in the middle of each of them, and the ground or bottome of the flower whitiſh alſo, with a few threds ſtanding about a ſmall head, not to be ſeene untill the flower be almoſt or fully paſt, unleſſe one open it; which after it is ripe is ſmall and long, containing very ſmall browniſh ſeede.

3. *Gentianella minor Verna.* The ſmaller Vernall Gentian.

This little Gentian groweth in all things like the laſt, ſaving that the leaves are not ſo long and narrow, but are ſmall, and of the breadth of the naile of ones little finger, ſomewhat pointed at the end: the ſtalke is much about the ſame height, and beareth ſuch a like ſmall blew flower, ſometimes having thoſe ſmall peeces or eares at them, and ſometimes without them: and theſe be the chiefeſt differences betweene them.

4. *Gentianella omnium minima.* The leaſt Gentian of all.

This leaſt Gentian (ſo called becauſe of the bitterneſſe in it, elſe it might very well be accounted rather a kind of moſſe) ſpreadeth, and as it were matteth upon the ground, with many ſmall and long leaves, among which

1. *Gentianella Alpina verna major.*
The greateſt of the ſmall Gentians of the Spring.

Gentianella verna minor.
The ſmaller Vernall Gentian.

rise small little footestalkes, little more then an inch high, bearing each of them one flower, larger then the proportion of the plant may seeme to beare, of a pale blew colour scarse appearing out of the huske: the roote is small and white.

The Place.

The first groweth upon the *Alpes*, that are neere unto *Switzerland* as *Bauhinus* saith, The second groweth on the dry cold hils of *Savoy*. The third *Clusius* saith he found as well upon the *Pyrenæan* hils neare *Spaine*, as also upon divers hils of *Austria* and *Hungary*, *Gerard* saith it is found upon *Salisbury* plaine, in *Sussex*, and nere St. *Albons*, but I doubt he was mistaken, for that which groweth in those places, as farre as I can heare or learne, as also in many other of our owne land, is not this Vernall kinde, but some other, that flower some in the Sommer, some in Autumne, as you shall understand by and by. The last as *Bauhinus* saith groweth upon the hilles among the *Switzers*.

The Time.

The two first sorts doe usually flower in Aprill, the third in May, and the last latest, and it is but casuall, if they flower at any other time, for their leaves abiding greene all the Winter, they do encrease at the roote and may be easily parted.

The Names.

These are called by most writers, *Gentianella quasi Gentiana minor*, and *vernæ* becaus they doe chiefely flower in the Spring time. *Lugdunensis* saith, they may be called *Thylacitis major & minor*. The first *Bauhinus* in his *Pinax* and *Prodromus* calleth *Gentianella Alpina latifolia magno flore*, as it none had made mention of it before himselfe, but assuredly it is the same that *Lugdunensis* setteth forth, although that of *Lobel* and *Clusius* be a lesser of that great sort, which is that I have already set forth in my former booke, which he calleth *Gentianella Alpina angustifolia magno flore*. The second is the *Gentianella angustifolia* of *Lugdunensis*, which differeth from the *Alpina minor* of *Clusius*, although *Bauhinus* doth not distinguish them, but calleth it *Gentianella Alpina major*, when all others call it *minor*. *Gesner in hortis Germaniæ* calleth it *Calathiana verna*, and *Lugdunensis Helleborine Dalechampij* on *Dioscorides*. The third *Clusius* calleth *Gentianella minor verna*, and is thought by divers to be *Cantabrica* of *Pliny*. *Cæsalpinus* taketh it to be *Vincetoxici species pusilla*. The *French* by a speciall name, call both the greater and the lesser of this sort *Reperet*. The last *Bauhinus* calleth *Gentiana omnium minima*, as it is in the title, and peradventure is the *Gentianella Bavarica* of *Camerarius* in his *Icones*, but that this he saith hath longer and that rounder leaves.

Gentianella æstive. Small Gentians of the Sommer.

1. *Gentiana Pennei cærulea punctata.* Docter *Pennies* blew spotted Gentian.

Although I am in some doubt, whether this be a Gentian, and dare not affirme it to be any of the great kinds of Gentian (and *Clusius* also to whom Dr. *Penny* gave both the figure and description, was doubtfull of it not to be of the smaller kinde, let mee therefore place it either as the last of the greatest Sommer sorts, and least of them, or first of the Sommer kinde, but greater then any of the smaller, whose description is as followeth. It hath a joynted stalke about a foote and a halfe high, somewhat reddish toward the bottome next to the roote, with two leaves like the great Gentian, set at each joynt, but much smaller, and with more veines or ribbes therein then it, each standing upon a reddish footestalke, greater below then those above, where they do in a manner compasse the stalke, from the middle of the stalke upward come forth the flowers at the joynts with the leaves, on both sides of the stalke, three for the most part standing together, except the uppermost of all, where they stand five together, each of them with a short footestalke under them, consisting of five small pointed leaves, spread like a starre, of a pale blew colour finely spotted, with many small blacke prickes on the inside, having a small umbone in the middle, and five small threds, tipt with yellow standing about it: the seede that followeth, is enclosed in such heads or huskes, as the Gentians have: the roote is small and yellow, with many fibres annexed unto it. Hereunto I may referre another very like unto it, found in the North parts of this land, namely in *Lancashire*, by Mr. *Hesket*, a Gentleman in his life time very skilfull in the knowledge of Plants, whose figure I here exhibit, that some other may be stirred up to finde it out againe, that we may have further knowledge thereof.

1. *Gentiana Pennei cærulea punctat a.*
Dr. *Penny* his blew spotted Gentian.

Gentiana dubia Anglica.

2. *Gentianella æstiva cordata.* Small Heartlike Sommer Gentian.

This Sommer Gentian, hath a small long fibrous, but wooddy yellowish roote, (and thereby may be judged to be but annuall and not abiding) from whence arise small leaves, somewhat round pointed, with a greenish yellow ribbe in the middle of them, two alwaies set one against

another

another: the ſtalke is ſquare, about halfe a foote high, with the like leaves at the joyntes and divided from the middle upwards, into divers ſmall ſhort branches, on the toppes whereof ſtand very large flowers, in compariſon to the ſmallneſſe of the Plant, which is of a whitiſh blew colour before it be open, and writhed together, like to many of the flowers of the ſmall Bindeweeds, but being opened conſiſteth of a long hollow round huske ending in five hard leaves, ſomewhat broad and pointed like a ſtarre, of as brave a deepe blew colour, as any of the former: betweene thoſe greater leaves, there are other ſmaller leaves ſet, each of them round at the ends and dented in, making them ſeeme like unto a heart, as it is painted, from whence the name in the title *cordata* heart-like, was impoſed upon it, the like forme being not obſerved in any of the other: the ſeede veſſell after the flower is paſt, groweth to have a ſmall long necke, and bigger above, which being ripe openeth it ſelfe at the head, contrary to the reſt, containing within it much blacke ſeede, but twiſe as bigge and as long as the other.

3. *Gentianella æſtiva purpuro-cærulea.* Small purple Sommer Gentian.

This purple Sommer Gentian ſhooteth forth a reaſonable ſtrong ſtalke, a foote and a halfe high, with divers joynts, and two leaves at every one of them, ſomewhat broad at the bottome, where it joyneth to the ſtalke, not having any footeſtalke to ſtand on, growing ſmaller to the end, and long pointed: the ſtalke at the toppe hath ſome ſhort branches, whereon are ſet five or ſix or more ſmall purpliſh blew flowers, ending in five ſmall pointed leaves, after they are fallen and paſt, come up ſmall long cornered pods, or ſeede veſſels, containing much ſmall ſeede: the roote is ſlender long and fibrous, and periſheth after bearing, raiſing it ſelfe againe from its owne ſowing, and if it ſpring before Winter, it will endure it well and flower the next yeare, elſe if it riſe in the Spring, it will abide all the firſt yeare and flower and ſeede the next.

4. *Gentianella æſtiva flore lanuginoſo.* Sommer Gentian with a cottony flower.

This Sommer Gentian ſpringeth up with many long and narrow leaves, lying in compaſſe upon the ground, with three veines in every one of them, as is uſuall in all or moſt of the Gentians, from among which riſeth up a ſquare ſtalke, about a foote high or more, bearing at every joynt two ſuch like leaves as grow below, but leſſer and longer pointed: at the joynts with the leaves, toward the toppes of the ſtalkes, ſhoote forth two or three ſhort branches, bearing every of them three or foure flowers, larger then the former and bigger bellyed, ending in five points or leaves, of a paler purple colour, having a ſmall purpliſh cottony downyneſſe, at the bottome of each of the leaves, where they are divided on the inſide: after the flowers are fallen, there appeare ſmall long huskes, like hornes, full of ſmall round ſeede, the roote is ſmall and long, of a pale colour ſomewhat wooddy, periſhing as all the Sommer kindes doe.

5. *Gentianella æſtiva flore breviore.* Sommer Gentian with ſhort flowers.

This kinde of Gentian is ſomewhat like unto the laſt, but that the leaves are broader by the halfe, two alwaies ſtanding at a joynt, of a deeper greene colour, the ſtalke is ſquare and branched at the toppe in the ſame manner, bearing divers flowers on every of them, which are both ſhorter and greater then they, and of a pale blewiſh colour, the ſeedes and rootes are much alike: all theſe kinds as well as the former are very bitter, which cauſe them to be referred to Gentian.

6. *Gentianella æſtiva minima Neapolitana.* The ſmall Sommer Gentian of *Naples*.

This ſmall Gentian hath ſmall ſquare ſtalkes, little more then halfe a foote high, but fuller of branches and flowers then the laſt, the leaves thereon are ſomewhat long and narrow, the ſtalkes are branched from the bottome, with many ſmall flowers on them, ſtanding in ſmall huskes, which are long like a cuppe, the brimmes ending in foure parts, ſomewhat diſtant one from another, making the ends to ſeeme the longer, of a purpliſh colour enclining to redneſſe, with a ſmall woollineſſe at the bottome of each of the foure leaves, where they are divided, and white alſo on the inſide, at the lower part of them, and of a paler purple about the edges; after which come up ſmall long heads, forked at the toppe, wherein is contained ſmall round ſhining yelloviſh ſeed, yet bigger then any of the former, the roote is longer and more full of threds or fibres then the laſt, ſpreading much under ground.

The Place.

The firſt as *Cluſius* ſaith, Dr. *Penny* of *London*, ſhewed him the figure, and gave him the deſcription, and told him that he gathered it upon *Bockmut* a hill of the *Switzers*, and the other of that kinde, as is ſaid in ſome places of *Lancaſhire*, but we know not where. *Columna* ſaith he found the ſecond upon the hils *Æquicoli* in *Naples*. The third and fourth groweth in the meddowes, at the foote of hills in many places of *Germany*, as *Cluſius* ſaith. The fifth groweth on the toppes of hills onely, in many places of *Auſtria*. And the laſt on the hils in *Naples* as *Columna* ſaith.

The Time.

Theſe doe all flower in the Sommer Moneths of Iuly, and Auguſt, and not before, the ſeede growing ripe ſoone after, which ſhedding themſelves continue their kinds, but will hardly endure tranſplantation, or riſe of the ſeed ſowen in a Garden, as both *Camerarius* and others have obſerved, and my ſelfe can ſay the ſame.

The Names.

Theſe are called *Gentianellæ æſtivæ*, and are *mediæ inter Gentianas & Centaurias minores*, as partaking of both in forme and property, *Cluſius* calleth them *Fugaces*, becauſe they abide not a Winter, unleſſe it be upon their firſt yeares ſowing, that they doe not runne up to flower, for ſo they may be ſaid to abide two yeares, yet they are called annuall in that they periſh after flowring. *Bauhinus* calleth them *pratenſes*, becauſe they grow in meddowes, yet ſome of them are onely found on the toppes of hils. The firſt Dr. *Penny* called *Gentianã punctata*; but *Cluſius* referreth it to the Claſſis of his *Fugaces*. *Bauhinus* calleth it in his *Phytopinax Aliſma folio glabro* but in his *Pinax*, *Gentiana paluſtris latifolia flore punctato*. *Columna* calleth the ſecond *Gentianella cærulea cordata*, for the cauſes expreſſed in the deſcription, which *Bauhinus* entitleth *Gentianella utriculis ventricoſis*. The third is *Cluſius* his firſt kind of *Gentiana fugax*, which *Bauhinus* calleth *Gentiana autumnalis ramoſa*; which title in my judgement is not correſpondent to the Plant, as indeed in theſe ſmall Gentians, as well as in many others, he is much and often miſtaken, making two ſorts of one, and ſometimes miſapplying the authors titles, to thoſe that are not right, for neither is this plant onely full of branches, to beare the title *ramoſa*, for others of this ſort are ſo alſo, neither doth it flower ſo late to be made an *Autumnalis*, more then the other in this order,

which

which for the moſt part are paſt before the Autumnall kindes be in flower. The fourth is *Cluſius* his ſecond *Gentiana fugax*, which *Bauhinus* calleth *Gentiana pratenſis flore lanuginoſo*: the fift is *Cluſius* his third *Gentiana fugax*, which *Bauhinus* calleth *Gentiana pratenſis flore breviore & majore*: the laſt *Columna* calleth *Gentianella purpurea minima*.

Gentianellæ autumnales. Small Autumne Gentians.

1. *Gentianella Autumnalis Pneumonanthe dicta.* The greater Autumne Gentian.

THe greater of theſe ſmall Gentians, that doth flower in Autumne, riſeth ſometimes with more, and ſometimes with fewer ſtalkes, ſometimes alſo they riſe higher, to be two foote high at the leaſt, and ſometimes not above a foote high, according to the fertilitie of the ſoile, of a browniſh greene colour, having many long and narrow darke greene leaves, ſet by couples on them, up to the toppes, which ſeldome branch forth, but beare every one, a reaſonable large hollow flower, bigger than any of the reſt that follow, of a very deepe blewiſh purple colour in moſt, yet in ſome a little paler, ending in five points or corners: the rootes are many, ſmall and long, thruſting downe deeper for the moſt part into the ground, then thoſe before named, and abiding after ſeede time, not periſhing as the reſt.

2. *Gentianella autumnalis fimbriato flore.* Autumne Gentian of *Naples*.

This Gentian of *Naples*, from a long yellowiſh ſmall roote, creeping like Couchgraſſe, doth ſhoote forth a few long and narrow leaves, ſomewhat like unto the leaves of Line or Flaxe, but ſhorter, but thoſe that grow up higher on the ſtalke, unto the middle thereof are ſtill larger, and from the middle to the toppe, decreaſing againe, but in all places two ſet at every joint, and ſtriped from every one of the joynts on both ſides all the length of the ſtalke, which being greene and about a foote high, beareth at the toppe thereof a purpliſh greene cuppe or huske, conſiſting of foure large pointed leaves encloſing the flower, which before it blow open is long and writhed, of a pale blew colour, but being open, is of a deeper blew colour, ending in foure leaves ſomewhat long, and as it were purfled about the edges, with a little hairineſſe at them alſo, having a ſmall leafe at the bottome of each of them, and a few yellow threds in the middle, ſtanding about an umbone or head, which when the flower is fallen groweth to be the ſeede veſſell, forked into two parts at the head, where it is ſomewhat greater then it is below, wherein when it is ripe is contained, very ſmall blacke ſeede.

3. *Gentianella autumnalis Centaureæ minoris folio.* Autumne Gentian with ſmall Centory leaves.

This Autumne Gentian groweth up with ſundry ſtalkes, not a foote high, parted into divers ſmall branches, whereon ſtand two ſmall leaves together, as is uſuall in all the Gentians, very like unto thoſe of the leſſer Centaury, which are not ſo long as either of the former, a little broader and of a whiter greene colour: at the toppes of the ſtalkes and branches grow divers orient blew flowers, not ſo large as either of the two former, but

1. *Pneumonanthe.*
The greater Autumne Gentian.

3. *Gentianella autumnalis Centaureæ minoris foliis.*
Autumne Gentian with ſmall Centory leaves.

set in small long huskes, halfe way rising above the toppes of them, after which come small seede in long horned vessels, the roote is small and full of threds.

4. *Alia flori Centaureæ minoris similis folio majore.*

Another with small Centory like flowers.

I have seene in Mr. *Thomas Pemble* his garden at *Maribone* a sort that was more spreading than the former sorts, small but with larger leaves and flowers than Centory, and of the same colour of the Centory flowers, yet more plentifully stored and longer lasting; the plant perishing as the other.

5. *Gentianella Centaureæ minoris folio minor.*

A smaller Gentian with Centory leaves.

This small Gentian is very like unto the last, in the fashion and order of the leaves, but that they are somewhat smaller, and the stalke much lower, being not above three inches high, yet stored with many small branches, whereon are set long and somewhat large blew flowers, very like unto the lesser Vernall Gentian, after which the seede and vessels being ripe shew to be like the last: the roote is likewise small, but with many more fibres thereat then others.

6. *Gentianella minima elegantissima Bavarica Camerarij.*

Other excellent sorts of Autumne small Gentians with Centorie like leaves.

The greater of them spreadeth sundry branches upon the ground, set full of small Centory like leaves, but a little pointed, and at the toppes of each, an orient blew flower made of five leaves. The other is even the smallest of all, with small round leaves (which the cutter hath perverted) and Starre-like blew flowers like the last.

6. *Gentianella minima Bavarica Camerarij.*
Other sorts, of Autumne small Gentians with Centory like leaves.

The Place.

The first groweth in many places of *Germany*, and other places beyond the seas, as also in divers places of our owne land, as neare *Longfield* by *Gravesend*, neare *Greenehithe* and *Cobham* in *Kent*, in the fields about Sir *Percivall Harts* house at *Lellingstone* in *Kent*, and in a chalkie pit, not farre from *Dartford* in *Kent* hard by a Paper Mill, in the West Country also in divers places: it groweth as well in wet as in dry grounds. The second groweth on the hills in *Naples*, as *Columna* saith. The third groweth in *Kent* in divers places, as about *Southfleete* and *Long-field* upon the Downes, as also upon *Barton* hills in *Bedfordshire*, upon a peece of waste Chalkie ground, as yee goe out of *Dunstable* way, towards *Gorkambury*, and not farre from the ruines of the old Cittie *Verulam*, which is not farre from Saint *Albones*: the fourth is not knowne from whence it came: the fift upon divers of the Alpes: and the last according to the title in *Bavaria*.

The Time.

These flower for the most part not untill *August*, and that is later than the former, and therefore deservedly have the name of Autumne Gentians.

The Names.

The first is set downe by *Matthiolus*, *Lobel*, *Cordus*, *Clusius* and others; some under the name of *Gentiana minima*, as *Matthiolus*; some *Pneumonanthe*, as *Cordus* and *Lobel*; some *Calathiana viola*, as *Gesner in hortis Germaniæ*; some *Campanula Autumnalis* as *Dodonæus*, and of *Lugdunensis Campanula patersis*: the second *Columna* onely mentioneth by the name of *Gentianella cærulea fimbriata angustifolia autumnalis*. *Bauhinus* calleth it *Gentianella cærulea oris pilosis*: the third is the tenth *Gentian* of *Clusius*, and called by *Eystotensis horti author Gentianella autumnalis foliis centaureæ minoris flore cæruleo*. *Lobel* calleth it *Gentiana minima*. *Bauhinus Gentiana angustifolia autumnalis floribus ad latera pilosis*: the fourth is not mentioned by any before: the fift is the eleventh small Gentian of *Clusius*: the last is called by *Camerarius*, *Gentianella elegantissima Bavarica*; *Bauhinus* referreth it to the *Gentiana verna Alpina*,: I to the *Calathiana verna Dalechampij* of *Lugdunensis*; but that *Camerarius* saith it flowreth in Autumne.

The Vertues.

The greater Gentians are more used in Physicke with us then the smaller, although they be neare of one propertie, and almost as effectuall both inwardly and outwardly, and in the places, where the smaller are in plentie to be had, and the greater not so readily to be gotten, they doe very well serve in their stead. They are by their bitternesse so availeable against putrefaction, venomne and poyson, the plague also or pestilence, being a most certaine and sure remedy, that the *Germans* account it their Treakle, holding nothing to be a more commodious counterpoison, and for this purpose did formerly make a Treakle therewith and other things, at *Iena* which was transported into our country, and we thereupon called it *Iene* Treakle, made of Gentian, *Aristolochia*, Bayberies and other things, which were all good, wholesome, and effectuall for griefes and paines in the stomacke, and an especiall medicine against the infection of the plague, to expell the malignitie of that, and all other infectious diseases, and to preserve the heart, to strengthen it also against faintings and swounings; which Treakle was bitter, and therefore the more likely to worke these, and other good effects; but that *Ieane* Treakle, which hath since crept into the place of it among the vulgar, because it is sweet and pleasant; is for that cause greedily sought after, and for the cheapenesse, of most sorts of poore people desired, but there is nothing in it, that can doe them good, nor hath beene found to helpe them of any disease, being nothing but the drosse and worst part of Sugar, taken

taken from it in purifying, the which they call refining; and becauſe the good is bitter, therefore but few can away with it: yet in *London* it hath beene upon occaſion, both cenſured and condemned by a Jury, and many hundred weights thereof, beene publikely burned in the open ſtreetes, before their doores that ſold it, as a juſt witneſſe to all (if they would underſtand their owne good, and be perſwaded by reaſon, true judgement and experience) that it is not a thing tollerable in a Common-wealth. I have thus farre digreſſed from the matter in hand, and yet I hope not without good and juſt cauſe, to informe all of our countrie to ſubmit their wills and affections unto thoſe of learning and judgement in Phiſicke, and not be obſtinate in their ſelfe willed opinions, and ignorance; for aſſuredly if that kind of *Ieane* Treakle were wholſome or effectuall to any good purpoſe, it were as eaſie for the Phiſitians to give way to the uſe thereof, as for any other tollerated medicine: but the ſaying is moſt true, *Nitimur invetitum ſemper, cupimuſque negatum,* the more a thing is forbidden the more it is deſired; for the wrong opinion of many is to thinke, that it is for the private profit of ſome that the thing is forbidden, and therefore ſtollen bread is ſweeteſt: But to the matter now in hand, The powder of the dried rootes taken in wine, either of themſelves or with other things, as Mirrhe, Rue, Pepper, and the like, is a certaine remedy againſt the ſtingins or bitings of Serpents, Scorpions, or any other venemous beaſts, and againſt the bitings of a madde dog, being taken three or foure dayes together, and care taken to keepe open the wound with Vinegar or ſalt water, and to cleanſe and dreſſe it in order as it ſhould be; the ſame rootes alſo taken in wine helpeth thoſe that have obſtructions in their livers, or are liver growne as they call it, or have paines in their ſtomackes; thoſe alſo that cannot keepe or relliſh their meate, or have dejected appetites to their meate, for hereby they ſhall finde preſent eaſe and remedy: being ſteeped in wine and drunke, it refreſheth thoſe that are overwearied with travell, and are by cold and ill lodging abroad, growen ſtarke or lame in their joynts: theſe alſo that have any griping paines in their ſides, as prickings, ſtitches or the like: it helpeth thoſe that are bruiſed by blowes or falls, by diſſolving the congealed bloud, and eaſing the paines: the ſame alſo is held very effectuall againſt all agues, to take of the roote not in wine, but ſome other drinke, or the water diſtilled of the herbe: the freſh roote, or the dried made into a peſſary, and put into the matrice, expelleth the dead child, and the afterbirth, for it throughly worketh upon thoſe parts, and therefore not to be given to women that are with child, and being taken inwardly, procureth their courſes being ſtopped, and the urine when it is ſtaied: the decoction of the roote is mervellous effectuall to helpe thoſe that are pained with the ſtone: the ſame alſo taken in wine doth mervellous much good to thoſe that are troubled with crampes and convulſions in any parts: it doth much good alſo to thoſe that are burſten, and have any ruptures. *Dioſcorides* ſaith that there is ſo great power and efficacie in the rootes hereof, that it helpeth not men onely, but beaſts alſo that are troubled with coughes, and the outgoings of their intrails, and that it expelleth the wormes of the belly: it breaketh much winde in the body, and cauſeth it to avoid; and generally it is availeable in all cold diſeaſes, either inward or outward, and as *Galen* ſaith, is moſt effectuall, where there is any neede to extenuate or make thinne, thicke flegme or groſſe humors, clenſing of corrupt and filthy ſores or ulcers, purging of peccant and offenſive humours, and opening the obſtructions of the liver and lungs, gall and ſpleene, and freeing the parts affected, with any the diſeaſes incident unto them, and all theſe things, *Galen* holdeth it to worke by the facultie of bitterneſſe therein; for aſſuredly if our ſtomackes could brooke this and other bitter medicines, and were not ſo nice and daintie to refuſe whatſoever is not pleaſing to the palate, it would worke admirable effects in the curing of many deſperate and inveterate diſeaſes inwardly, and clenſing and healing foule corrupt and deſperate ſores and ulcers outwardly, and therefore the *Italians* not undeſervedly, doe call the *Gentiana cruciata, Petimborſa, quaſi mettere in burſa,* put it into your purſe, either as *Matthiolus* ſaith that it was to be gathered whereſoever it was found and fit to be kept in ones purſe, as ready to be uſed upon all occaſions, or that it did by curing of diſeaſes, get ſtore of crownes to be put into the purſe; ſo excellent they accounted this roote and herbe to be uſed: the decoction of the leaves, or the juice of them, or the rootes, worketh the ſame effects: and ſo doth the diſtilled water of the leaves, flowers, and rootes, artificially made in Glaſſe, and drawen by the vapours of a *Balneum* or Hot water; for this water drunke, hath beene often tried to cure in a wonderfull manner, all thoſe ſorts of agues that breede by the obſtruction of humours or blood, and killeth the wormes of the belly: the ſaid water uſed to the face, clenſeth it from all ſorts of ſpots, freckles, morphew, and other defections, or diſcolourings of the skinne whatſoever, if it be often bathed lightly therewith; the powder of the roote, or the juyce thereof healeth all wounds that are freſh; as alſo is moſt ſoveraigne and effectuall for all ſorts of foule, putride, or rotten ulcers whereſoever, yea although they be hollow, or fiſtulous, cancrous alſo fretting or running, for it mightily clenſeth and drieth and healeth up alſo: the ſame alſo or the powder of the dried rootes applied to the ulcers, knots, or kernells of the necke or throate, which is called the Kings evill, healeth them certainely and ſpeedily, as alſo the painefull ſwellings of the hemorrhoidiall veines, which are called the piles when they are fallen downe and grow vlcerous or ſore: the juice either freſh or condenſate, that is, made thicke by extraction and evaporation to his conſiſtence fit to be kept, is uſed to be infuſed into the eyes, to take away inflammations and redneſſe in them, and to cleare & clenſe them from skins and filmes growing upon them: the roote or the juice of them, or the decoction of the herbe or roote, is given likewiſe very often to cattell to drinke, to free them from the Bottes, and wormes, and many other diſeaſes, as alſo when they begin to ſwell, being poiſoned by any venemous worme or ticke, which they often licke up with the graſſe; as alſo when ſuch wormes or other hurtfull vermine have bitten Kine by the udders or other tender places, which preſently thereupon ſwell, and put the cattle to much paine, making them forbeare their meate; which when the countrey people ſee, they bruiſing the leaves of any of the Gentians, growing neare unto them, and wringing out the juice, ſtroke therewith the udder, or bitten place, and they by two or three times ſo doing are helped and cured: the rootes of the ſmaller Gentian of the Spring, being dried and given in powder to any to drinke, will cauſe much venting or farting, and is given with good ſucceſſe to helpe the torments of the windcollicke, and other ſore and grievous panges, or paines in the ſtomacke or bowells, it is alſo profitable to helpe the yellow jaundiſe, as alſo any evill diſpoſition in the liver or body, engendred by long ſickeneſſe or bad diet, whereby they pine away by a conſumption.

CHAP.

CHAP. XXVII.

Scorsonera. Vipers Graſſe.

ALthough I have ſet forth in my former Booke two ſorts of *Scorsonera* or Vipers Graſſe which are the *Spanniſh* kinde and the low purple kinde, yet becauſe there are ſome others that *Cluſius* and others have made mention of, and ſome alſo not yet publiſhed by any, I thinke it meete to declare all thoſe not ſpoken of before, in this place and Chapter.

1. *Scorsonera major Pannonica latifolia.*
The greater *Hungarian* broad leafed Vipers Graſſe.

This greater *Hungarian* Vipers graſſe is very like unto the *Spaniſh* kinde, in all things almoſt, the leaves hereof are more in number, that riſe from the head of the roote, as broad and long as they, but not crumpled about the edges, nor of that grayiſh greene colour, but ſmooth, and of a darke or evill greene colour; this hath two or three ſtalkes riſing up among the leaves, and ſometimes but one, according as the roote hath encreaſed into ſeverall heads, having ſome leſſer leaves upon them, and at the top, a ſcaly ſomewhat long greene head, from the middle whereof groweth the like double yellow flower as the *Spaniſh* kinde hath, and the like ſeede alſo, lying in ſuch downy ſubſtance, neither of them to be well diſcerned the one from the other, after they have growne any time in the garden together: the roote alſo is long and great, ſpreading into many branches, and ſhooting forth into divers heads, from the upper part thereof, blackiſh on the outſide, and white and pleaſant within as the other, yeelding milke in every part in the ſame manner alſo, abiding many yeares and not periſhing after ſeede time, as the Goates beards doe, whereof all theſe are accounted as kindes.

2. *Scorsonera humilis latifolia Pannonica.* The dwarfe *Hungarian* Vipers graſſe.

This dwarfe or low *Scorsonera*, ſhooteth forth not ſo many long leaves but almoſt as broad as the laſt, ſomewhat ſtiffer and ſhorter; and of the ſame greene colour; from among which riſeth up one firme, but hollow and ſhort ſtalke, not above an handbredth high, bearing ſome few ſmall and ſhort leaves thereon and a yellow flower, out of the like greene ſcaly head, but ſhorter than the other, with the like ſeede therein alſo: the roote is blacke without, and white within yeelding milke as the other doth.

3. *Scorsonera minor anguſtifolia Pannonica.* The ſmall *Hungarian* Vipers graſſe.

This ſmall Vipers graſſe hath long and very narrow greene leaves, very like the leaves of *Tragopogon* or Goates beard, but ſhorter and not ſo many, the ſtalkes are ſlenderer and much lower then the firſt, bearing ſmaller and more ſingle flowers upon them then it, and leſſer ſeede, but like in all other reſpects, lying in ſuch downe; the roote likewiſe is long and blacke without and white within, but ſmaller and ſlenderer, never growing to be halfe ſo great, neither yeeldeth ſuch ſtore of milke as the other doth.

1. *Scorsonera major Pannonica latifolia.* The greater *Hungarian* broad leafed Vipers graſſe.

5. *Scorsonera tuberoſa radice.* The ſmalleſt *Spaniſh* Vipers graſſe.

2. 3. *Scorsonera humilis latifolia & anguſtifolia.* The greater low, and the leſſer tall *Hungarian* Vipers graſſe.

4. *Scorsonera elatior angustifolia Pannonica.* Tall narrow leafed Purple Vipers grasse.

The taller purple Vipers grasse, hath many such like narrow long leaves as the last, and longer stalkes, with some lesser leaves on them, divided sometimes into two or three branches, bearing every one a small flower like unto the last, but of a blewish purple colour, standing in a shorter greene head, wherein is contained shorter and thicker seede, then in the former, the roote is long, and blacke without and white within, like the other, and yeelding also but little milke, yet abiding as the rest.

5. *Scorsonera minima tuberosa radice Hispanica.* The smallest Spanish Vipers grasse.

This least Vipers grasse hath divers leaves very small and narrow, lying on the ground, some rootes giving smooth leaves, and others crumpled about the edges, the stalkes are very small, and scarse rising three or foure inches high, bearing out of a long small scaly head, a very small and single pale yellow flower, wherein grow smaller blacke seedes, and enclosed in farre lesser downe, then in any of the other, the roote is as thicke as three fingers or more, but much shorter then in any other kindes, blackish without, and somewhat whitish within, yeelding very little milke, when it is broken, but abideth the Winter almost as well as any of the rest.

6. *Scorsonera Illyrica.* Vipers grasse of *Sclavony.*

The multitude of long narrow leaves with three ribbes in them to the number of fifty or an hundred, and of twenty slender stalkes, of small yellow flowers, and smaller seed afterthem then most of the former, the roote being blacke and thicke, maketh this kinde differ from the rest.

The Place.

The first groweth in many places of *Germany*, *Bohemia*, and *Hungary*. The second on the hils by *Baden* in *Germany*. The third in many of the same places with the first. The fourth on a small hill nigh unto *Stampfen*, which is two *Dutch* miles from *Posonium*, a chiefe City in *Hungary*, and in other places thereof. The fifth grew in *Spaine*, and good store of the rootes being brought hither, I planted some of them in my Garden, perceiving them in forme to differ from others, which growing yeelded such leaves, flowers, and seede, as is before set downe. The last in *Illyria* or *Sclavonye*, as *Alpinus* saith.

The Time.

They doe all flower in May, and their seede is ripe before the end of Iune.

The Names.

The first knowledge of *Scorsonera* to the world, came by *Monardus* a famous Physition in *Sivell*, although it was found out, and the use of it likewise, thirty yeares before he wrote thereof, who made a small *tractat* thereof, and of the *Bezar* stone, which *Clusius* translated out of the Spanish into the Latine tongue, and published it with other of his workes translated also, and annexed to his booke of strange or *Exoticke* things, wherein it is set downe that a Moore, a bondslave did helpe those that were bitten of that venemous beast, (or Vipe as it is called by others) which they of *Catalonia*, where they breed in abundance, call in their language *Escuerfo* (from whence *Scorsonera* is derived,) with the juice of this herbe, and the roote given them to eate, which both tooke away the poison and healed the bitten place very quickely, when Treakle and other things would do no good, which ever since hath growne in estimation, as well against venome or poyson, as against other diseases as you shall heare by and by. The first is called by *Clusius*, *Scorsonera major Pannonica*, by *Matthiolus Scorsonera Bohemica*, whom *Lobel* and *Lugdunenses* follow, *Tabermontanus* and *Gerard*, call it *Germanica*, and *Bauhinus Latifolia altera*. The second is called by *Clusius*, *Scorsonera humilis latifolia Pannonica*, by *Tabermontanus*, *Scorsonera Pannonica*, and by *Bauhinus*, *Scorsonera latifolia humilis nervosa*. The third is called by *Lobel Scorsonera altera*, by *Tabermontanus*, *Scorsonera Germanica angustifolia*, and by *Bauhinus Scorsonera foliys nervosis*. The fourth is called by *Clusius*, *Scorsonera angustifolia elatior Pannonica*, by *Thalius*, *Scorsonera tenuifolia altera*; and by *Bauhinus*, *Scorsonera angustifolia subcærulea*. The fifth because it came from *Spaine* without any name, I have entitled it according to the face and forme thereof, *Scorsonera minima tuberosa radice Hispanica*, it is very probable that *Bauhinus* in his *Prodromus* doth meane this plant, it commeth so nere unto it which he there calleth *Hieracium cap llacco flore*, for he saith it better agreeth to a *Scorsonera* then *Hieracium*. The last *Alpinus* setteth forth under the same title it hath, some doe call them *Viperaria* and *Viperina*, and some *Serpentina*.

The Vertues.

Bauhinus saith that the rootes of the Spanish kinde, hath in their naturall places some bitternesse, which if it be so (for I never saw such) is not perceived in those that have growne many yeares in our land, it is very likely that the temperature of the Climate, doth alter in some part the bitternesse thereof; but *Monardus* writeth, that those that grow in *Spaine* are somewhat sweete in taste like a Parsneppe, and may be eaten in the same manner, the roote hereof saith *Monardus*, whether raw or dressed, or condited, as also the juice of the herbe taken by themselves, or with any other cordiall or Counterpoyson, doth not onely helpe the biting of that so venemous a Serpent the *Escuerfos*, but of the Viper, and all other virulent creatures, the water distilled in glasses, is a present remedy for all contagious fevers, for by causing sweate the infection is evaporated, and the sicke person restored, the same also or the roote it selfe taken, is good against the passions and tremblings of the heart, as also against swounings, sadnes, & melancholy: the roote preserved and taken fasting, or the said water drunke for some dayes together, doth open the obstructions of the liver, spleene, and the other inward parts, as also helpeth to bring downe womens courses, and to ease the suffocation, or other diseases of the mother whatsoever, for in those feminine griefes it hath a very powerfull effect as hath beene often and certainely found true: it is also very good against the swimming or turning of the braine, and all other paines in the head, it is also very cordiall both to strengthen the vitall spirits, when they are much subject to faint or swoune, as also against melancholy or sadnesse, that ariseth without manifest cause, if the clarified juice of the herbe be set in the Sunne for certaine dayes, and the purer liquor thereof mixed with a little hony, be dropped into the eyes, it both cleareth and strengthneth the sight, and taketh away the spots and blemishes in them. The rootes preserved with Sugar, are not onely very pleasant to the taste, but effectuall for many of the aforesaid griefes.

CHAP. XXVIII.

Tragopogon. Goates beard.

ALthough it is not certainely knowne, that the Goates beardes have the like *Alexipharmicall* property, to expell venome and poyſon, as the *Scorſoneras* or Vipers graſſes, yet becauſe they are ſo like unto them in outward forme and manner of growing, they being but as *ſpecies ejuſdem generis*, the *Tragopogon*, or Goates beard, being the ſtandard or *genus*, and herein principally differing, that all the *Tragopogons* are but annual, or periſhing after they have borne ſeede, and all the ſorts of *Scorſonera*, living after ſeede time many yeares. I have thought it not amiſſe to joyne them in neighbourhood as they be in kindred, whereof there be ſundry ſorts, ſome delivered in my former worke, others here to be expreſſed, and of them ſome not written of by any before.

1. *Tragopogon æſtivum.* Sommer Goates beard.

The Sommer Goatesbeard, (which I ſo call becauſe it is but annuall, to be ſowen in the Spring, and periſhing in the end of Sommer, when it hath given ſeed) is a ſmall Plant, riſing up with one ſtalke little above a foote high, whereon grow three or foure long and narrow leaves, yet ſhorter then in any of the other, that hath beene deſcribed in my former booke, broader at the bottome then they, and growing leſſe by little and little to the end, of a pale greene colour, with a whitiſh ribbe in the middle; the ſtalke brancheth out into two or three parts, each of them bearing a large greene head, wherein is contained a ſmall flower, of a pale purpliſh aſhe-colour, opening onely in the morning, and ſhutting up before noone, the long pointed ends of the huske or head, riſing above the flower, which is not uſuall in moſt of the other Goats beards; which being paſt the head groweth greater, having the outermoſt ſeedes greater and thicker then the reſt, ſpreading one from another, with no downe at all at the ends of them, but the ſmaller ſeede being in the middle, are ſmaller then any of the other, the roote is ſomewhat long wooddy, periſhing before winter, and yeeldeth but a very little ſhew of milke, when the leaves are broken, or the rootes being young.

2. *Tragopogon minus luteum.* Small yellow Goates beard.

The ſmall yellow Goates beard, hath a ſmall ſlender ſtalke, about a foote high, with very few leaves thereon, which are ſomewhat long and narrow, as it were dented but rather waved about the edges, and of a pale greene colour, at the toppe of the ſtalke ſtandeth one greene head, like other Goates beards with pointed ends, enclo-ſing a large flower of a pale yellow colour, like unto the greater yellow kinde, which yeeldeth ſmall ſeed with downe at the endes of them, and ſpreading in the ſame manner, the roote is ſomewhat long, and yeeldeth milke as the other doth.

3. *Tragopogon lacinia tum majus.* The greater Goats beard with jagged leaves.

This jagged Goats beard hath his firſt leaves, long, narrow, and ſmooth at the edges, like unto the pulple Goats

1. *Tragopogon æſtivum.*
Sommer Goats beard.

3. *Tragopogon lac niatum majus.*
The greater Goats beard with jagged leaves.

beard, long and narrow at the bottome, and broader towards the ends, but thoſe that riſe up afterwards, and thoſe that grow next unto them upon the ſtalke, are jagged or torne as it were on the edges, on both ſides in ſome leaves, and in ſome but upon the one, in ſome alſo more divided, and others leſſe, of a paler greene colour underneath then above; the ſtalke riſeth up to be about two foote high, with ſuch leaves but ſmaller on it to the toppe, but leſſe divided, and the uppermoſt not at all, where it is branched into three or foure ſmaller parts, every one bearing a ſmall greene head, like unto the ordinary kinde, not having any pointed leaves riſing up, as is in the purple and ſome other ſorts, encloſing within it a ſmaller yellow flower, then the ordinary yellow ſort, opening in the morning, and ſhutting at noone, which being paſt, there commeth ſuch like ſeede, but ſmaller and not rough, the roote is long and blackiſh on the outſide, and white within, yeelding milke as others doe, and periſhing after ſeede time, as others doe.

Tragopogon purpureum.
Purple Goatsbeard.

4. *Tragopogon laciniatum minus.*
The leſſer Goats beard with jagged leaves.

This leſſer kinde, ſhooteth forth from a long and ſomewhat thicke roote, browniſh on the outſide, divers long and very narrow leaves, more finely cut in on the edges, and into farre ſmaller parts then the former, among which riſeth up the ſtalke a foote and a halfe high or better, with ſome ſuch like leaves thereon, but ſmaller, and leſſe divided at the toppe where it is divided into three or foure branches, with every one a flower on them, like unto the laſt, but of a paler yellow colour, ſtanding in greene heads, without beardes, as moſt of the ſorts of yellow Goats beards doe, and after yeeldeth the like head of long rough ſeede, with downe at the ends of them as others doe.

5. *Tragopogon luteum angustifolium.*
Common Goats beard with narrow leaves.

This Goatsbeard is very like unto the common yellow kind, but that it is not ſo great, nor riſeth up ſo high, and hath much narrower, or rather graſſe like leaves, and almoſt as long, the flowers are not ſo large, nor ſo thicke of leaves, and give the like ſeede.

6. *Tragopogon hirſutum humile.* Small rough Goats beard.

This likewiſe differeth not much from the laſt, but that it is lower, and the leaves are not ſo long and narrow, but a little broader, ſhorter, and rough withall, on both edges ſet with haires, as in the hairy wood graſſe, the flowers are ſmall and yellow like the laſt, but leſſer, and ſo is both ſeede and roote.

7. *Tragopogon luteum Apulum.* Goats beard of *Naples*.

This Goats beard of *Naples*, hath many very long narrow leaves, ſomewhat broader then the next ſmall purple kind, but ſomewhat hairy, ſome of them growing upright, and others bending downewards, among which a ſtalke riſeth ſcarſe higher then the leaves, bearing a large greene bearded huske, contrary to all other, with yellow flowers, containing a flower which conſiſteth of many yellow ſhort leaves, more like a Hawke-weed, then a Goats beard, which paſſeth with the downe at the ſeed like others, and not halfe ſo great but yellowiſh, and ſmaller at the lower end, where others are greater.

8. *Tragopogon crocifolium purpureum.* Small purple Goats beard.

This ſmall purple Goats beard hath many very long and narrow leaves, lying on the ground at the head of the roote, the ſtalke divideth it ſelfe into three or foure reddiſh branches, ſet with ſome leaves thereon, all of them narrower then graſſe leaves, very like unto the narrow long leaves, of the manured or *Engliſh* Saffron, with a white line downe the middle of them, and hard in handling, each of the branches bearing a bearded greene huske, with a darke purple flower therein, dented at the endes of the leaves thereof, and having yellow threds ſprinkled with meale as it were in the bottome of them, as the greater purple flower hath, and openeth but in the morning, and cloſeth at noone in the ſame manner, after which come the ſeede, ſpreading into a round globe or head, with the downe at the ends of them, as in the greater, the roote is great and long, yeelding milke as the others.

9. *Tragopogon Apulum ſuave rubens.* Roſe coloured Goats beard.

The Roſe coloured Goats beard ſendeth forth many long and narrow leaves like unto Graſſe, with a white line in the middle of them, ſmooth and gentle, if you take them upwards, but as rough as Barly leaves, ſtroaking them downewards, and broadeſt at the ſetting to of the ſtalke, which is two foote high, ſcarſely dividing it ſelfe into any branches, but beareth at the toppe one large and great head, in reſpect of the Plant, parted into eight long leaves or beardes, in the middle thereof is the flower, conſiſting of tenne or twelve leaves, of a pale purple or bluſh colour, neere unto a Damaske Roſe, having divers blackiſh blew threds in the middle of them with a mealy duſt upon them, which being paſt, the head or huske groweth ſomewhat narrow, with a long necke, containing within it the ſeed, which is not faſhioned into a round globe, with downe at the head of the ſeedes, as in all the former except the firſt, it hath five longer and greater ſeedes on the outſide, with little or no downe at the ends of them, and the leſſer in the middle, with a little downe at the ends, which are yellowiſh and ſmooth but the leaſt of all other: the roote is long and ſlender, even the ſmalleſt of all, white downewards and ſomewhat hard,

hard but more reddish at the toppe. This is very like the former or annuall Goates beard if it be not the same. *Camerarius* in his *Hortus Medicus* maketh mention of one with a white flower, which I never saw yet nor heard of by any other. *Flore Albo*

The Place.

The first was sent me out of *Italy* among other seedes, but from whence they had it I know not. The second as *Bauhinus* saith groweth about *Mompelier*, and so doth the fourth also. The third groweth in many places, both in *Italy* and *Spaine*, for I had seedes thereof out of *Spaine*, by my friend *Boelus* that gathered them: the fift I found in the Medowes about *London*, and other places of our land, but not so plentifully as our greater yellow kinde: the sixth, seventh, eighth and ninth, grow on the hills in *Naples*, as *Columna* recordeth, both in his *Phytobasanos*, and *stirpium minus cognitarum historia*.

The Time.

These doe flower about the time of the others, which is in the end of *May*, or in *Iune*, and the seede is ripe soone after: but all of them, except the first, doe abide greene the first Winter after it is sowen, or doth rise of its owne sowing, and flowreth and seedeth the next yeare after: but the first as I said, flowreth and seedeth the same yeare, and must be new sowen every yeare, for I never knew it spring from any seede, that it shed it selfe.

The Names.

It is called in Greeke, τραγοπώγων, and τραγοπώγον, *Tragopogon*, *Barba hirci* and *Barbula hirci*, and γενειοπώγων *Barba senis*, *quod a calyce semina promiscæ hirci vel senis barbæ instar pendent*; so say both *Dioscorides* and *Theophrastus*. The first came to me with the same name, I have set with it in the title *Tragopogon æstivum*: the second *Bauhinus* calleth *Tragopogon folio oblongo sinuato*: the third, both *Anguillara* mentioneth, calling it *Acorus Theophrasti* as he saith others did, and *Fabius Columna* in his *Phytobasanos Tragopogon laciniatis foliis*. The fourth *Bauhinus* calleth *Tragopogon tenuissime laciniatum*. The fift is called by *Tabermontanus Barbula hirci minor*, and by *Bauhinus Tragopogon gramineo folio radice villosa*. The sixt *Columna* calleth *Tragopogon Apulum hirsutum humile*; and *Bauhinus Tragopogon hirsutum*. The seventh *Columna* calleth *Tragopogon Apulum humile hirsutum luteum*: the eighth *Columna* also calleth *Tragopogon crocifolium montanum flore nigro purpureo*, and *Bauhinus Tragopogon purpuro cæruleum crocifolium*. The last is called by *Columna Tragopogon gramineo folio suave rubente flore*. Some have doubted that this is not the *Tragopogon* of *Dioscorides* and *Theophrastus*, because the leaves of the most of them are greater than the leaves of the Saffron, but notwithstanding it is generally taken to be the right, because of the head of seede, which agreeth so well thereto, as no plant else can doe the like; and besides *Columna* hath set forth some of those before recited, which agreeth better with *Dioscorides* and *Theophrastus* Saffron leaves, than any of the rest, which therefore he taketh to be the truest. It is called in *Italian Saffifrica*; and with some *Sassifica*, and *barba di becco*: in *Spanish Barba Cabrona*, and *Barba di Cabron*: in *French Barba de bouc*: in *High Dutch Bocks bart*: in *Low Dutch Boexbaert ende Iosephs bloemen*: in *English* Goates beard, and goe to bed at Noone, or Noone tide, and of some Starre of *Ierusalem*, and others after the *Dutch* word *Iosephs* flower: of some also Saxifrage.

The Vertues.

The rootes of the greater wild yellow kinde chiefely, as also of the other kindes here set forth, being dressed as a Parsneppe, is more delicate and pleasant to the taste in eating: the rootes boyled and dressed (or as some do eate them raw) is a fine sallet likewise to be eaten cold, and are very acceptable to the stomacke, helping to strengthen them that are growing into a consumption, or are become spare and leane by some long sickenesse: the distilled water saith *Tragus*, is the most present remedy that is to helpe inward impostumes (such as is the Pleurisie) and all other paines and stitches in the sides: the *Italians* use it much and often against all the griefes of the stomacke, both to take away the heart burne as we call it (which is an hot and sharpe humour in the stomacke fretting and paining it) and doth helpe also in a dejected appetite, to incite and stirre it up, as also against the defects of the breast or liver, and to helpe to expell gravell and the stone from the reynes, kidneies, and bladder, whereof the name *Sassifrica*, which is as much as breakestone, declareth the propertie: some doe hold opinion, that the purple and ashcoloured kindes being more bitter, astringent and absterssive, have a more binding and clensing qualitie than the others, and are therefore onely to be used for medicament, and the others as nutriment, and that they onely are effectuall to all the purposes before recited.

CHAP. XXIX.

Echium. Wilde Bugloss, or Vipers Bugloss.

Lusius that painefull and industrious searcher of plants, hath given us the knowledge of many more sorts of Vipers Bugloss as he hath don of many other plants, than any before him; whereof I meane to entreate in this place, and with them some others also.

1. *Echium vulgare.* The common Vipers Bugloss.

The common Vipers Bugloss hath many long rough leaves, lying on the ground, from among which rise up divers hard round stalkes, very rough, as if they were thicke set with prickles or haires, wherein are set, such like long rough hairie or prickly sad greene leaves, somewhat narrow, the middle ribbe for the most part being white: the flowers stand at the toppe of the stalkes, branched forth into many long spiked leaves of flowers bowing or turning like the Turnesole, all of them opening for the most part on the one side, which are long and hollow turning up the brimmes a little, of a purplish violet colour, in them that are fully blowne, but more reddish while they are in the budde, and not blowen open, as also upon their decay and whithering, but in some places of a paler purple colour, with a long pointell in the middle, fethered or parted at the toppe: after the flowers are fallen, the seedes (growing to be ripe, and enclosed in round heads) are blackish, cornered and pointed somewhat like unto the head of a Viper: the roote is somewhat great and blackish and wooddy, when it groweth toward seede time, and perisheth in the Winter.

2. *Echium vulgare flore albo.* White flowred Vipers Bugloſſe.

There is little difference in any thing betweene this and the former, but in the colour of the flowers, which in this is of a white colour wholly, and the leaves of a little freſher greene colour, and in ſome places groweth greater.

3. *Echium flore rubro.* Red flowred Vipers Bugloſſe.

The red wilde Bugloſſe is alſo like the former, but that his hairy ſtalkes are ſometimes marked with purpliſh ſpots, and the leaves thereof ſomewhat broader: the flowers which ſtand in the ſame crooked and bowing manner, upon ſhort foote ſtalkes, are of a brave red colour, and in ſome a little paler: the ſeede and rootes are alike and differ not.

4. *Echium pullo flore.* Vipers Bugloſſe with darke reddiſh purple flowers.

This wilde Bugloſſe hath ſhorter ſtalkes, and not ſo rough, but rather ſoft and woolly, whereon ſtand leaves, more thinnely placed, and without order: toward the toppe of the ſtalkes it brancheth forth into divers ſhort ſprayes, with ſome flowers on them, but not ſo plentifully as in the former, and are of a dead or darke blackiſh purpler colour: there is no diſagreement either in ſeede or roote.

5. *Echium Creticum latifolium rubrum.* Red flowred Vipers Bugloſſe of *Candy*.

This *Candy* wilde Bugloſſe, hath large rough leaves lying on the ground, of a fiſe betweene Bugloſſe and Plantane leaves, betweene whom riſeth up round rough ſtalkes, two foote high, ſometimes divided into many branches, with divers rough ſmaller leaves on them to the toppes, which are bowing in the ſame manner with the former, from whence grow holllow flowers, ending in five cornered brimmes like unto the reſt, of an excellent pale red or bluſh colour at the firſt, and more purpliſh afterwards, ſtanding in rough huskes, made of five ſmall leaves a peece: the ſeede that followeth is like the reſt.

6. *Echium Creticum anguſtifolium rubrum.* Spotted Vipers Bugloſſe of *Candy*.

This ſpotted wilde Bugloſſe hath rougher leaves and ſtalkes than the laſt, riſing not fully ſo high, but both ſtalkes and leaves marked with red ſpots, almoſt as much as the ſtalkes of Dragons, but the ſpottes on the leaves are paler than on the ſtalkes: the leaves are very long, but narrower than the laſt: the flowers ſtand in the ſame manner that the others doe, of ſo orient a red colour, that they will not loſe it, but keepe their bravery after many yeares keeping drie: in the reſt it is like the former.

7. *Echium pumilum flore luteo.* Dwarfe yellow Vipers Bugloſſe.

This dwarfe kinde is in all things like the former Vipers Bugloſſe, but in the ſmalneſſe of the whole plant, not growing to be a foote high: the leaves likewiſe are thereunto anſwerable, and ſo are the flowers alſo, of a pale yellow colour but not ſo buſhie as it.

8. *Echioides lutea minima.* The leaſt yellow baſtard Vipers Bugloſſe.

This little baſtard wilde Bugloſſe, hath divers leaves lying upon the ground, not above two inches long, and

1. *Echium vulgare.*
The common Vipers Bugloſſe.

3. *Echium flore rubro.*
Red flowred Vipers Bugloſſe.

not

4. *Echium pullo flore.*
Vipers Bugloſſe with darke reddiſh flowers.

11. 12. *Echium Creticum album & nigrum.*
Hoary white and blacke Vipers Bugloſſe of *Candy*.

not full halfe an inch broad, thicke, rough, and a little hard, but thoſe that grow upward upon the ſtalke which is a foote high, are ſomewhat broader, rough and whitiſh, the leaves that grow towards the toppes being marked with yellowiſh purple ſpots: the toppe of the ſtalke is branched, and beareth ſmall yellow long hollow flowers, like the other; the ſeede contained in the huskes are ſmall, foure for the moſt part ſet together in a head or huske, and ſomewhat like the reſt: the roote is ſmall and ſomewhat long, browne on the outſide, and white within.

9. *Echioides parva alba.* The ſmall white Vipers Bugloſſe.

This ſmall white wilde Bugloſſe, is in moſt things like unto the laſt, but that the leaves have no ſpots upon them, and the flowers are pale almoſt white: the ſeede differeth not, but the roote is very ſmall and threddy, yet browne as the other.

10. *Echium Hiſpanicum flore calcari donato.* Small *Spaniſh* Vipers Bugloſſe with ſpurres.

This ſmall plant which *Bauhinus* referreth unto the kindes of wilde Bugloſſe, becauſe I am not well acquainted with it, muſt paſſe as he hath called it, and that you may know it, he thus deſcribeth it; from a wooddie fibrous browne coated roote, riſe divers round and ſomewhat hairie ſtalkes, ſome of an hand breadth long, and others ſhorter bending downewards, compaſſed with a few thicke leaves, like unto the mountaine Speedewell but thicker and rougher: the flowers that grow at the tops, are hollow, long, and ending in foure brimmes like unto the other ſorts, but of a blew colour, having a ſpurre or taile behind, like thoſe of Todeflaxe: the ſeede is long, rough, and blacke like the other.

11. *Echium Creticum album.* Hoarie white Vipers Bugloſſe of *Candy*.

This *Candy* plant hath many thicke long and narrowiſh hoary leaves, ſomewhat like thoſe of Alkonet, ſet full of ſharpe haires, from whence riſe ſundry ſmall hand-high ſtalkes, round and rough likewiſe with a few ſmaller leaves ſparſedly ſet thereon, at whoſe toppes ſtand tufts of yellow flowers in ſmall long rough huskes unto whom ſmall white ſeede doe ſucceede of the likeneſſe of Vipers heads, and of the bigneſſe of wheate cornes: the roote is long blacke ſmall and woddie, divided into other ſmaller partes.

12. *Echium Creticum nigrum.* Blacke Vipers Bugloſſe of *Candy*.

This daintie *Candie* Bugloſſe groweth high with many ſharpe prickly thicke ſtalkes bending downewards ſet full of thicke long leaves as ſharpely ſet with prickly haires as the ſtalkes, and ending in a ſharpe point: at the toppes of the ſtalkes, and likewiſe at the joynts with the leaves, come forth faire large bell flowers with open brimmes, ſome of them being blew, either pale or deepe, others more purple with foure or five ſmall threds in their middles, after whoſe fading riſe blacke Viperhead-like ſeede in long cods, or ſeede veſſells; from whence the name of that, was impoſed to diſtinguiſh it from the other with white ſeede; it hath a ſingle long white roote of a thombes bigneſſe, and ſmall at the end: the whole plant is of little ſent, but of a ſweetiſh ſharpe taſte.

The

The Place.

The first groweth wilde almost every where. The second about the Castle walles of *Lewes* in *Sussex*. The third and fourth in *Hungary*, and *Austria*. The fifth and sixth in *Candy*. The seaventh and tenth in *Spaine*. The eighth and ninth on the hils in the Kingdome of *Naples*, as *Columna* reporteth. The eleventh and twelfth in *Candy*.

The Time.

They all flower in Sommer, and their seede is quickely ripe after.

The Names.

It is called in Greeke Ἔχιον *Echium*, ἀλκιβιάδιον & ἀλκιβίον *Alcibiadion*, and *Alcibion*, or *Alcibiacum*, of the first finder thereof, who being bitten by a Viper, gathered this herbe, and chewing it, and swallowing downe the juice, and applying the rest of the herbe to the bitten place, freed himselfe from danger, *Apuleius* saith it was called Θηριορρίζον *theiorrhizon*, *Viperee radix* and ἐχιόν, from the forme of the seede, which as *Dioscorides* saith is like the head of a Viper, and thereof tooke the name *Echium*, yet some others say from the effects in the rootes, to cure the bitings of the Viper, in Latine also *Echium*, of most Authours, yet of some *Buglossum silvestre viperinum*, & *Serpentaria*, and some also tooke it for *Anchusa*, as *Thalius*, and *Cæsalpinus*, and under that name saith the seede of the *Candy* sorts were sent him. *Cordus* on *Dioscorides* called the first *Lycopsis* and *Lonicerus Buglossum sylvestre*. *Camerarius* and *Matthiolus* mention the second, *Clusius* the third, fourth, fifth, and sixth, and the seventh in his *Curæ posteriores*, *Columna* the eighth, and ninth, and *Bauhinus* the tenth, under their severall titles as they are here expressed, the two last by *Alpinus* in his booke *de plantis exoticis*. It is called of the *Italians Echio*, and *Buglossa Salvatica*. Of the *Spaniards Yerva di las bivoras*. Of the *French Borrache sauuage*, and *L' herbe aux viperes*. Of the *Germans wild ockſen song*. Of the *Dutch* men *wild ossentonghe*. In *English* wild Bugloſſe, and Vipers Bugloſſe.

The Vertues.

It is as you have heard, by the first finder out of it, an especiall remedy against the biting of the Viper, and of all other Serpents or venemous creatures, as also against poyson, and poysonfull herbes, it is added further by *Dioscorides* and others, that whosoever shall take of the herbe or roote, before they be bitten, shall not be hurt by the poyson of any Serpent. And I thinke from this and some other the like qualities in herbes, to heale the diseases, whereof some forme may be seene in them, hath come the application of many other, whose formes have beene imagined to have beene found in them, which they call *Signaturæ plantarum*, whereof *Crollius* in his *Basilica chymica*, hath given demonstration of all the parts of the body, from the head to the foote, and moreover of many the diseases of the body, and of divers other things, whereof they that will reade his worke may be better informed that desire the knowledge thereof; the rootes or seedes, are thought to be most effectuall for the foresaid causes, as also to comfort the heart, and to expell sadnesse, and causelesse Melancholy, it tempers the blood, and allayes the hot fits of agues, the seede drunke in wine procureth aboundance of milke in womens brests; the same also being taken, easeth the paines in the loines, backe, and kidneies, the distilled water of the herbe, when it is in his chiefest strength, that is in flower is excellent to be applyed inwardly or outwardly, for all the griefes aforesaid. There is a syrupe made hereof, very effectuall for the comforting of the heart, and expelling sadnesse and melancholly, which is made in this manner. Take of the clarified juice of the common wilde or Vipers Bugloſſe foure pound, of fine Sugar three pound, of the infusion of the flowers thereof one pound, boyle these gently unto the consistence of a syrupe, which keepe by you, to use as you shall have cause. But because it is somewhat hard to presse forth this juice, by reason of the slimenesse thereof, it is fit that after you have beaten the herbe well, you set it close covered in a cold cellar, or other cold, and moist place for two daies and nights, and then wring or presse forth the juice, and clarifie it with the whites of egges beaten, and passed gently of it selfe, through a thicke *Hippocras* bagge; and because many know not how to make the infusion, before spoken of rightly as it should be, it is thus. Gather of the flowers of the said wild Bugloſſe, a good quantity, which you shall put into a pot, with some water, being made boyling hot aforehand, stoppe the pot close untill it be cold, and then wring forth the infusion; you may renew the infusion, by putting in fresh flowers as before, once or twice more, if you will have it strong of the flowers.

CHAP. XXX.

Fraxinella sive Diptamnus albus. False white Dittany.

I Have given you the descriptions of all the sorts of false Bastard Dittany, or white Dittany, in my former Booke, whereunto I referre you. I shall onely here exhibite the figure and amplifie the Vertues.

Fraxinella may more fitly be called false white Dittany, then bastard Dittany, because there is one already set forth in the first Tribe or Classis by the name of *Pseudodictamnus*, Bastard Dittany, least two herbes should be called by one name, and then neither should be well understood when they were called for: distinct *epithites* is most requisite therefore to avoid confusion.

The Vertues.

The false white Dittany then is heating and drying, the rootes which are most in use doe attenuate or make thin grosse humours, it openeth obstructions, provoketh the menstrues and urine, and clenseth that which is foule and contagious. It is very effectually both against poyson, and the venome of Serpents, and other poysonfull creatures, and against the pestilence, and other contagious diseases, to take a dramme or two of the powder of the roote in wine or broth: the same also taken, killeth the wormes of the belly, breaketh the stone, causing it to avoid in the urine, it warmeth and cleanseth the matrixe, expelleth the dead childe, and after-birth, if the part be fumigated with it and Penniroyall, or taken in Wine: it easeth the paines and torments in the inward parts or bowels, and healeth inward hurts and wounds: it is much commended against the Epilepsie or falling sickenesse, and other cold griefes of the head and braines, and is held to be of great good use against the *French* disease, to use it with the decoction of *Guaiacum*.

CHAP.

Fraxinella vulgaris.
The moſt common falſe white Dittany.

CHAP. XXXI.

Galega. Goats Rue.

BEcauſe this herbe is ſo effectuall againſt all infections, I could do no leſſe then inſert it here, and take it from the other leguminous plants, where it might be placed, which otherwiſe I would not have done; and hereunto I muſt adjoyne another, for the neereneſſe, both for forme and vertues.

1. *Galega vulgaris.*
Common Goats Rue.

The common or moſt uſuall Goats Rue, ſendeth forth many round hard ſtalkes, foure or five foote high, whereon grow one above another at ſeverall joynts, long winged leaves, that is, many leaves ſet on each ſide of a middle ribbe, which are ſmall yet ſomewhat broad and long, and pointed at the end, ſmooth on the edges without any dentes, ſomewhat like unto the leaves of Vitches, and of a faint greene colour, at the toppes of the ſtalkes ſtand many ſmall Leguminous flowers, one above another, of a pale blewiſh purple colour, and in ſome plants pure white, after which come ſmall round pods, about an inch and a halfe long, a little bunched out in ſome places, but nothing ſo much as the *Orobus* or bitter Vetch, wherein lie three or foure or five ſmall pale ſeede like unto a Vetch: the roote is white and wooddy, ſpreading well in the ground, and abiding divers yeares.

2. *Galega montana Dalechampij.*
Mountaine Goats Rue.

This other Goats Rue ſhooteth forth divers round hard ſtalkes, nothing ſo high as the former, whereon groweth ſuch a like winged leafe at every joynt, but broader and thicker ſet together, ſmooth alſo on the edges, but having the middle

1. *Galega ſive Ruta Caprariа.*
Goats Rue.

ribbe,

ribbe of every leafe, raiſed up a little high: at the toppe of the ſtalkes ſtand divers ſuch like flowers as the former, but all on one ſide of a pale colour, tending to yellow, which afterward yeeld ſmall, long, blackiſh pods, wherein lie ſmall flattiſh ſeede, like unto Lentills: the roote is ſomewhat great and blacke, ſending forth very long ſtrings, whereby it faſteneth it ſelfe deepe in the ground.

The Place.

The firſt groweth commonly wilde by the way ſides of moiſt fields and medowes, both in *Italy*, *Savoy* and other places; as alſo found of late growing wilde in the Medowes by *Linton* in *Cambridgeſhire*: the other not but upon the toppes of mountaines, where any plaines are found.

The Time.

They flower in the end of *Iune* and *Iuly*, and the ſeede is ripe in *Auguſt*.

The Names.

This herbe hath not beene knowne to the ancient Authors; and therefore hath no name, but is uſually called in Latine *Galega* or *Ruta Capraria*, for they that firſt found it and the vertues, gave that name of *Ruta* thereunto, as finding it no leſſe effectuall than the beſt Rue: ſome call it *Gralega*, and ſome *Herba Gallica* as *Fracaſtorius*: and of ſome *Capraria*: the *Florentines* call it *Lavaneſe*; in other parts of *Italy* it hath divers other names as *Geſner* ſaith *Caſtracane*, *Lavanna*, *Thorina* or *Taurina*, *Martanica*, *Sarracena*, *Capragina*, *Herbaneſe*, and *Giarga* as *Braſavolus* ſaith. Some with us call it *Italian* Vetch, but moſt commonly Goates Rue. The other *Lugdunenſis* calleth *Galega montana*; and *Bauhinus* referreth it to the *Orobus Pannonicus* of *Cluſius*, which it cannot be, for he ſaith it periſheth every yeare; and alſo to the *Arachus latifolius* of *Dodonæus*, which it cannot be neither, for *Dodonæus* ſaith, his *Arachus* is called of divers *Ervum Venetum*, which differeth little or nothing at all from *Cluſius* his firſt *Orobus Pannonicus*, ſo that in this, as in very many other things, he is much miſtaken.

The Vertues.

Goates Rew is moſt effectuall againſt the bitings or ſtings of any venemous creature, yea thoſe *Italians* and others (as *Pena* and *Lobel* ſay) that uſe to gather Vipers (which are certainely Adders with us, by the judgement of the beſt) doe account it more effectuall to preſerve them being bitten or ſtung, than any Treakle of the beſt making, or to defend them from any other infection, and therefore eate it continually, as other herbes in ſallets or otherwiſe in their meates and brothes. It is no leſſe powerfull and effectuall againſt poiſon then the plague or peſtilence, or any infectious or peſtilentious fevers or diſeaſes, that breake forth into ſpots or markes, as the meaſells, purples, and the ſmall pocks, in all which it is admirable, what effects it worketh, both to preſerve from the infection, and to cure them that are infected, to take every morning ſome of the juice thereof, as alſo to eate the herbe it ſelfe, every morning faſting, but it will be the more effectuall if the juice be taken with a little good Treakle and ſome Tormentill rootes in powder, mixed with *Cardus benedictus* water, or with ſome vinegar and fine Bole-armonicke, and Treakle in the ſaid water, and preſently to ſweat two houres thereupon, which it cauſeth alſo in ſome ſort it ſelfe, and may be uſed as well when any is infected, as when any feare themſelves to be infected with the plague; a ſpoonefull alſo of the juice given in a morning faſting, is very effectuall to kill the wormes in children, or the herbe it ſelfe fried with a little oyle of bitter Almons, and laid hot unto the navell, as alſo to helpe the falling ſickneſſe before it grow ſtrong, and old upon them; it is very profitably applied to the belly pained with gripings of winde and the collicke, being fried and laid to warme: in the ſame manner alſo laid upon plague ſores before they be broken, either diſperſeth them (yet defending the heart, not ſtriking it inwardly) or draweth them forth, and healeth them: it is alſo effectually applied with vinegar to gangrenes, running ulcers and ſores, to ſtay the malignitie of them in their fretting and ſpreading, and to defend the vitall ſpirits from danger: it is held alſo to be very cordiall to preſerve the heart from palpitations, tremblings and ſwounnings, and againſt melancholike vapours oppreſſing it. Some uſe a Syrupe made of the juice, and ſome of the diſtilled water as a more familiar medecine, to take upon all occaſions inwardly, for all the purpoſes aforeſaid; and ſome uſe to make an oyle of the flowers digeſted in the Sun, by often repetitions of infuſion to anoint the wreſts of the hands where the pulſe is felt, as alſo the region of the heart, to defend it from the diſeaſes aforeſaid, and danger of infection: it is no leſſe effectuall for Sheepe, Goates, and Cattle, for from the experience of Goat-heards therein, came the name of *Capraria* added unto it: it fatteneth hennes alſo wonderfully, and cauſeth them to lay egges the more plentifully. The other Mountaine Goates Rew, is held alſo almoſt as effectuall againſt poyſon and infection of the plague as the other.

CHAP. XXXII.

Phalangium. Spiderwort.

THere are divers ſorts of Spiderworts, ſome of antient knowledge, others of later acceſſe, of all which I have given the deſcriptions in my former Book, which although I meane not to repeate here again; yet I thinke it not amiſſe both to give you ſome of their names & figures, and to ſet downe their vertues. It is thought it tooke the name φαλάγγιον and φαλάγγιος, *Phalangium* and *Phalangites* from the forme of the ſeede veſſells, others from the forme of the leaves like to that Spiders legges in going, but more certainely I thinke from the propertie of curing the dangerous poiſon of that great Spider: For which purpoſe both *Dioſcorides* and *Galen* doe commend the flowers, leaves, and ſeedes of it, as alſo againſt the verulencie of Scorpions and other Serpents, and to diſcuſſe the torments that riſe from their hurts or otherwiſe. The names of thoſe deſcribed are theſe *Phalangium Allobrogicum*: The *Savoy* Spiderwort: *Phalangium majus Italicum album*. The greater *Italian* Spiderwort. *Phalangium non ramoſum vulgare*. Vnbranched Spiderwort. *Phalangium ramoſum*. Branched Spiderwort. *Phalangium Ephemerum Virginianum Iohannis Tradeſcanti*. The ſoone fading Spiderwort of *Virginia*, or *Iohn Tradeſcants* Spiderwort of *Virginia*, which is of a deepe purpliſh blew colour, whereunto may be added of later knowledge one with a white flower, and another with a reddiſh or Carnation.

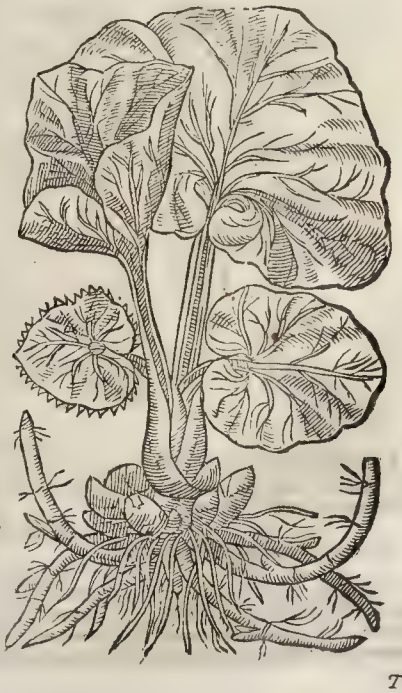
CHAP. XXXIII.

Petasites vulgaris.
The common Butter burre.

Petasites vulgaris. The Butter burre.



THE Butter burre is of two ſorts, the one greater the other leſſer, differing alſo in the flowers, as you ſhall heare: but becauſe they are ſo like one another, one diſcription ſhall ſerve for them both. Each of them riſeth up very early in the yeare, that is, in *February*, with a thicke ſtalke about a foote high, whereon are ſet a few ſmall leaves, or rather peeces, and at the toppes a long ſpiked head of flowers, in the one which is the leſſe and the more rare to finde, wholly white and of a better ſent than the other (yet ſome ſay it hath no ſent) in the greater which is more common with us of a bluſh or deepe red colour according to the ſoile wherein it groweth, the clay ground bringing a paler colour ſomewhat weake, & before the ſtalke with the flowers have abidden a moneth above ground will be withered and gon, blowen away with the winde, and the leaves will beginne to ſpring, which when they are full growne are very large and broad, that they may very well ſerve to cover the whole body, or at the leaſt the head like an *Umbello* from Sunne and Raine, being ſomewhat thinne and almoſt round, whoſe thicke red foote ſtalkes about a foote long, ſtand toward the middle of the leaves; the lower parts being divided into two round parts cloſe almoſt one to another, and of a pale greene colour above, and hoary underneath, that with white flowers bringing ſmaller leaves than the other, and having divers ribbes and veines therein: the roote is long and ſpreading under ground being in ſome places no begger than ones finger, in others much bigger, blackiſh on the outſide, and white within, of a bitter and unpleaſant taſte.

The

The Place and Time.

Both these sorts grow in low and wet grounds by rivers and waters sides, their flowers, as is said, rising and decaying, that is, in *February* or *March* before the leaves appeare in *Aprill*.

The Names.

It is called in Greeke πεταώτης, and *Petasites* also in Latine, deduced *a Petaso, id est, magno galero ita ut vicem galeri supplere possit*. Some take it to be *Iphium* of *Theophrastus*; and some to be *Personata* or *Persolata* of *Pliny*. *Camerarius in horto* calleth the more common *mas*, and the other *fœmina*; but in his Epitome upon *Matthiolus*, he and *Matthiolus* call the greater sort *Tussilago major*. The *Italians* call it *Capellazi*; the *Spaniards Sombrereta*: the *French Herbe aux tigneux*: the *Germans Pestilentz wurtz*; the *Dutch Dockbladeren*.

The Vertues.

The rootes hereof are hot in the first degree, but as *Galen* saith drie in the third, and are by long experience found to be very available against the plague, and pestilentiall fevers by provoking sweat, if the powder thereof be taken in wine; as also resisteth the force of any other poyson; the roote hereof taken with *Zedoaria* and *Angelica* or without them helpeth the suffocation or rising of the mother: the decoction of the roote in wine being taken is singular good for those that wheese much and are short winded: it provoketh urine also and womens courses, and killeth the flat and broad wormes in the belly: the powder of the roote doth wonderfully helpe to drie up the moisture of sores that are hard to be cured and taketh away all spots and blemishes in the skinne.

CHAP. XXXIV.

Polyrhizos Virginiana. The rattle Snakeweeke of *Virginia*.

THis plant of *Virginia* so certaine a remedy against the biting of that venemous rattle Snake, as they call it which breedeth in *Virginia*, must not be forgotten among the rest, for it is a Counterpoison, to be compared, and I thinke preferred before any the forerememberd most soveraigne plants against poysons: whose description as farre forth, as hath yet come to our observation, is this: It riseth up with divers small square stalkes, spreading not much above halfe a foote long, whereon are set divers duskish hoary greene leaves, somewhat rugged as it were with many veines, and somewhat resembling the leaves of *Pistolochia*, whereunto it may be referred but smaller, set without order one at a joint: the flowers grow more at the bottome of the stalkes next the roote than on the branches as the *Pistolochia* doth, and are not much unlikeit, but of a darke or sullen yellow colour, and somewhat lesse also; after which come very small heades with seede, somewhat like to the *Pistolochia* but lesser: the rootes are a number of very small blackish gray fibres or threds, as small almost as haires, which have both an aromaticall and resinous smell, when they are drie, more than when they are greene, and of an aromaticall resinous astringent taste, without any great or manifest heate.

Polyrhizos Virginiana. The rattle Snakeweede of *Virginia*.

The Place.

It groweth very frequent in the upper parts of our *Virginian* plantation, in the fields and champion countries, where under the grasse and herbes, that venemous rattle Snake lurketh and abideth, ready to bite whomsoever shall come neare unto it.

The Time.

It flowreth with us in *June* and *July*.

The Names.

This may very well be referred to the *Pistolochia* I said, but I have severed it being so notable an Antidote; but by what Latine name it might best be called, either *Pistolochia Virginensis*, or as I doe *Polyrhizos Virginiana*; I leave it to every man to doe as he will, or untill a fitter Latine title may be given it, if it be thought expedient: our people in *Virginia* doe there call it the Snakeweede, or Snakeroote, and thereupon may be called *Colubrina*

lubrina Virginiana, I have kept the ſame *Engliſh* name, untill another of better reſpect may be given unto it. But there is a cornuted *Cornutus* that among his *American* plants, calleth this (a horne plague on his head for his labour) *Snagroel* or *Snagroel nothæ Angliæ*, the envy was baſe, whereby he wrote ſo, yet would colour it in that he could not write true, but falſe *Engliſh* and *Latine* too, it were not amiſſe therefore that he were whipt at the ſchoole for it.

The Vertues.

It is both a moſt certaine and preſent remedy againſt the venome of the Rattle Snake, which is a Serpent of a large ſiſe, farre greater then any Snake or Adder with us, having naturally under the throate, certaine looſe hard skinny ſcales, which by motion grate one againſt another, making a creking noiſe, which our people called a rattle, not that it hath any rattle indeed, but this noyſe it maketh, ſtirre it ſelfe never ſo little, yet uſually it is ſo quicke and wary in leaping at any, that it doth it not but ſuddenly: Now the manner of the uſing hereof, is this (God of his goodneſſe providing a remedy, out of the ſame place and ground, from whences the eviſl doth proceed,) as ſoone as any is bitten by that creature, (for oftentimes it happeneth that ſome are bitten, before they can avoid the Serpent, the manner of them being to leape ſuddenly upon one, that the rattle cannot be heard before they be bitten) they take of this herbe and chaw it in their mouthes, and ſwallow downe the juice thereof, and alſo apply of the herbe to the wound or bitten place, which inſtantly cureth them; for being taken quickly after they be bitten, it doth ſo defend the inward parts, that the party feeleth not ſo much almoſt as any outward paine, much leſſe any of thoſe inward Symptomes, are incident to thoſe that doe not preſently uſe this remedy, this is the preſent helpe of the preſent hurt, but if it ſo happen that any being bitten, cannot get of this herbe in any reaſonable time, he dyeth certainely, yet if within twelve houres after the biting; he doe uſe this remedy, it will aſſuredly recover him, but with more trouble and paine, and with longer time, before it hath wought a perfect cure, for it is evident, that the poyſon of this Serpent pierceth the blood, which runneth with all the ſpeed it can unto the heart, the chiefeſt fortreſſe of life and health, which being infected, death muſt neceſſarily and ſpeedily follow, but if it be defended by the vertue and force of any medicine, it preſerveth the one, and expelleth and untterly defeateth the intent of the other. The powder of the herbe and roote taken in wine or other drinke, hath beene found a certaine and preſent cure for the biting of a madde dogge: as alſo to cure both the quartaine ague within three times taking, *viz.* halfe a dramme, or if neede be a whole dramme at a time before the acceſſe of the fit, and any other ague, or peſtilentian feaver, or the peſtilence it ſelfe.

CHAP. XXXV.

Alexipharmacum Indicum ſive Contrayervæ Hiſpanorum. The Indian Spaniſh Counterpoyſon.

BEcauſe the roote of this herbe alſo is of as certaine a cure, to helpe all ſorts of venome and poyſon (as well of hurtfull beaſts, as of herbes, rootes, &c. wherewith the Indians by dipping their arrow heads therein, did kill whomſoever they wounded,) as the former *Virginian* Plant, I thought fit to joyne it thereunto, although we have no more knowledge thereof, then what we may gather from ſeeing and obſerving the dryed rootes and from the relation thereof by *Monardus*, out of *Petrus de Oſma* his letter to him, which is extant in his booke of the ſimple that are brought out of the new world, which *Cluſius* tranſlated out of the Spaniſh into the Latine tongue, and hath publiſhed it with other of his workes and joyned it to his booke of *Exoticks*. It hath ſaith *Monardus*, the roote of a Flower-deluce, and is of the ſmell of a Figgetree leafe: this is all the deſcription that *Monardus* hath made of it: but *Oſma* in his Epiſtle maketh mention of the leaves to be like the Ribbewort Plantaine, *Ioſua Ferrus* alſo wrote thereof as he ſaith to *Monardus*, to Dr. *Tovar*, and to *Valdes*, and in his booke of ſecrets maketh mention thereof in two Chapters, the one is of *Contrayerva*, the other he entituleth *de Contrayerva Bezoar*, whereby he meaneth the herbe or roote that is found in the middle of a *Bezoar ſtone* when it is broken, which he accounteth to be of more vertue then the ſtone it ſelfe, whereon it is engendred, but we in viewing many dryed rootes that came from *Spaine* unto us, have obſerved no good forme of any Flower-deluce in the roote, nor have ſeene any roote to exceed the bigneſſe of ones thumbe, and not one of many to be ſo great, but for the moſt part of the bigneſſe of a finger or leſſe, and not any ſo long, but uſually no longer then a joynt or two at the moſt, not ſo ſmooth on the outſide as the roote of white *Orris* or the Flowerdeluce, but more rugged in all, & in ſome more knobbed, (that is, with ſmall knobs or bunches ſticking out all along the roote) then in others, which are of an even ſiſe, and ſome againe are greater at the one end, and ſmaller at the other, divided as it were by little ſpaces, in the growing almoſt like the greater Figgewort roote, or the roote of *Dentaria Coralloides*, being of a yellowiſh browne colour on the outſide, and in ſome more blacke, but white on the inſide, with many fibres or ſtrings growing from them, this roote lyeth or creepeth under the upper cruſt of the ground, like as the Flower-deluce, Tormentill, Biſtort, and the like

Contrayerva Hiſpanorum ſive Drakena radix Cluſij.
The Indian Spaniſh Counterpoyſon.

doe;

doe, and doth not grow downe right, like other sorts of rootes, and are a little warme or hot in taste upon th tongue, drawing water as *Pellitory* of *Spaine*, but nothing so hot nor sharpe, or drawing rheume so much, whic is not well perceived, unlesse heedfully observed, neither doth the heate abide any long time after the chewin but is soone gone, leaving the roote almost like a dry chippe, without any manifest stipticity, astringency, o aromatirity, that I could perceive, although *Monardus* saith it hath, and judgeth it to be hot and dry in the secon degree.

The Place.

It groweth saith *Monardus* in *Charcas*, and as *Ferrus* aforesaid, saith in *Tonsaglia*, provinces in *Peru*, in th *West-Indies*, and in some other places there, and from thence brought into *Spaine*, and so to other Countryes.

The Time.

We must abide the time to know further hereof, before we can declare it to any other.

The Names.

Monardus first wrote hereof from the intelligence he had by *Osmus* Letter to him, and called it *Radices Vene nis adversantes*, and said the *Spaniards* called it *Contrayerva*, which is as much as *Alexipharmacum*, a counter poyson, or rootes resisting venome and poyson, especially of that where with the *Indians*, by dipping their arro heads therein, killed both the *Spaniards* and other their enemies in their warres, and the wild beasts whom the hunted, and is the same also that *Clusius* calleth *Drakena radix*. I have given it the title of *Alexipharmacum Indi cum sive Contrayerva Hispanorum*, and in *English* the *Indian Spanish* Counterpoyson, from both places and pro perties.

The Vertues.

The rootes hereof (saith *Monardus*, *Petrus de Osma* and *Iosua Ferras* made into powder, and taken in whit Wine is a most present remedy against all manner of venomes and poysons, of what kinde soever they be (excep ting *Mercurie Sublimate* onely, which is to be cured by drinking of no other thing but milke) by forcing th poyson upward by vomit, and avoiding and expelling it by sweating: the powder drunke in the same manne (they say) resisteth such charmes or the like witchery, that is used in such drinkes that are given to procure love It likewise killeth the wormes of the belly, and is also good against agues, either *tertian*, *quotidian*, or *quartaine*, t be taken before the comming of the fit, which will not onely hinder or lessen the fits, but by continuing the us thereof, will utterly take them away. I have knowne somethat have made a composition of the powders of thi roote, *Bezarstone* and *Scorsonera* rootes made into a masse or lumpe, to be used upon occasion against poysons an infections of the Plague, or any other contagious disease as the small pox, purples, measles, or other that rais spots in the flesh, and is a most soveraine cordiall, to preserve the heart and the vitall spirits from danger, an to expell it by sweating, &c. For the said *Ferrus* saith, that the *Bezarstone* is engendred in the beast that breedet it by the vertue of this herbe which it eateth, and by the naturall disposition of the beast, some also adde unt that confection, some other things, as besides *Scorsonera* rootes, Bistort, Tormentill, or the like, as every ones af fection leadeth them more or lesse. *Ferrus* saith he made a tryall hereof with the best Treakle, and found it mor effectuall for the diseases aforesaid. Againe he saith, that the *Indians* doe not eate the bodies of those they hav slaine by their poysoned arrowes, untill they have lyen three or foure dayes with their wounds washed with th juice of this herbe, which rendereth them tender and fit to be eaten, which before were hard.

Vnto this Classis also should appertaine divers other Plants, but that some of them are already described, an set forth in my former Booke, as *Mirabilia*, &c. And of the Antidotes, or remedies against poyson, some ar there also set forth, as *Angelica*, *Carduus Benedictus*, *&c.* And some likewise not onely in the first Tribe of thi worke here before, as *Chamapitys*, *&c.* but in sundry other *Classies*, hereof, as they happen to be entreated of i their order.

SAXI-

SAXIFRAGÆ PLANTÆ
NEPHRITICÆ SIVE CALCVLVM FRANGENTES.
SAXIFRAGES OR BREAKE-Stone Plants.
CLASSIS QVARTA, *THE FOVRTH TRIBE.*

CHAP. I.

1. *Saxifraga alba vulgaris.* The common white Saxifrage or Breakestone.

THere are so many and divers sorts of herbes that beare the name of Saxifrage, that is, from the effects in breaking and expelling the stone, much differing in forme one from an other, that I have therefore thought a small good to make a peculiar Classis of them, and yet not of all, for there are sundry Vmbelliferous and other plants, which cannot so fitly be severed from their owne Tribes.

This white Saxifrage that is most common in our land, hath a few small reddish kernells or rootes, covered with some skins, lying among divers small blackish fibres, which send forth divers round faint, or yellowish greene leaves, and grayish underneath, lying above the ground, unevenly indented about the edges, and somewhat hairy, every one upon a little foote stalke; from whence riseth up a round browniſh hairy greene stalke, two or three foote high, with a few such like round leaves thereon as grow below, but smaller, and branched somewhat at the toppe, whereon stand pretty large white flowers of five leaves apeece, with some yellow threds in the middle, standing in long crested browniſh greene huskes: after the flowers are past sometimes ariseth a round hard head, by-forked at the toppe, wherein is contained small blackish seede, but usually they fall away without any seede, which yet is not that which is called white Saxifrage seede, for those same kernells or graines of the rootes, are they which are usually called the white Saxifrage seede and so used.

2. *Saxifraga alba altera bulbifera.* The Mountaine white kernelly Saxifrage.

This other white Saxifrage is very like the former in every part, but yet hath many especially differences to distinguish it, as first in the rootes, which although they are round, red, and bulbous like the other, yet are they twise as great, and made as it were of scales or cloves, one laid upon another, like the roote of a Lilly: the leaves are round and hairy, but somewhat lesser, with browniſh foote stalkes: the stalkes are greater, having leaves thereon, as in the former, but at every joynt with the leafe commeth forth a small bulbe or kernell, like unto those at the roote, which when it is thorough ripe, will encrease to be plants, as the bulkes of the bulbed Lilly, or of the bulbed Corrall roote will: the flowers and heades with seede are alike: the bulbes on the stalkes by the Cutters fault are not specified in the figures.

3. *Saxifraga alba Alpina.* Mountaine Saxifrage without kernelly rootes.

This Mountaine Saxifrage groweth so like unto the first white Saxifrage, that *Bauhinus* taketh it to be no other but the very same with the first, but there is some varietie therein; first, in that this springeth up with fewer leaves at the ground, yet round and like to the white Saxifrage, then, although it hath small stalkes, with leaves thereon like it, yet at the toppes it hath pale yellowish flowers: and lastly the rootes are wholly composed of long strings or fibres, not having any of those small knots or kernells, that the former hath growing amongst them.

The Place.

The first of these groweth in many places of our owne land, in the lower moist, as also in the upper drie corners of Medowes, and grassie sandy places, on the backe side of *Grayes Inne*, where Mr. *Lambes* Conduit heade standeth. The second groweth on the hills in the Kingdome of *Naples*: the last on the high snowie *Alpes* under the trees.

1. *Saxifraga alba vulgaris.*
The common white Saxifrage.

2. *Saxifraga alba bulbifera.*
The Mountaine white Saxifrage.

The Time.

They flowēr in *May*, and thēn thēy arē gathered both for thē ſeēdes' ſakē, which are as I ſaid, thē ſmall graines or kernells at the rootes, or upon the ſtalkes, as alſo to diſtill: it quickly periſheth downe to the ground, when any heate commeth.

The Names.

This herbe is called *Saxifraga* or *Saxifragia*, from the effect to breake the ſtone, (but not knowne to any of the Greeke or antient Latine Writers, that we can finde) and *alba* from the flowers, which is added to diſtinguiſh it from all the other ſorts. The firſt is generally called *Saxifraga alba*, by all the moderne Writers; *Lobel* addeth *Chelidonides*, becauſe of the kernelly rootes; of *Bauhinus rotundifolia*, and of *Cluſius tuberoſa radice*. *Fabius Columna* onely maketh mention of the ſecond, by the name of *Saxifragia bulboſa altera bulbifera montana*; and *Bauhinus* from him *Saxifraga adfolia bulbos gerens*: the laſt is called by *Lugdunenſis* as it is in the title, who maketh it different: in *Engliſh* white Saxifrage or Breakeſtone: the *Italians* and *Spaniards* call it *Saſſifragia bianca*; the *French Rompt pierre* and *Saxifrage blanche*: the *Germans* and *Dutch Witt Stein brech*.

The Vertues.

This Saxifrage being ſomewhat bitter, and held to be hot and drie in the ſecond degree, is as effectuall as any other ſort of Saxifrage whatſoever to cleanſe the reynes and bladder, and to diſſolve the ſtone engendered in them, and to expell it and the gravell by urine; to provoke urine alſo abundantly being ſtopped, and to helpe the ſtrangury or piſſing by droppes: for which purpoſes, the decoction of the herbe or rootes in white wine, or the powder of the ſmall kernelly rootes, which is called the ſeede taken in white wine, or in the ſame decoction made with white wine is moſt uſuall. The diſtilled water of the whole herbe, rootes and flowers, as it is effectuall in a manner, ſo it is much more familiar to be taken of any that hath neede thereof; it provoketh alſo womens courſes, and freeth and cleanſeth the ſtomacke and lungs from thicke and tough flegme, that troubleth it, and cauſeth it the more eaſily to be avoided.

CHAP. II.

Saxifraga alba Petræa. White Rocke Saxifrage.

THis white Rocke or Mountaine Saxifrage, I have joyned next unto the former, for the neare affinitie it hath therewith. It ſendeth forth from a ſmall long reddiſh roote, with ſome fibres thereat, divers ſomwhat hairy leaves longer & deepelier cut in on the edgds, than thoſe of the former, among which riſeth up a browniſh hairy ſtalke, about a foote and a halfe high, ſtored with branches from the bottome to the toppe; at the ends whereof ſtand the flowers in greene huskes, conſiſting of five very white leaves a peece, having ſome yellowiſh threds in the middle, ſtanding about a head or umbell, which in time

time growing to be the ſeede veſſell, hath divers ſmall ſeede contained within it; the taſte of the leaves are ſweetiſh at the firſt, but a little ſharpe afterwards.

The Place.

It groweth on Mount *Baldus*, not farre from *Verona*, in the territory of the *Venetians*.

The Time.

This flowreth in the naturall places in the end of *Iune*, and the ſeede is ripe ſoone after, and periſheth wholly afterwards.

The Names.

It is called by *Pona* who ſet forth the deſcription of Mount *Baldus*, and what plants doe grow in every part thereof, by the name of *Saxifragia alba petræa*; but *Bauhinus* according to his uſuall manner, in all things almoſt that may be altered, doth vary the name twiſe, calling it firſt in his *Phytopinax*, *Alſine Tridactylites Alpina*; but afterwards in his *Pinax* changing his former minde, calleth it *Sedum tridactylites Alpinum majus album*, and none of them both in my opinion anſwerable to ſo famous an Herbariſts judgement; as to referre them to ſuch plants, as yeeld ſo ſmall likeneſſe: for unto the *Alſines*, (whereunto I ſaid he referred it at the firſt, but diſclaimeth it afterwards) although it may ſeeme to have ſome reſemblance, in the white flowers, yet the leaves and other parts thereof, withſtandeth that compariſon; and unto any kinde or ſort of *Sedum*, it hath in my judgement farre leſſe correſpondencie, which ſheweth a ſtrong conceit in him beyond compare, to make his later opinion worſe than the former, which as is judged in moſt, ſhould be more conſiderate and exact: but ſurely I thinke it doth ſo neare'y reſemble, as I ſaid before, the former white Saxifrage, both in forme and qualitie, that it is moſt fitly to be referred unto it, and unto no other plant ſo likely: the chiefe differences conſiſting in the forme of the branches, leaves and rootes, as you may plainely perceive both by the diſcription and figure.

Saxifraga alba petræa. White Rocke Saxifrage.

The Vertues.

It hath no doubt the ſame properties that the former hath, both the name arguing it, and the likeneſſe of face in growing not reclaiming, and the taſte eſpecially, whereby the qualitie is chiefely diſcerned anſwering thereunto, and although there is not any authorities extant to warrant this my conceit, yet thoſe forerememberd conditions therein, may plead a ſtrong perſwaſion of veritie, and untill it be contradicted by ſufficient triall and experience to be otherwiſe, I hold it may paſſe for currant as a Saxifrage.

CHAP. III.

Saxifraga aurea. Golden Saxifrage.

GOlden Saxifrage is a ſmall low herbe having many round leaves lying on the ground bluntly endented about the edges ſomewhat like the former common Saxifrage, but not hairy, ſomewhat thicker alſo and of a darker greene colour, among which riſe up divers ſlender and weake ſtalkes, little above a hand bredth high, with ſuch like leaves on them as grow below up to the toppes, where among the leaves come forth very ſmall gold yellow flowers not eaſily obſerved, and falling away ſo quickly, that they are ſo ſeldome ſeene with them, and after they are paſt, there appeare in their places ſmall round heads, wherein is contained ſmall round reddiſh ſeede: the roote is compoſed of a number of ſmall ſtrings or fibres: the whole plant is almoſt inſipide or without taſte, but nothing hot that it may be judged to be effectuall to diſſolve or expell the ſtone.

Saxifraga aurea. Golden Sxifrage

The Place.

It alwayes groweth in moiſt places by Well ſides, or other ſtanding and ſometimes running waters, and ſometimes alſo in mooriſh grounds, as about *Tidnaham* in the Forreſt of *Deane*, at *Aſhford*, and *Iden* in *Kent*, at *Chepſtow* in *Eſſex*, and in divers other places.

The Time.

It flowreth in *May* and ſometimes in *Aprill*, but abideth greene all the reſt of the yeare, and periſheth not like the laſt.

The Names.

It is called *Saxifraga aurea* of moſt Writers, from the
